PREFACE TO NINTH EDITION

THIS is the ninth edition of this dictionary. A new edition does not fully reveal to the consultant all the changes and improvements that have been made in it. For instance, two to three printings of this dictionary are made every year, and in each one of these printings numerous changes and improvements are instigated.

Many obsolescent words have been eliminated to make space for the entry of new and up-to-date terms. Not only have many new words been introduced, including new subjects, but late developments and new facts pertaining to the various branches of medical science have made it necessary to rewrite, revise, and change the material relating to important subjects.

In the Appendix, *The Interpreter*, presented in an earlier edition, has been reintroduced as a result of requests from many users of the dictionary. The Table of Physical Constants of the Elements, Table of Muscles, Table of Principal Joints, Table of Nerves, and the Vitamin Tables have been revised, with the *Nomina Anatomica* (Parisensis) being used where practicable.

The purpose of this dictionary is to inform as well as to define; to extend information about the things that words symbolize. The dual aim of the work stems from the need of people in medicine and related fields to learn what they have to know quickly and conveniently. The person who wishes to know something about a particular subject is frequently in search of *information*—not words, not a mere definition. Experience shows that such a requirement is met most fittingly by a combined medical dictionary and dictionary of medical subjects. In science, a reader's threshold of exasperation is notoriously and properly low. He expects a dictionary to contribute to his professional performance, and it is a matter of observation that that cannot be done by definitions alone or by the mere herding of scientific facts in alphabetical order. In all these matters, the author of this book has sought to detach it from the commonplace category of dictionaries that deal mostly with terms and spellings. The aim throughout has been to supply voluminous information in the various fields of medical practice, nursing, and allied subjects.

Even though much new matter has been added, the basic material in previous editions which has made this dictionary famous has been retained in this revision.

CLARENCE WILBUR TABER

PUBLISHER'S FOREWORD

THERE is precious little that a publisher can say about a dictionary which in the short span of 21 years has sold well over 1,000,000 copies. Everything has been said, and the sales record says it.

We merely note that neither the author nor the publisher is content to stand on past acclaim. This ninth edition has been carefully revised.

The *Nomina Anatomica* of Paris has replaced the older anatomical nomenclature in the appendix, and the charts and tables in the appendix have been carefully checked and brought up to date. "The Interpreter," a feature in a past edition, has been redone and included. Many of the pictures have been redrawn. As always C. W. Taber has laboriously checked every item, every definition, deleted many, and added still more.

Thus we believe that this edition stands more than ever before as an excellent source of information—a coordinated work of knowledge concerned with every clinical feature of medicine, nursing, and allied science. It is **more** than a multitude of facts and principles, for its many features, visible on almost every page, are creative conceptions, devised to communicate information beyond definitions. Through the use of expanded discussions, of etiology, symptoms, diagnosis, treatment, nursing procedures, and the like, the reader obtains authoritative, up-to-the-minute information revealed by no other dictionary.

In preceding editions the authority, scope, and presentation of *Taber's Cyclopedia Medical Dictionary* showed that it is something more than just another medical dictionary. We believe that this edition is a worthy successor to those that have gone before.

F. A. DAVIS COMPANY

SOURCES CONSULTED

THE factual material of this dictionary is supported by the outstanding authorities in medical science. The ninth edition represents the contribution of a number of outstanding scientists. In addition, scores of modern reference works and medical and nursing textbooks have been consulted for the verification of facts and for new data. Likewise, the leading medical and nursing periodicals have been freely used for new discoveries and for the latest procedures in the allied medical sciences. To give individual credit to the multitudinous sources consulted would be most difficult.

The data on the content and chemical composition of foods have been largely based upon the findings of Sherman, although other eminent authorities in the field of food and nutrition have been drawn upon. It should, however, be understood that there can be no definite standard of values for any food, and that this accounts for the differences in the findings of various food specialists.

Much credit should be given to Edwin B. Steen, of the Department of Biology, Western Michigan University, for his revisions and contributions pertaining to Bacteriology, Biology, and Parasitology in harmony with modern classifications of these subjects. New data have also been added to the subjects relating to "blood" by this and other well-known specialists.

C. W. TABER

FEATURES AND THEIR USE

ONLY a thoroughly trained mechanic would pretend to understand the workings of a complicated piece of machinery with its thousands of parts. Almost any one, however, feels competent to use successfully and to understand a dictionary that in reality represents hundreds of highly specialized subjects. To most persons, a dictionary is a dictionary. Nevertheless, *Taber's Cyclopedic Medical Dictionary* contains many subjects and features never before incorporated in such a reference work.

This work is a *medical dictionary*, but it is more than that. It is as much a dictionary of medical subject matter as it is a dictionary of medical terms. It is a source book of medical knowledge that will save much time in consulting a great many other works. A few of its more outstanding features are the following:

Pronunciations: Fully 99% of all words are respelled for pronunciation. Long and short vowels are marked diacritically, the primary accent is shown, and frequently the secondary accent. Latin rules cannot be depended upon for the pronunciation of medical words, and authorities do not agree upon any standardized pronunciations. Common usage, however, seems to prevail, and this has been followed as much as feasible in this book. Respellings for pronunciation are accurate and do not distort the actual spelling of the word any more than is necessary to indicate the proper phonetic sound.

Spellings: Diphthongs, for the most part, have been eliminated. Only proper nouns have been capitalized. Words formerly hyphenated, such as gastrointestinal, are now indicated as one word. Proper nouns used as adjectives do not take a capital initial. The letter "k" has been substituted for "c" in such words as leukocytes.

Vocabulary: This is sufficiently extensive to meet the daily needs of the practicing physician, the medical student, and the nurse. Highly specialized topics which belong in separate lexicons, such as botany, and obsolete words have been eliminated. Hundreds of drugs, for instance, that have not been in general use for ten or twenty years, have been weeded out of the vocabulary to make room for the inclusion of many new drugs. Medical literature has been combed to provide the very latest terms now in good medical standing.

Definitions: These stand out in a paragraph separate and apart from all collateral terms, and apart from additional supplementary matter, thus making it easy to read the definitions. The majority of synonyms have their own complete definitions, even at the risk of duplication. Words marked with an asterisk as they appear in a definition indicate that the word is defined in its proper place.

There probably is no profession in which there is less agreement regarding certain subjects than Medicine. The prevailing opinion of the profession, however, has been given in this dictionary, in so far as this has been available. Unfortunately, this may result in an adverse opinion in some instances, especially if the consultant is not familiar with opposing views, or unduly favorable to a definition other than the one expressed.

Subtopics: Many related words are listed and defined in most dictionaries in the same paragraph, such as the many *acids*, or different forms of the same disease. In this dictionary each of these words has its own vocabulary entrance with its definition separate and apart from other material. These topics are listed in alphabetical order, making access to them easy and quick.

Etymologies: This is the only abridged medical dictionary containing the derivations of words showing their Latin, Greek, and other sources with their meanings. These are not merely reproductions from other works, but the result of research which has made possible a great degree of accuracy. Prefixes and Suffixes also appear in alphabetical order the same as words.

Medical Synonyms: Medical synonyms are incorporated with the definition of a word; that is, when there *are* synonyms for a given term. This is a great aid to medical writers and speakers.

Words Pertaining To: Following important words will be found a list of other words pertaining to the one defined. In this way, a complete study or cycle of information pertaining to a given term may be acquired by reading the definitions of these words in the text. In many instances, following the definitions will be found a list of related subjects pertaining to the one defined.

First Aid: Practically every form of accident has been listed with first aid treatment. Included among these are poisons and their antidotes, bites and stings of all kinds, fractures, and other accidents, including different forms of unconsciousness.

Diseases: The principal diseases with their various forms are given, together with their diagnosis and symptoms, prognosis, treatment and nursing procedures, including diet.

Dietetics: Many foods and beverages are listed with all that is known about them. Also mineral content of the human body, and the physiology of digestion, assimilation, and elimination.

Drugs: Many of the terms for drugs have been given their trade-mark names, even though no references to the trade-mark or proprietary nature of the drug is made in the individual listing. These names are in common use by physicians and nurses who may be more familiar with them than with their scientific names.

Nursing Procedures: More of these are given than are usually found in the handbooks of nursing on the market.

Tabulations: Many important tabulations will be found in this text, but long tables which interfere with finding words in the dictionary have been grouped in the Appendix.

The Interpreter: This contains 373 questions and statements which are most often used during examination and taking the patient's history to aid in establishing diagnoses. Each item is in five languages: English, French, German, Italian and Spanish.

Only consistent use of this medical dictionary will prove its value and reveal much of its treasures.

FACT-FINDING INDEX

THE user of reference works seldom becomes aware of the many subjects they contain. The following index lists a few of the entries covering such important subjects as *Diagnosis*, *First Aid*, *Nursing Procedures*, and *Poisoning*. Many other subjects could be listed in the same manner. They, however, will be found in regular alphabetical order.

- | | | |
|---------------------------|---------------------------|------------------------|
| Diagnosis | Heat | Breast |
| Gait | cramps | Breath |
| Gums | exhaustion | Bromidrosis |
| Headache | stroke | Bronchitis, chronic |
| Lips | Hemorrhage | Bronchopneumonia |
| Mucous membranes | arterial | Bronchotomy |
| Nail, finger | carotid artery | Bruise |
| Nose | venous | Burn |
| Pain | Hip, dislocation of | acid |
| Pulse | Hornet sting | alkali |
| Respiration | Human bite | chemical |
| Skin | Humerus, fracture of | Bursitis |
| Sputum | Internal injury | Cancer |

PRONUNCIATION

Diacritics: These are marks over or under vowels to indicate the pronunciations. In this dictionary, only two diacritics are used. The *macron*, showing the name sound or so-called long sound of vowels, as the *a* in *râte*, *e* in *êat*, *i* in *isle*, *o* in *ôver*, and *u* in *ûnite*; also *e* as in *éver*, *i* as in *ît*, *o* as in *nôt*, *u* as in *cût*.

Accents: These indicate the stress upon certain syllables. A single accent ' is called a *primary* accent. A double accent " is called a *secondary* accent, indicating less stress upon a syllable than that given to a primary accent. Examples are "ob'ject," and "o'ar-i-al'ji-a."

Pronunciations only may be approximately indicated unless all the markings in Webster's New International Dictionary are used which is not practical in an abridged dictionary.

ABBREVIATIONS USED IN THE TEXT

abbr.	abbreviation	Inf.	inferior
adm.	administration	Int.	interior, internal
anat.	anatomy	K	potassium, kalium
ant.	anterior	L.	Latin

A

a. Abbr. for *accommodation*, *anode*, *anterior*, and *total acidity*.

A. Symb. for *argon*.

Å. or **A. u.** Abbr. for *Angstrom unit*

A₂. Abbr. for *aortic second sound*.

A. A. Abbr. for *achievement age*.

aa, ãã [Abbr. *G. ana*, a distributive preposition] Prescription sign denoting the stated amount of each of the substances is to be taken

a-, an- [*G. alpha*, privative]. Prefix meaning *without*, *away from*, *not*, as *atypical*.

Aaron's sign. Distress in region of heart or stomach upon pressure over McBurney's point* as in *appendicitis*

ab- [*L.*] Prefix meaning *from*, *away from*, *negative*, *absent*

abacterial [*G. a-, priv + G. baktêrion*, rod] Without bacteria

abactio (ab-ak'shi-o) [*L. abactus*, driven away] Induced abortion.*

abactus venter [" + *L. venter*, belly] Nonspontaneous abortion

Abadie's sign (ã-bã-dez') 1. In exophthalmic goiter, spasm of the levator palpebrae superioris. 2. In tabes dorsalis, insensibility to pressure over tendo Achillis.

abaïssement (a-bãs'mon) [*Fr* a lowering] 1. Depression 2. Coughing. 3. Falling

abalienated (ab-ãl'yen-ã-ted) [*L. abalienare*, to separate from]. Deranged

abalienatio mentis (ab-ãl'yen-a'shi-o men'tis). Insanity

abalienation (ab-ãl'yen-a'shun) [*L. abalienare*, to separate from]. Physical or mental decay, lunacy or delirium

abalone (ãb'ã-lõ-ne) [Origin uncertain] Large sea snail with flattened shell. Eaten on Pacific Coast. Average serving 100 grams. Pro. 217, Fat 0.1, Carbo 3.7

abanet (ab'an-et) [*Heb abnêt*, long scarf] Girdle or girdlelike bandage. SYN. *abnet*.*

abarognosis (ã-bar-og-no'sis) [*G. a-, priv + barus*, weight + *gnosis*, knowledge]. Without sense of weight.

abarthrosis (ab-a-thro'sis) [*L. ab*, from, + *G. arthron*, joint] A movable joint or point upon which bones move freely upon each other. *diarthrosis* *

abartic'ular [" + *articulus*, joint]. At a distance from a joint

abarticula'tion. Dislocation of a joint.

abasia (a-bã'zi-ã) [*G. a-, priv. + basis*, step]. Motor incoordination in walking, atasia. Inability to stand or walk due to loss of coordination, organic disease in such cases usually easily recognized; if not, hysteria is probable

a. asfasia. Inability to stand or walk.

a. atactia. Uncertain movements

a., choreic. That due to cramps in the limbs similar to movements of chorea.

a., paralytic. That in which the legs give way from body weight.

a., paroxysmal trepidant. That caused by trepidation, stiffening legs and making walking impossible.

a., spastic. Paroxysmal trepidantia

a., statica. Uncertainty of movement

a., trembling, a. trepidans. That due to trembling of the legs.

abasic (ã-bã'sik). Pert. to *abasia*.

abate (a-bât'- [*L. ab*, from + *battere*, to beat]. 1. To lessen or decrease. 2. To cease or cause to cease.

abate'ment. Decrease in severity of pain or symptoms

abatic (ab-at'ik). Pert. to *abasia*. SYN. *abasic*.*

abaxial (ab-ak'si-al), **abaxile** [*L. ab*, from + *axis*]. 1. Without the axis of the body. 2. At the opp. end of the axis of a part.

Abbé's catgut ring (ab'bã's). A ring of catgut to reinforce the suture in intestinal anastomosis.

A.'s condenser. Several nonachromatic lenses to increase illumination under lens of a microscope

A.'s operation. 1 For relief of the tic douloureux by resection of the 5th cervical 2 Lateral anastomosis of the intestine

Abbé-Zeiss apparatus. An instrument for estimating number of blood corpuscles.

Abb'ot's paste. A paste for killing a nerve of a tooth

Abbott's method. Treatment of lateral curvature of the spine by a series of plaster jackets

A. B. C. lin'iment. Liniment composed of aconite 40, belladonna 40, chloroform 20.

a.b.c. process. The use of alum, blood, and charcoal in purification of water or sewage or deodorization

Abderhalden's reaction or test (ãb'der-hãl-denz) Creation of ferments in circulation as result of injection of foreign protein, fat, or carbohydrate. Used in testing for pregnancy, acute infections, malignancies, goiter, dementia precox.

abdomen (ab-do'men) [*L. abdomen*, The belly] The area between the diaphragm and the pelvis

Contains the stomach with lower part of esophagus, small and large intestines, liver, gallbladder, spleen, pancreas, and bladder. A serous membrane called the *peritoneum* lines this cavity

I **DIAG** 1. **SKIN** General discoloration—jaundice 2. **Dirty brown**—Addison's disease 3. **White area**—albinism. 4. **Pale lemon-yellow**—pernicious anemia 5. **White line** (*linea albicans*)—ascites, loss of fat, stretching from pregnancy

II **RASIDS** 1. **Rose-c. spots**—typhoid. 2. **Scaly copper-c. spots**—secondary syphilis 3. **Lesions with white "mother of pearl" scales**—psoriasis *

III **VRINS** **Enlarged, superficial veins**—obstruction of return circulation, abdominal tumors, cirrhosis or abscess of liver

IV **PERISTALSIS** **If visible**—colitis, partial internal obstruction **Reversed p.** Intestinal and pyloric obstruction.

V **SIZE** **General enlargement**—ascites, peritonitis, tumors, enlarged liver, spleen or both, and gaseous distention; pregnancy. **Boat-shaped**—meningitis, lead color, tumor of brain.

VI. **RETRACTION** Occurs in wasting diseases, inanition due to pyloric or esophageal stenosis, vomiting, purging, cholera, and yellow atrophy of liver.

VII. RIGIDITY: May be caused by appendicitis, inflammation of ovary, psoas abscess, hernia, cholelithiasis, abscess, cysts, sarcoma of adrenals, disease of spleen or kidney, gastric ulcer or carcinoma, peritonitis, intussusception,* etc., according to location affected.

VIII. TENDERNESS, OF THE ABDOMEN: May be due to inflammatory condition of peritoneum or a portion of it over an inflamed viscus. If general, may denote acute or chronic peritonitis, Asiatic cholera, early meningitis, or reflex from chest. Local tenderness depends upon location of tender area.

a., **accorcion**. Nervous pseudotympany.

a., **acute**. Any acute abdominal condition demanding prompt operation.

a., **boat-shaped**. SEE a., **scaphoid**.

a., **carinate**. SEE a., **scaphoid**.

a., **navicular**. SEE a., **scaphoid**.

a., **obstipum**. Congenital shortness of the rectus abdominus muscle

a., **pendulous**. A relaxed condition of the abdominal wall

a., **scaphoid**. Sunken as in emaciation and in meningitis. One whose ant. wall is hollowed.

abdomen, words pert. to: "abdom-" words, alvine, alvus, bythus, carreau, cecopy, coliac axis, celagra, "celo-" words, cholecystiditis, cholecystopty, colica, facies abdominalis, meteorism, ptosis, splanchnic cavity, venter, ventruct, "ventro-" words, viscera, visceral cavity, visceralgia

abdominal (ab-dom'i-nal). Pert to the abdomen, its function and disorders

a., **cavity**. Cavity within the peritoneum

a., **gestation**. Abdominal pregnancy. Extrauterine pregnancy in belly cavity

a., **reflexes**. These consist of muscular contraction of either side of the abdomen, induced by friction on that part

a., **r. l.** Pert to hemiplegia. In such condition reflex is absent on side opposite lesion in transverse myelitis above

ANATOMIC DIVISION OF ABDOMEN

1. Left hypochondriac region. 2. Epigastric region. 3. Right hypochondriac region. 4. Left lateral abdominal region. 5. Umbilical region. 6. Right lateral abdominal region. 7. Left inguinal (iliac) region. 8. Hypogastric region. 9. Right inguinal (iliac) region. 4, 5 and 6 constitute the mesogastric region.

sixth dorsal, in disseminated sclerosis, and occasionally in cord tumors.

a., **r. ll.** Pert. to pregnancy. With advance toward term, reflex progressively falls in the nulliparous. In the multipara, reflex cannot be elicited after pregnancy.

a., **r. ill.** Pert. to intestinal inflammation. In this condition, reflex is absent. SYN. *Rosenbach's sign* # 1.

a., **regions**. Nine regions into which the abdomen and its external surface are divided by four imaginary planes, two horizontal, one at the level of the ninth costal cartilage (or the lowest point of the costal arch); the other at the level of the highest point of the iliac crest, and two vertical, through the centers of the inguinal ligaments (or through the nipples, or through the centers of the clavicles), or curved and coinciding with the lateral borders of the two abdominal recti muscles

The abdomen may be divided into four quadrants drawing a vertical and a horizontal line through the umbilicus. The contents of each quadrant are

I UPPER RIGHT Q Right lobe of liver, gallbladder, part of transverse colon, part of pylorus, hepatic flexure, right kidney, and duodenum

II LOWER RIGHT Q Cecum, ascending colon, small intestine, appendix, bladder if distended, r ureter, r spermatic cord in male, r ovary and r tube, and uterus, if enlarged in female

III UPPER LEFT Q Left lobe of liver, stomach, transverse colon, splenic flexure, pancreas, l kidney, and spleen

IV LOWER LEFT Q Small intestine, l. ureter, sigmoid flexure, descending colon, bladder if distended, l spermatic cord in male, uterus, l ovary, and l. tube in female

a., **rings**. The apertures in the abdominal wall, a., **external**. An interval in aponeurosis of external oblique, just above and to outer side of crest of os pubis a., **triangular**. About one inch from base to apex, and half an inch transversely, gives passage to spermatic cord in male, round ligament in female, a., **internal or deep**. Situated in the fascia transversalis, midway between the ant. superior spine of ilium and symphysis pubis, half inch above Poupart's ligament, oval form, larger in male. Transmits spermatic cord in male, round ligament in female

abdominal examination: a., **auscultation**. Of service in diagnosis of aneurysm, fetal heart sounds and uteroplacental murmur in pregnancy

a., **inspection**. Most satisfactorily performed with patient on back with thighs slightly flexed. In health, abdomen is of an oval form, marked by elevations and depressions corresponding to abdominal muscles, umbilicus, and in some degree by form of adjacent viscera. Is larger relatively, to size of chest, in children than in adults, more rotund, and broader inferiorly in females than in males.

Alterations in shape due to disease are first, enlargement, which may be general and symmetrical, as in ascites; or partial and irregular, from tumors, hypertrophy of organs, as the liver and spleen, or from tympanitic distention of portions of intestines by gas, as the colon in typhoid fever; second, retraction, as in extreme emaciation, and in several forms of cerebral disease, esp.

noticeable in tuberculous meningitis of children.

The respiratory movements of abdominal walls bear a certain relation to movements of the thorax, are often increased when the latter are arrested and vice versa; thus abdominal movements are increased in pleurisy, pneumonia, pericarditis, etc. but decreased or wholly suspended when disease causes abdominal pain, or in peritonitis.

The superficial abdominal veins are also at times visibly enlarged, indicating an obstruction to the current of blood, either in the portal system as in cirrhosis, or in the inferior vena cava.

a. palpation. May be performed with tips of fingers, whole hand, or both hands, pressure may be slight or forcible, continuous or intermittent. To obtain greatest amount of information, patient should be placed in horizontal position with head slightly raised and thighs flexed. Sometimes necessary to place in standing position or leaning forward.

IND. FURNISHED BY PALPATION. Size and position of viscera, existence of tumor, and swellings, whether superficial or deep, large or small, hard or soft, smooth or nodulated, movable or fixed, solid or liquid, and whether they change position with respiration. Also ascertain whether tenderness exists in any portion of the abdominal cavity, and if pain is increased or relieved by firm pressure. Aneurysms of abdominal aorta are usually felt in median line or to left of it, on right side or both sides, and are immovable.

Impulse, if one exists, is systolic and expansive, though when situated high up there also may be a slight diastolic movement. A thrill is rarely perceptible. Surface of tumor, when not ruptured, is rounded and smooth. Effusion of blood into surrounding tissues may produce lobulations.

a. percussion. Patient should be placed in same position as for palpation, and percussion should be for most part mediate. In exploring abdomen by means of percussion, finger should first be placed immediately below the xiphoid cartilage, pressed firmly down, and carried along the median line toward the pubes, striking it all the way, now forcibly, now gently. The *different tones* of stomach, colon, and small intestines will be distinctly heard. Percussion should then be made laterally, alternately to one side, then the other, till whole surface is percussed. Abdominal aneurysm gives dullness or flatness over it unless a distended intestine lies above it.

abdominal section. Abdominal incision for any operation on abdominal organs. See *laparotomy*.

abdominoanterior (ab-dom'i-no-an-te'ri-or). Position of fetus in utero with belly facing ant abdominal wall of mother.

abdom'inocar'diac re'flex **I.** Increased heart consciousness when abdominal sympathetics are stimulated.

a. r. II. Sudden change from recumbent to standing position induces cardiac and vasomotor phenomena in visceroptosis; visceromotor and viscerosensory phenomena in ulcers (gastric, duodenal) and gallbladder disease.

abdominocentesis (ab-dom'i-nō-sen-te'sis) [L.abdomen, belly, + G. *kentēsis*, punc-

ture]. Abdominal puncture by tapping. SYN *paracentesis abdominis*.

abdominocys'tic [' + G. *kystis*, bladder]. Pert. to abdomen and bladder.

abdominogen'ital [' + *genitalis*]. Pert. to abdomen and genital organs.

abdom'inohysterec'tomy [' + G. *ystera*, uterus, + *ektomē*, excision]. Removal of uterus through abdominal wall.

abdom'inohysterot'omy [' + " + *tome*, a cutting]. Incision into the uterus through an abdominal opening.

abdom'inoposte'rior. Position of fetus in utero with abdomen toward mother's back.

abdom'inosc'opy [L. *abdomen*, belly, + G. *skopein*, to view]. Instrumental examination of abdomen or its viscera.

abdom'inoscro'tal [' + *scrotum*, bag]. Pert. to abdomen and scrotum.

a. muscle. Cremaster m.

abdominothoracic (ab-dom'i-no-tho-ras'ik) [' + G. *thōrax*, breastplate]. Pert. to abdomen and thorax.

a. arch. The costal arch, dividing the thorax from the abdomen. [domen

abdom'inous. Having a prominent **abdom'inouterot'omy** [L. *abdomen*, belly, + *uterus*, womb, + G. *tomē*, incision]. Cesarean section. SYN *abdominohysterotomy*.

abdom'inovag'inal [' + *vagina*, sheath]. Pert. to abdomen and vagina.

abdom'inoves'ical [' + *vesica*, bladder]. Pertaining to the abdomen and the urinary bladder.

a. pouch. Peritoneal fold which includes urachal folds.

abduce (ab-dūs') [L. *abducere*, to draw away]. To draw away.

abduces (ab-dū'sen) [L. drawing away from] 1 The 6th cranial nerve. 2 The external rectus muscle of the eye, which moves the eyeball outward. 3 Pert. to certain muscles or their nerves drawing from the median line of the body.

a. labiorum. a. oris, q' r

a. nerve. Sixth cranial nerve * Motor nerve supplying lateral rectus muscle of eye. ORIG. *Fasciculus teres*. SEX: *Cranial nerves* Tables in Appendix.

a. oculi. BNA *Musculus rectus lateralis*. Muscle of eye.

a. oris. Muscle of mouth. BNA *Musculus caninus*.

abdu'cent. Abducting, leading away from. **abduct'** [L. *abductus*, past p. *abducere*, to lead away]. To draw away from axis of body or one of its parts.

abduc'tion. Movement away from midline of body, or middle portion of a part as of the arm or thumb.

abduc'tor. A muscle which draws certain parts away from a common center.

Abel's bacillus. One found in nasal secretion in ozena, *Klebsiella ozaenae*.

abenteric (ab-en-ter'ik) [L. *ab*, from + G. *enteron*, intestine]. Located in a part outside the intestines, as *a. typhoid*.

abepithymia (ab-ep-i-thi'mi-ā) [' + G. *epithymia*, desire]. 1. Perverted desire or longing. 2. Solar plexus paralysis.

Abernethy's fascia (ab'er-nē-thēz). Superperitoneal areolar tissue separating *ext. iliac art.* from iliac fascia over the psoas.

A.'s sarcoma. A circumscribed fatty tumor occurring principally on the trunk.

aber'rant [L. *ab*, from, + *errare*, to wander]. Wandering from the normal or usual course.

a. pyramidal tract. Several groups of fibers from motor cortex to the cranial nerve nuclei, running apart from the rest of the pyramidal system.

aberratio (ab-er-a'shî-o). Aberration.

a. **humorum**. Abnormal flow of blood to another tract, as in vicarious menstruation (a. *menstrui*).

aberra'tion. 1 Deviation from a normal course. 2 Mental unsoundness, but not insanity. 3 Imperfect refraction.

a., **chromatic**. Unequal refraction of different wave lengths of the spectrum producing a blurred image.

a., **dioptric**. Spherical a.

a., **distantal**. Blurring of a distant object.

a., **mental**. Mental unsoundness that may or may not amount to insanity.

a., **spherical**. Imperfect focus produced by a convex lens.

aberron'eter [L. *ab-*, from + *errare*, to wander + G. *metron*, measure]. An instrument for measuring optical error.

abevacuation (ab-ê-vak-u-a'shun) [" + *evacuare*, to empty]. Abnormal evacuation either in excess or in deficiency.

abeyance (a-bâ'ans) [Old French]. A temporary suspension of activity, sensation, or pain.

abiochemistry (ab-i-o-kem'is-trî) [G. *a-*, priv + *bios*, life, + *chemica*, chemistry]. Inorganic chemistry.

abiogenesis (ab-i-o-jen'e-sis) [" + " + *genesis*, production]. Spontaneous generation.

abiogenet'ic, **abio'genous**. Pert. to spontaneous generation.

abiological (ab-i-o-loj'i-kal) Not related to biology or the science of life.

abiology (a-bi-ol'o-jî) [G. *a-*, priv. + *bios*, life, + *logos*, study of]. The study of inanimate things.

abionergy (ab-i-on'ur-jî) [" + " + *energeia*, action, energy]. Premature degeneration. *Syn* *abiopathy*.

abiosis (ab-i-ô'sis) [G. *a-*, priv + *bios*, life]. Absence of life.

abiot'ic. Incompatible with life, not viable.

abiotro'phia. Abiotrophy.

abiotrophy (ab-i-ol'ro-jî) [G. *a-*, priv. + *bios*, life + *trophê*, nourishment]. Premature loss of vitality or degeneration of tissues and cells.

abirritant (ab-ir'it-ant) [L. *ab-*, from + *irritare*, to irritate]. Relieving irritation, soothing.

abirrita'tion. 1 Asthenia, or atony. 2. Lowered tissue irritability.

abiuret (a-bi'û-ret) [G. *a-*, priv + L. *bis*, double, + *urea*] Nonbiuret. Not giving the biuret reaction.

ablactation (ab-lak-ta'shun) [L. *ab-*, from + *lac*, milk]. Cessation of, or cessation of milk secretion, weaning.

ablastem'ic [G. *a-*, priv. + *blastos*, germ, seed]. Not germinal.

ablate [L. *ablatu*, taken away]. To remove, esp. by excision.

ablatio (ab-la'shi-oi) [L. *ablatio* carrying away]. Ablation, removal, detachment.

a. **placentae**. Premature detachment of a normally situated placenta.

Etiol. Toxemia, anemia, chronic nephritis, syphilis, trauma.
Path. Extravasation of blood between placenta and uterine wall, occasionally between muscle fibers of the uterus. The peritoneal coat of uterus may exhibit small linear fissures which allow for free blood to enter the peritoneal cavity. Liver frequently shows marked fatty changes.

Sym. (a) Hemorrhage, concealed or evident, or a combination of the two. (b) Pain, constant at point of separation of placenta due to blood extruding

between muscle fibers. (c) Uterine contraction, constant, occasionally tetanic in nature. (d) Evidences of fetal asphyxia and death, increased fetal movements, and changes in heart-tone rate until final cessation of both. (e) Albuminuria a frequent accompaniment.

Treatment. (a) *Mild cases* Rest in bed; if near term, induction of labor. (b) *Severe cases* Shock must first be combated and uterus emptied as rapidly as possible, avoiding accouchement forcé. With the child still alive, if the mother's condition allows, a Cesarean section may be indicated. If extensive blood extravasation between muscle fibers we have an apoplectic uterus and Porro-Cesarean section is necessary.

See *placenta*.

a. **refinae**. Detachment of retina.

ablation (ab-la'shun) [L. *ab-*, from, + *latu*, carried] Removal of a part, as by cutting. *See* *ablatio*.

-**able**; -**ible**; -**ble** [L.]. Suffixes. Capable of being, power to be, as *audible*.

amblyopia (â-blep'si-â) [G. *a-*, priv. + *blepein*, to see]. 1. Blindness. 2. Dull perception.

abluent [L. *ab-*, from, + *luere*, to wash]. An agent possessing cleansing qualities, as a detergent.

ablu'tion. A cleansing or washing. PT. Pouring water out of bucket over body or part. Mechanical effect mild, action depends mainly on temperature.

ambor'tal [L. *ab-*, from, + *mors*, death]. Passing from dead or dying to living fiber, as an electric current.

abner'val [" + *nervus*, nerve]. Passing from a nerve to a muscular fiber.

abnet [Heb. *abnet* a long scarf]. A girde or girdlelike bandage.

abneural (ab-nu'ral) [L. *ab-*, from, + G. *neuron*, nerve]. Ventral. Remote from neural or dorsal aspect.

abnormal (G. *anomalos*). Not normal. *See* *chondralloplasia*, *chondroplasia*.

ab'normal'ity. That which is not normal.

abnormity (ab-norm'i-tî) 1. Deformity, abnormality. 2. A monstrosity.

abnoiment (â-bwa-moi') [Fr.]. The making of barking sounds.

abol'ition [L. *abolere*, to perish]. Doing away with anything.

aborad (ab-o'rad) [L. *ab-*, from, + *oris*, mouth]. Away from the mouth.

abo'ral. Opposite to, or away from, the mouth.

abort' [L. *aboriri*, to perish]. 1. To cause expulsion of an embryo or of the fetus before time of viability. 2. To arrest progress of disease. 3. To arrest growth or development.

aborticide (a-bor'ti-sid) [" + *cadere*, to kill]. A term etymologically incorrect for an agent causing death of fetus and expulsion from uterus.

abortient (ab-or'shent). 1. Producing abortion. 2. Abortifacient.

abortifacient (a-bor-i-ta'shent) [L. *abortus*, abortion, + *facere*, to make] A drug which causes an abortion.

abortion (ab-or'shun). 1. The arrest of any physical action or disease. 2. The termination of pregnancy before the term of viability, i.e., before the 28th week, the fetus measuring 35 cm or less, and weighing less than 3¼ lb (1500 Gm.). The term *miscarriage* is sometimes applied when occurring after 4th mo and before 7th mo, *premature delivery* after 7th mo and before full term.

Etiol. Most common causes in the early months are (a) diseases of endo-

metrium; (b) nephritis; (c) malpositions of uterus; (d) syphilis; (e) defective development of embryo; (f) endocrine disorders esp. of ovaries; (g) toxemias of pregnancy

Sym. Abdominal cramps and bleeding from vagina.

NP Send for doctor. Keep patient quiet. Care as for uterine hemorrhage. Save discharges for doctor's inspection. Watch for shock and symptoms of sepsis.

The Catholic Church claims all induced abortions are criminal.

a., accidental. That which occurs spontaneously and accidentally without criminal intent.

a., artificial. When induced or performed purposely, as by a surgeon

a., criminal. When produced for other than medical purposes

a., embryonic. Before 4th month.

a., fetal. After 4th month.

a., habitual. When in course of repeated pregnancies with no apparent cause

a., incomplete. When some of products of conception are retained with continuation of symptoms

a., induced. When brought on intentionally, criminally or therapeutically

a., inevitable. That which cannot be stopped or when occurring after the embryo is dead

a., infected. When accompanied by infection of retained material with resultant febrile reaction [mother's life.

a., justifiable. When done to save the

a., missed. That in which the fetus died with products of conception retained in uterus

a., ovular. That which occurs within first three weeks after conception

a., partial. In multiple pregnancy, aborting of only 1 fetus, or less than the entire number

a., spontaneous. Occurring naturally without interference

a., therapeutic. One done when life of mother is endangered by continuation of the pregnancy

a., threatened. When only earliest signs of abortion are present

a., tubal. An ectopic (abnormally placed) pregnancy in which the fetus has been expelled through rupture of a uterine tube

abortionist (a-bor'shun-ist) One who performs a criminal abortion

abortive (a-bor'tiv) 1. Preventing the completion of 2. Abortifacient, that which prevents a natural or regular course 3 Rudimentary

abortus (a-bor'tus). An abortion.

aboulia (ā-boō'li-ā) [G *a-*, priv. + *boulē*, will]. Inability to exercise will power **Syn** *abulia*, *q.v.*

aboulomania (ā-boō'lo-ma-nī-ā) [" + " + *mania*, frenzy] Mental disorder with loss of will power. **Syn** *abulomania*.

abrade [L. *ab*, from + *radere*, to scrape] 1. To chafe. 2. To roughen or remove by friction

Abrams' heart reflex. Reduction of area of cardiac dullness resulting from manual friction of precordial and epigastric areas.

A. lung reflex. Following irritation of the skin over the thorax or upper abdominal region, there is an increase in pulmonary area.

abrasio corneae [L. abrasion of corneal]. Removal of corneal excrescences by scraping.

abrasion (ab-ra'shun) [L. *ab*, from, + *radere*, to scrape]. An injury resulting

from scraping away of a portion of skin or of a mucous membrane. A brush burn.

Foreign bodies (*q.v.*) may be present. **Sym.** Painful, red, denuded surface.

F. A TREATMENT Remove any foreign body. Apply mild antiseptic and dressing, may be tannic acid, 5%, gentian violet, 5%, or any bland ointment.

See *avulsion*, *bruise*.

abrasive. 1. Producing abrasion. 2. That which abrades

abreaction (ab-ie-ak'shun) [L. *ab*, from, + *re*, again, + *actus*, acting]. **Psy** Re-evaluation of an emotion-laden experience during its free discussion with an understanding psychotherapist. Freud calls the process *catharsis*.

abresia (ab-rē'zi-ā) [L. *ab*, from, + *erodere*, to gnaw away]. 1. Fasting, the need for food 2 A wasting away

abruptio (ab-rup'shi-o) [L. *ab*, from, + *ruptere*, a break]. A tearing away from.

a. placenta. Premature detachment of normally situated placenta. **See** *ablatio placenta*.

abscess (ab'ses) [L. *abscessus*, a going away] A localized collection of pus in a cavity; the pus formed by disintegration of tissue. There is an increase of neutrophils in abscesses and active infection.

SUBEPITHELIAL ABSCESS

A. Abscesses located at tip of finger

B. Subepithelial abscess developed from felon which perforated derma and spread out beneath epidermis, which is lifted up in a manner analogous to a blister.

a., acute, or warm. One with local symptoms of inflammation, with fluctuation, and pointing, also pressure and constitutional symptoms. Inflammation becomes intensified with increased heat, redness, swelling, and edema. Pain becomes throbbing and greater, with impaired loss of function of the part. An elevation appears, with fluctuation and softening as it reaches the surface, becoming necrotic and yellow, giving way with evacuation of pus. **Pressure symptoms.** according to size and depth. In floor of mouth or neck, swelling may cause dyspnea and dysphagia. **Constitutional symptoms** vary, from slight temperature (fever may be absent in a well walled-off abscess) to high temperature, with rigors and sweats if associated with pyemia and septicemia. Any or all general symptoms may be absent in deep-seated abscesses except loss of weight and strength. If there is active tissue resistance and free absorption of toxin, leukocytosis will occur.

TERMINATION. This may be by pointing, evacuation, and discharge of pus, which may become inspissated, encapsulated, and at times absorbed

a., alveolar. One of the gum or alveolus

a., amebic. One containing amebae.

a., anorectal. One in the tissue near the rectum.

a., apical. One at the apex of lung or at extremity of root of a tooth

a., appendiceal, appendicular. Pus formation about vermiform appendix

a., arthritic. A wandering abscess having origin in a diseased joint

a., atheromatous. Atheromatous softening in wall of an artery

a., axillary. One or multiple abscesses in axilla

a., Bartholinian. One affecting Bartholin's gland

a., Bezold's. A deep abscess in the neck

a., bicameral. One with two pockets

a., bilharzial. One in an intestinal wall caused by *Schistosoma mansoni*

a., biliary. One of the biliary tract or gallbladder

a., blind. A dental granuloma

a., bone. Suppurative periostitis

a., brain. Seldom primary. May result from suppurative disease of middle ear, mastoid cells, and accessory sinuses. Secondary to lung suppuration, such as lung abscess or bronchiectasis, and following general septicemia. It may be acute, subacute, or chronic. The headache is constant and severe, usually localized over the affected area. Fever, vomiting, vertigo, mental dullness, irritability, and general weakness usually accompany the localized pain and the general headache

a., Brodie's. Tuberculosis with supuration of articular end of a bone

a., bursal. One in a bursa

a., canalicular. A breast abscess discharging into the milk ducts

a., carniform. One containing cheesy matter, or carnisiform

a., caseous. One in which the pus has a cheesy appearance

a., cerebral. A brain abscess

a., cheesy. Caseous abscess

a., cholangitic. One of the bile duct

a., chronic, or cold. One with pus but without signs of inflammation, usually of slow development. Formed by liquefaction of tuberculous tissue. May occur anywhere on the body but more frequently in connection with the spine, hips, genitourinary tract, and lymphatic glands. Symptoms may be very mild when present being due to pressure upon surrounding parts. Tenderness often absent. Chronic septic intoxication with hectic fever occurs when there is mixed infection. Amyloid disease usually appears eventually

a., circumscribed. An abscess limited by exudation of lymph

a., circumtonsillar. Quinsy

a., cold. Same as chronic

a., collar-button. One perforating the palmar fascia into the subcutaneous tissue at the web with superficial accumulations of pus in the palm, connected by a narrow channel with a larger collection of pus in deeper tissues

a., congestive. One that shows pus at a point distant from where formed

a., consecutive. A critical abscess

a., constitutional. One resulting from a general disease

a., deep. One arising from below the deep fascia

a., Delpech's. One without fever which develops rapidly, causing great prostration

a., dental. One about a tooth

a., dentoalveolar. One at the root of a tooth

a., diathetic. One caused by a diathesis

a., diffuse. A collection of pus not circumscribed by a well-defined capsule

a., Douglas'. One in Douglas' pouch

a., dry. One that disappears without pointing or breaking

a., Dubols'. One of the thymus formed in congenital syphilis

a., embolic. One due to a septic embolus

a., emphysematous. Same as tympanic

a., encysted. One with pus circumscribed in a serous cavity

a., endamebic. Entamebic Amebic

a., epiploic. One in the omentum

a., extradural. One on the dura mater

a., fecal. A stercoralaceous abscess

a., filarial. One caused by filaria

a., fixation. One produced artificially by subcutaneous injection of an irritant

a., Fochler's. Same as fixation

a., follicular. One forming in a follicle

a., frontal. One in the frontal lobe of the brain

a., fungal. Abscess caused by a fungus

a., gangrenous. One attended with gangrene of surrounding parts

a., gas. An abscess containing gas due to *B. aerogenes* or other gas-forming microorganism

a., gastric. Phlegmonous gastritis

a., gingival. A parietal one in cemental gingival tissue

a., glandular. One around a lymph node

a., gravitation. An abscess in which the pus migrates, sinking to lower depths

a's., heart. In interstitial myocarditis, multiple small abscesses

a., helminthic. One caused by a worm

a., hematic. One due to an extravasated blood clot

a., hemorrhagic. One containing blood

a., hepatic. Abscess of the liver

a., hot. An acute abscess with local inflammation

a., hypostatic. A wandering abscess

a., idlopathic. One due to local causes

a., iliac. One in the iliac region

a., intramammary. An abscess of the mammary gland

a., intramastoid. A mastoid process abscess of the temporal bone

a., ischiorectal. One in the ischiorectal fossa

a., lacrimal. Suppuration of a lacrimal gland

a., lacunar. One in the urethral lacunae

a., lateral, a., lateral alveolar. A periodontal abscess

a., lumbar. One in the lumbar region

a., lung. A occurring in the lung

NP This may cover a prolonged course. Constitutional treatment is indicated. High caloric diet to build up body tissues and to help overcome infection. Glucose may have to be given intravenously to supply an adequate caloric intake. Bowel hygiene and frequent baths for elimination of toxins. Mouth care essential because of frequent expectoration of pus which has a foul taste and odor. If postural drainage is ordered, the patient's chest should be as nearly straight as possible. The treatment is given for 1 to 2 minutes, but the time is gradually increased to from 15 to 30 minutes twice a day. The patient is encouraged to cough and expectorate. The sputum should be meas-

ured, and the amount and character should be recorded. The treatment should not be given just before or after a meal, as it will nauseate the patient.

a., lymphatic. A cold abscess of a lymphatic gland.

a., mammary. One in the female breast.

a., marginal. One near the orifice of the anus.

a., mastoid. Suppuration of the mastoid portion of the temporal bone.

a., mediastinal. Suppuration in the mediastinum.

a., metastatic. A secondary one at a distance from focus of infection.

a., migrating. See *wandering abscess*.

a., miliary. A small embolic abscess. One discharging numerous small collections of pus.

a., milk. A mammary abscess during lactation.

a's., Monro's. Intraepidermal accumulations of cellular debris in the epidermis.

a., mother. A primary abscess giving rise to other abscesses.

a., multiple. A group of abscesses accompanying pyemia.

a., mural. One in tissues of the abdominal wall following celiotomy.

a., nocardial. One caused by *Nocardia*.

a., orbital. Suppuration in the orbit.

a., ossifluent. One dependent on degeneration of bone tissue.

a., Paget's. One recurring about the site of a former abscess.

a., palatal. One in an upper lateral incisor, erupting toward the palate.

a., palmar. A purulent effusion into the tissues of the palm of the hand.

a., parafrenal. One of Tyson's gland.

a., parametric, a., parametric. One between the folds of the structures adjacent to the uterus.

a., paranephric, a., paranephritic. One in the tissues around the kidney.

a., parapancreatic. One in the pancreatic tissues.

a., parietal. A periodontal abscess arising in the periodontal tissue other than the pulpal foramen.

a., parotid. One of the parotid gland.

a., pelvic. Abscess of the pelvic peritoneum, especially Douglas' pouch.

a., pelvirectal. A deep rectal abscess.

a., perialipical. One at the root apex of a tooth. A parietal abscess in the pericemental tissue which is not an extension of a periclasial pocket.

a., peribronchitic. A. in inflamed tissue around the bronchi. Syn *Fauvel's granule*.

a., pericemental. An alveolar abscess not involving apex of a tooth.

a., pericoronal. One around the crown of an unerupted molar tooth.

a., peridental. Periodontal abscess.

a., perinephric. One in tissue about the kidney.

a., periodontal. An alveolar abscess.

a., peripleuritic. One beneath the parietal pleura.

a., periproctic. One in the areolar tissue about the rectum.

a., peritoneal. An encysted mass of exudate in peritonitis.

a., peritonsillar. Quinsy.

a., perilurethral. One formed around the urethra. One associated with an inflammation in connective tissues.

a., phlegmonous. An acute abscess.

a., pneumococcal. One due to infection with pneumococci.

a., postcecal. One sometimes occurring in appendicitis.

a., posttyphoid. A chronic abscess following typhoid fever.

a., Pott's. One developing in Pott's disease of the hip.

a., prelacrimial. One of the lacrimal bone.

a., premammary. A small cutaneous abscess on the mammary gland.

a., primary. One originating at point of infection.

a., protozoal. One caused by a protozoan.

a., psosas. One with pus descending in sheath of psosas muscle due to vertebral disease.

a., pulmonary. One of the lungs. Non-tuberculous suppuration of lung tissue with one or more localized areas of necrosis resulting in pulmonary cavitation.

a., pulp. 1 A cavity discharging pus formed in the pulp of a tooth. 2 One of the tissues of the pulp of a finger.

a., pyemic. A metastatic one, usually multiple due to pyogenic organisms.

a., rectal. One in the rectum.

a., residual. One occurring in old inflammatory products.

a., retromammary. One below the mammary gland and within the tissues of the chest wall.

a., retroperitoneal. Same as subperitoneal.

a., retropharyngeal. One of the lymph nodes in the walls of the pharynx. It sometimes simulates diphtheritic pharyngitis. Respiratory obstruction is caused by accumulation of pus behind the posterior pharyngeal wall.

a., root. Dental granuloma. Granulations at root of a tooth.

a., sacrococcygeal. One over the sacrum and coccyx.

a., satellite. A secondary one arising from a primary one situated near it.

a., scrofulous. One due to tuberculous degeneration of bone or lymph nodes.

a., secondary. Embolic abscess.

a., septal. One at the proximal surface of a tooth root.

a., septicemic. One resulting from septicemia.

a's., shirt-stud. Two abscesses communicating by a sinus.

a., spermatic. One of the seminiferous tubules.

a., spinal. One due to necrosis of a vertebra.

a., spirillary. One containing *Spirilla*.

a., splenic. One of the spleen.

a., stercoralaceous. One containing pus and fecal matter.

a., stitch. One formed about a stitch or suture.

a., streptococcal. An abscess caused by streptococci.

a., strumous. A cold abscess of tuberculous causation.

a., subaponeurotic. One beneath an aponeurosis or fascia.

a., subdiaphragmatic. One beneath the diaphragm.

a., subepithelial. Infection under the epidermis of the hand with accumulation of pus.

a., submammary. One beneath the mammary gland.

a., subpectoral. One beneath the pectoral muscles.

a., subperitoneal. One between the parietal peritoneum and the abdominal wall.

a., subphrenic. One beneath the diaphragm.

- a., subscapular.** One between the serratus anterior and the posterior thoracic wall.
- a., subungual.** One beneath the distal portion of a finger nail. May follow injuries with pins, needles, or splinters
- a., sudoriparous.** One of a sweat gland.
- a., superficial.** One occurring above the deep fascia
- a., suprahepatic.** One in the suspensory ligament between the liver and the diaphragm
- a., sympathetic.** One arising some distance from the exciting cause
- a., syphilitic.** One occurring in the bones during syphilis
- a., thecal.** One in sheath of a tendon.
- a., thymus.** Dubois' a
- a., tonsillar.** Acute suppurative tonsillitis, or quinsy
- a., tooth.** Dental abscess
- a., traumatic.** One provoked by injury
- a., tropical.** An abscess of the liver due to *Endamoeba histolytica*
- a., tympanic.** An abscess that contains air or gas
- a., tympanocervical.** One arising in the tympanum and extending to the neck
- a., tympanomastoid.** A combined abscess of the tympanum and mastoid
- a., urethral.** One of the urethra
- a., urinary.** One caused by extravasation of urine.
- a., urinous.** One which contains pus with urine
- a., verminous.** One which contains insect larvae or other animal parasites
- a., von Bezold's.** One resulting from mastoiditis by perforation with extension into the digastric fossa, and to tissues of the lateral aspect of the neck
- a., wandering.** One at a distance from focus of disease with pus along fascial sheaths of muscles
- a., warm.** An acute abscess.
- a., worm.** One caused by or containing worms
- abscession** (ab-sesh'un). 1. Metastasis 2. A critical discharge 3. An abscess *

abscission (ab-sf'shun) [L. *abscindere*, to cut off]. The removal of a part by excision.

absentia epileptica (ab-sen'shi-ä). The loss of consciousness in the mild form of epilepsy

absolute alcohol. A. with no more than 1% of water

a. temperature. Temperature reckoned from the absolute zero

a. zero. 273.7° below zero Cent. The lowest possible temperature.

absorb' [L. *absorbere*, to suck in]. To suck up as through pores. SEE *absorbent*.

absorbefacient (ab-sor-be-fä'shent) [“ + *facere*, to make] Causing or that which causes absorption

absorb'ent. 1. A substance that causes absorption of diseased tissue. 2 Taking up by suction | moisture

a. cotton. Cotton prepared to absorb

a. glands. Lymph glands

absorptiometer (ab-sorp-shi-om'e-ter) [L. *absorptio*, absorption + G *metron*, measure] An instrument for measuring thickness of liquid drawn by capillary attraction, between glass plates

absorption (ab-sorp'shun) [L. *absorptio*, from *absorbere*, to suck in] 1. The taking up of liquids by solids, or of gases by solids or liquids 2 The taking up of light or of its rays by black or colored rays 3. The taking up by the body of radiant heat, causing a rise in body temperature 4 **PHYS.** The passage of a substance through some surface of the body into body fluids and tissues, as the passage of ether through the respiratory epithelium of lungs into the blood during anesthesia, or passage of oil of wintergreen through the skin, the result of several processes

Diffusion Spreading of dissolved substances throughout a solution and through porous, or permeable membranes If a partition has visible openings, passage of liquid occurs and direction of flow is determined by mechanical pressure (such as that due to

Summary of Food Absorption (Final Products of Digestion)

Final Products of Digestion	Absorbable Food Compound	Place of Absorption	Route in Circulation	Food Products Carried by the Blood
Carbohydrates	Monosaccharides	Epithelium of villi of small intestine into capillaries	Blood of portal vein to the liver formed from the fructose and galactose is changed by the liver into glycogen Other tissues may form glycogen	Glucose (part of the glucose absorbed and that
Fats	Glycerol and Fatty Acids	Epithelium of villi of small intestine into lacteals	Lacteals to lymphatics, to left thoracic duct, to bloodstream at left subclavian vein	Emulsified fat, the absorbed glycerol, and fatty acids having been reunited in the cells of the mucosa
Proteins	Amino acids	Epithelium of villi of small intestine into capillaries	Blood of the portal vein to the liver	Amino acids
Water		Stomach, small intestine principally in large intestine	Through portal vein and lymphatic vessels	
Mineral Salts		Stomach, small and large intestine	Through portal vein and lymphatic vessels	

gravity), but in physiological absorption the movement of solvent is commonly through membranes having no demonstrable pores and frequently opposite to direction of mechanical pressure.

Filtration Passage of a fluid through a semipermeable membrane as a result of a difference in hydrostatic pressures

Osmosis Passage of a solvent through a membrane separating solutions of unequal concentrations

RS absorbefacient, absorptive, chondrolysis, imbibition, impermeable, osmosis, resorption.

a., colon. Water (important in the conservation of body fluids) and products of bacterial action are normally absorbed esp in the ascending colon. Some nutrients and drugs are absorbed by the lower bowel. Cellulose is not digested but passes from the body as residue.

Colon absorption is facilitated by the following kinds of movement: 1 The ascending colon shows reverse peristalses, which tend to keep the contents packed in the cecum. The food mass remains in the ascending colon for about 24 hours. The alkaline fluid aids bacterial growth, the bacteria setting up the normal process of digestion in the colon. Undigested protein undergoes putrefactive fermentation. 2 The sacculations exhibit "haustal churning." 3 The transverse colon, being suspended like a festoon between the hepatic and splenic flexures, due to the contractions of its longitudinal muscles, shows "pendulum movements" from side to side. 4 Large boli, starting from the transverse colon, can, by mass peristalsis, be moved rapidly down the descending colon and through the sigmoid into the rectum. The activity of the descending colon is such that it is empty most of the time. End products are disposed of in the feces, the elimination of which is aided by gas formed from fermentation. The *Bacillus acidophilus* seems necessary to intestinal processes. The colon excretes calcium, magnesium, and iron salts. 5 From the rectum, masses not promptly evacuated may, by reverse peristalsis, be returned to the transverse colon. See, *evacuation*.

a. lines. Dark lines of solar spectrum. SYN *Fraunhofer's lines*.

a., mouth. Some substances, but no food nutrients, can be absorbed from the mouth, some drugs, esp alkaloids, can pass through the oral mucosa.

ABSORPTION—INTESTINAL SURFACE
Showing villi and crypts, which greatly increase the number of cells that have access to an epithelial surface.

a., pathological. A. of contents of an excretion or an abnormal product into blood stream.

a. of proteins. In the form of amino acids, produced by digestive hydrolysis, proteins enter the portal vein from the intestinal walls, and through the liver into the general circulation from whence they are absorbed by the tissues. Each tissue synthesizes its own form of protein from the amino acids received from the blood.

a. of radiation. Grotthuss' law states only rays which are absorbed are physiologically active.

a., small intestine. The most important absorption of products of digestion occurs in the small intestines, esp the ileum. Products of digestion absorbed from the gastrointestinal tract pass into either blood or lymph. The mesenteric veins unite to form the portal vein and carry such blood to the liver, the mesenteric lymphatics are called *lacteals* because during absorption of a fatty meal the lymph which they contain looks milky and is called *chyle*. The lacteals empty into the *cisterna chyli* and are joined by lymphatics from other parts of the body, the mixed lymph is finally emptied into large veins near the heart and is thus mixed with, and becomes part of, the blood.

a. spectrum. A spectrum showing a. lines.

a., stomach. Water, alcohol, and some salts can be absorbed through the gastric mucosa and a small amount of glucose in food.

Substances can also be absorbed from other surfaces of the body such as the skin, the lining of the nose and lungs, the peritoneum and other serous membranes, and the mucosae of the vagina, urinary bladder, and urethra.

absorption co-efficient. PT The ratio of the linear rate of change of intensity of roentgen rays in a given homogeneous material to the intensity at a given point within the same mass.

absorptive. Absorbent.

abstergent (ab-stur'jent) [L *abstergere*, to wipe off] 1 A cleansing agent. 2. Having cleansing properties. 3. A purgative.

abstersion (ab-ster'shun). Cleansing.

abster'sive. Abstergent. Cleansing.

abstinence (ab-sti-nens) [L *abstinere*, to abstain]. Going without voluntarily.

a. symptoms. Partial collapse resulting from withdrawal of alcohol, stimulants, and some opiates.

abstract [L *abstrahere*, to draw away]. 1. A preparation containing the soluble principles of a drug evaporated and mixed with sugar of milk. 2. v. **abstract'**. To remove from. 3. To condense or abbreviate.

abstraction (ab-strak'shun) Bloodletting. **CUPPING.** Dry C. Employing an exhausted receiver over integument whereby congestion of included skin is effected and sometimes serum effused. **Instruments:** Cupping glasses and suction pump, or small tumblers or wine glasses may be used. **Wet C.** Having congested skin by dry cup, make parallel incisions with lancet or apply spring scarificator. Set to such a depth as to cut only through true skin. Spring the lancets. Set, reapply at right angles, spring again and apply cup. When enough blood has been drawn, wash parts with mild antiseptic solution and cover with dry aseptic or antiseptic compresses.

LEECHING: The American leech is capable of withdrawing one dram of blood, European or Swedish, one ounce. Keep in water one hour before applying. A few drops of blood or little milk smeared on part will induce them to take hold. Eyelids and scrotum should never be leached and only circumjacent tissues of inflamed areas. If slow in dropping off sprinkle the leech with salt.

PUNCTURE Passing of a needle, or a narrow scalpel into the cavity filled with pus or into the spinal canal.

SCARIFICATION Numerous small parallel incisions made in long axis of limb or part.

VENESECTON or PHLEBOTOMY Opening vein in arm, most advantageous

abterminal [L. *ab*, from, + *terminus*, end] Away from an end toward the center, noting course of.

abulia (a-boō'li-ā) [G. *a-*, priv + *boule*, will]. Absence of or inability to exercise "will power"; hesitation, indecision. Seen in dementia precox.

abulic (ab-u'lik). Pert to abulia.

abulomania (a-boō'lo-ma-ni-ā) [G. *a-*, priv + *boulē*, will, + *mania*, frenzy] A mental disorder accompanied by impaired (or loss of) will power. These are obsolete terms.

abutment [Fr. *aboutier*, to place end to end] The tooth to which a bridge is anchored.

A. C. Abbr. for anodal closure.

a. c. Abbr. for *L. ante cibos*, before meals.

a. c. interval. One bet beginning of auricular and carotid wave, intersystolic period.

acacia (ak-ka'shī-ā) (Gum Arabic) USP. A dried, gummy exudation from the tree *Acacia senegal*.

Uses. Demulcent, and for suspending insoluble substances in water, and for formation of pills and troches.

acalcerosis (ā-kal-ser-o'sis) [G. *a-*, priv. + *L. calx*, calcis, limestone, + *-osis*, condition]. Lack of calcium in the body.

acalculia (a-kal-kū'li-ā) [G. *a-*, priv. + *L. calculare*, to reckon]. Inability to solve mathematical problems.

acampsia (a-kamp'sī-ā) [+ *kamptein*, to bend]. Inflexibility of a limb, rigidity, ankylosis.

acantha [G. *akantha*, thorn]. 1. The spine. 2. A vertebral spinous process.

acanthesthesia (a-kan-thes-the'zi-ā) [+ *disthēsis*, sensation]. A sensation as of a prick; a form of paresthesia, *q. v.*

acanthion [G. *akanthion*, a thorn]. Tip of ant nasal spine.

Acanthocephala (ā-kan'tho-sef'āl-ā) [G. *akantha*, thorn, + *kephalē*, head]. A class of wormlike entozoa related to the Platyhelminthes, including a few species parasitic in man.

acanthocephaliasis (ā-kan'tho-sef-āl-i-ā-sis). Infestation with Acanthocephala.

acanthoid [G. *akantha*, thorn, + *eidos*, form]. Thorny, spiny; of a spinous nature.

acanthokeratoderma (ā-kan'tho-ker'ā-to-der-mi-ā) [G. *akantha*, thorn, + *keras*, horn, + *derma*, skin]. Hypertrophy of hands and feet. [edema]

a. adenoides cysticum. Sweat gland

a. alveolaris. Tumor of epithelium.

SYN. epithelioma.

a. verrucosa seborrholica. Warty growths in the senile

acantholysis (a-kan-thol'is-is) [+ *lysis*, solution] Any disease of the skin accompanied by atrophy of the prickley-layer.

a. bullosa. A skin condition of large bullae produced by irritation.
SYN. Epidermolysis bullosa.*

acanthoma (a-kan-tho'ma) [+ *-oma*, tumor]. 1. Papilloma. 2. Cancer of skin.

a. adenoides cysticum. Eruption arising in the rete spinosum of the skin and resembling spiradenoma.

acanthopelvis [+ *pelyx*, pelvis]. A prominent and sharp pubic spine on a rachitic pelvis.

acanthosis (a-kan-tho'sis) [G. *akantha*, thorn]. Disease of prickly cell layer of skin.

a. nigricans. Chronic inflammatory disease of skin in adult life generally associated with cancer of some internal organ.

Etiol. Unknown. Hypothetically, disease of the abdominal sympathetic is suggested.

SYM. Symmetrically distributed hard and soft papillary growths accompanied by pigmentation and hyperkeratosis.

PROG. Depends upon presence or absence of underlying carcinomatous factor.

TREATMENT. Empirical and purely symptomatic.

acanthotic. Pert to acanthosis.

acanthulus (a-kan'thu-lus). An instrument for removing thorns or splinters from wounds.

acapnia [Gr. *akapnos*, smokeless]. The presence of less than normal amount of carbon dioxide in blood and tissues, *e. g.*, after voluntary overbreathing and the condition resulting therefrom.

SYM. Depressed respiration, giddiness, paresthesia, cramps, occasionally convulsions.

acapnial. Showing or pert to acapnia.

acarbia [G. *a-*, priv + *L. carbo*, coal]. Diminution of carbonate of the blood due to asphyxia.

acariasis (ak-ā-rī'a-sis) [L. *acarus*, mite, + *G. -iasis*, condition]. Any disease caused by a mite or *acarus* (*Acaridae*).

acaricide (a-kar'ī-sid) [+ *caedere*, to kill]. 1. An agent that destroys acarids. 2. Destroying a member of order *Acarina*.

ac'arid, acaridan. A tick or mite, member of order *Acarina*.

acaridasis. Disease caused by a mite.
SYN. acariasis

acarinosis (ā-kar-i-no'sis). Disease caused by a mite. **SYN. acariasis**

acarodermatitis (ak-a-ro-der-mā-tī'tis) [L. *acarus*, mite, + *G. derma*, skin, + *-itis*, inflammation]. The itch. Inflammation of skin caused by a mite.

ac'aroid [+ *eidos*, resemblance]. A mite, or resembling one.

acarophobia (a-kar-o-fō'bi-ā) [+ *phobos*, fear]. Psy. Delusion that the skin is infested with mites or worms.

acarpia (a-karp'i-a) [G. *a-*, priv + *karpōs*, fruit]. Barrenness; sterility.

ac'arus [G. *akari*, a mite]. A mite or tick.

acaryote (ā-kar'ī-ōt) [G. *a-*, priv. + *karyon*, nucleus]. Without a nucleus.

acatalepsia (a-kat-a-lep'si-ā) [+ *katalambainein*, to comprehend]. 1. Dementia. Impairment of mind. 2. Diagnostic uncertainty.

acat'alepsy [G. *a-*, priv + *katalēpsis*, comprehension]. 1. Dementia or impairment of mind. 2. Uncertainty. **SYN: acatalepsia.***

acatalep'itic. 1. Deficient mentally. 2. Uncertain or doubtful.

acatamathesia (a-kat-a-ma-the'zi-ā) [+ *katamathēsis*, understanding]. **PSY:** 1. Psychic blindness or deafness, or

blunting of sensation. 2. Inability to comprehend words, conversation, or signs, due to a brain lesion.

acataphasia (a-kat-a-fa'zī-ā) [*ac* + *kataphasia*, affirmation]. Inability to formulate a sentence

acataposis (ā-kā-tap'o-sis) [*ac* + *kataposis*, gulping down]. Dysphagia. Difficulty in swallowing.

acatastasia (ā-kat-as-ta'zī-ā) [*G. akatastasia*, disorder]. Irregularity or fixed characteristics in the course of a disease or in excretion

acatharsia (a-ka-thar'sī-ā) [*G. akatharsis*, uncleanness]. Foulness, impurity, lack of purging

acathetic (a-ka-thek'tik) [*G. ac*, priv. + *cathectis*, holding in]. Inability to retain. Lack of retention

a. jaundice. That due to inability of liver cells to prevent bile from passing into lymph and blood

acathexia (a-ka-theks'ī-ā). An inability to retain excretions or secretions

acathisia (a-ka-thiz'ī-ā) [*G. ac*, priv. + *kathisis*, sitting]. Inability to remain seated

acaulino'sis [*ac* + *L. caulis*, stalk]. A disease due to a fungus, causing eczematous eruption.

ACC. Abbr for *anodal closure contraction*. **accelerans** (ak-sel'er-ans) [*L. pres* part of *accelerare*, to hasten]. The acceleration heart nerve

It increases the rate and force of the heart's action

acceleration [*L. acceleratus*, past p. of *accelerare*, to hasten]. Increasing the motion of, as pulse or respiration

accelerator (ak-sel'er-a-tor). Anything that increases action or function.

a. nerve. Nerve increasing heart rate and action. *SEE* *accelerans*.

a. urinae. Bulbocavernosus muscle

accentuation [*L. ad*, to, + *cantus*, a singing]. Marked with a special stress, emphasis

acceptor [*L. accipere*, to accept]. A substance absorbing nascent hydrogen freed by a reducing enzyme

a. hydrogen. Substance which receives h from a hydrogen donor

accessorius [*L. past p. accedere*, move toward]. Accessory, supplementary, as certain muscles, glands, nerves

a. nerve. 11th cranial nerve. Motor nerve made up of a cranial and a spinal part which supplies the trapezius and sternomastoid muscles and pharynx. Accessory portion joins the vagus, to which it supplies its motor and some of its cardio-inhibitory fibers. Afferent fibers carry proprioceptive impulses. *ORIG.* Medulla and spinal cord

a. Willis's. Spinal accessory nerve.

accessory. Auxiliary; assisting, as accessory glands of the pancreas or Brunner's glands *

a. articles of diet. Condiments, * flavors, and stimulants

accident [*L. accidens*, happening]. 1. An unexpected event. 2. An unforeseen occurrence of an unfortunate nature, a mishap.

RS asphyxia, burn, choking, collapse, coma, dislocations (under name of bone), fractures (the same), frostbites, fumes, gases, heat cramps and exhaustion, hemorrhage, insect bites, poisons (name of), resuscitation, shock, suffocation, sunburn, sunstroke, syncope, unconsciousness, wounds, etc.

accipiter (ak-sip'it-er) [*L. a hawk*]. A bandage for the face with clawlike tails.

acclima'tion [*F. ā*, to, + *climat*, climate]. To become accustomed to a climate.

acclimatization (a-kli-ma-ti-za'shun). Becoming accustomed to a new climate.

acclimatize (ak-klī'mā-tiz). To make accustomed to a new climate.

accommoda'tion [*L. accommodare*, to suit].

1. Adjustment. *Esp. ant.* surface made possible by contraction and relaxation of the ciliary muscles. 2. Adaptation. Convergence of eyes brought about by contraction of the extrinsic eye muscles.

OPHTH 1. The adjustment of the eye for seeing at different distances. Produced by change in shape of lens, *esp. ant.* surface. 2. Act of accommodation accompanied by contraction of pupils and convergence of eye, made possible by the contraction and relaxation of the ciliary muscle

ANOMALIES (a) Subnormal accommodation (toxiemia). (b) Paralysis (toxins, diphtheria, poisoning, atropine, hemiatropine, hyoscyamine, scopolamine, syphilis, contusions of eyeball). (c) Spasms (frequently in children and young adults, due to excessive use of eyes). (d) Presbyopia *

a. absolute. Accommodation of either eye separately

a. amplitude of. *SEE* *range of a.*

a. binocular. Meeting of both eyes at a point in order to carry the object's image to the retina of both

a. histologic. Change in cell form and function due to change in surrounding conditions

a. mechanism. Method by which curvature of eye lens is changed in order to focus close objects on the retina

a. negative. Relaxation by the eye to adjust itself for long distances

a. positive. Contraction by the eye to adjust itself for short distances.

a. range of. Space of vision between its closest and most remote points.

a. reflex. The normal dilation and contraction of pupil as eye focuses for near and far objects. *SEE* *Argyll-Robertson pupil*.

a. relative. Accommodation produced by the two eyes acting together

accommodative iridoplegia. Noncontraction of pupils during accommodation.

accouchée (ak-koo-shay') [*Fr. accoucher*, to be delivered of child]. One who has been delivered of a child

accouchement (a-kooosh-mon'). The act of delivery in childbirth, parturition

a. forcé. Forceful hand delivery

accoucheur, accoucheuse (ak-kooosh-er', a-koo-shūz') (*Fem.*). One who practices obstetrics

accrementition (a-kre-men-tish'un) [*L. accrescere*, to increase]. Increase of growth by interstitial development from blastema and by reproduction by cellular fission. Gemmation, *q.v.*

accretion (ak-re'shun) 1. Increase by external addition, accumulation. 2. The growing together of parts naturally separate

accubation (ak-u-ba'shun) [*L. accubare*, to recline near]. 1. Act of taking to one's bed or assuming a reclining posture. 2. Lying in bed with another person

accumulator or storage battery. *PT* A vessel containing sulfuric acid diluted until its sp. gr. is 1.200. In this are immersed lead plates.

a.c.e. mixture. An anesthetic for general inhalation made up of one part of alcohol, two parts of chloroform, and three parts of ether. Now seldom used.

acedia (a-sē'dī-ā) [G. *a-*, priv. + *kedos*, care]. Indifference. Insensibility. Lack of emotion. SYN *apathy*.

acenesesthesia (a-sen-es-the'zī-ā) [G. *a-*, priv. + *koinos*, common, + *aisthēsis*, sensation]. Absence of a feeling of well-being, present in such disorders as hypochondriasis and neurasthenia.

acenteric [' + *kentron*, point around which a circle is described]. Not central, peripheral.

acephalocyst, **acephalocystitis** [G. *akephalos*, headless, + *kystis*, bladder]. An echinococcus cyst, hydatid.

a. racemosa. A hydatid uterine mole.

acephalous (ā-sef'al-us). Without a head.

acerbity (a-serb'i-ti) [L. *acerbus*, sharp]. Astringency combined with acidity.

acervuline (a-ser'vu-līn) [L. *acervulus*, a little heap]. Aggregated, occurring in clusters.

acervuloma (ā-ser-vu-lo'ma) [' + *-oma*, tumor]. Intracranial tumor containing brain sand

acer'vulus [L]. Sandv, sabulous

a. cer'e'brī. Sabulous matter filling the follicle of the pineal gland, brain sand

acescence (a-ses'ens) [L. *ascere*, to become sour]. 1. Slight acidity 2. Process of souring

acesent (a-ses'ent). Slightly acid.

acestoma (a-ses-to'mā) [G. *akestos*, curable, + *-oma*] The fresh granulations which later form a cicatrix [acetabulum]

acetabular (as-et-ab'u-lar). Pert to the

acetabulum (as-et-ab'u-lum) [L. a little saucer for vinegar] The rounded (cotyloid) cavity on the external surface of the innominate bone (os coxae or os innominatum) which receives head of femur SEE *cotyloid cavity*. 2 The ventral sucker of the fluke

acetanilid (as-et-an'il-id) (antifebrin).

USP A white powder or crystalline substance obtained by interaction of glacial acetic acid and aniline
INCOMPATIBILITIES Chloral, antipyrine
ACTION AND USES Analgesic and antipyretic In excessive dose, cardiac depressant Dosage 3 gr (0.2 Gm)

POISONING SYM Weakness, sweating, prostration, prolonged cyanosis due to methemoglobin Depression of cerebral and medullary centers, feeble pulse and respiration If prolonged, find hematuria, nephritis, and jaundice

F A TREATMENT Wash out stomach; saline purge, give stimulants, intravenous fluids and blood-transfusion often invaluable

acetarsonic (as-et-ar'sōn). An organic arsenical compound originally introduced as "stovaisol" containing 27.1 to 27.4% arsenic

ACTION AND USES In treatment of amebic dysentery and syphilis Reaction from excessive dose same as arsenphenamine.

DOSAGE Orally. 4 gr (0.25 Gm)

acetate (as'e-tā). A salt of acetic acid.

acetbroman'ilid. Antisepsin, asepsin, an analgesic and hypnotic.

acetic (a-se'tik) [L. *acetum*, vinegar]. Pert. to vinegar, sour.

a. acid. Gives vinegar sour taste. CH₃COOH SEE *acid*, *chloroaceticization*.

a. a. test for albumen. Acetic acid is added to heated urine. If cloudy, albumen present. SEE *albumen*.

a. fermentation. A continuation of alcoholic fermentation

aceticceptor (ā-se'tik-o-sep'tor). One of the side chains which have an affinity for the acetic acid radical.

acet'idin. Ethyl acetate.

acetify (a-se'ti-fi) [L. *acetum*, vinegar, + *feri*, to become]. To produce acetic fermentation or vinegar.

acetimeter (ā-se-tim'e-ter) [' + G. *metron*, measure] An apparatus which determines the acetic acid in fluid.

Acetobacter [' + G. *bakterion*, little staff]. A genus of *nitrobacteriaceae*.

A. aceti. A form of *A.*, producing vinegar from wine or cider

acetone (as'e-tōn). Dimethyl ketone (CH₃)₂CO, a colorless, volatile, inflammable liquid, miscible with water, useful as a solvent, and having a characteristic irritating odor

Dosage 5-15 gr. (0.3-1.0 Gm).

Found in the blood, and in urine in diabetes, faulty metabolism, and after lengthy fasting, produced when the fats are not properly oxidized, due to inability to oxidize glucose in the blood. SEE *acetonuria*, *acidosis*, *ketone*, *ketosis*, and *testis*.

a. bodies. Certain substances related to acetone. An example is *acetoacetic acid* q v, under *acid*.

a. in urine, test for. Take 2 to 3 cc of urine, acidity with 3 or 4 drops of glacial acetic acid, add a few crystals of sodium nitroprusside, and shake a little Cover with a layer of strong ammonia The presence of acetone is indicated by the formation of a purple ring between the layers of liquid

acetonemia (as-e-to-ne'mi-ā) [acetone + G *aima*, blood] Large amounts of acetone in blood SYM erethism, gradual depression, acidosis

acetonuria (as-e-to-nū'ri-ā) [' + G. *ouron*, urine] The occurrence of acetone and diacetic bodies in the urine, as in the *ketosis* of diabetes, starvation, etc., which may be due to incomplete oxidation of albuminous substances SEE *acetone*, *acidosis* and *testis*.

acetophenetidin (as-e-to-(ē-ne'tīd-in) (phenacetin) USP A crystalline substance manufactured from coal tar

ACTION AND USES Same as for acetanilid but less depressing

INCOMPATIBILITIES Same as for acetanilid

DOSAGE 5 to 15 gr. (0.32-1.0 Gm).

acetous (as'e-tus) [L. *acetum*, vinegar].

1 Pert to vinegar 2 Sour in taste

acetum (pl. *aceta*) (a-se'tum) [L]. Vinegar

The vinegars are solutions of medicinal substances in diluted acetic acid There is 1 official vinegar. They are seldom prescribed

acetylcholine (ā-sēt-īl-kō'len). A substance found normally in many animal and vegetable tissues. It has been used in the form of its chloride and bromide salts to relax peripheral blood vessels.

acetylsalicylic acid (as'et-il-sal-i-sil'ik) (aspirin) USP A white powder or crystalline substance obtained by action of acetic anhydride on salicylic acid. A substance liberated at the endings of the vagus nerve in the heart, sometimes called "vagal substance". It is a choline ester and is produced at the endings of postganglionic fibers of the parasympathetic division of the autonomic nervous system, in sympathetic ganglia at the synapses between pre- and postganglionic fibers, and at the motor end plates in striated muscles. It is also produced at some sympathetic-nerve endings and along a nerve fiber during the passage of a nerve impulse.

achalasia (ă-kal-a'zî-ă) [G. *a-*, priv. + *chalis*, relaxation] Failure to relax, said of muscles, such as sphincters, the normal function of which is a persistent contraction with periods of relaxation

a., pelvirectal. Congenital dilatation of the colon

a., sphincteral. Intestinal failure of sphincters to relax

achievement age. Determined by test for proficiency in a subject measured by what average child of that chronological age can do *See* *age*.

a. quotient (A Q) A state of progress in learning ascertained by dividing the achievement age by the mental age

Achilles jerk. The motor response to striking tendon of gastrocnemius muscle

The variations and their significance correspond closely to those of the knee jerk. It is exaggerated in upper motor neuron disease and diminished or absent in lower motor neuron disease *See* *reflex*.

Achilles tendon (a-kil'ez) (*tendo achillis* or *tendo calcaneus*) [Greek warrior, invulnerable except for his heel] The tendon of the soleus and gastrocnemius muscles, at the back of the heel

A. t. reflex. Plantar flexion of foot and contraction of calf muscles following blow upon tendon of Achilles. Absent in sciatica

achillobursitis (a-kil-o-bur-si'tis) [" + L. *bursa*, a pouch + G. *-itis*, inflammation] Inflammation of the bursa lying over the Achilles tendon

achillodynia (a-kil-o-din'i-ă) [" + *odynē*, pain] Pain caused by inflammation bet the *tendo calcaneus* and the bursa

achillorrhaphy (a-kil-o'r-rai-i) [" + G. *raphē*, sewing] Suture of *tendo achillis*.

achillotomY (a-kil-o-tō-mi) [" + *tomē*, incision] A division of *tendo achillis*.

achilous [G. *a-*, priv. + *cheilos*, lips]. Without lips

achiria (a-ki'ri-ă) [" + *cheir*, hand] 1. Congenital lack of hands 2. Loss of sense of possession of one or both hands. 3. Inability to tell on which side of body a stimulus is applied

achlorhydria (a-klor-hi'dri-ă) [" + *chloros*, green, + *ydōr*, water]. Absence of free hydrochloric acid in the gastric juice

Etiol. May be due to gastric carcinoma, pernicious anemia, syphilis of stomach, chronic atrophic gastritis, and neuroses, carcinoma, and in diseases of other organs than the stomach, may be a normal condition in 30% of adults up to 70 yrs of age, and in 4% of children *See* *achylia*.

achloride (ă-klo'rid) A salt other than a chloride, nonchloride

achloropsia (ă-klo-rōp'se-ă) [G. *a-*, priv. + *chloros*, green, + *opsis*, vision] Color blindness as regards green.

acholia (ak-o'li-ă) [" + *cholē*, bile]. An absence or want of bile.

acholic (ak-o'lik) [" + *cholē*, bile]. Pert. to acholia

acholuria (a-kol-u'ri-ă) [" + " + *ouron*, urine] In some forms of jaundice, absence of bile pigments in the urine.

achondroplasia (ă-kon-dro-pla'si-ă) [" + *chondros*, cartilage, + *plasis*, a moulding]. Defect in the formation of cartilage at the epiphyses of long bones, producing a form of dwarfism, sometimes seen in rickets

achor (a'kor) [G. *achōr*, scurf]. 1. Small pustules on hairy parts of body. 2.

Pointed pustules 3. Scabby eruption on scalp and face of infants.

achoresis (ă-ko-re'sis) [G. *a-*, priv. + *chōrein*, to make room]. Contraction of the bladder, stomach, or other hollow viscous, reducing its capacity

Achorion (ă-ko'ri-on). A genus of fungous organisms found in the skin, esp. in hair follicles.

A. schoenleinii. A species of *A.* in ringworm

achrocythemia (a-kre-o-si-the'mi-ă) [G. *achroos*, colorless, + *kytos*, cell, + *aima*, blood]. Absence of coloring in the blood

achrocyte (a-krō'a-sit) [G. *a-*, priv. + *chroa*, color, + *kytos*, cell]. A lymphocyte, a colorless cell

achrocytosis (a-krō-ă-si-tō'sis) [" + " + " + *-osis*, condition]. Many lymphocytes in the peripheral circulation

achroicythemia (ă-kroy'o-si-the'mi-ă) [G. *achroos*, colorless, + *kytos*, cell, + *aima*, blood]. Deficiency of hemoglobin in red blood cells.

achroma (a-krō'ma) [G. *a-*, priv. + *chroma*, color]. 1 A form of macula * 2 An absence of color Leukoderma. Hereditary, circumscribed skin areas deficient in pigmentation

achromacyte (ak-rō-mă-sit) [" + *kytos*, cell] A decolorized erythrocyte *

achromasia (ak-ro-ma'zi-ă) [G. *achrōmatos*, without color] 1 Albinism, vitiligo, or leukoderma 2 Lack of pigment in the skin. 3 Pallor due to poor nutrition.

achromate (ak'rō-măt) [G. *a-*, priv. + *chroma*, color] One who is color blind.

achromatic (ak'rō-mat'ik) [G. *achrōmatos*, without color] Colorless

a. lens. One correcting chromatic aberration

a. sensation. A descriptive name for visual sensation in white, black and gray, contrasted with the chromatic or colored sensations

achromatin (ă-krō-măt-in). The basis of a cell nucleus, so-called because it is not readily colored by basic stains.

achromatism [G. *a-*, priv. + *chroma*, color] Colorlessness

achromatocyte [" + " + *kytos*, cell]. A decolorized red blood cell

achromatolysis (ă-kro-mă-tol'i-sis) [" + " + *lysis*, loosing]. Dissolution of cell achromatin

achromatophil (ă-kro-măt'o-fil) [" + " + *philos*, love]. A cell not stainable the usual way

achromatopsia (ă-kro-mă-top'si-ă) [G. *achrōmatos*, without color, + *opsis*, vision] Color blindness, partial or total.

achromatop'sy. Color blindness. *Syn* achromatopsia.

achromatosis (a-achro'ma-tō'sis) [G. *achrōmatos*, without color, + *osis*, state] Condition of being without natural pigmentation. *See* *achroma*.

achromatous (a-krō'mă-tus). Without color

achromaturia (ă-krō'mă-tu'ri-ă) [G. *achrōmatos*, without color, + *-ouron*, urine]. Colorless or nearly colorless urine

achromia [G. *a-*, priv. + *chroma*, color]. Absence of color. *Syn*: *achroma*. *See*: *chloranemia*.

a. parasitica. Skin disease causing spotted appearance.

achromic (ă-krō'mik). Lacking color.

achromoder'mia [G. *a-*, priv. + *chroma*, color, + *derma*, skin]. Lack of color in skin

achro'mophil [" + " + *philos*, fond]. Not staining easily.

achromotrichia [ak' + " + *trichia*, condition of the hair]. Lack of color in the hair.

achromycin (äk-rō-mī'sin). An antibiotic effective against Gram-positive and Gram-negative bacteria, rickettsiae, and certain viruses and protozoa.

achrodextrin (äk'rō-o-deks'trin) [G. *achroos*, colorless, + *dextrin*]. One of the varieties of dextrin resulting from the first splitting of a polysaccharide molecule, the other being *erythrodextrin*.

This process is followed by further splitting of the molecules to maltase, a disaccharide, and then to glucose, a monosaccharide. It is not colored by iodine.

achylia (a-ki'lī-ä) [G. *a-*, priv. + *chylōs*, chyle] Absence of chyle.

a. gastrica. Hypoacidity; a deficiency of hydrochloric acid and of gastric enzymes, present in 40% of adults, in children during febrile diseases and gastroenteritis, during the last months of pregnancy, and in some anemias. Usually secondary to pernicious anemia, carcinoma, chronic appendicitis, cholecystitis, and other conditions. Dilute hydrochloric acid often indicated.

a. pancreatica. Absence or deficiency of pancreatic secretion.

Sym. Emaciation, fatty stools, impaired nutrition, etc. [Syn. *achylia*.]

achylosis (ä-ki-lō'sis). Absence of chyle.

achylous (äk'lūs) [G. *achylos*, without chyle]. 1 Lacking in any digestive secretion. 2 Without chyle.

achymia, achymosis (a-ki'mī-ä, a-ki-mō'sis) [G. *a-*, priv + *chymos*, juice]. Deficiency or absence of chyme.

acicular (a-sik'u-lai) [L. *aciculus*, little needle]. Needle-shaped.

acid [L. *acidus*, sour]. 1 Any substance containing hydrogen replaceable by metals, yielding hydrogen ions as the only positive ions, when dissolved in water, and affecting indicators in certain ways. SEE *indicator*. 2 Sour.

a., acetic, CH_3COOH . It gives the sour taste to vinegar.

a., adenylar. Assumed to be a vitamin B. It is intimately associated with life processes. A vital metabolic link in energy-transfer mechanisms, muscular contractions, and enzymic reactions, it is involved in fat and carbohydrate metabolism.

a., a., glacial. A pure anhydrous preparation which melts at 16.7°C . and is consequently crystalline in a cold room.

a., acetoacetic, $\text{CH}_3\text{COCH}_2\text{COOH}$. SYN. *Diabetic acid* (in diabetic urine).

a., amino. A series of compounds that can be prepared from proteins or made synthetically and which have the general formula $\text{NH}_2\text{R COOH}$. Ex: *a., amino-acetic*, hydantoin, and tryptophan.

a., aminocetic, $\text{NH}_2\text{CH}_2\text{COOH}$. The same as glycine, one of the simplest examples of an amino acid.

a., ascorbic. Synthetic vitamin C ($\text{C}_6\text{H}_8\text{O}_6$). Similar to natural vitamin in citrus, etc., in comp. and therapeutic value.

Dosage: Infants and children: *prophylactic*, $\frac{1}{4}$ – $\frac{3}{4}$ gr. (0.01–0.05 Gm.); *curative*, $\frac{1}{2}$ gr. (0.03 Gm.). Adults: *prophylactic*, $\frac{3}{4}$ gr. (0.05 Gm.); *curative*, $\frac{1}{4}$ – $\frac{1}{2}$ gr. (0.05–0.1 Gm.).

a., barbituric, $\text{C}_4\text{H}_4\text{O}_3\text{N}_2$. Malonyl urea. A heterocyclic compound from which veronal and other hypnotics are derived.

a., benzoic, $\text{C}_6\text{H}_5\text{COOH}$. A white crys-

talline material prepared from coal tar; used in keratolytic ointments.

a., betaoxybutyric. SYN. for *a., acetoacetic*.

a., bile. Any substance occurring in the form of salt in the bile. Ex *glycocholic* and *a., a., taurocholic*.

a., boric, H_3BO_3 , **a., boracic**. A white crystalline substance giving very weakly acid solutions, poisonous to plants and animals, and useful as a bacteriostatic. Prepared from interaction of sulfuric acid and borax. Uses: Mild antiseptic dusting-powder alone, or diluted with talcum or starch, or as 4% solution to mucous membranes.

a., butyric, $\text{C}_4\text{H}_7\text{COOH}$. A liquid having odor of vomitus and rancid butter.

a., carbolic. Obsolete name for phenol.

a., carbonic, H_2CO_3 . A weak acid from carbon dioxide dissolved in water.

a., carboxylic. Any one containing the group COOH . The simplest examples are *formic* and *acetic*.

a., citric, $\text{C}_6\text{H}_8\text{O}_7$. H.O. USP. Prepared from lemon or lime juice in form of large white or transparent crystals. Uses: As a flavor and in effervescent drinks. Dosage: 8 gr. (0.5 Gm.).

a., diacetic. Same as *acetoacetic*.

a., fatty. One of a series of carboxylic acids which can be combined with glycerol to form fats, the simplest members of the series are *formic* and *acetic*, most typical *stearic* and *oleic*.

a., formic, HCOOH . The simplest member of the series of fatty acids, a liquid heavier than water and 12 times as strong as acetic acid.

a., gallic, $\text{C}_7\text{H}_5(\text{OH})_3\text{COOH}$. A crystalline acid that can be prepared from tannic and plant galls.

a., glutamic, $\text{COOHCH}_2\text{CH}_2\text{CHNH}_2\text{COOH}$. An important amino acid.

a., glycocholic, $\text{C}_{24}\text{H}_{41}\text{NO}_6$. Occurs as a sodium salt in bile and can be decomposed into aminoacetic and cholic acids.

a., glycuronic, $\text{CHO}(\text{CHOH})\text{COOH}$. Related to the carbohydrates, is found in small quantities in the urine, and occurs among the decomposition products of mucoids.

a., hydriodic, HI. Used in medicine for its iodine content; its salts are called iodides.

a., hydrochloric (HCl) (Muriatic acid). USP. An aqueous solution of a gas produced by the interaction of sulfuric acid and sodium chloride. Found naturally (up to 0.4%) in gastric juice, its salts are called *chlorides*. Incompatibilities: Alkalies, carbonates and oxides. Uses: To check fermentation and putrefaction in stomach by partially restoring necessary hydrochloric acid. Dosage: Diluted (10%) 15 m (1 cc.). Taken through a glass tube.

a., hydrocyanic, HCN. A weak, unstable, poisonous volatile acid which forms salts called cyanides, has a characteristic odor suggesting almonds, and in minute doses stimulates respiration.

Dosage (Dil.) $\frac{1}{12}$ gr. (0.1 Gm.)

a., lactic, $\text{C}_3\text{H}_5\text{O}_3$. Results in nature from the fermentation of lactose (as in sour milk) and when pure is a clear syrupy liquid.

a., linoleic, $\text{C}_{18}\text{H}_{33}\text{O}_2$. May be prepared from linseed and cottonseed oils and is an example of unsaturated fatty acid.

a., malic, $\text{C}_4\text{H}_6\text{O}_5$. Found in certain sour fruits as apples and apricots.

a., mineral. Acids prepared from non-organic materials, as sulfuric, hydrochloric, nitric, and phosphoric.

a., muriatic. Obsolescent name for a., hydrochloric.

a., nitric. HNO_3 . A strong corrosive acid prepared from sulfuric acid and a nitrate.

a., oleic. $\text{C}_{17}\text{H}_{34}\text{O}_2$. An unsaturated fatty acid that can be prepared from various fats and oils

a., organic. An acid containing the carboxyl radical COOH

a., oxalic. $\text{C}_2\text{H}_2\text{O}_4$. A white crystalline solid found in cranberries, rhubarb, and other plants, is poisonous in large quantities, and occurs (as calcium oxalate) in urinary calculi.

a., palmitic. $\text{C}_{16}\text{H}_{32}\text{O}_2$. A fatty acid prepared from palm oil.

a., pectic. $\text{C}_{16}\text{H}_{20}\text{O}_{16}$. An acid derived from pectin.

a., phosphoric. H_3PO_4 . Gives rise to salts called phosphates and related compounds widely distributed in nature.

Dosage (10%) 15 gr (10 Gm)

a., phosphorous. H_3PO_3 . A dibasic oxy-acid of phosphorus. It has 1 atom less of oxygen than phosphoric acid

a., phosphotungstic. $\text{P}_2\text{O}_5 \cdot 12\text{WO}_3 \cdot 42\text{H}_2\text{O}$ Used in chemical and histologic technique. Precipitates proteins and alkaloids

a., picric. $\text{C}_6\text{H}_3(\text{NO}_2)_3\text{OH}$. A yellow crystalline substance which reacts with proteins and alkaloids and leaves bright yellow stains

a., prussic. Obsolescent name for a., hydrocyanic

a., pyrogallol. Same as pyrogallol, $\text{C}_6\text{H}_3(\text{OH})_3$. A white crystalline sub-

stance which absorbs oxygen rapidly in alkaline solution and is used in gas analysis and photography.

a., pyruvic. CH_3COCOOH . The simplest of the ketonic acids, important in metabolism because of its close relation to a., lactic.

a., salicylic. $\text{C}_6\text{H}_4(\text{OH})\text{COOH}$. A white, crystalline powder used for its antiseptic and keratolytic actions, its derivatives, the salicylates, are much used as analgesics. USP. A white crystalline powder from oil of wintergreen and sweet birch. INCOMPATIBILITIES Iron salts, sweet spirit of niter. Uses Externally as antiseptic and irritant. Internally, same as sodium salicylate. Dosage 5-20 gr. (0.3-1.3 Gm)

a., stearic. $\text{C}_{17}\text{H}_{35}\text{COOH}$. A fatty acid prepared from animal fats, esp. beef

a., sulfonic. Any organic compound of the general formula $\text{R}\cdot\text{SO}_3\text{H}$ generally prepared by the action of strong sulfuric acid on benzene or its derivatives

a., sulfuric. H_2SO_4 . A corrosive, heavy liquid prepared from sulfur and indispensable in the industries

a., sulfurous. H_2SO_3 . An acid existing in solutions of sulfur dioxide in water and giving rise to salts called sulfites.

Dosage (6%) 15-60 gr (1.0-4.0 Gm).

a., tannic. A glucoside prepared from oak galls and sumac and yielding gallic acid and glucose on hydrolysis

a., tartaric. USP. $\text{C}_4\text{H}_4\text{O}_6$. Occurs free or as tartrates in fruit juices. A light yellow powder, from nut galls, freely soluble in water and glycerin. INCOMPATIBILITIES Alkalies, alkaloids, and iron salts. Uses Astringent and hemostatic. Dosage 8 gr (0.5 Gm).

Acid and Alkaline Reaction of Foods

Foods	Oz. in 100 Calories	Excess of Acid	Excess of Alkali
Almonds	54	1 00
Apples	5 61	6 00

Squash	7 65	6 10
Tomatoes	15 61	24 50
Turkey	1 21	3 36
Turnips	8 95	7 00
Veal, leg	2 89	8 70
Walnuts	1 50	1 10
Watermelons	11 68	8.80
Wheat, cracked	97	3 30
Whitefish	2 35	7 60

a., taurocholic. A substance occurring in bile and yielding cholic acid and taurine on hydrolysis

a., unsaturated. Organic acid containing less than the maximum possible number of hydrogen atoms. For example, compare unsaturated *oleic* and *linoleic* acids with the saturated *a. stearic*.

a., uric. A crystalline solid (formula $C_5H_4N_4O_3$) prepared from urine

a., valeric. $C_5H_{10}O_2$. Same as valeric acid, an oily liquid of the fatty acid series, existing in 4 isomeric forms, having a disgusting odor, and prepared from valerian root. *ApM*. Dilute well with water. Protect teeth by giving through straw or glass tube.

DOSAGE 1-8 gr (0.06-0.5 Gm.)

acidaminuria (as'id-ā-m'ī-n-ū'rī-ä) [*L. acidum*, acid, + *amine* + *G. ouron*, urine]. Excess of amino acids in voided urine.

acid and alkaline reaction of foods. One of the principles of dietetics is to maintain an equilibrium between the acids and the alkalis in the body, by balancing the ration so that neither an excess of acid-forming or alkali-forming foods is consumed. The following percentages, adapted from Sherman, show both the excess of acid and the excess of alkali in the indicated number of ounces constituting 100 calories. Observe that excess acid foods include: Meats, Fish, Poultry, and Cereals; excess alkali nearly all vegetables and fruits.

acid-ash diet. Decrease or omit fruits, vegetables, milk. Adjust cals. by increasing neutral or acid-ash foods.

acid-base balance. In metabolism, the balance of acid to base (alkaline ash) necessary to keep the blood neutral (slightly alkaline), between pH 7.35 and pH 7.43.

acid-base diet. One which favors the de-

velopment of acidosis and which produces a loss of fixed base and water from the tissues; the amount of nitrogen intake compared with the output. Acidosis may be due to increase of ketone* bodies or to excess of acid-ash. This diet is used in rickets, nephritis, and epilepsy, *q.v.* The value of a balanced acid-base, base-forming diet has not yet been determined.

RS. *acidic effects, acidosis, alkalosis, ash, base, body, ketogenic diet, ketosis, also names of foods.*

acidemia (as-i-de'mi-ā) [*L. acidum, acid, + G. aima, blood*] A condition in which uncompensated reduction in alkaline reserve or uncompensated increase in circulating acid substances results in increased acidity of the blood, so that the pH drops from a normal range of 7.3-7.5 to more acid values, *e.g.*, 7.0 to 7.3 **SEE: acid-base balance, acidity, acidosis**

acid-fast. Not decolorized easily when stained by acids. Pertaining to bacteria which after staining are decolorized by a mixture of acid and alcohol. The acid-fast bacteria retain the red dyes, but the surrounding tissues are decolorized.

acidic effects of foods. Proteins, such as meat and eggs, when burned in the body result in a number of end products which are acidic, such as uric acid, sulfuric acid, and phosphoric acid.

They should be neutralized by alkaline substances to form neutral salts, the salts being eliminated by the kidneys. Organic acids, such as benzoic and quinic, may be present following the ingestion of plums, cranberries, and prunes, and may not be burned in the body, the effects being acidic though salts are present. Acidity or its effect in the body is not indicated by its taste or its original acidity.

acidification [*L. acidum, acid, + factus, past p. of facere, to make*] Becoming sour, conversion into an acid.

acidifiable (a-sid-i-fī-ā-bl) [*— + fieri, to be made, + habilis, uel.*] Capable of transformation into an acid.

acidimeter (as-i-dim-ē-ter) [*— + G. metron, measure*] Instrument for testing purity of acids.

acidimetry (as-i-dim'i-trī). Determination of an acid's strength, or of the acidity of a fluid.

acidism, acidismus [*L. acidus, sour*]. Poisoning due to acids introduced from outside.

acidity (a-sid'i-tī). Quality of being acid; having an excess of acid, sourness.

In chemistry denoting (a) the quality of possessing the characteristics of an acid and so, in acids or acid salts, equivalent to basicity, (b) the capacity for saturating an acid evinced by a base; (c) the intensity of an acid reaction, expressed usually in terms of the hydrogen-ion concentration. **SEE: hydrogen ion.**

a. of stomach. Sourness due to fermentation of food in the stomach, or oversecretion of acid. It does not necessarily indicate acidosis.

acidophilic (as-sid'o-fīl or fīl) [*L. acidum, acid, + G. philos, love*]. Capable of being stained by acid stains such as eosin. Said of cells or parts of cells prepared for microscopic study.

acidophilic (a-sid'o-fīl'ik). Having affinity for acid or pert. to certain tissues and cell granules. **SYN: acidophilous.**

acidophilism (ā-sid-of'il-izm). State due

to acidophil adenoma of the hypophysis, causing acromegaly.

acidophilous (ās-i-dof'ī-lus). Capable of being stained by acid stains, said of cells. **SYN: acidophil, q.v.**

a. milk. Milk fermented by *Lactobacillus acidophilus* cultures. **Uses.** To change intestinal flora. Average serving 240 grams. **Pro.** 8.2, **Fat** 4.8, **Carbo.** 3.7. **SEE: milk.**

acidoresistant. Acid resisting, said about bacteria.

acidotic. Having acidosis.

acidosis (as-i-dō'sis) [*L. acidum, acid, + G. -osis, condition*] A disturbance of the acid-base balance of the body. The blood is never acid except in extreme pathological conditions.

It may be caused by an abnormal production of acids in the body and faulty elimination or by abnormal decrease of alkalinity, inability of the body to maintain its normal alkali reserve due to failure of the fatty acids being reduced to their normal end products, the process stopping with the intermediary products such as acetone-bodies. The blood is never acid.

DIAG. In all cases the CO₂ combining power is lowered from 40 to 30 and to 20, showing the degree of acidosis, the normal figures being 55 to 75 cc per 100 cc of blood.

Increased ammonia in the urine or sour stomach does not necessarily indicate acidosis, but it is an indication that the body is reacting to prevent this condition.

Acidosis may be determined by the amount of sodium bicarbonate needed to render the urine alkaline. In *compensated* acidosis there is a corresponding reduction of the acid normally found in the blood (*e.g.*, carbonic), so that no actual acidity results.

The pH of the blood remains within the normal limits, the alkali defect being small, but in *uncompensated* acidosis the alkali defect is great and therefore the pH falls below the lower limit of normal (pH below 7.3).

Acetonuria frequently accompanies acidosis but is not identical with it.

Acidosis is secondary to some other disorder. It is common in diabetes, and in some forms of nephritis, in epilepsy, also in diarrhea and in toxemias.

ETIO. This condition may be produced by a high fat diet with low carbohydrate and protein content. Hunger and starvation, pregnancy, cyclic vomiting and chloroform poisoning are other causes.

SYM. Sickly sweet breath, headache, nausea, vomiting, visual changes, and acetone bodies in urine.

TREATMENT. Administer glucose. Reduce fat in diet. Sodium bicarbonate, 10-20 gr every 4 hours.

SEE: acidosis, acidotic, oxyosis.

acidotic (a-sid-ot'ik). Pert. to acidosis.

acid poisoning. Acids have a sour taste and many of them are corrosive or poisonous.

SYM. Burning with disintegration and often discoloration of involved tissues.

T. **A. TREATMENT:** Dilute and wash with large volumes of water; followed by dilute alkaline substances as baking soda, chalk, soap, milk of magnesia, lime water, weak ammonia, etc. Follow with bland or soothing oils or salves as olive oil, sweet oil, liquid paraffin, cold cream (ung. aq. rosae), lanolin, butter, petro-

leum jelly, etc. **See:** name of special acids.

acid-proof. Acid-fast.

acid-salt. A compound formed when only a part of the hydrogen of an acid is replaced by a metal

acid/ulate [L. *acidulus*, slightly acid]. To make somewhat sour or acid [**acid acidulous** (a-sid'u-lus). Slightly sour or **acidum** (as'i-dum) [L.] Acid.

acidu'ric [L. *acidus*, sour, + *durare*, to endure]. Capable of growing in an acid medium, but preferring a slightly alkaline medium, as certain bacteria

acinesia (as-in-e'si-ä) [G. *a-*, priv. + *kinesis*, movement]. Akinesia. 1. Loss of voluntary motion 2. Immobility 3. Interval following the systolic heartbeat

acinesic (as-in-e'sik) Acinetie, akinetie.

acinetie (as-in-e'tik) 1. Afflicted with akinesia. 2. Lessening muscular action

acini'form (as-in'i-form) [L. *acinus*, grape, + *forma*, shape] Resembling grapes

acinitis (as-in-i'tis). Inflammation of glandular acini.

acinous (as'in-us) [L. *acinus*, grape] Pert to glands resembling a bunch of grapes, such as *acini* and *alveolar* glands

ac'inus (Pl *acini*) [L. *acinus*] Smallest division of a gland, a group of secretory cells surrounding a cavity It is distinguished from an alveolus by possession of a narrow lumen

accladio'sis. An ulcerative dermatitis due to the fungus *Actidium castellani*.

acclasia (ä-kla'si-ä) [G. *a-*, priv. + *klasis*, a breaking away] Pathologic continuity of structure chondrodystrophy

a., diaphyseal. Imperfect formation of cancellous bone in cartilage bet diaphysis and epiphysis

acclasis (ak'lä-sis). Pathological continuity of structure **See** *acclasia*.

acclastic. Not refracting light rays

acclasticcardia (ä-kliis-to-kar'di-ä) [G. *akleistos*, not closed, + *kardia*, heart]. Patent foramen ovale

acclu'sion [G. *a-*, priv + L. *claudere*, to close] Imperfect adjustment of opposing tooth surfaces

acclastic (ak-mas'tik) [G. *akmē*, prime]. Pert to disease with regular increase of symptoms (*epacclastic*) and decrease (*paracclastic*), or period of decline.

acme (ak'me) 1. The time of greatest intensity of a symptom 2. Acne

acne (ak'ne) [corruption of G. *akmē*, point]. Any inflammatory disease of the sebaceous glands.

See *bacchia*, *bottle nose*, *stictacne*.

a. albid. Whitish nodules on face. **See** *milium*.

a. artificialis. A. caused by external disturbance or irritation

a. atrophica. **See** *a. varioliformis*

a. ciliaris. That which affects the edges of the eyelids

a. decalvans. Quinquad's disease; a purulent folliculitis of the scalp resulting in irregular bald patches.

a. disseminata. **See** *a. vulgaris*.

a. generalis. A. over the entire body.

a. hypertrophica. Thickening of the lips and sides of nose with *acne rosacea*

a. indurata. Form of *a. vulgaris* with chronic discolored indurated surfaces.

a. keratosa. Acne in which a horny plug takes the place of the comedo.

a. papulosa. Common acne in which the lesions are papular.

a. punctata. A form with pointed papular lesions the centers of which are black-tipped comedones.

a. rosacea. Called also brandy nose, toper's nose, brandy face, rosy drop; characterized by congestion and telangiectasis, often accompanied by acne and seborrhea of angioneurotic origin.

Etiol. Result of any disorder giving rise to persistent reflex flushing of the face. Presence of *Demodex folliculorum*. Thyroid and utero-ovarian disturbance in women, dyspepsia, constipation, strong tea or coffee, alcohol, damage in alimentary canal, or local vascular disturbance causing dilatation of cutaneous blood vessels [underlying cause]

Prog. Depends upon eradication of **Treatment** Correction of underlying cause, elimination of stimulants, condiments, etc. Radiotherapy and electrolysis; otherwise same as in *acne vulgaris*.

a. simplex. **See** *a. vulgaris*

a. tarsal. Acne affecting the sebaceous glands of the eyelids

a. urticaria (kaposi). A form with itching patches

a. varioliformis. Variety with pustular eruptions Contagious **See.** *molluscum contagiosum* [plex.]

a. vulgaris. Common acne, *acne simplex*

Etiol. Heritable predisposition possible Microbic, favored by the oily secretion, and with age, alimentary tract disorders, pelvic irritation, focal infection, as predisposing factors

Sym. There may be either papules about comedones with black centers, or pustules, or hypertrophied nodules caused by overgrowth of connective tissue In the indurative type the lesions are deep-seated and cause scarring. Face, neck, shoulders are common sites

Prog. Curable, though obstinate and recurrent

Treatment Local in all, systemic when indicated Locally alternate bathing with hot and cold water, removal of comedones, incision and drainage of abscesses, followed by hot lysol wash, *lotio alba* at night and a sulfur powder by day, then replaced by soothing lotions by day and cold cream at night, or green soap, or resorcin, or mercury bichloride (1:1000) in acute superficial cases. Eliminate rich foods, condiments, and stimulants Laxatives (*cascara*) and tonics when indicated Injections of boiled liver extract remarkably successful

a. bacillus vaccine. Acne bacillus is found mainly in lesions of acne vulgaris. *Staphylococcus albus* is included in the combined acne-staphylococcus vaccine.

Dosage First dose 25 million acne bacilli, 25 million staphylococci Doses are gradually increased to 250 million acne bacilli at intervals of 3 days Subcutaneous route is used mostly Some favor 0.1 cc intracutaneously

acneiform (ak'ne-form). Resembling acne.

acneiform (ak-ne'i-form) Acneiform

acnemia (ak-ne'mi-ä) [G. *a-*, priv. + *knēmē*, lower leg]. Wasting of the calves of the legs.

acni'tis [G. *akmē*, point, + *-itis*, inflammation]. A papular eruption which becomes pustular, leaving slight scars.

acoin (ak'o-in) A white crystalline powder, bactericide and local anesthetic.

acolasia (ak'o-la'zi-ä) [G. *akolasia*, intemperance] 1. Lust. 2. Unrestrained self-indulgence. Intemperance.

acom'atol. Pancreatic hormone.

aco'mia [G. *a-*, priv. + *komē*, hair]. Baldness. **Syn.** *alopecia*.

acnifite (ak'o-nit). USP. A poisonous and very powerful alkaloid. The dried tu-

berous root of *Aconitum napellus*. Its action, which is due to the presence of two very potent alkaloids, was well known to the ancients, and believed to have been used as an arrow poison early in Chinese history, and perhaps also by the inhabitants of ancient Gaul.

Uses Cardiac depressant, antipyretic, and diaphoretic. Externally an irritant.

Dosage Of tincture (10%) 5 to 15 m (0.3-1 cc).

Poisoning SYM Slowness and weakness of pupils, coldness of skin, sweating, tingling about face and mouth, burning in throat, sometimes nausea, occasionally cramping in extremities, convulsions, respirations abnormal. Dimness of vision.

TREATMENT Wash out stomach, and introduce tannic acid, strong, black coffee or strong tea to precipitate the alkaloid, or powdered charcoal to diminish solubility. Stychinine, atropine, artificial respiration, application of heat.

aconuresis (a-kon'u-re'sis) [G *akon*, involuntary, + *ourasis*, micturition] An involuntary voiding of urine.

acoprosis (â-kop-ro'sis) [G *a-*, priv. + *kopros*, feces] Imperfect formation of feces.

acoprosus (â-kop'rus) Absence of feces in

acor (a'kor) [L a sour taste] Acidity.

acoria (a-ko'ri-â) [G *a-*, priv + *koros*, satiety] 1 Lacking in satisfaction after eating but not from hunger. 2 Glutinous. SLE *bulimia*, *hyperorexia*, *piea*, *purorexia*, *polyphagia*.

acormus (â-ko'r'mus) [G *a-*, priv + *kormos*] 1 Lack of the trunk. 2 A monster without a trunk but with only a head and extremities.

acouesthesia [G *akouein*, to hear, + *ais-*

thesis, sensation] Sense of hearing.

acoumeter (a-koo me-ter) [+ *metron*, measure] An instrument for determining acuteness of hearing.

acouphonia (a-koo-o-to'ni-â) [+ *phone*, sound] Auscultatory percussion.

acouphone (a koo-fo-ni) An electric appliance to aid the deaf to hear.

acousia (a-koô'zi-â) [G *akousis*, hearing] The hearing faculty.

acousma (a-kooz'mâ) [G *akousma*, a thing heard] Nonverbal auditory hallucination.

acousmatagnosia (â-koos-mâ-tag-no'sis) [+ *agnosia*, ignorance] Inability to understand what is said, due to mental disorder.

acousmatamnesia (â-koos-mâ-tam-ne'zi-â) [+ *amnesia*, forgetfulness] Loss of memory for sounds.

acoustic (a-koos'tik) [G *akoustikos*, rel. to hearing] Pert to sound or to the sense of hearing.

a. center. In the temporal lobe of the cerebrum.

a. meatus. The external auditory canal.

a. nerve (*nervus acusticus*). 8th cranial nerve. FUNC Special sense of hearing and equilibrium. ORIG Two roots, cochlear and vestibular. DIS Cochlear, vestibule body canals. BR Cochlear, vestibular. SEE *cranial nerves*. Tables in Appendix.

acous'ticon [G *akoustikos*, rel. to hearing] A type of hearing aid.

acoustics (a-koos'tiks). The science of sounds and their perception.

acquired [L *acquirere*, to get]. Not congenital; gotten after birth.

acraconitine (ak-ra-kon'i-tin). An alkaloid derived from *Aconitum ferox*. SYN: *pseudaconitine*.

acragnosis (ak-rag-no'sis) [G *akrôn*, extremity, + *gnosis*, knowledge] Absence of sensibility in limbs.

a'cral. Pert to extremities.

acraldehyde (ak-ra'l'de-hîd) Volatile liquid produced by dry distillation of glycerin. SYN *acrolein*.

acra'nia [G *a-*, priv. + *kranion*, skull]. Congenital absence of the cranium, either partial or complete.

acrasia (a-kra'zi-â) [G *akrasia*, bad mixture] Without self-control, intemperate.

acratia (a-kra'shî-â) [G *akrateia*, want of power] 1 Loss of strength, impotence. 2 Incontinence, or loss of control.

acratu'resis (a-kra't-u-re'sis) [G *akratês*, powerless, + *ourasis*, urination] 1 Urinary incontinence. 2 Vesicle atony causing feeble urination.

acremonio'sis. A condition marked by fever and development of swellings, due to *Acetomonium poltroni*.

acribom'eter [G *acribes*, exact, + *metron*, measure] Instrument which measures minute objects.

acid (ak'id) [L *acer*, *acris*, sharp] Burning, bitter, irritating.

acriflavine (ak'ri-fla-ven) USP A dye manufactured from coal tar.

Uses Antiseptic.

Dosage For irrigations and treatment of wounds, 1 4000 to 1 1000 solutions in normal saline.

a. neutral. Same as acriflavine but less acid and less irritant.

Uses Urinary antiseptic.

Dosage Oially 1/2 to 1 1/2 gr (0.3-0.1 Gm).

acrimony (ak'ri-mô'ni) [L *acrimonia*, pungency] Quality of being pungent, acid, irritating.

acrinia (a-krin'i-â) [G *a-*, priv + *krimin*, to separate] Suppression or diminution of an excretion or secretion.

acrisia (a-kris'i-â) [G *akrisia*, want of judgment] Condition of uncertainty in diagnosis and prognosis.

acritical (ak-rit'ik-al) [G *a-*, priv + *kritikos*, critical] Not marked by a crisis.

acritochro'macy [G *akritos*, not distinguishing, + *chrôma*, color] Color blindness.

acroagnosis (ak-ro-ag-no'sis) [G *a-*, priv. + *akron*, extremity, + *gnosis*, knowledge] Absence of feeling in a limb.

acroanesthesia (ak'ro-an-es-the-zi-â) [G. *akron*, extremity, + *a-*, priv + *anesthesia*, sensation] 1 Absence of sensation. 2 Lack of sensation in one or more of the extremities.

acroarthritis (â-kro-ar-thrit'is) [+ *arthron*, joint, + *-itis*, inflammation]. Arthritis of the hands or feet.

acroasphy'ia [+ *asphyxia*, pulse stoppage] Cold, pale condition of hands and feet, sym. of Raynaud's disease.

acroataxia (a'kro-â-taks'i-â) [+ *ataktos*, out of order] Ataxia involving, or limited to, the fingers and toes.

ac'roblast [+ *blastos*, germ] The outer layer of the mesoblast.

acrobystiolith (â-kio-bis'ti-o-lith) [G. *akrobystia*, prepuce, + *lithos*, stone]. A calculus of the prepuce.

acrobystitis (â-kro-bis-ti'tis) [+ *-itis*, inflammation] Preputial inflammation.

acroceph'alia [G *akron*, tip, + *kephalê*, head] Pointed condition of the top of the cranium.

acrocephalic (ak"ro-se-fal'ik) A skull with a vertical index above 77, pert to one with a peaked head

acrocephaly (ak"ro-sef'ā-ll) A malformed cranial vault having a high or peaked appearance due to premature closure of the coronal, sagittal, and lambdoid sutures

acrocinnesia, acrocinesis (ā-kro-sin-e-si-ā, -sis) [G *akros*, extreme, + *kinesis*, movement] Excessive motion

acrocinetie (a-kro-sin-et'ik) Showing acrocinesis

acrocontracture [G *akron*, extremity, + *L contractare*, to draw together] Contracture of the hands or feet

acrocordon (a-kro-koi'dōn) [+ *chordē*, cord] A soft pedunculated growth

acrocyano-sis (ak-ro-si-a-no'sis) [+ *kyano-sis*, dark blue color] Cyanosis of finger tips, and other extremities

Etiol. Due to vasomotor disturbances. Seen in catatonica, hysteria, etc

acrodermatitis (ak'ro-der-ma-ti'tis) [+ *derma*, skin, + *-itis*, inflammation] Dermatitis of the extremities

a., continuous. An obstinate eczematous eruption confined to the extremities

a. hiemalis. A form occurring in winter, affecting the extremities and tending to spontaneous disappearance

acrodynia (ak-ro-din'ā) [+ *odynē*, pain] 1. Disorder of skin and limbs in children See *Swift's disease* 2 Multiple neuritis of digits

acroesthesia (ak-ro-es-the'zi-ā) [+ *esthesia*, sensation] 1. Marked hyperesthesia 2 Pain in the extremities

acrogno'sis [+ *gnosis*, knowledge]. Sensory perception of limbs

acrohy-pothermy [+ *hypo*, under, + *thermē*, heat]. Abnormal coldness of extremities

acrokinesia (ak-ro-kin-e'si-ā) [+ *kinesis*, movement] Excessive motion. SYN *acrocinesis*

acrolein (ak-ro-le'in) A volatile liquid produced by dry distillation of glycerin

acromast'ria. Spider-fingers SYN *arach-nodactyly*.

acromania (ak-ro-ma-ni-ā) [G *akros*, extreme, + *mania*, frenzy] Mania accompanied by great motor activity and sometimes by muteness

acromasti'tis [+ *mastōs*, breast, + *-itis*, inflammation] Inflammation of the nipple, thelitis

acromegaly (ak-ro-meg'ā-ll), **acromegalia** (ac-ro-me-ga'li-ā) [+ *megas*, *meg-*, big] A chronic disease (Marie's disease), characterized by progressive enlargement of the bones of the head, and soft parts of the hands, feet, thorax, and face, often associated with hypertrophy of the pituitary body or with diseases of thyroid gland

Etiol. Probably altered function of cerebral hypophysis

Sym. Anterior fontanelle* often remains open until tenth year. Facial features are enlarged, mandible and malar bones becoming prominent with protrusion of orbital ridge. Teeth become widely separated. Swelling of fingers and toes with redness and pain, vomiting and headache.

acromelalgia (ak-ro-mel-al'i-ā) [+ *melos*, limb, + *algos*, pain] A disease of the extremities, esp. the feet, with pain upon walking SYN *erythromelalgia*.

Sym. Pain, redness, swelling of toes and fingers, headache, and vomiting.

acrometagenesis (ā-kro-mēt-ā-jen'ē-sis)

[+ *meta*, beyond, + *genesis*, origin]. Abnormal growth of extremities leading to deformity

acromial (ak-ro-mi-al) [+ *ōmos*, shoulder] Rel to the acromion *

a. angle. The angle at edge of spine of the scapula where it ascends to become the *acromion*, q.v.

a. process. The acromion

a. reflex. Flexion of forearm with internal rotation of hand resulting from quick blow upon acromion. Elicited in hyperkinetic states

acromicria (ak-ro-mik'ri-ā) [+ *mikros*, small] Congenital shortness or smallness of the extremities

acromioclavicular joint (a-kro'mi-o-klā-vik'u-lar) [+ *ōmos*, shoulder, + *L clavula*, small key] Joint between the acromion (outward extension of spine of the scapula, forming part of shoulder) and clavicle

acromioclavoid (a-kro'mi-o-kor'ā-koid) [+ *koraz*, crow, + *oidos*, resemblance] Rel to the acromion and clavoid process

acro'miohu'meral [+ *humerus*, shoulder] Pert to acromion and humerus.

a. muscle. Deltoid muscle

acromion (a-kro'mi-on) [G *akron*, tip, + *ōmos*, shoulder] The lateral, triangular projection of spine of scapula, forming point of the shoulder, and articulating with the clavicle. SEE *acromioclavicular*, *acromioclavoid*

acromioclavicular (a-kro'mi-o-klā-vik'u-lar) [+ *thorax*, breast plate]. Pert. to acromion and thorax

acromphalus (ak-rom-fal-us) [+ *omphalos*, umbilicus] 1. Center of navel. 2. Beginning of umbilical hernia, marked by abnormal projection of umbilicus

acromyle (ak-rōm'il-e) [G *akron*, point, + *myle*, patella] The patella *

acromyotonia (ak'ro-mi-ō-to-ni-ā) [+ *mys*, muscle, + *tonos*, tension]. Myotonia of extremities causing spasmodic deformity

acronarcotic (a-kro-nar-kot'ik) [L *acer*, acris, sharp, + G *narcosis*, a benumbing] Having the property of a narcotic and yet irritant in local effects

acro'neuro'sis [G *akron*, extremity, + *neuron*, nerve] Any neurosis, usually vasomotor, in extremities

acronyx (ak-ro-niks) [L *acer*, acris, sharp, + G *onyx*, claw] Ingrowing of a nail.

acropachy (ak-ro-pak-i) [G *akron*, extremity, + *pachys*, thick]. Thickening of fingers or toes

acroparal'ysis [+ *paralyein*, to disable at the side]. Paralysis of one or more extremities

acroparesthesia (ak'ro-par-es-the'zi-ā) [+ *para*, beside, + *aisthesis*, sensation]. Extreme paresthesia or morbid sensation of the extremities

acro'pathol'ogy [+ *pathos*, suffering, + *logos*, science]. Pathology of extremities

acropathy (ak-ro-p'ath-i). Any disease of extremities

acrophobia (ak-ro-fō-bi-ā) [G *akron*, top, + *phobos*, fear]. Morbid fear of high places

acroposthitis (ak-ro-pos-thi'tis) [G *akroposth*s, prepuce, + *-itis*, inflammation] Inflammation of prepuce

acroscleroderma (ak'ro-skler-o-der'mā) [G *akron*, extremity, + *skleros*, hard, + *derma*, skin] Hard, thickened skin condition. SYN *scleroderma*.

ac'rose. A substance forming starting point for synthesis of fruit sugars.

acrosinosis (ak"rō-si-nō'sis) [G *akron*, point, + *L sinus*, hollow, + *G -ōsis*, condition]. Condition of having pointed or malformed sinuses.

ac'rosome [G *akron*, extremity, + *soma*, body]. The ant. end of head of the spermatozoon.

acrophacelus (ak-ro-sfas'el-us) ["" + *sphakelos*, gangrene] Gangrene of digits. SYN *Raynaud's disease*.

acroteria (ak-ro-te'li-ā) [G *akrotērion*, summit]. The extremities.

acrotic (a-krot'ik). 1 [G *a-*, priv. + *krotos*, striking] Pert to failure of or defective beating of the heart. 2 [G. *akrotēs*, an extreme] Pert to the surface or glands of the skin.

acrotism (ak"ro-tizm) [G *a-*, priv + *krotos*, a striking] Apparent absence of the pulse.

acrotrophoneurosis (ak-ro-tro"fo-nu-ro'-sis) [G *akron*, extremity, + *trophē*, nourishment, + *neuron*, nerve, + *-ōsis*, condition]. Trophoneurosis of extremities.

acrylaldehyde (ak-ril-al'de-hid) A volatile liquid from glycerin. SYN *acrolein*.

ACS. Abbr for American Chemical Society. Also antitreticular cytotoxic serum.

ACTH. Abbr for adrenocorticotrophic hormone, a pituitary hormone that stimulates the cortex of the adrenal glands. RF *cortisone*.

act re'flex. Involuntary reflex act immediately following any stimulus.

actin (akt'in). One of the proteins in muscle fiber, the other being myosin.

actinic (ak-tin'ik) [G *aktis* ray]. Pert to the chemical action of the sun's rays.

PT Pert to actinism. * Capable of producing chemical changes as applied to radiant energy. Usually applied to radiant energy having this property.

a. **burns**. Those caused by ultraviolet or sun rays. F A TREATMENT As for dry heat burns. SEE *burns*.

actinism (ak'tin-izm) That property of radiant energy which produces chemical changes, as in photography or heliotherapy.

ac'tinochem'istry [G *aktis*, ray, + *chemia*, chemistry]. Action of rays from a luminous source.

actinocutitis. SEE *actinodermatitis*.

actinodermatitis (ak'tin-o-der-ma-ti'tis) ["" + *derma*, skin, + *-itis*, inflammation]. Actinourtic. Cutaneous inflammation, acute or chronic, caused by roentgen rays or radium.

ETIO. Susceptibility, those with little skin pigment being exceedingly sensitive, failure to use filters when indicated.

SYM. Varying from reddish erythema, resembling sunburn from single overexposure, to gangrene and sloughing. *Keratosis*. * Potentially malignant, may follow in subjects with dry seborrhea of long standing. Ulcers heal slowly if at all.

TREATMENT. Astringent soothing lotions and boric acid ointment with carbolic acid in mild cases. Radium for x-ray ulcers and keratoses. Surgery in gangrenous forms.

actinogen (ak-tin'o-jen). Any radioactive element.

actinogenesis (ak'tin-o-jen'es-is) [G. *aktis*, ray, + *genesis*, source]. The source or production of actinic rays.

actinogenic (ak'tin-o-jen'ik) [G. *aktis*, actin, ray, + *gennan*, to produce]. Producing rays; radiogenic.

actin'ogram ["" + *gramma*, picture]. Roentgen ray photograph.

actin'ograph ["" + *graphem*, to write]. A skiagraph. AN x-ray picture.

actin'o'ogy ["" + *logos*, study]. Radiology, science of the chemical effects of light.

actinometer (ak"-tin-om'e-ter) ["" + *metron*, meter]. PT. An instrument to measure the intensity of an actinic effect.

Actinomyces (ak-tin-o-mi'sēz) ["" + *mykes*, fungus]. A vegetable parasite (*Actinomycetaceae*), causing actinomycosis.

actino'myce'tic. Pert to Actinomyces.

actinomycetin (ak'tin-ō-mi-sit'in) A substance that is antibacterial from Actinomyces, effective against some gram-positive and gram-negative organisms.

actinomycin A. (ak'tin-ō-mi-sin) An antibacterial substance from Actinomyces *antibioticus*, heat-stable and highly toxic, effective against gram-positive organisms. It is orange-colored, soluble in alcohol and ether.

a. **B**. Similar to A but not soluble in alcohol and chemically unsuitable because of its great toxicity.

actino'myco'ma [G *aktis*, ray, + *mykes*, fungus, + *-oma*, tumor]. A tumor produced by actinomycosis.

ACTINOMYCOSIS

Part of a "sulfur granule" from discharge. Swollen degenerated ends of ray fungus. The fungus (dark) is surrounded by the lymphocytes (dotted background).

actinomycosis (ak-tin-o-mi-ko'sis) ["" + *osis*, condition]. A ray fungus disease in animals, sometimes communicated to man, invading the brain, lungs, gastroenteric tract, or jaw (lumpy jaw).

ETIO. *Actinomyces bovis*.
SYM. Formation of slow growing granulomata, which later break down, discharging viscid pus containing minute yellowish granules. Mouth, tongue, jaw, lungs, and alimentary tract mostly affected. There are thickening of the tract, later suppuration, breaking down of tissues, and discharge of pus through sinuses.

TREATMENT. Surgical incision and drainage, x-ray, and large doses of potassium iodide.

actino'mycot'ic. Pert to actinomycosis.

actinon (ak'tin-on) [G *aktis*, actin, ray]. Emanation from actinium, which is one of the radium, actinium, and thorium series.

actino'neur'itis ["" + *neuron*, nerve, + *-itis*, inflammation]. Neuritis due to exposure to radium or x-rays.

actino'praxis ["" + *praxis*, a doing]. Employment of radioactive rays in diagnosis and treatment.

actinoscopy [' + *skopein*, to write] Examination of deep structures by x-rays

actinostereoscopy [' + *stereos*, solid, + ''] Examination by x-ray SYN *actinoscopy*.

ac'finoth'er'apy [' + *therapeia*, healing]. PT Treatment of disease by rays of light, esp actinic or chemical light.

ac'f'ino'tox'e'm'ia [' + *toxikon*, poison, + *aima*, blood] Blood-poisoning produced by x-ray or radioactivity

ac't'ion [L *actio*, from *agere*, to do] Performance of a function, or process, in pathology, a morbid process.

a., antagonistic. The ability of one drug to antagonize the effect of another

a., asfringent. One in which the tissue cells are contacted by a chemical combination of drug and tissues, forming an albuminate. If this is not dissolved in fluids surrounding tissues, they are not acted upon neither by the drug

a. current. PT Same as *action potential*

a. of arrest. Inhibition [tion

a., poisonous. SEE *toxicological a-*

a. potential. The momentary difference in electrical potential between active and resting parts of a nerve fiber found when the two parts are connected with a sensitive galvanometer

a., reflex. Involuntary movement produced by a sensory nerve and carried to a center and returned by an efferent nerve to its origin or source of stimulus.

a., synergistic. The ability of one drug to aid the effect of another

a., toxicological. The effect resulting from an overdose of a drug

ac't'ivate. 1. To make active. 2. To make radioactive

ac't'ivator. A substance in the body that activates glandular or chemical function, such as cholesterol and cod liver oil, which stimulate the parathyroid glands, or enterokinase* which activates the trypsinogen* of the pancreatic juice. Sunlight and ultraviolet light are also activators. SEE *antibody*

ac't'ive prin'ciples. The chemical substances in drugs which cause changes in activity of the body, classified as *plant acids*, *alkaloids*, *fixed oils*, *glucosides*, *essential oils*, *balsams*, *oleoresins*, *saponins*, *resins*, *hormones*, *enzymes* or *ferments* q.v. SEE *drug action*

ac'tol. Silver lactate, containing 50% silver. Usually employed in solutions from 1:5000 to 1:1000 in dentistry as an antiseptic

actomyosin (äk-tö-mi'ö-sin) The combination of actin and myosin in a muscle

actual (ak'chu-al) [L *actus* past p of *agere*, to do] Real, existent

a. cautery. Cautery acting by virtue of its heat and not chemically

acup'lo'pressure (ak-u-flö'-presh-ur) [L *acus*, needle, + *flum*, thread, + *presura*, pressure] Acupressure increased by a ligature [shaipness]

acu'ity [L *acuiere*, to sharpen] Cleanness, **acuminate** [L *acuminatus*, sharpened]. Conical or pointed

acup'pressure (ak'u'-presh'ur) [L *acus*, needle, + *pressura*, pressure] Compression of arteries by means of needles

a. forceps. Spring-handled forceps for compressing blood vessels

a. needles. Elastic needles for same purpose

ac'upuncture [' + *punctura*, puncture]. Puncture with needles for diagnostic and therapeutic purposes, also in treatment of edemas of lower limbs.

acus (a'kus) [L. needle]. A surgical needle. **acusection** (ak-u-sek'shun) [' + *secare*, to cut]. Section by an electrosurgical needle.

acus'ficus [G *akoustikos*, hearing]. The auditory or 8th cranial nerve. SEE *Tables in Appendix*

acute [L *acutus*, sharp]. 1. Sharp, severe. 2. Having rapid onset, severe symptoms and a short course, not chronic

acutenaculum (ak'u'-ten-ak'u-lum) [L *acus*, needle, + *tenaculum*, holder] A needle holder

acutor'sion [' + *torsio*, twisting] Twisting of an artery with a needle to control hemorrhage

acyanoblepsia (a'si-an-o-blep'si-ä) [G *a-*, priv + *kyanos*, blue, + *blepsis*, sight]. Inability to discern blue colors. SYN *acyanopsia*.

acyanopsia (a-si-an-op'si-ä) [G *a-*, priv + *kyanos*, something blue, + *opsis*, sight]. Inability to discern blue colors

ac'ysis (ä-si-e-sis) [G *a-*, priv + *kyōsis*, pregnancy] 1. Absence of pregnancy. 2. Sterility of the female. 3. Incapability of natural delivery

acystineuria (ä-sis-tin-u'i-ä) [G *a-*, priv + *kystis*, bladder, + *neuron*, nerve]. Inability to control nervous mechanism of the bladder

ad- [L] Prefix. Adherence, increase, toward, as *adduct*

-ad, [L] Suffix. Toward, in direction of. **a. d.** [L *ausis dextra*] Abbi right ear. **A. D. A.** American Dental Association or American Dietetic Association

ad'al'in (Carbromal) USP A white crystalline powder containing 36% bromine in combination with urea

AD'ION AND USIS Mildly hypnotic, somewhat analgesic. Used as nerve sedative in neurasthenia, hysteria, and whooping cough

DOSAGE As a sedative 5 to 10 gr (0.3-0.6 Gm) in cold water. As hypnotic, from 10 to 20 gr (0.6-1.3 Gm)

adamantine (ad-ä-män'tin) [G *adamantos*, very hard] Very hard. Feit to enamel of teeth

ad'amantino'm'a [' + *-oma*, tumor] A tumor of the jaw, esp the lower one, arising from the enamel organs

It may be partly cystic, partly solid, and may reach a large size, sometimes malignant

adamantoblast (ad-a-män'to-blast) [' + *blastos*, germ] An enamel cell from which tooth enamel is formed

adamantoblastoma (a-dä-man'to-blas-to-mä) [' + *-oma*, tumor] Overgrowth of an enamel cell

adamanto'm'a [' + *-oma*, tumor]. An enamel tissue tumor

Adam's apple [pomum *Adami*] The laryngeal prominence. SEE *prominentia laryngea*, *pomum Adam*

Adams' operation. Subcutaneous palmar aponeurotomy for Dupuytren's contraction

A.'s saw. A saw used in osteotomy. **Adams-Stokes syn'drome.** Slow, perhaps irregular pulse, vertigo, syncope, and occasional pseudoepileptic convulsions and Cheyne-Stokes breathing

adapta'tion [L *adaptare*, to adjust] The adjustment of the pupil of the eye to light variations

adap'ter. A device for joining one part of an apparatus to another part

adaptom'eter [L *adaptare*, to fit, + G *metron*, measure]. Device for measuring time required for ocular adaptation.

addephagia (ad-ef-a'ji-ä) [L. *addere*, to add, + *G. phagein*, to eat]. Insatiable hunger.

ad'dict [L. *addictus*, past p. of *addicere*, to consent] 1 To form a habit for the use of a drug 2 One habituated to the use of a drug

addiction (ä-dik'shun). Enslavement to some habit, esp. the drug habit.

a. stafe. A condition in which cessation of narcotic or other drug produces definite "symptoms of abstinence." SEE *alcoholism*, *narcotism*

addiment (ad'im-ent) [L. *addimentum*, an increase] A substance described by Ehrlich, which resembles a ferment in its action and is present in normal serum.

It is destroyed by 56° to 58° C., and when attached to such cells as bacteria or red blood corpuscles by the intermediary body or amboceptor it dissolves or destroys these substances by bacteriolysis or hemolysis SYN *complement*.

add'isin. A substance supposed to be present in gastric juice which tends to keep red blood cells and hemoglobin at a normal level through stimulation of bone marrow, named after Thomas Addison, who described pernicious anemia during first half of 19th century

addisonism (ad'i-sun-izm) Symptom complex not due to disease of suprarenal glands, resembling that of Addison's disease

Addison's disease. One due to deficiency in the secretion of adrenocortical hormones, the result of tuberculous infection of the gland or atrophy of the cortical tissue

SYM. Bronzing of skin, esp about the anus and surfaces subject to irritation, pigmentation of mucous membranes, extreme weakness including muscle weakness, asthenia,* moderate anemia of secondary type, marked gastrointestinal disturbances, diarrhea, loss of weight, low blood pressure, faintness or dizziness, nervousness and twitches, psychic disturbances, white line on pressure of skin which lasts two or three minutes, renal insufficiency and dehydration, pains

Proc. Formerly fatal within two or three years but now, if diagnosed early enough, it responds to various cortical preparations

NP. Freedom from anxiety, the prevention of fatigue The patient should be kept warm and bedsores must be guarded against Watch the pulse for sudden changes, as fainting and syncope may occur, and patient may die in such an attack He never should be left alone if confined to the bed Keep the patient as cheerful as possible

TREATMENT. Rest, nutritious but easily assimilable diet A preparation made from the adrenal gland has been successful in some cases Requires prompt medical attention SEE *adrenal*, *adrenalin*, *bronzed skin*

A.'s keloid. Firm, round, discolored patches on skin. SYN. *morphea*. SEE *scieroderma*

ad'duct [L. *adductus*, past p. of *adducere*, to bring to] To draw toward a center.

adduc'tion. 1 Movement of a limb toward the body's center or beyond it 2 Position assumed by such a movement.

a. of the foot. Its movement around its own axis, or inward rotation around the leg's axis

adduc'tor [L. a drawer toward]. A mus-

cle which draws toward the medial line of the body or to a common center.

a. reflex. Contraction of adductors of right thigh, indicative of appendicitis, elicited with patient lying completely relaxed and with thighs half flexed. Pressure is exerted outward by a finger on inner side of each knee

adelomorphous (ad'el-ö-mor'fus) [*G. adelos*, not seen, + *morphe*, shape] Having undefined form, as the pepsin glands.

adelphotaxis (ä-del'fö-täk'sis) [*G. adelphos*, brother, + *taxis*, arrangement]. Grouping of cells in mutual relationships.

adenalgia (ad-en-al'ji-ä) [*G. aden*, gland, + *algos*, pain]. Adenodynia.* Pain in a gland

ad'enase [" + *ase*, enzyme] Enzyme secreted by the pancreas, spleen, and liver, and which converts *adenine** into *hypoxanthine*.* SEE *enzymes*.

adenasthenia (ad'en-äs-the-ni-ä) [" + *asthenia*, weakness]. Deficient glandular functional activity.

adendrit'ic [*G. a-*, priv + *dendritēs*, rel. to a tree] Without dendrites, as certain cells in spinal ganglia

adenectomy (ad-en-ek'to-mi) [*G. aden*, gland + *ek*, out, + *temnein*, to cut] Excision of a gland.

ad'enecto pia [" + *topos*, place]. A gland out of its normal place

ad'emphraxis [" + *emphraxis*, stoppage] Obstruction to discharge from a gland

adenia (ad-e-ni-ä) Hypertrophy of lymphatic glands with hyperleukocytosis absent

aden'iform [*G. aden*, gland, + *L. forma*, shape] Like a gland in form

adenin(e) (ad'en-in) 6-amino purine, C₅H₅N₅, a solid substance of the uric acid group, and derivable from the nucleic acids, e.g., of ox pancreas

adenitis [*G. aden*, gland, + *-itis*, inflammation] Inflammation of lymph nodes or a gland

adeniza'tion. Abnormal change into a glandlike structure

ad'enoblast [*G. aden*, gland, + *blastos*, germ]. 1 Any active gland cell 2 Embryonic cell which forms a gland

adenocarcinoma (ad-en-o-kai-sin-o-mä) [" + *karkinos*, cancer] Adenoma* combined with carcinoma

adenocèle (ad ë-no-sel) [" + *kêlē*, tumor]. A cystic tumor arising from a gland A tumor of glandular structure

adenocellulitis (ad-en-o-sel-u-lit'is) [" + *L. cella*, small chamber, + *G. -itis*, inflammation] Inflammation of a gland and adjacent cellular tissue

adenochondroma (ad'ë-no-kou-dro-mä) [" + *chondros*, cartilage, + *-oma*, tumor]. Adenoma with added characteristics of chondroma

adenocyst (ad'e-no-sist) [" + *kystis*, sac]. A cystic tumor arising from a gland.

adenocystoma (ad'en-o-sis-to-mä) [" + *-oma*, tumor] Cystic adenoma

adenodynia (ad-en-o-din'i-ä) [" + *odynē*, pain]. Pain in a gland SYN *adenalgia*.

adenofibro'ma [" + *L. fibra*, fiber, + *G. -oma*, tumor] Fibrous and glandular tissue tumor frequently in uterus

adenogenous (ad-en-o'en-us) [" + *gennan*, to produce]. Having origin in glandular tissue.

adenog'raphy [" + *graphein*, to write]. Study of or treatise on glands

adenohypersthenia (ad'ë-no-hi'pers-the-ni-ä) [" + *yper*, excess, + *sthenos*, strength]. Excessive glandular activity.

adenoid (ad'en-oid) [G. *adēnoeides*, glandular]. A lobulated, lymphoid mass composed of lymphoid tissue similar to the tonsils, and containing masses of lymphocytes* found in tonsils, lymph nodes, spleen, and in the nodules of the intestines *SYN pharyngeal tonsil*

a. tissue. Reticular tissue with lymph cells in the meshes of the network, also called lymphoid tissue.

adenoidectomy (ad-en-oid-ek'to-mī) [+ *ektomē*, excision] Excision of adenoids
NF Watch color and pulse for signs of excessive bleeding, children often swallow blood and signs are only as above *SYN tonsillectomy*.

adenoids (ād'en-oids) The pharyngeal tonsils, especially when hypertrophied

ad'enoip'oma [G. *adēn*, gland, + *lipos*, fat, + *-oma*, tumor] A tumor with characteristics of adenoma and lipoma

adenol'ogy [+ *logos*, study]. Science of the glands

adenolymphitis (ad-ē-no-lim-fī'tis) [+ *L lymphā*, lymph, + *G -itis*, inflammation] Inflammation of a lymphatic gland *SYN lymphadenitis*

adenolymphocoele (ad'en-o-lim'fo-sēl) [+ *L lymphā*, lymph, + *G kēlē*, tumor]. Cystic dilatation of a lymph node from obstruction

adenolymphoma (ad'en-o-lim'fo-mā) [+ *+* + *-oma*, tumor]. A lymph gland adenoma

adenoma (ad-en-o'mā) (*Pl. adenomata*) [+ *+* + *-oma*, tumor] A neoplasm of glandular epithelium
SYN choroidadenoma.

a., acinous. Form with glands having acinous structure

a., chromophobe. Tumor of pituitary gland composed of cells that do not stain readily.

a., malignant. Adenoma combined with carcinoma *SYN adenocarcinoma*.

a., multiglandular. A containing many small changed glands

a. sebaceum. Steatadenoma; acanthoma of sebaceous glands. Benign tumorlike growths developing from epithelium of sebaceous glands, which undergo fatty but never colloid metamorphosis
ETIOL Unknown. Congenital in those mentally below par.

SYM Pinhead to split-pea size, usually over nose, cheeks, nasolabial folds; yellowish or pinkish

PROG Harmless but persistent.

TREATMENT Electric needle, cutaneous punch, curette.

a. simplex. Form with hyperplastic condition of the glands

adenomalacia (ad'ē-no-mal-a'sī-ā) [+ *malakia*, softening] Glandular softening

adenomatome (a-dē-no'mā-tōm) [+ *tomē*, a cutting down] Instrument for removing adenoids

ad'enomato'sis [+ *-oma*, tumor, + *-osis*, increase] Multiple glandular tissue overgrowths.

adenomatous (ad-ē-no'mā-tus). Pert. to adenomas

adenomere (ad'en-o-mēr) [G. *adēn*, gland, + *mēros*, part]. The functional part of a gland

adenomycosis (ad'dē-nō-mī-ko'sis) [+ *mykēs*, fungus, + *-osis*, increase]. Disease of the lymph nodes *SYN: Hodgkin's disease*.

adenomyoma (ad-ē-no-mī-o'mā) [+ *mys*, muscle, + *-oma*, tumor]. A tumor containing glandular and smooth muscular tissue.

adenomyometritis (ad-en-o-mī-o-me-trī'tis) [+ *+* + *metra*, womb, + *-itis*, inflammation] GYN A hyperplastic condition of the uterus which is the result of pelvic inflammation and grossly resembles an adenomyoma

adenomyosis (ad-ē-no-mī-o'sis) [+ *+* + *-osis*, condition]. Ectopic adenomatous growths.

ad'enomyxo'ma [+ *myxa*, mucus, + *-oma*, tumor] A tumor with adenoma and myxoma characteristics

ad'enomyx'osarco'ma [+ *+* + *sarx*, flesh, + *-oma*, tumor]. A tumor with adenoma, myxoma, and sarcoma characteristics

adenoncus (ad-en-on'kus) [+ *ogkos*, tumor]. A tumor of a gland or its enlargement

adenopathy (ad-en-op'ā-thī) [+ *pathos*, suffering] Swelling and morbid change in lymph nodes, glandular disease.

ad'epopharyngi'tis [+ *pharynx*, throat, + *-itis*, inflammation] Inflammation of tonsils and pharyngeal mucous membrane

adenoplegmon (ad-ē-no-fleg'mon) [+ *phlegmonē*, inflammation] Inflammation (acute) of a gland and its adjacent tissue

ad'epophthal'mia [+ *ophthalmos*, eye]. Inflammation of the meibomian glands.

ad'enosarco'ma [+ *sarx*, flesh, + *-oma*, tumor]. A tumor with characteristics of adenoma and sarcoma

adenosclerosis (ad-ē-no-skī-ro'sis) [+ *sclerosis*, hardening] Glandular induration

adenosis (ad-en-o'sis) [+ *-osis*, increase]. Any disease of a gland, esp. of a lymphatic gland

a., syphilitic. Enlarged and indurated lymphatic glands symptomatic of syphilis, most commonly the inguinal, the posterior cervical, and the cubital

adenotome (ad'en-o-tom) [+ *tomē*, cutting instrument] An instrument for incision of a gland

ad'eno'tomy [+ *tomē*, a cutting up]. 1. Glandular anatomy 2. Excision or incision of a gland

adenotyphus (ad'en-o-tī'fus) [+ *typhos*, stupor] Abdominal typhus fever

adepts (ad'eps) [L]. Lard, omental hog-fat

a. benzoina'tus. Benzoinated lard.

a. la'nae. Wool fat

a. ovil'us, a. ovis. Mutton suet or tallow

ader'mia [G. *a-*, priv + *derma*, skin]. Lack of skin, congenital or acquired

ader'mogen'esis [+ *+* + *genesis*, production] Imperfect growth or repair of skin

ADH. Abbr for antidiuretic hormone

adherent (ad-he'rent) [L *ad*, to, + *haerere*, to stick] 1 Attached to, as of two surfaces 2 OB A placenta that remains attached to the uterine wall after delivery

adhes'ion. Abnormal joining of parts to each other

CAUSES OR PREDISPOSING CONDITIONS: 1. Abdominal operations 2. Congenital bands 3. Previous intraabdominal, inflammations not treated by operation, as infections of the gallbladder, attacks of appendicitis, and inflammation of the pelvic organs

SYM Abdominal pain, nausea, and vomiting, elevation of the pulse without a rise in temperature; intestinal obstruction.

TREATMENT Operative at earliest moment. Diathermy* may help through increase of circulation.

Prog Favorable if early surgical measures are resorted to. **SEE** *brismement, cardiosymphysis*.

a., primary. Healing by first intention.

a., secondary. Healing by second intention

adhesive (ad-he'siv) [F. *adhésif*]. 1. Causing adhesion 2 Sticky, adhering 3. That which causes 2 bodies to adhere.

a. inflammation. A serous membrane inflammation exuding fibrinous matter making adhesions possible.

a. plaster [emplantrum adhaesivum]. A heavy material, as cloth, coated with gummy sticky materials to remain in place after application. Many varieties are on the market, some are colored, others elastic, and some are waterproofed. Made of resin, rubber, mole-skin, soap plaster, or various types of isinglass.

Uses 1. For support as in sprains, strains, etc 2 Hold dressings in place. 3 Approximate skin edges (narrow strips passed through flame to sterilize) and to make more adhesive 4 Obliterate cavities 5 To make pressure 6 Circular or oval pads to prevent pressure in center 7 Many other purposes

adiadochokinesis (a-di-ad'o'-ko-kin-e'sis) [G. *adiadochos*, perpetual, + *kinēsis*, movement] 1 Inability to make rapid alternating movements 2 Incessant movements which cannot be carried out with accuracy. Seen in cerebellar disease **RS** *asynergia, dysmetria, gait*.

adiaphoresis (a-di-af-o-re'sis) [G. *a-*, priv + *diaphoresis*, perspiration]. Deficiency or absence of sweat

adiapneustia (ad-i-ap-nū'sti-ā) [G. *a-*, priv + *diapneustia*, an exhaling] Absence of perspiration **SYN** *adiaphoresis*

adiastole (ā-di-as'to-le) [G. + *diastole*, dilatation] Imperceptibility of diastole.

adiathermancy (ā-di-ā-thur-mān-sī) [G. + *dia*, through, + *thermē*, heat]. State of being impervious to heat

adiemorrhysis (ad'i-em-or'i-sis) [G. + *aima*, blood, + *rysis*, a flowing]. Arrest of capillary circulation

adipic [L. *adeps*, fat]. Relating to fat, fatty

adipocèle (ad'i-pō-sēl) [G. + *kēlē*, tumor] Fat in a hernial sac. Lipocèle

adipocellular [G. + *cellula*, small store-room] Made up of or pert. to fat and connective tissue

adipocere (ad'i-pō-sēr) [G. + *cera*, wax]. A waxy substance converted from dead tissue

ad'ipofibro'ma [G. + *fibra*, fiber, + *G* -oma, tumor]. A fibroma and adipoma.

adipogenous (ad-i-po'ēn-us) [G. + *G* -nān, to produce]. Inducing the formation of fat

adipolysis (ad-i-pol'i-sis) [G. + *lysis*, setting free]. The hydrolysis of fat.

adipolytic (ad'ip-o-lit'ik). Pert. to adipolysis.

adipoma (ad-ip-o'mā) [L. *adeps*, fat, + *oma*, tumor]. Fatty tissue tumor. **SYN:** *lipoma*.

a'dipopex'is [G. + *pēxis*, fixation]. The storing of fat.

a'dipose. Fatty, pert. to fat.

a. capsule. Renal fat.

a. fossae. Fatty accumulations on outer mammary surface.

a. tissue. Connective or areolar tissue containing masses of fat cells

adiposis (ad-i-po'sis) [L. *adeps*, fat, + *G* -ōsis, increase] Abnormal accumulation of fat in the body. **SYN** *corpulence, liposis*

a. dolorosa. A neurosis, the symptoms of which are nodular formations, chronic bronchitis, and pain

a. hepatica. Fatty degeneration or infiltration of the liver

a. tuberosa simplex. A disease resembling adiposis dolorosa in which the fat occurs in small circumscribed nodules sensitive or painful to touch. **SYN** *Anders' disease*.

adipositis (ad-i-po-si'tis) [L. *adiposa*, fatty tissue, + *G* -itis, inflammation]. Infiltration of an inflammatory nature in and beneath subcutaneous adipose tissue.

adiposity. Excessive fat in the body **SYN** *adiposis*

adipo'sogen'ital syndrome. Combination of adiposity, impaired development of genital organs, and change in secondary sex characteristics **SEE** *Frohlich's syndrome*.

adiposuria (ad-i-pō-su'ri-ā) [L. *adeps*, fat, + *G* *ouron*, urine]. Fat in the urine. **SYN** *lipuria*.

adip'sia, adip'sy [G. *a-*, priv. + *dipsa*, thirst] Absence of thirst

adip'sous (ā-dip'sus). Quenching thirst.

ad'itus [L]. An approach, an entrance.

a. ad antrum. The recess of the tympanic cavity, which lodges head of malleus and greater part of incus.

a. ad aquaeductum Sylvii. The entrance to the sylvian aqueduct, situated at lower posterior angle of third ventricle of brain

a. ad infundibulum. A small canal leading from the third ventricle into the infundibulum.

a. ad laryngem, a. laryngis. Upper aperture of larynx.

adjuster (ad-jus'ter) [L. *a*, to, + *iuste*, just, right] Device for holding together the ends of the wire forming a suture.

ad'juvant [L. *adjuvans*, pres. p. of *adjuvare*, to aid] 1 That which assists.

2 **Mat. Med.** A drug added to a prescription to hasten or increase the action of a principal ingredient, synergist.

Adler's organ-inferiority. A theory that ascribes psychic compensations to structural defects, tending to minimize the importance of psychosexual and other functional inadequacies

ad lib. Abbr. *L. ad libitum*, at pleasure.

admaxillary [L. *ad*, to, + *mazilla*, jaw]. Accessory to the jaw.

a. gland. An occasional accessory salivary gland located near the angle of the jaw excreting through the parotid duct.

adnata (ad-na'tā) [L. *adnatus*, past p. *adnasci*, to grow to]. Layer of conjunctiva touching the eyeball. **SEE:** *tunica adnata*.

adner'val [L. *ad*, to, + *nervus*, nerve]. Near a nerve.

adneur'al [G. + *G* *neuron*, nerve]. Ad-neural.

adnex'a [L. *adnectere*, to tie or bind to]. Accessory parts as *a. uteri*, the oviducts, and ovaries.

a. oculi. Lacrimal glands.

a. uteri. Ovaries and oviducts.

adnex'al [L. *adnexus*, past p. *adnectere*, to tie to]. Adjacent or appending.

adnexi'tis [L. *adnexus* + G. -itis, inflammation]. Inflammation of the *adnexa uteri*.

adnexopexy (ad-neks'ô-peks-ê) [“ + G. *pexis*, a putting together]. Fixing the fallopian tube and ovary to the abdominal wall.

adolescence (ad-o-les'ens) [L. *adolescens*, pres. p. *adolescere*, to grow up]. The period from the beginning of puberty until adult life. In temperate climates 15 yr for boys and 13-14 yr. for girls. Recent research proves adolescence is earlier in temperate climates and later in hot and cold regions.

ad'oles'cent. 1 Pert to adolescence • 2. Young man or woman not fully grown.

adoral (ad-o'ral) [L. *ad*, to, + *os*, *oris*, mouth]. Toward or near the mouth.

adosculation (ad-ôs-kû-la'shun) [L. *adoscularis*, to kiss]. 1 Impregnation without intromission of the penis. 2 Insertion of one part into the cavity of another.

adrenal (âd-rên'al) [L. *ad*, to, + *ren*, kidney]. 1 Near the kidney. 2 a gland. Also called *ad capsule*. *ad body*, *suprarenal gland*, *suprarenal capsule*. A triangular shaped body adjacent to and covering the superior surface of each kidney. It is a gland of internal secretion producing hormones essential to life.

EMBRYOLOGY The adrenal glands are essentially double organs, each composed of an outer *cortex* and an inner *medulla*. The cortex arises in the embryo from a region of the mesoderm, which also gives rise to the gonads or sex organs. The medulla arises from ectoderm which also gives rise to the sympathetic nervous system.

ANAT The entire gland is enclosed in a tough connective tissue capsule from which *trabeculae* extend into the cortex. The cortex consists of cells arranged into three zones, the outer *zona glomerulosa*, the middle *zona fasciculata*, and the inner *zona reticularis*. The cells are arranged in a cordlike fashion. The medulla consists of chromaffin cells arranged in groups or anastomosing cords. The two adrenal glands are situated retroperitoneally, each imbedded in perirenal fat above its respective kidney.

The right adrenal measures 4 x 13 x 6 cm ($1\frac{1}{2}$ x $\frac{1}{2}$ x $\frac{1}{4}$ inch), and weighs 2 to 25 Gm (30 to 40 gr). The left adrenal measures 4.5 x 2 x 6 cm ($1\frac{3}{4}$ x $\frac{3}{4}$ x $\frac{1}{4}$ inch), and weighs 2.5 to 3 Gm (40 to 45 gr).

PHYS The *MEDULLA* Secretes the hormone *epinephrine* or *adrenalin* acting on all body structures, innervated by the sympathetic division of the autonomic nervous system. Its effects are similar to those resulting from stimulating sympathetic nerves, namely elevation of blood pressure resulting from increase in rate and force of heart beat and constriction of arterioles, inhibition of gastrointestinal movements; relaxation of smooth muscles in bronchioles, dilatation of pupils of eyes, liberation of glucose from liver.

The emergency theory or the fright, fight, or flight theory, was advanced by Dr. Cannon of Harvard University to explain the function of the adrenal medulla. According to this theory the medulla secretes very little of its product during ordinary activities, but under the influence of pain, fear, rage, or asphyxia, it secretes a larger amount of its hormone, which enters

the blood stream and stimulates body to meet either physical or mental emergencies. The principal secretion of the cortex is corticosterone and other hormones, that of the adrenal medulla, is adrenalin.

Absence or disease of the adrenal cortex may cause Addison's disease, resulting in anemia, tiredness, languor, aching, skin changes, and inability to strain. Poor blood circulation, indigestion, and insomnia. Personality may be altered by an adrenal disorder. One may become morose, self-conscious, inhibited, and unhappy. If placid, one may be phlegmatic or with little interest in life. Lack of adrenalin will cause one to react too slowly in an emergency. It has been claimed that professional soldiers, such as Napoleon, exhibit unusual activity as result of adrenalin secretion.

Although the hormone of the adrenal cortex decreases brain excitability, another hormone of the cortex, abbreviated as DOCA, increases it. It is said that disposition may be maintained by the proper balance of these two hormones.

THE CORTEX Secretes a large number of substances, some twenty-eight crystalline compounds (steroids) of known constitution having been isolated from cortical material. In addition there is an "amorphous" fraction which to date has not been analyzed. Cortical tissue is essential to life. Its removal or destruction results in disturbances in salt balance with loss of sodium and accumulation of potassium. Kidney function is impaired, carbohydrate stores depleted, resistance to stress situations (injury, cold, heat, fatigue, infection) is decreased. *Ser. cortex*.

Among the cortical hormones are cortisone (Kendall's compound E), corticosterone and its derivatives, among them *desoxycorticosterone* and *17-hydroxycorticosterone* (Kendall's compound F). Cortisone has been shown to have a marked therapeutic value in the treatment of rheumatoid arthritis and other ailments. The secretion of cortical hormones is under the control of the adrenocorticotrophic hormone (ACTH) produced by the hypophysis.

The cortex is also capable of producing androgens and estrogens, the male and female sex hormones.

PATH MEDULLA Abnormalities in the function of the medulla are rare. *Hyposecretion* produces few changes of physiological significance. *Hypersecretion* may result from tumors involving the chromophil cells. Symptoms are paroxysmal hypertension, tachycardia, sweating, dilatation of the pupils, headache.

CORTEX Hypersecretion This may result from tumors involving the cortex (*primary hypercorticalism*), or from hyperactivity of the anterior lobe of the hypophysis (*secondary hypercorticalism*). It is accompanied by disturbances involving the sex organs and secondary sexual characteristics (*adrenogenital syndrome*). The symptoms vary with the age of the individual at time of the onset of the disease and the sex of the patient. In fetal life or early childhood, sexual precocity occurs in both sexes and is accompanied by obesity, great muscular development, accelerated growth, and early development of secondary sexual characters. In adult females

there is marked virilism (*masculinization*) and pronounced development of body hair (*hirsutism*), male characters appear, menstruation may cease, mammary glands atrophy. In adult males, the condition is rare and results in feminization, the testes atrophy, mammary glands develop.

Hyposecretion. Addison's disease. This disease is the result of chronic adrenal cortical insufficiency, which may be brought about by tuberculosis of the glands, cancer, or atrophy. Symptoms are extreme muscular weakness, fatigue, gastrointestinal disturbances, impaired nervous functioning, reduced basal metabolism, and a characteristic increase in pigmentation of the skin and mucous membrane of the mouth. Various degrees of cortical insufficiency may occur.

RS Addison's disease, *adrenalin*, *adrenalism*, *adrenuralem*, *chromaffin*, *kidney*, *neurocirculatory asthenia*.

adrenalectomy (ad-rē-nāl-ek'tō-mī) [*ad* + *G. ektomē* excision]. Excision of an adrenal body.

adrenalin (epinephrin(e)). USP (C₉H₁₃O₃N). Proprietary name for epinephrine. The active principal of the medulla of the adrenal gland. See *epinephrine*. **Function.** Thought to be concerned with maintenance of the tonus of blood vessels and heart.

Uses. (a) Heart and circulatory stimulant. (b) raises blood pressure. (c) checks secretions as in rhinitis, asthma, hay fever, etc. (d) a hemostatic in hemorrhages. (e) for operations on nose, as it renders the tissues bloodless. (f) allays spasm of asthma. (g) contracts the uterus. (h) overcomes local congestions.

Adm. (a) Locally. (b) hypodermically. **Dosage.** Internally, 5 to 15 m (0.3-1.0 cc) of the 1:1000 solution. *Subcut.* 1:1000 m (0.005 cc). *Locally* 1:1000 to 1:1000 solutions. In recent years a solution of 1:100 has been marketed, and recommended for use by inhalation in allergic conditions, particularly asthma.

adrenaline'mia [*L. ad*, to, + *rēn*, kidney, + *G. aima*, blood]. Adrenalin in the blood.

adrenalinu'ria [*ad* + *G. ouron*, urine]. Adrenalin in the urine.

adren'alism. Illness due to overactivity of suprarenal glands.

adren'alitis (ad-rē-nāl-'tis). Inflammation of the suprarenal gland, adenitis.

adren'er'gic [*L. ad*, to, + *rēn* kidney, + *G. ergon*, work]. Applied to nerve fibers which when stimulated, release epinephrine (adrenalin) or an epinephrine-like substance at their terminations. The substance has been called *sympathin*. Most postganglionic sympathetic fibers are adrenergic.

adren'ine (ad-rē-nīn). A preparation made from the medulla of the suprarenal gland, the adrenal hormone.

adren'itis. Inflammation of the suprarenal gland. SYN *adren'alitis*.

adrenop'athy. Suprarenopathy. Any disease of the suprarenal glands.

adren'oster'one. Male sex hormone obtained from urine.

adren'otrope, adrenotrop'ic. One of adrenal type. Pert. to adrenotropism.

adren'otrop'in. Hormone obtained from male urine, controlling islands of Langerhans.

adrenotropism (ad-rēn-ōt'rō-pizm) [*L. ad*, to, + *rēn*, kidney, + *G. tropē*, turning]. A type dominated by adrenal influence.

adsorp'tion [*L. ad*, to, + *sorbere*, to suck in]. 1. A process whereby a gas or a dissolved substance becomes concentrated at the surface of a solid or at the interfaces of a colloid system. Ex. removal of dyes from solutions by filtration through charcoal. 2. Attachment of one substance to the surface of another.

ad'sternal (ad-ster'nal) [*L. ad*, toward + *G. sternon*, chest]. In situation, near, or in direction, toward the sternum.

ad'er'minal [*L. ad*, to, + *terminalis*, end]. Toward extremity of any structure.

adul'terant [*L. adulterare*, to falsify]. That which adulterates or weakens a substance.

adultera'tion. The addition of an impure or weaker substance to another one.

adu'stion [*L. adustus*, past p. *adurere*, to burn]. 1. Being scorched, parched, dry. 2. Application of cauterization.

advancement (ad-vans'ment) [*Fr. avancer*, to set forth]. Operation to remedy strabismus, by which the insertion of an ocular muscle is attached at a point further removed from its origin.

a, capsular. Attachment of capsule of Tenon in front of its normal position.

adventitia (ad-ven-tish'yā) [*L. adventitus*, coming from abroad]. The outermost covering of a structure or organ, such as the *tunica adventitia*, or outer coat of an artery.

adventitious (ad-ven-tish'us) 1. Acquired, accidental. 2. Arising sporadically. 3. Pert. to adventitia.

ad'vitant [*L. ad*, to, + *vita*, life]. A vitamin.

adynamia, adynamy (a-din-am'i-ā, -din'-a-mī) [*G. a-*, priv. + *dynamis*, strength]. Asthenia,* debility.

adynamic ad-i-nam'ik). Weak, feeble, asthenic. Pert. to adynamia.

aegophony (e-gōf-o-nī) [*G. aīz, aigos*, goat, + *phonic*, voice]. A goatlike bleating sound heard on auscultation of the chest.

aerated (a'er-a-ted) [*G. aer*, air]. Containing air or gas.

aeration (a-er-a'shun). 1. Act of airing. 2. Change of venous into arterial blood in the lungs. 3. Saturating a fluid with gases.

aerendocardia (a-er-en-do-kar'dī-ā) [*G. aer*, air, + *kardia*, heart]. Bubble of air in the blood within the heart.

aerenterectasia (a'er-en-ter-ek-la'zī-ā) [*ad* + *enteron*, intestine, + *ektasis*, stretching out]. Distention of intestine with gas.

aerial (a-er'i-al). Pert. to the air.

aeriferous (a-er-i-fer-us) [*G. aer*, air, + *L. ferre*, to bear]. Carrying air.

aeriform (a-er'i-form) [*ad* + *L. forma*, shape]. Anlike, gaseous.

a'erobe [*ad* + *bios*, life]. A microorganism which can live and grow only in the presence of free oxygen.

aerobian (a-er-o-bi-an). Aerobiotic; living only in the presence of oxygen.

aerobic (a-er-o'bik) 1. Living only in presence of oxygen. 2. Concerning an organism living only in oxygen.

aero'bion (pl. *aerobia*) [*G. aer*, air, + *bios*, life]. An organism which lives only in presence of oxygen.

a., facultative. One able to live without oxygen under some conditions, but which normally requires it.

a., obligate. One which cannot live without air.

aerobiosis (a-er-o-bi-o'sis). Living in an atmosphere containing oxygen.

aerobiotic (a-er-o-bi-ō'tik). Pert. to aerobiosis.

aerocoele (a'er-o-sēl) [G. *aer*, air, + *kele*, tumor]. Gas within and distending a cavity.

aerocolpos (a'er-o-kol'pos) ["" + *kolpos*, vagina]. Distention of the vagina with air.

aerocoly (ā-ē-rok'ō-ll) ["" + *kōlon*, colon]. Distention of colon with gas.

aerocystoscopy (a-ēr-ō-sis-tōs'kō-pl) ["" + *kystis*, bladder, + *skopein*, to view]. Examination of the bladder, when distended by air, with a cystoscope.

aerodermeclasia (a-er-ō-der-mek-ta'zī-ā) ["" + *derma*, skin, + *eklasia*, stretching out]. Subcutaneous emphysema.

aerodynamics ["" + *dynamis*, force]. Science of air or gases in motion.

aerembolism (a-ēr-ō em'bō-lizm) [G. *aer*, air, + *embolus*, blood]. A condition in which nitrogen bubbles form in blood and tissues during rapid ascent to high altitudes.

Sym Boring, gnawing pain in joints, itching of skin and eyelids, unconsciousness, convulsions and paralysis.

Prevention may be secured by becoming supersaturated with oxygen while at high altitude by use of oxygen mask.

aerogen (a'er-o-jen) ["" + *gennan*, to produce]. A gas-forming microorganism.

aerogenesis (a-er-o-jen'e-sis) ["" + *genesis*, production]. Formation of gas.

aerogenic (a-er-o-jen'ik) Gas-forming.

aerogenous (a-er-o-jen-us) Gas-forming.

aerogonioscope (a-er-og-on'is-kōp) [G. *aer*, air, + *gonē*, seed, + *skopein*, to see]. Device for collecting organic dust from the air.

aerohydropathy, **aerohydrother'apy** [G. *aer*, air, + *ydor*, water, + *pathos*, suffering, - + *therapeia*, treatment]. Treatment by application of air and water.

aerometer (a-er-om'e-ter) ["" + *metron*, measure]. Device for measuring density of gases.

aeromicrobe (a-er-o-mī'krōb) ["" + *micro*, small, + *bios*, life]. Any aerobic organism.

aeroneurosis (a-er-o-nu-ro'sis) ["" + *neuron*, nerve]. A chronic functional nervous disorder affecting aeroplane flyers.

Etiol. Emotion is the background of their fatigue.

Sym General irritability, gastric neurosis, insomnia, hyperacidity, and depletion of the high mental center, probably nerve tissue destruction.

aeropathy (a-er-op'ath-i) ["" + *pathos*, suffering]. Morbid condition caused by atmospheric pressure, such as mountain sickness, and caisson disease.

aeroperiton'ia ["" + *peritonaeum*, to stretch over]. Distention of peritoneal cavity with gas.

aerophagy (a-er-o-faj-i) ["" + *phagein*, to eat]. Swallowing of air.

aerophilous (a-ēr-of'i-lūs) ["" + *philos*, fond]. Requiring air for development. Syn *aerobic*.

aerophobia (a-er-o-fō'bī-ā) ["" + *phobos*, fear]. Morbid fear of a draft or of fresh air.

aerophore (a'er-o-fōr) ["" + *phoros*, bearing]. 1 Conducting air. 2 Apparatus for introducing air into lungs of still-born child.

a'erophyte ["" + *phytos*, plant]. An organism or plant that lives upon air.

aeroplethysmograph (a-er-o-ple-thiz'mo-graf) ["" + *plethysmos*, enlargement, + *graphein*, to write]. Instrument for recording air respiration.

aeropleura (a'er-o-plū'rā) ["" + *pleura*, side]. Pneumothorax, air in pleural cavity.

aeroporotomy (a'er-o-po-rot'o-mī) ["" + *poros*, passage, + *tome*, cutting]. Operation for admitting air into the air passages.

aeroscope (a'er-o-skōp) ["" + *skopein*, to view]. Device for examining air dust.

aerospirin (ā'ēr-ōs-pōr'in) An antibiotic from a soil organism similar to *Bacillus aerosporus*.

Uses Said to be more effective than penicillin or streptomycin in typhoid, dysentery, cholera, and other intestinal diseases, also in whooping cough.

Action It attacks gram-negative germs whereas penicillin attacks only gram-positive germs. It does not attack tuberculosis germs as does streptomycin.

aerotaxis (a'ei-o-tak'sis) ["" + *taxis*, arrangement]. Movement of organisms away from or toward air, said of aerobic and anaerobic bacteria.

aerotherapy (a-er-o-ther'a-plī) ["" + *therapeia*, treatment]. PT Air-bath therapy.

aerothermotherapy (a'er-o-ther'mo-ther-ā-plī) ["" + *thermos*, hot, + *therapeia*, treatment]. Applications of hot air.

aerotonometer (a-er-o-to-nom'e-ter) ["" + *tonos*, tension, + *metron*, measure]. Apparatus for measuring tension of gases of the blood.

aerotympanal (a'ei-o-tim'pā-nāl) ["" + *tympanum*]. Pert to air in tympanum.

aerourethroscopy (a'er-o-u-reth'ro-skōp) ["" + *ourethra*, urethra, + *skopein*, to view]. An apparatus for making urethral examination by electric light, after dilatation by air.

aerourethroscopy (a'er-ō-u-re-thros'kō-pl) Examination of the urethra when distended with air.

aer'teriver'sion [G. *aēr*, air, + *tōrein*, to hold, + *L. vertio*, a turning]. Eversion of artery ends to stop hemorrhage. Syn *arterioeversion*.

aer'teriver'ter. Instrument for use in arterioversion. Syn *arteriorerter*.

aesthetic moral'ity. Right conduct as an expression of the ego ideal apart from any consideration of prudence or fear of wrongdoing. Without fever.

afeb'ile [G. *a-*, priv. + *L. febris*, fever].

afen'il. Compound of calcium chloride and urea in aqueous solution.

Action and Uses For calcium deficiency, copulative.

Dosage 10% solution, 10 cc. intravenously every 2nd or 3rd day.

af'fect [L. *affectus*, past p. *afficere*, to apply oneself to]. Psy The emotional reactions associated with an experience. Syn *psychic trauma*.

affection (āf-lēk'shun) [L. *afficere*, to act upon or affect]. 1 Love, feeling. 2 Disease, physical or mental.

a., *celiac*. Intestinal infantilism.

af'fctive [L. *afficere*, to apply oneself to]. Stimulating emotion. [sanity].

a. *Insanity*. Impulsive or emotional.

a. *memory*. Memory of a psychic trauma causing recurrence of emotion.

a. *psycho'sis*. Psy An emotional one as manic-depressive psychosis.

Etiol. Possible hereditary predisposition or highly charged emotional environment.

Sym Occurs most frequently from 18 to 35 yr of age and more frequently in women. Recurrent attacks common. Overactivity, dehydration, sometimes fever and delirium. Frankish, excited, decorative, abusive, destructive. Flight of ideas, moody, delusions of grandeur.

NP: In caring for patients, avoid threats, lies, bribery, oversolicitude, and the granting of all wishes. Pains and tubs may be indicated.

a. spasms. Attacks of laughing, screaming, or weeping in hysteria.

afferent [L. *ad*, to, + *ferre*, to bear]. Carrying impulses toward a center, as when a sensory nerve carries a message toward the brain, also said of certain veins and lymphatics. Opp of efferent.*

affinity [L. *fin*-it-ly] [L. *affinis*, neighboring]. 1. Common relationship, attraction. 2. Chemical attraction bet. two substances, i.e., oxygen and hemoglobin. **Syn.** *chemoreceptor* [of various substances].

a., chemical. Force combining atoms.

a., elective. Force causing a substance to elect 1 substance rather than another with which to unite.

afflux [L. *ad*, to, + *fluere*, to flow]. Rush of blood to a part.

affluxion (af-fluk'shun). Afflux, congestion.

affusion [L. *affusus*, past p *affundere*, to pour to]. The pouring of water upon, as on the body, for cooling, cleansing, or therapeutic purposes.

INO. Collapse, syncope, shock, asphyxia, and fevers.

CONTRA. Typhoid accompanied by complications, or decompensating heart, or hemorrhagic cases.

NP. Patient may lay on a rubber sheet arranged to direct the water into a pail at bedside. A thin sheet may cover patient. Water can be poured on body through a watering can.

afibrinogenemia (ä-fī-brīn-ō-jēn'ä-mī-ä). A rare blood disease characterized by the absence of fibrinogen from the blood plasma so that the blood is incoagulable, may be congenital or acquired. Congenital afibrinogenemia is generally transmitted as a Mendelian recessive character by a gene on one of the autosomal chromosomes. The acquired type may occur as a complication of parturition as a result of the entry into the maternal circulation of amniotic fluid or other tissue materials from the placental site.

afteraction. A term used particularly in connection with nerve centers to designate the fact that they continue to react for some time after the stimulus ceases. In the sensory centers this action gives rise to after-sensations.

afterbirth. Placenta and membranes expelled after birth of child.

afterbrain. Section of embryonic brain which develops subsequently into oblongata, auditory nerve and 4th ventricle. **Syn.** *metencephalon*.

aftercat'aract [*Cataracta secundaria*]. Retained portion of lens substance bet. agglutinated layers of capsule, seen after extracapsular cataract extraction. **Treatment.** Dissection or needling.

after-discharge. The discharge of impulses from a reflex center after stimulation of the receptor has ceased. Results in prolongation of response.

afterimage. One that persists subjectively after disappearance of object seen.

If colors are same as object it is called *positive*, *negative* if complementary colors are seen. In the former case the image is seen in its natural bright colors without any alteration, in the latter, the bright parts become dark, while dark parts are light.

afterpains. Uterine cramps due to contraction of uterus, occurring during first

few days after confinement (*puerperium*), commonly seen in multiparae.* Pains more severe during nursing.

Treatment. Codeine, aspirin, phenacetin, pyramidon, or morphine. The earlier given, the less needed. Ergot for 2 or 3 days postpartum.

after-sensation. Sensation persisting after stimulus causing it has ceased.

Ag. [L. *ab*, for *argentum*]. Chem. symb. of silver.

agalactia (ä-gäl-ak'tī-ä) [G. *a-*, priv. + *gala*, *galaktos*, milk]. Absence of milk secretion after childbirth.

agalorrhea (ä-gäl-ō-rē-ä) ["" + "" + *roia*, flow]. Arrest of milk flow.

agamaglobulinemia (ä-gäm-mä-glō-būl-in-ē'mī-ä). A rare blood disease characterized by the virtual absence of gamma globulin from the blood plasma with resulting loss of the ability to produce immune antibodies, and the absence of natural blood group isoantibodies from the serum, may be congenital or acquired. The congenital form is inherited like hemophilia as a sex-linked recessive character, and therefore occurs only in male children, being transmitted by females by a gene in the X-chromosomes.

agamogen'esis [G. *a-*, priv + *gamos*, marriage, + *genesis*, development]. Asexual reproduction.

agar (äg'ar). 1. Sea weed (alga) belonging to the genus *Gelidium*. The source of agar-agar. 2. A culture medium containing agar-agar, such as blood-agar, used in culturing certain species of bacteria.

agar-agar. A dried mucilaginous product obtained from certain species of algae, especially *Gelidium*. It is unaffected by bacterial enzymes, hence widely used as a solidifying agent for bacterial culture media, also used as a laxative because of its great increase in bulk upon absorption of water.

AgCl. Silver chloride.

age [Fr. *âge*, L. *aetas*]. The time of existence of anything.

40's and 50's. Prime of maturity but degenerative changes are taking place.

50's and 60's. Symptoms ill defined. May be fatigue, depression, headache, irritability, insomnia, loss of appetite, low-back pain or in bones and joints.

70's and 80's. Endocrine and nutritional deficiency apparent.

Sym. Loss of body mass, skin texture changes, susceptibility to fracture, osteoporosis, arthralgia, senile vaginitis, anemia, emotional instability, mental fatigue, decreased muscular tone, vitamin B and C deficiency.

a., achievement. One determined by a proficiency test in any schoolroom study, measured by the mental ability of the average child of chronological age.

a., chronolog'ical. The years of one's life. See *chronological*.

a., marriageable. One at which the individual is physically suited for marriage. **Syn.** *nubility*.

a., mental. The age of a person with regard to his mental development; this is determined by a series of mental tests as devised by Binet. Thus, if a woman of 30 can pass only the tests of a child of 12, she is said to have a mental age of 12. See *Binet*.

a. of consent. An arbitrary age fixed by state statutes when a girl is supposed to be responsible for giving her consent to coitus.* It ranges from 10 to 18 years of age. Under that age the

act is legally *rape* even though consented to. In England the age of consent is 13, but between that age and 16, sexual intercourse* is a misdemeanor.

age, words pert. to: adolescence, anility, Binet, cataplasia, climacteric, consensence, chronological (SPE *intelligence*), decrepitude, dotage, ecmnesia, geriatrics, gerocomia, geroderma, gerodermia, geromorphism, gerontopia, latency period, longevity, maturation, mental a., old age, puberty, rejuvenescence, senescence, senile, senility, valetudinarian.

-age [L] Suffix put in motion, to do, to move, as *manage*.

agenesia, agenesis (ä-jen-e'si-ä, ä-jen'es-is) [G. *a-*, priv. + *genesis*, production]. 1. Sterility, impotence 2 Incomplete development.

agenitalism (a-gen'i-tal-izm) [' + L. *genitalis*, genital]. Symptoms resulting from absence of the testicles or ovaries

agenosomia (ah-jen-o-so'mi-ä) [G. *a-*, priv. + *gennan*, to beget, + *soma*, body]. Imperfect development of genitals

agerasia (ä-jär-ä'si-ä) Healthy, vigorous old age, youthful appearance of an old person

ageusia (ä-gu'si-ä) [' + *geusis*, taste]. Absence of the sense of taste, a partial loss or an impairment of the sense of taste.

Etrol. It may be due to disease of the chorda tympani on one side, or of the gustatory fibers, or to the excessive use of condiments, the effect of certain drugs, or lesions involving sensory pathways or taste centers in the brain

a., central. That due to a cerebral lesion

a., peripheral. That due to a disorder of taste buds of mucous membrane of tongue or pharynx

a., conduction. That due to a lesion involving sensory nerves of taste

agger (äg'ër) A small elevation or eminence, a mound

a., nasi. A small elevation near ant. extremity of middle nasal concha, ant. portion of ethmoid crest on medial surface of maxilla

agglomerate (ag-lom'er-ät) [L. *agglomeratus*, past p. *agglomerare*, to form into a ball] To congregate, to form a mass.

agglutinable [L. *agglutinare*, to glue a thing]. Capable of agglutination

agglutinant (a-glu'tin-ant). 1 Anything causing adhesion. 2 Causing to unite or adhere, as healing of a wound.

AGGLUTINATION REACTION

Left, negative, with uniform distribution of bacilli; right, positive, with the formation of clumps.

agglutination (ag-glu-tin-a'shun). 1. Clumping of microorganisms when a specific immune serum is added to a bacterial culture 2 Clumping of blood corpuscles when incompatible bloods are mixed 3 Adhesion of surfaces of a wound

agglutinative. Causing or capable of causing agglutination.

agglutinin (ag-lu'tin-in) An antibody which causes agglutination, more specifically a substance present in normal or immune serum (capable of causing agglutination or clumping of specific antigens (bacteria or cells) SEE *agglutinogen*, blood groups, blood typing, *isoagglutinin*

a., anti-Rh. A factor normally absent in human plasma but sometimes occurring in Rh-negative mothers, bearing an Rh-positive fetus or in Rh-negative individuals who have received multiple transfusions of Rh-positive blood

a., chief. A specific one in the blood of a person who has been immunized against a specific disease or microorganism

a., group. A acting as a specific on 1 species, but which will act on others

a., haupt. SYN *chief a*

a., flagellar. One which agglutinates only the flagella of an organism

a., immune. A causing immunity, found in the blood either because of recovery from the disease or of having been inoculated with the microorganism

a., major. SEE *chief a*.

a., minor. One acting on an organism related to the one utilized for immunization but in lower dilutions

a., O. SYN *somatic agglutinin* One acting on the bodies of organisms, in contrast to flagellar agglutinins

a., nonspecific. One found in individuals who have had a certain disease and which agglutinates organisms having no relation to the disease Utilized in certain diagnostic tests

a., partial. SEE *minor a*.

a., somatic. SEE *a, O*

agglutinin (ä-glu'tin'in-jen) [L. *agglutinare*, to glue a thing + G. *gennan*, to produce] 1 An antigen which when injected stimulates the development of a specific agglutinin which in turn will agglutinate the antigen 2 Substances in the red blood cells of certain individuals which are strongly antigenic causing severe agglutinative and hemolytic reactions SEE *blood groups*.

a's, A and B. Discovered by Karl Landsteiner in 1901 These two antigenic substances are found in the red blood cells of human beings and react with the alpha and beta iso-agglutinins in the blood The red corpuscles may contain A, B, or a combination of A and B agglutinogens, or may not contain either A or B, the four resulting blood groups are A, B, AB, and O Blood groups are inherited according to Mendel's law

a's, M and N. These two antigenic substances are found in the red corpuscles of human beings, related iso-agglutinins have not been found The red blood cells may contain M, N, or M and N agglutinogens, resulting in blood types M, N, or MN, respectively.

agglutinoid (â-glu'tin-oid) [L *agglutinare*, to glue a thing, + *G eidos*, resemblance] One with the zymotoxic group deficient or absent

agglutinophilic (a-glu-tin-o-fil'ik) [' + *G. philos.*, fond] Contributing to agglutination.

agglutinophore [' + *G. phorem*, to bear]. The active agent producing agglutination

agglutogenic (ag-gloo-to-jen'ik) [' + *G. gennan*, to produce] 1 Pert to substances from which agglutinins originate 2 Causing agglutinins

agglutometer [' + *G. metron*, measure]. Device to simplify the agglutination or Widal test

aggregate, aggregated [L *aggregatus*, past p of *aggregare*, to collect] 1 Total substances making up a mass 2 To cluster or come together

a. glands. Lymphoid follicles found mainly in the ileum *Syn* Peyer's patches.

aggressin [L *aggressus*, past p *aggre*di, to approach] A supposed substance which renders the action of bacteria more aggressive by lowering the activity of the phagocytes and weakening resisting power

agitated depression. *Psy* A psychiatric phase differing from the manic or depressive phases, involution melancholia or a rel condition

Sym Patients are restless, depressed, and agitated, pacing up and down, wringing hands, crying, picking, and rubbing. They have feelings of guilt and ideas of persecution, phobias, and obsessions

NP Similar to manic and depressive cases. Prevent patient from hurting self, as from pulling out hairs and tearing skin, etc. Divert patient but do not argue with him. Hydrotherapy indicated

aglauphopsia (a-glaw-kop'si-â) [G *a-*, priv. + *glaukos*, bluish-green, + *opsis*, vision] Green blindness

aglobulia [' + *L globulus*, globule]. Marked decrease of red blood cells

aglutition (ag-lu-tish'un) [' + *L glutire*, to swallow] Difficulty in swallowing or inability to swallow

aglycosuric [' + *glykus*, sweet, + *ouron*, urine] Free from glycosuria

agmatology [G *agma*, fragment, + *logos*, study of] The study of fractures.

agminate(d) (ag'min-at) [L *aqmen*, a crowd] Aggregate, grouped in clusters.

a. glands. Lymphoid follicles found mainly in the ileum *Syn* Peyer's patches

ag'nail [AS *anq*, painful, + *naegel*, nail]. 1 Hangnail 2 Whitlow *

agne'a [G *a-*, priv. + *gnosis*, knowledge]. A condition in which objects are not recognized, agnosia, *q.v.*

agno'sia [G *ignorance*]. Loss of comprehension of auditory, visual, or other sensations although the sensory sphere is intact, inability to recognize an object

a., auditory. Deafness of mind.

a., optic. Blindness of the mind

a., tactile. Inability to distinguish objects by sense of touch.

agomphiasis (ag-ôm-fî-as-is) [G *agomphos*, toothless, + *iasis*, state]. 1. Looseness of the teeth. 2. Without teeth.

agonad (â-go'nad) [G *a-*, priv. + *gonê*, seed]. One without gonads.

agonadal. Having no gonads

agonal [G *agonia*, orig a contest]. Rel. to the moment of death, or to agony.

agonia (ag-o'ni-â) [G] 1 Extreme anguish, mental distress 2 The death struggle.

agonist [G *agôn*, a contest] The muscle directly engaged in contraction as distinguished from muscles which have to relax at the same time

Thus in bending the elbow, the *m. biceps brachii* is the agonist and the triceps the antagonist

agony (ag'o-ni) 1 Extreme suffering, mental or physical 2 Death struggle.

a. clot, a. thrombus. Clot formed in the heart after long heart failure and when dying

agoraphobia (ag-o-ra-fô'bi-â) [G *agora*, market place, + *phobos*, fear] 1 Morbid dread of open spaces 2. Dread of crowds of people

-agra [G *seizure*]. Suffix pert to gout or a gouty affection, loosely, a severe pain; seizure

agraffe (â-graf') [F *agrafer*, to hook, fasten] An appliance for clamping together edges of a wound

agrammatica [G *agrammatos*, illiterate]. Agrammatism

agrammatism. Inability to form a grammatical or intelligible sentence or to arrange words in grammatical sequence. *Etiol.* Cerebral disease

agranulocyte (â-gran'u-lô-sit) [G *a-*, priv. + *L granulum*, granule, + *G kytos*, cell] A nongranular leukocyte.

agranulocytic (a-gran-û-lô-sit'ik) Pert to agranulocytosis

agranulocytosis (a-gran'u-lô-sit-tô'sis). 1. Condition marked by destructive ulcerative lesions of the throat, *leukopenia*. * 2. Marked reduction of polymorphonuclear leukocytes in the blood and bone marrow

a., Ludwig's. Purulent inflammation about the floor of the mouth, submaxillary glands, and beneath the jaw

a., Plaut-Vincent's. An infectious ulceromembranous disease of the mucosa caused by *B. fusiformis* associated with a spirillum (*Spironema vincentii*).

agranuloplastic [G *a-*, priv + *L granulum*, granule, + *G plastikos*, formative] Capable of forming nongranular cells

agranulosis [' + " + *osis*, condition]. Marked reduction of granular leukocytes in blood and bone marrow *Syn* *agranulocytosis*

agraphia (ah-graf'i-â) [G *a-*, priv + *graphein*, to write] A loss of ability to express oneself in writing due to a central lesion, or to muscular incoordination.

Copying or writing from dictation may still be possible. It is analogous to or associated with motor aphasia. * *Syn.* *logographia*. See *anorthography*.

agraphic. Pert to agraphia

agremia [G *agra*, gout, + *aima*, blood]. Blood condition in gout

agria (ag'ri-â) [G *agrios*, wild]. Herpes; malignant pustules or pustular eruption.

agromania [G *agros*, field, + *mania*, frenzy]. Unreasonable desire for solitude or solitudinous wandering. Morbid desire to live in solitude or in the country

agrypnia (a-grip'ni-â) [G *agrypnos*, sleepless] Inability to sleep *Syn* *insomnia*. * *ahypnia*. *

agrypnotic. 1. Afflicted with insomnia. 2. That which causes wakefulness.

ague (a'gu) [Fr. *ague*, sharp, acute]. 1. Intermittent or malarial fever, typified by chills, fever, and sweating. 2. A chill. SEE. *malaria*.

ah. Abbr. for *hypermetropic astigmatism*.
Ahlfeld's sign (ah'felt). On Uterine irregular contractions after the 3rd month of pregnancy.

ahypnia (ah-'up-ni-ä) [G. *a-*, priv + *hypnos*, sleep] Insomnia or sleeplessness, *agrypnia*.

aichmophobia (äk-mö-fo'bi-ä) [G. *aichmē*, point, + *phobos*, fear] Morbid fear of pointed instruments or of being touched by them or with a finger.

ailurophobia (i'lu-ro-fo'bi-ä) [G. *ailuros*, cat, + *phobos*, fear] Psy Morbid fear of cats.

A symbolism of psychoneurotic origin.

air (är) [G. *aer*, air] The invisible, tasteless, odorless mixture of gases surrounding the earth.

The air, so-called "breath of life," is made up of 21% oxygen, 0.8% argon, 78% nitrogen, aqueous vapor, carbon dioxide, and traces of ammonia, helium, and other rarer gases, but in cities and factories it is polluted. The proportions, esp. of water vapor, are variable. The composition of dry atmospheric air is given approximately in the table below, in the column headed "Inspired," the numbers are in volumes per cent.

	Inspired	Expired	Alveolar*
Oxygen	20.96	16.3	14.2
Nitrogen (including small amounts of argon and other inert gases)	79.00	79.7	80.3
Carbon Dioxide	0.04	4.0	5.5

FUNCTION 1 Its oxygen is necessary in metabolism, just as it is necessary for combustion. 2 It carries off waste products of metabolism in the form of heat, carbon dioxide, and aqueous vapor.

a., alveolar. Air in the alveoli.

a., complementary. The amount that may be breathed in over and above the tidal air, by deepest possible inspiration.

a., minimal. The small amount of air left in the alveoli by collapse of small bronchi when the supplemental and residual air is driven out when the lungs collapse with the thorax open. This makes it possible for the excised lungs of animals to float, hence the term "floats."

a., reserve. Residual air plus supplementary air in the chest after normal expiration. About 5 pt. (2600 cc).

a., residual. The amount remaining in the lungs after the fullest possible expiration. About 1300 cc.

a., supplemental. Amount that may be forcibly expired after a quiet expiration. About 1600 cc.

a., tidal. The amount that flows in and out of the lungs with each quiet respiration, average of adult male about one pint (500 cc).

air, words pert. to: "aer-" words, apneumatosis, aspiration, atelectasis, atmos, atmotherapy, atomize, complementary, expiration, inspiration, mephitic, respiration, ventilation.

air bed. Large inflated air cushion used as a mattress. SEE *air cushion*.

air cell. An air vesicle.

air conditioning. Adjustment of normal temperature and humidity while insuring adequate ventilation.

air cushion. An airtight inflatable cushion. To inflate, a pump like a bicycle pump may be used.

NP When inflating orally, place layer of gauze over opening and between lips.

air embolism. Obstruction of a blood vessel brought about by entrance of air into the blood stream.

It causes blood to froth.

Error. A postoperative possibility, or air may enter during hypodermic injection, if syringe is not properly filled or if during injection a minute vein is punctured. Air should be excluded when giving an intravenous injection.

air hun'ger. Shortness of breath marked by rapid, labored breathing. SYN *dyspnea*.

Causes the type of respiration similar to that preceding onset of diabetic coma.

Error. Extreme acidosis, seen in excessive loss of blood.

SYM More complete expiration than normal, increased respiratory rate, 16 to 20 per minute.

air sac. An air vesicle.

airsickness. Condition similar to seasickness occurring during airplane flight.

air swallow'ing. Oral intake of air either voluntarily or involuntarily. SYN *aerophagia* *q.v.*

Involuntarily, this condition mainly occurs in infants due to improper feeding.

ing. in adults in neurasthenia or hysteria or when on a fluid diet.

air vesicle. Pulmonary tissue sacculle filling with air during breathing.

air'way. A metallic or rubber instrument inserted into the mouth to keep the air passages of a postanesthetic patient clear until he is conscious.

Aix-Les-Bains (eks-la-bän) *douche massage*. Water up to 115° F flowing from a tube on a certain part of body while operator massages that part.

akatamathesia (ah-kät-äm-ath-e-zä-ä) [G. *a-*, priv + *katamathesis*, understanding] Inability to understand.

akathisia (ah-kath-iz-i-ä) [G. *a-*, priv. + *kathisis*, a sitting] Psy Inability to remain seated.

Seen in catatonia,* in agitated melancholia, and in some compulsive conditions.

akinesia (ah-kin-e-si-ä) [G. *a-*, priv + *kinesis*, movement] Loss of movement for any reason. *Acinesia, q.v.*

a. algera. Form with intense pain caused by any movement.

a. amnestica. Form marked by failure of muscular power due to lack of use.

akoas'ma [G. *akouen*, to hear] Auditory hallucination, consisting of tinnylike sounds of buzzing, whistling, etc., but also much more complex noises of groans, screams, etc.

akutomy (a-koo'to-mi) [L. *acus*, needle, + G. *tome*, cutting]. PT The electrical cutting current, *acusection*.

Al. Chemical symbol for aluminum.

-al [L.] Suffix Pert. to, as *abdominal*.

ala (a'la) (*pl. alae*) [L. wing] 1. An expanded or winglike structure or appendage. 2. Axilla.

a'lae na'si [L.] The cartilaginous flap on the outer side of each nostril.

ala'lia [G *a-*, priv + *laia*, talking]. Loss of ability to speak due to defect or paralysis of the vocal organs. Aphasia. Etiol. Psychic or due to lesion

alar (a'lar) [L. *ala*, wing]. 1 Pert. to or like a wing. 2. Axillary.

a. artery. Small br. of axillary. Supplies tissues of axilla

a. cartilage. Lower lateral; one on each side of nose.

a. vein. The M-shaped arrangement of superficial veins in fold of elbow

alas'trim [Portuguese, *alastrar*, to spread]. A modified smallpox with pustules not umbilicated and with no secondary rise of temperature

alate (al'at) [L. *ala*, wing]. Winged

al'ba [L. *albus*, white]. 1 White 2 White substance of the brain

albar'as [Arabic, white leprosy] A disease of the skin, forming white anesthetic patches on which the hair turns white

albedo (al-be'do) [L. from *albus*, white] Whiteness. Reflection of light from a surface

a. ret'inae. Retinal edema

a. ungulum. White semilunar area at nail root SEE *lunula*

Albee's operation (awl'bez). Removal of upper end of head of femur and corresponding edges of the acetabulum with approximation, artificial ankylosis of the hip

Albers-Schonberg disease (äl-bärs-shên'-bärg) Abnormal bone calcification giving bones spotted, marblelike appearance and causing them to fracture spontaneously SYN *osteosclerosis fragilis*; *marble bones*

Al'bert's disease. Achilodermia Inflammation of the retrocalcaneal bursa

al'bicans (pl *albicans*) [L. pres. p. *albicare*, to be white] 1 White or whitish 2. One of the *corpora albicantia*. [cortex *a. corpus*. Whitish body in ovarian

albidum (äl-bi-düm) [L.] White

albidu'ria [L. *albidus*, whitish, + G *ouros*, urine] 1 Passing of white or colorless urine and of low specific gravity. 2 Chyluria *

Albini's nodules (äl-bi'nî) Minute nodules on margins of heart and tricuspid valves of the heart, sometimes seen in newly born

albinism (al'bin-izm) [Portuguese from L. *albus*, white] 1 Abnormal, nonpathological absence of pigment in skin, hair, and eyes, partial or total, frequently accompanied by astigmatism, photophobia, and nystagmus, because the choroid is not sufficiently protected from light because of lack of pigment 2. A form of macula *

albino (al-bi'no) A person deficient in pigment, one afflicted with albinism

albinu'ria [L. *albus*, white, + G *ouros*, urine] Passing of white or colorless urine of low specific gravity SYN *albiduria*.

albicinereous (al-bô-sîn-e'rê-üs) [“ + *cinereus*, gray] Pert to both white and gray matter of brain and spinal cord

Albright's disease. Same as Recklinghausen's disease

albuginea (al-bu-jîn'î-ä) A layer of firm, white, fibrous tissue forming the investment of an organ or part

a. epididymidos. The fibrous coat of the epididymis, resembling the *a. testis*, but with less firmness and strength.

a. lenis. The white, highly elastic fibrous coat, lying directly beneath the serous investment of the spleen SYN: *tunica propria of the spleen*.

a. ovaril. The layer of firm fibrous tissue lying beneath the epithelial ovarian covering

a. penis. A strong, very elastic white fibrous coat, forming a sheath common to both corpora cavernosa of the penis.

a. penis. The fibrous renal capsule **a. testicul**, **a. testis**. The thick, unyielding layer of white fibrous tissue lying under the tunica vaginalis

albugineotomy (al-bu-jîn-e-o'to-mî) [L. *albus*, white, + G *tomē*, cutting] Incision of tunica albuginea of the testis

albuginitis (al-bu-jîn-'itis) [“ + G. -*itis*, inflammation] Inflammation of any tunica albuginea

albu'go [L. whiteness from *albus*]. White opacity of the cornea

albu'kalin. A substance in leukemic blood **albu'men** [L. *albus*, white] 1 Egg white; 2 former name for albumin, *qv*

a. water. After removing the specks from 2 eggs, separate the white from the yolk, and then cut the whites across several times, but do not beat Add ½ pt of cold boiled water Stir lightly and add a pinch of salt or a few drops of lemon For infants the lemon is omitted and the albumen water must be strained through gauze

albumimeter (al-bu-mim'et-er) [L. *albumen*, + G *metron*, measure] An instrument for quantitative estimation of albumin in urine

albu'min [L. *albumen*, coagulated egg white] A protein substance found in nearly every animal or plant tissue and fluid

One per cent of the body consists of albumins Albumin is found in (a) the blood, as *serum-albumin*, (b) in milk, as *lactalbumin*, and in (c) the white of egg, as *albumen* It is soluble in cold water, coagulated on heating, then no longer dissolved by cold or hot water In the stomach coagulated albumins are made soluble by *peptase*, being changed at the same time into albumoses* and peptones* Vegetable albumin, such as that in cereals is radically different from animal albumin The former is harder to digest and to absorb. SEE: “albumin” words, *scralbumin*, *thyroxin*.

a. test. The commonest type of albumin found in urine is serum-albumin. Before testing, certain precautions must be observed (a) The specimen of urine must be fresh (b) The specimen must also be clear To ensure this, the safest way is to filter it through special filter paper (blotting paper makes a good substitute) (c) The urine must be acid. (d) The specimen must be cold

There are many tests for albumin, but the most usual are the following **Acetic acid test**. Heat the top inch or so of a test-tube filled three parts full of urine over a spirit lamp A cloudiness will form, which may be due to phosphate or albumin Add 2 or 3 drops of acetic acid, and if the cloud disappears it is due to phosphates, if it becomes intensified, albumin is present

Heller's cold test. Take about ½ in. of concentrated nitric acid in a test-tube, and carefully overlay it with the urine, with a pipette An opaque line appears at the junction of the fluids. This may take a few minutes to develop.

Salicyl-sulfonic acid test. To some urine in a test-tube add 10 to 20 drops of salicyl-sulfonic acid. Albumin is shown as a white, cloudy precipitate. This may be carried out as a ring test, as in Heller's test. SEE *Esbach's test*.

Since albuminuria can be caused by many different conditions, the results require careful interpretation.

SEE *Esbach's method*, *Esbach's quantitative estimation*.

a., acid. Compound resulting from action of acid on a

a., alkali. Compound resulting from action of weak alkalies on a

a., blood. Serum albumin, one of the blood proteins. Comprises about 60% of the latter

a., circulating. A. present in the liquids of the body

a., derived. A changed by chemical action

a., egg. Form in egg white

a., floating. SEE *circulating a.*

a., incipient. Imperfect form of a. found in chyle

a., muscle. Form found in muscular tissue

a., myosin. A. of meat.

a., native. Any a. present in an organism normally

a., serum. SEE *blood a.*

a., soluble. One that has not been altered by chemical action so that it is insoluble in water

a., vegetable. Any albumin or derived from plant tissue

a., whey. A. obtained from whey

albuminate. Metaprotein, a product of hydrolysis of albumen and globulin

albuminaturia [L. *albumen* white of egg, + *G. ouron*, urine] Albuminates in voided urine

albuminiferous (al-bu-min-if'ei-us) [+ *ferre*, to bear] Producing albumin

albuminimeter (al-bu-min-m-e'ter) [+ *G. metron* measure] Instrument for measuring amount of albumin in urine
SEE *albumimeter*

albuminiparous (al-bu-min-ip'ai-us) [+ *parere*, to bear] Yielding albumin

albuminogenous (al'bu-min o'i'en-us) [+ *G. gennao*, to produce] Producing albumin

albuminoid [+ *G. eidos*, similarity] 1. Resembling albumin 2. Any one of a large class of proteins, such as (a) *collagen** in white fibers of connective tissue which produces gelatin on boiling, (b) *elastin*, in yellow fibers of connective tissue, and (c) *keratin**, found in hair, skin, and finger nails, *ossicles* in osseous tissue, and *chondrigen* in cartilage

They resemble *proteids** in origin and composition of which *albumin* is a type

albuminolysis (al-bu-min-ol'i-sis) [+ *G. lysis*, solution] Proteolysis, decomposition of protein

albuminone. Noncoagulable protein in blood serum

albuminoptysis (al-bu-min-op'ti-sis) [L. *albumen*, + *G. ptysis*, spitting] Albumin in sputum

albuminoreaction [+ *re*, again, + *agere*, to act] The presence or absence of albumin in the sputum

Positive reaction indicates inflammatory condition of lungs

albuminorrhoea [+ *G. roia*, flow] Albumin in urine

albuminose (al-bu'min-oz). 1. Albumose 2. Albuminous

albumino'sis [L. *albumen*, + *G. -osis*, state of] Abnormal increase of albuminous constituents in blood plasma

albuminous. Having the nature of albumen.

albu'minuret'ic [L. *albumen*, + *G. ouretikos*, causing urine to flow]. Pert. to albuminuria.

albuminuria (al-bu-min-u'ri-ä) [+ *G. ouron*, urine]. The presence of albumin in the urine, indicating either a simple mixture of albuminous matters with the urine, or a pathological state of the kidneys

It occurs during onset of febrile diseases, and in pneumonia, typhoid, diphtheria. Esp. grave in scarlet fever. Also seen in heart disease

SEE *nephritis*, *nephrosis*

a., cardiac. Caused by disease of the heart valves

a., cyclic. Deposit at regular diurnal intervals of small amounts of albumen in the urine, esp. in childhood and youth

a., extrarenal or accidental. Due to contamination of urine with pus, chyle, or blood

a., functional or transient. One in which the only finding is occasional presence of albuminuria, associated with physical or mental distress or slight emotional excitement. Occurs in some after taking certain foods

a., gravidarum. A. developing in pregnant women

a., pathological. A. caused by a disease.

a., physiological. A. in a temporary form, existing without evidence of pathology

a., renal. Due to changes in epithelial cells of kidneys, making them pervious to proteins of the blood as in all forms of nephritis

a., toxic. Due to toxins generated within the body or by poison from outside source

albuminur'ic retini'tis. Inflammation of retina characterized by hazy retina, blurred disc margin, distention of retinal arteries, retinal hemorrhages, and white patches in the fundus, esp. the telltale figure at the macula. SEE *retinitis*

albu'moscope [L. *albumen* + *G. scopem*, to view] An instrument for determining the presence of albumen in the urine.

al'bumose. The intermediate product produced by enzymes in the splitting of proteins which in the course of digestion becomes peptones

Primarily albumoses are first formed which in time become "deutero albumoses" or secondary albumoses. They in turn result in peptones or simpler bodies. SEE *Bence-Jones test* for a in urine

albumosemia (al-bu-mo-se'mi-ä) [*albumose* + *G. aima*, blood] Albumose in the blood

albumosuria (al-bu-mo-su'ri-ä) [+ *G. ouron*, urine] Albumose in the urine

Alcock's canal. A space in the external fascia of the *ischiorrectal fossa*, above the tuberosity of the ischium.

It contains the internal pudendal artery, veins, and nerve

al'cohol [Arabic *al*, the, + *koh'l*, fine antimonial powder] One of many carbon compounds of the general formula

$R^1 R^2 \text{---} COH$, where R^1 , R^2 and R^3 may be hydrogen atoms or any organic radicals.

Examples are methyl alcohol (wood spirits) and ethyl alcohol. Higher alcohols, with more complicated formulae, may be solid and crystalline. Polyhydric alcohols are those containing more than

one OH-group; examples are *glycerol* and *glucose*.

SEE "alco-" words, *atonicity*, *cholesterol*, *delirium tremens*, *dipsomania*.

a., absolute. Contains 99% alcohol or not more than 1% by weight of water

a., denatured. Alcohol rendered unfit for use as a beverage or medicine

a., ethyl. Ordinary or grain alcohol
ACTION Externally a rubefacient and astringent used to harden and cleanse the skin. In 70% solution antiseptic. Internally - a narcotic

USFS One of the most useful of the disinfectants, and sterilizing agents. A good skin-cleanser when used in strength of 50% to 70% and will kill vegetative bacteria in fifteen minutes. The addition of acetone adds to its efficiency both in preoperative and postoperative sterilization of hands and skin. Alcohol is a very useful agent in the sterilization of cutting instruments, for all cutting instruments should be placed in solutions preferably to boiling.

Boiling has a tendency to injure the cutting edges and dull them. Hypodermics and needles are rinsed in alcohol, then in sterile water, to render them clean. Sutures are also sterilized in alcohol. It is not practical to use for large utensils or large bulky equipment as the quantity required would be too much.

a., methyl. Wood spirit

alcoholase (al'ko-höl-áz) A ferment converting lactic acid into alcohol.

alcoholic. 1 Pertaining to alcohol. 2 One afflicted with alcoholism.

a., fermentation. That which is produced by yeast in bread. RS Fermentation, *acetic acid lactic*

alcoholism (ál'kō-höl-izm) [Arabic *al*, the, + *koh'l*, fine antimonial powder] Diseased condition due to acute or chronic excessive indulgence in alcoholic liquors.

ETIOLOGY Unknown. Psychological factors play an important part, a deep-seated neurosis. Subconscious feelings of insecurity and inadequacy, conflicts and frustrations are factors. Vitamin deficiency.

SYM Edema of brain with serous meningitis in both acute and chronic cases. Thickened *dura* and *pia mater*, some tissue degeneration. Thickening of cerebral blood vessels and some glial cells is found. It acts, at least in part, by inhibiting the ego-ideals and revealing the antisocial. Consequently, a great variety of clinical pictures present themselves, esp. in the acute intoxications, i. e., coma, amnesia,* furor,* automatism. Periodic drinking is a separate type. SEE *dipsomania*. The persistent heavy drinker develops delirium tremens.* Korsakoff's psychosis,* chronic hallucinosis,* and dementia, *q.v.*

a., acute. Excessive indulgence in a.
SYM Flushing of face, quickening of pulse, mental exhalation, followed by incoherent speech, deep respiration, loss of coordination, odor of alcohol on breath, thickened speech, dilated pupils, vomiting, delirium, slow pulse, subnormal temperature, impaired judgment, emotional instability, muscular incoordination, and finally stupor and coma. In coma of alcoholism, patient can be roused by screaming in the ear, or by firm pressure over a sensitive spot, as the supraorbital notch.

TREATMENT Stomach should be emptied with stomach pump. Doubling and flagellation to rouse patient. Large doses of coffee, hot water, saline cathartics,

stimulants, massage, sleep, induced perspiration, oxygen inhalation. Glucose and insulin accelerate decrease of alcohol in the blood.

Antibuse causes nausea when alcohol is taken, discouraging chronic drinking. It, however, is toxic. Cortisone prevents the acute stage and hastens recovery, lessening tendency to indulge. Excessive drinking exhausts the adrenals and they are rehabilitated by the adrenal hormone.

a., chronic. Continued use of alcohol.
SYM Fine tremor, mental impairment, disturbed sleep, injection of conjunctivae, redness of nose, anorexia, coated tongue, nausea, vomiting, constipation alternating with diarrhea. If long continued, atheroma of arteries, cirrhosis of liver, and chronic interstitial nephritis are apt to develop.

This brings mental deterioration in its wake and changes in the central nervous system resulting in impaired memory, failure of judgment, inability to carry on business and lower moral ideals and habits. Natural affection disappears.

TREATMENT Alcohol should be withdrawn, nutritious diet, graduated physical exercise, constitutional treatment. SEE *delirium tremens*, *intoxication*.

a., psychoses. These include (a) pathological intoxication, (b) delirium tremens,* (c) Korsakoff's psychosis,* (d) acute hallucinosis,* (e) other types.

TREATMENT Isolation, quiet, sleep, rest; hydrotherapy. Lumbar puncture may be necessary to relieve edema of brain.

a., vitamin treatment. Vitamins B₁ and B₂ help to prevent toxicomania and the proper combustion of the alcohol. A total dosage of 600 cc. of 25% ethyl alcohol, combined with glucose and hepatic extracts given intravenously as follows, has proved successful.

1st day 180 cc in two injections (morning and evening)

2nd day 150 cc in two injections

3rd day 120 cc in two injections

4th day 100 cc in two injections

5th and 6th days 50 cc in one injection

alcoholomania (al-ko-hol-o-ma'ni-ä) [alcohol + *G mania*, frenzy] Abnormal craving for intoxicants.

alcoholometer (al-ko-hol-om'et-er) [*al* + *G metron*, measure] An instrument for measuring quantity of alcohol in a fluid.

alcoholophilia (al-ko-hol-o-fil'i-ä) [*al* + *G philos*, fond] Morbid craving for alcohol.

alcoholuria [*al* + *G ouron*, urine] **Alcosol** (al'kō-söl) A sol using alcohol as the solvent instead of water.

aldehyde (al'de-hid) [*al* abbr alcohol, + *dehyd* abbr dyhydrogenatum, alcohol deprived of hydrogen] 1 Oxidation product of a primary alcohol. 2. A hydrocarbon wherein hydrogen has been replaced by the -CHO group. 3 Carbon compounds of the general formula H

>CO; formaldehyde H₂CO, acetaldehyde CH₃CHO, and benzaldehyde C₆H₅CHO are members of this group. Formaldehyde is a combustible gas but soluble in water; its 40% solution is called formalin. Acetaldehyde and benzaldehyde are liquids.

alembic (al-em'bik) [Arabic *al-inbiq*, the still] Utensil used for distillation.

alemmal (ä-lēm'al) [*G a-*, priv. + *lemma*, husk]. Without a neurilemma, as a nerve fiber.

INCOMPATIBILITIES Tea (tannin), coffee (caffeine).

alkalometry [⁺ + G *metron*, measure]. Dosimetry. Administration of alkalo-

alkalosis [⁺ + G *-osis*, condition of]. A condition in which the alkalinity of the body tends to increase beyond normal, due to excess of alkalies or withdrawal of acid or chlorides from the blood.

ERROL 1 Forced breathing and crying in infants which removes excessive amount of carbonic acid from lungs 2 Excessive vomiting causing loss of hydrochloric acid and sodium chloride 3 Excessive use of bicarbonate of soda or other alkalies 4 Impropriet diet

SYM Irregular breathing, cyanosis, perhaps tetany, tingling of fingers, numbness of extremities, headache, lassitude, nausea, fever, vomiting, mental disturbances, drowsiness, twitching, possible coma, delirium, convulsions.

TREATMENT Withdraw alkaline foods, drinks, and drugs. Saline and glucose may be necessary, both by rectum and by mouth, if possible.

alkalofic. Pert to alkalosis

alkaluretic (al-lu-ri-et-ik) [alkali + G. *ourētikos*, a flow of urine]. Causing or that which causes an alkaline urine.

alkaptonic [⁺ + G *aptem*, to possess].

A yellowish-red substance sometimes occurring in urine, the possible result of incomplete oxidation of tyrosin.

alkaptonuria (al-kap-ton-u-ri-ä) [alkapton + G *ouron*, urine]. The presence of a yellowish nitrogenous substance in the urine not esp. indicative of disease or a local lesion although found in pulmonary tuberculosis. It turns the urine dark or black. SEE *benzothecumuria*.

alkyl (al-ki) [al, abhi alcohol, + G *ulē*, stuff]. Any univalent alcohol radical.

allachesthesia (al-ä-kes-the-zi-a) [G *al-lache*, elsewhere, + *aesthesia*, sensation]. Tactile sensation remote from point of stimulation.

allantiasis (al-an-tri-a-sis) [G *allanto*, sausage]. 1 Sausage-poisoning 2 Botulism 3 *Sfr atropisim*

allantochorion (al-län-tö-ko'i-i-on) Fusion of the allantois and chorion into one structure.

allantoic. Pert to the allantois.

allantoid [G *allanto*, sausage, + *eidos*, resemblance]. 1 Sausage-shaped 2 Allantoids 3 Pert to the allantoids.

allantoïn [chemical name, glyoxyldiuride]. A white crystalline powder, considered to be secreted by magots.

USLS In various forms of indolent ulcers and wounds, by stimulating tissue growth, and inducing granulation.

Dosage $\frac{1}{2}$ -2 gr (0.03-0.12 Gm.) In 0.4% solutions or as an ointment.

allantoïnuria [allantoin + G *ouron*, urine]. Allantoin in the urine.

allantois (al-an-tö-is) [G *allanto*, sausage, + *eidos*, resemblance]. A kind of elongated bladder between the chorion and amnion of the fetus, which is thrown out from the caudal extremity of the embryo, and communicates with the bladder by the urachus. It is very apparent in quadrupeds, but not in the human species. In the lower forms as the allantois is developed, its walls become very vascular, and contain the ramification of what becomes the umbilical artery and vein, which, by the elongation of the allantoids, are brought through the villi of the chorion into indirect communication with the vessels of the mother. SEE *chorion, urachus*.

allelic genes (al-lel'ik) Genes which occupy the same locus on a specific pair of chromosomes and control the heredity of a particular characteristic. The heredity of eye color appears to depend on a series of allelic genes; the four A-B-O blood groups are determined by the three allelic genes L^A , L^B , and L^O , the 12 standard Rh-Hr types are transmitted by the eight allelic genes r , r' , r'' , ry , R^0 , R^1 , R^2 , and R^3 , etc.

allocalatalysis (al-le-lo-kat-äl'i-sis) [G. *alleton*, reciprocally, + *catalysis*, dissolution]. Stimulation of a bacterial culture by the addition of cells of same type.

allelomorph (al-le'lö-morf) [⁺ + *morphē*, shape]. One of a pair of character units, the descendants not showing a mixture of the pair, but one or the other of the unit characters.

allelotaxis [⁺ + *taxis*, order]. Development of a part from different embryonic structures.

Allen-Doisy unit. Injection in a spayed mouse of the smallest amount of estrus-producing hormone secreted during pregnancy, producing desquamation of vaginal epithelium in the mouse.

Allen's law. The more carbohydrate taken by a diabetic, the less he utilizes.

A's treatment. A once popular method of treating diabetes mellitus consisting of a period of absolute fasting followed by a spare diet with little carbohydrate. Then a gradual food increase until 1500 to 2000 calories are reached. Absolute fasting is dangerous in diabetes, since it can bring on acidosis and death.

allen thesis. Introduction of a foreign substance into the body.

allergen (al-ei-jen) [G *allos*, other, + *ergen*, work, + *gennan*, to produce]. A substance supposed to produce symptoms of allergy.

Allergens include various foods, feathers, dust, pollens, etc.

allergic. Pert to or sensitive to an allergen.

a. extracts. Made from protein of various substances believed to have specific action in producing morbid conditions.

allergin [G *allos*, other, + *gennan*, to produce]. A substance supposed to produce allergy. SYN *allergen*.

allergization. Sensitization.

allergy [G *allos* other, + *ergia*, work].

1 Hypersensitivity to a specific substance 2 A clinical change in the capacity of an organism to react to an infection following a primary one, as in increased susceptibility, or immunity.

EX An infection of a common cold may render a patient more susceptible to future infection, while an attack of mumps or measles renders the patient less liable. Hypersensitiveness of body cells due to proteins such as ferment in the protein molecules, and which causes hay fever or asthma through inhalation, resulting in lesions, or skin eruptions.

Allergic conditions include eczema; allergic rhinitis, or coryza, hay fever, bronchial asthma, and urticaria or hives. Gastrointestinal allergy may appear in children.

NP In children Avoid extremes of temperature and humidity. Skin must not be chilled and sweating must be prevented. Soap and water must not be used on eczematous parts of the skin. Use pure olive oil or pure mineral oil. An ointment may be ordered which

should be applied many times during the day in a thin layer, and as often as the child rubs it off. Crude coal tar in equal parts of acetone or alcohol and flexible collodion may be ordered to be painted on the eczematous areas, once each day with a cotton applicator. Brush the skin with dry cotton to remove all loose material.

Woolen clothing and blankets should not be used, or leather stuffed pillows or mattresses. To prevent scratching, cuffs should be used so the child cannot bend the arm at the elbow. Other restraints of arms and legs may be necessary. Elimination diets are indicated.

ETIO. Heredity, pollen, dust, hair, fur, feathers, scales, or dandruff, also specific foods, such as chocolate, milk, wheat, oranges, nuts, and tomatoes, the most common offenders, and to a lesser extent, eggs.

SYM. Low blood calcium and eosinophilia* frequently present, urticaria, eczema, rash, an acne-like eruption which does not respond to x-ray, asthma, hay fever, migraine, or gastrointestinal disturbances.

TREATMENT (non-food allergy) Wet packs and an astringent but not oily dressing for relief. Other treatment is in an experimental stage.

RS *allergen, allergy, anaphylaxis, atopy, autotherapy, hay fever, hypersensitivity, immunity.*

a., food. Find the offending food by placing patient for six weeks on a non-allergic diet consisting of tea, coffee, lettuce, carrots, prunes, plums, apricots, veal, lamb, rice crackers, plum jam, olive oil, peppermint candy. If no eruption occurs within a week, add a new food every two weeks until the one causing the trouble expresses itself through appearance of new lesions which then should appear within from two to six hours, and not more than 12 hours. Discontinue use of offending food. Give ultraviolet rays or increase Vitamin D foods. **SYN:** *anaphylaxis.*

a., heat and cold. Changes of temperature may cause cutaneous reactions such as urticaria and also internal reactions with sensitive persons. Itching, redness of skin, headache, asthmatic symptoms, dyspnea, and shock can follow exposure to cold water. Heat may produce same symptoms.

alesthesia (al-es-the-si-ă) [G. *allos*, other, + *aisthesis*, sensation]. A sensation in one limb which is referred to the other one, *allochiria*.

alliaceous (al-i-a'se-us) [L. *allium*, garlic]. Tasting like garlic or onions.

alliteration [L. *ad*, to, + *littera*, letter]. Dysphasia, in which words are spoken according to sound.

allo- [G. *allos*, other]. 1 A prefix meaning differentiation from the normal. 2. Indicating a body made stable by heat. 3 **CHEM.** An isomer, close relative or variety of a compound. Isomerism when there is relative asymmetry.

allochesia [G. *alliche*, elsewhere, + *aisthesis*, sensation]. Tactile sensation remote from point of stimulation. **SYN:** *allochiria, allesthesia.*

allochezia, allochezia (al-o-ke'zi-ă, al-o-ke'shi-ă) [G. *allos*, other, + *chezein*, to defecate]. 1. Excretion of nonfecal matter from the bowels. 2. Excretion of feces through an abnormal opening.

allochiria (al-o-ki'ri-ă), **allochiria** [G. " + *cheir*, hand]. Sensation referred to

side of body opposite its origin; *al-lesthesia*.

Observed in locomotor ataxia and in hysteria.

allochroism (al-ôk'rô-izm) [" + *chroa*, color]. Change in color.

allochromasia (al-ô-ki'ô-mă'si-ă). Change in color of hair or skin.

allockinesia (al-o-sin-e'si-ă) [G. *allos*, other, + *kinêsis*, movement]. Movement on side of body opposite to the one directed. **SEE** *allockinesis*.

alloeotism (al-lo-e'ot-izm) [" + *Eros*, god of love]. Gratification of the sexual instinct directed to an external object. **CT** *autoerotism*.

allockinesis (al-o-kin-e'sis) [G. *allos*, other, + *kinêsis*, movement]. Movement on side of body opposite to the one directed.

allokinetic (al-o-kin-e'tik) [" + *kinêsis*, movement]. Movement caused by external forces.

allolalia [" + *lalia*, talk]. Speech defect, esp. if due to disease of speech center.

allonal (al'o-nol) Registered trade-mark for a compound of allyl-isopropyl-barbituric acid and acetophenetidin, a hypnotic analgesic.

DOSE. Average 2 2 3 gr (0.170 Gm.).

all'opath. A misnomer for a regular medical practitioner.

allopathy (al-lop'a-thi). A misnomer for a system of therapeutics administering medicines which produce effects different from those of the disease treated, in principle, the opp. of homeopathy. A term erroneously used for the regular practice of medicine.

allophasia (al-off'as-is) [G. *allos*, other, + *phasis* speech]. Incoherency, delirium.

alloplasia (al-o-pla'zi-a) [G. *allos*, other, + *plasis*, a molding]. *Heteroplasia*. * Replacement of normal cell forms by other cell forms in the tissue.

alloplasty. Plastic surgery with non-human tissue.

allosychic (al-lo-si'kik) [" + *psychê*, mind]. Ideas not related to the patient's personality, but to the external environment.

allosycho'sis [" + " + *-osis*, condition]. Derangement of perceptive powers.

allorhythmia (al-o-rith-mi-ă) [" + *rhythmos*, rhythm]. Irregular cardiac rhythm.

all-or-none law. That a stimulus to a nerve or muscle causes it to respond to its greatest extent or not at all.

allotherm (al'o-theim) [" + *thermê*, heat]. An organism whose temperature is directly dependent on its culture medium.

allotoxin [" + *toxikon*, poison]. A substance within the body which protects by destroying toxins inimical to it.

allotriogeusia (al-ot-i'ô-just'i-ă) [G. *allos*, strange, + *geusis*, taste]. Perverted taste.

allotriophagy (al-o-tri-of'ă-jî) [" + *phagēin*, to eat]. The habit of eating injurious, unusual, and nonedible substances.

allotriuria (al-ot-ri-u'ri-ă) [" + *ouron*, urine]. Abnormal urine.

allotropic (al-lo-trop'ik) [G. *allos*, other, + *tropos*, direction]. 1 **CHEM.** Pert to different forms of the same element without change of chemical composition. 2 Possessing an altered nutritive value.

a. type. One much concerned with what others think, say, or do.

allotropy, allotropy. Presence of an element in two or more distinct forms with unlike properties.

allox'an [L. *alloxanum*]. A substance obtained by the action of nitric acid or of nascent chlorine upon uric acid.

It has been found in the intestinal mucus in catarrhal enteritis. It gives a red color to the skin, and has been used as the basis of cosmetic preparations.

allox'in. Any one of a series of *xanthin* bases derived from the splitting of *chromatin*, which on oxidation produces uric acid.

allox'ur bases or bodies [*allox'an*] + *urica*] Xanthine bases. Nitrogenous substances formed by splitting of nucleins.

alloxuremia (al-oks-u-re'mi-ä) [*alloxur* + *G. aima* blood]. Xanthine* bases in the blood.

alloxu'ria ([" + *G. ouron*, urine] Xanthine bases in the urine.

al'tyl [L. *allium*, garlic, + *G. ylä*, matter] A univalent radical. It is present in garlic and mustard.

Almén's tests (äl-mans') Three tests of urine for blood, albumin, and sugar.

almond (ä-mond) [*G. amygdale*]. Comp.: Highly nutritive and rich in nitrogenous components. They surpass cheese and beans by a third in nutrients. Heavy in cellulose. Free from xanthic bodies and purins. They contain considerable albumin. Contains vit. A, good source of vit. B and G.

Action. Very slow to digest. Should not be eaten in quantities. Laxative due to their oleaginous principles and cellulose content.

alochia (ä-lo'ki-ä) [*G. -a*, priv., + *lochos*, pert. to childbirth] Absence of puerperal* vaginal discharge following childbirth.

aloe (al'o) USP. The inspissated juice of several species of aloe.

Action and Uses. A cathartic acting on large intestine, resembling but more irritant than cascara.

Dosage: 4 gr. (0.25 Gm.)

al'o'gia [*G. -a*, priv. + *logos*, speech] Inability to express oneself through speech. *SYN. aphasia*.

alopecia (al-o-pe'shi-ä) [*G. alopēkia*, fox mangle] Natural or abnormal baldness or deficiency of hair, partial or complete, localized or generalized.

Treatment. Prophylactically by personal brush and comb. Massage. Green soap, tar soap, or egg yolk shampoo. Treatment of seborrheic dermatitis if present. Locally, stimulating applications. Systemic tonics, hexamethylenamine, thyroid, internally.

a. adnat. Congenital baldness.

a. areata, a. Celsi, a. circumscripta. Baldness is sharply defined, circumscribed patches which leave the scalp smooth and white, and which are probably due to nervous disturbances or parasites.

a., congenital. Form with absence of hair bulbs at birth.

a. follicularis. Inflammation of the hair follicles of the scalp causing loss of hair from affected areas.

a. furfuracea. Called also *a. capilliti*, *pitiriasis capitis*, *seborrhea capilliti*, and *dandruff*. Chronic in course and marked by hyperemia, dandruff and itching, and falling out of hair (exfoliation of scales), which becomes harsh, dry, and lusterless.

a. localis, a. neuritica. Falling of hair in circumscribed spots in area of distribution of scalp nerves.

a. neurofica. Baldness following a nervous disease or injury to nervous system, and occurring at site of injury.

a. pityroides [*G. pityroides*, branny]. Falling of both scalp and body hair, together with abundant bran-like desquamation.

a. senilis. Baldness of old age.

a. simplex. Baldness prematurely.

a. symptomatica. Loss of hair after prolonged fevers or during course of some disease, also may result from changes in internal secretions.

a. toxica. Loss of hair thought to be due to toxins of infectious disease.

a. universalis. General loss of hair from all parts of body.

al'pha. First letter of Greek alphabet. *CHYM* Denotes first in a series of isomeric compounds.

a. leukocyte. One that disintegrates during blood coagulation.

a. rhythm. *SYN. Berger rhythm* or *wave*. In electroencephalography, rhythmical oscillations in electric potential occurring at a rate of 8 to 10 per sec. Characteristic of inattentive brain or in drowsiness or narcosis.

a. test. A U. S. army test for recruits capable of reading English.

a. tocopherol (to-ko'er-öl) A tocopherol in vitamin E, the others being *beta*, *gamma*, and *delta*.

Uses. In heart cases including coronary thrombosis a preventive of heart conditions, in Bueger's disease, in hemorrhage.

Action. Nontoxic even in large doses. Decreases oxygen requirements of heart muscles 50% or more, increasing blood supply. Decreases excessive capillary permeability or leakage, reduces blood clot in a thrombus, or prevents its formation and softens scar tissue.

Dosage. 300 milligrams daily.

a. wave. Alpha rhythm, *q v*.

al'phus (al'fus) [L], **al'phos** [G.] 1. Psoriasis. 2. A pustular, scitofulvous affection of the skin accompanied by white crusts.

al'terant [L. *alterare*, to change] An alterative. That which brings about a favorable change in the body functions.

alterative (al'ter-a-tiv) A medicine that alters the processes of nutrition and excretion, restoring the normal functions of the system. *Ex. Corrosive mercuric chloride, calomel, arsenic trioxide, and potassium iodide.*

al'ternate host [L. *alternare*, do by turns] A carrier of disease germs, such as the louse, and other insects.

al'ternating cur'rent. PT. An electrical current the direction of which reverses constantly.

al'ternator. PT. So-called sinusoidal alternator, an electromagnetic device consisting of a revolving armature which cuts the lines of force in a magnetic field and which delivers a sinusoidal current from secondary coil of the apparatus.

al'therm, altherm pad. A device containing chemicals applying heat to the eye or a sinus.

al'tricious (al-trish'us) [L. *altrix*, nourisher]. Slow in developing, requiring long nursing.

al'um [L. *alumen*] (ammonium alum, or potassium alum). USP. Large, colorless

crystals, or white powder, with sweetish, strongly astringent taste.

Its manufacture (which is of great antiquity) is by subjecting alum stone to a roasting process, and treating with sulfuric acid.

DOSAGE As an astringent, 5 to 15 gr. (0.3-1 Gm.). As an emetic, 1 drachm (4 Gm.).

alumen [L.] Alum.

a. exsiccatum. Alum that has been dried or burnt.

aluminosis (al-u-min-o'sis) [“ + G. -osis, condition of] Chronic catarrhal inflammation of the lungs in alum workers.

aluminum. A silver-white metal. Symb. Al. Atomic weight 26.97.

aluminum acetate (al'set-ăt). A salt formed by the reaction between aluminum sulfate and lead acetate. Its aqueous solution, containing 4 to 5%, is known as Burow's Solution.

Uses Regarded as a valuable local astringent and antiseptic.

DOSAGE 5-10 gr. (0.3-0.6 cc.)

alumol (a-lum'no) A fine, white, non-hygrosopic powder.

Uses As a mild antiseptic and, in concentrated solutions, as an irritant and caustic.

DOSAGE As surgical antiseptic, in from 1/2 to 3% solutions, in gynecology, in from 2 to 5%.

alusia (al-u'si-ă) [G. *aluein*, to wander]. Morbidity, hallucination.

alvajel (al-vă-jel') An ointment made from a tropical plant, or the caracus family, and recommended in x-ray burns.

Alvegniat's pump (al-văn-yats') Mercury vacuum pump for removing gases from the blood.

alveobronchitis [L. *alveolus*, little tub, + G. *bronchos*, windpipe, + -itis, inflammation] Inflammation of the bronchioles, and pulmonary alveoli, bronchopneumonia.

alveolar [L. *alveolus*]. A small depression or pert to an alveolus.

See *chilodysphthaltoecrosis*.

a. air. The mixture of gases collected by having the subject first execute a normal expiration and then exhale as much additional air (which comes from the alveoli of the lungs) into the collecting device as possible. Its composition is fairly constant at rest. Exercise increases the carbon dioxide above, and voluntary overbreathing decreases it below. 55%. For complementary, dead, minimal, reserve, residual, supplemental, and tidal air. **See** *air, spirometry*.

a. process. One of four processes which make up each maxillary bone.

alveolate [L. *alveola*]. Honeycombed; pitted.

alveoli (al-ve'o-li) [L.] Pl. of alveolus.

a. dentales (BNA). Tooth sockets.

alveolitis [L. *alveolus*, + G. -itis, inflammation] Inflammation of the alveolar processes, pyorrhea.

alveoloclasia (al-ve'o-lo-kla'zi-ă) [“ + G. *klasis*, fracture] Absorption of any part of the alveolar process.

alveolus (al-ve'o-lus) (Pl. *alve'oli*) [L. small hollow or cavity]. 1 A little hollow. 2 The socket of a tooth. 3. Air cell of the lungs. 4 A small depression such as those contained in the honeycomb cells of the gastric mucous membrane. 5 A follicle of a racemose gland.

a., mucous, of the salivary glands. Those that secrete the ropy material of the saliva, containing mucin.

a., parietal. An air space in the wall of an alveolar passage in the lung.

a. pulmoneus. A pulmonary air space.

a., serous, of the salivary glands. Those that secrete the serous albumin of the saliva, coagulating when heated.

a., terminal. An air space connected with a pulmonary infundibulum.

alveus (al've-us) [L. a hollow, a cavity].

A canal, tube, duct, or cavity.

a. ampullascens. Dilation at the receptaculum chyl.

a. hippocampi. Medullary layer investing the hippocampus major.

alvine (al'vin) [L. *alvus*, belly]. Pert. to the intestines or abdomen.

a. concretion. Intestinal stone.

a. discharge. Stools.

a. flux. Watery feces.

alvinolith [“ + G. *lithos*, stone]. An intestinal mass, formed from calcareous salts and other matter.

alvus [L.] 1 Abdomen and viscera. 2. uterus.

alycin (a-li'sin) A combination of natural salivates with an alkaline base. Given usually as a powder, or an elixir.

Uses In rheumatism, arthritis, etc.

DOSAGE Average, 1 teaspoonful.

alymphopotent (a-lim'fô-pô'tent) [G. *a-*, priv. + L. *lymphā*, lymph, + *potens*, able]. Unable to develop lymphocytes or lymphoid cells.

Alzheimer's disease (ahltz'shi-mer). **Psy.** Presenile dementia with hyaline degeneration of the smaller blood vessels of the brain.

Error. Faulty metabolism and imperfect nutrition, with mental enfeeblement.

Am. Symbol for mixed astigmatism, or for ametropic.

ama (a'mă) [G. *amē*]. Enlargement of a bony canal of labyrinth of the internal ear at the end opposite the ampulla.

A. M. A. Abbr. for American Medical Association.

amaas (ă mahs) A mild form of smallpox, milk-box.

am'acrine cell [G. *a-*, priv. + *makros*, long, + *is mos*, fiber] Nerve cell without any axis cylinder process.

amal'gam [G. *mal'agma*, emollient] Any alloy containing mercury.

amal'gamate. To make an amalgam.

amara (am-a'ă) [L. *amarus*, bitter] Bitters.

am'arthrit (am-ar-thrit's) [G. *ama*, at same time, + *arthron*, joint, + -itis, inflammation] Polyarthrit. Inflammation of more than one joint at the same time.

amasesis (ă-mas-ē'sis) [G. *a-*, priv. + *masesis*, chewing] Inability to masticate.

am'astia [“ + *mastos*, breast] Failure of breast development.

am'ative [L. *amare*, to love]. 1 Expressing sexual desire. 2 Propensity to love.

Amat'o bodies. Those seen in leukocytes in scarlet fever.

amaurosis (am-aw-ro'sus) [G. *amauros*, dark, dim, + -osis, condition] Complete loss of vision with no ophthalmoscopic evidence of pathologic conditions within the eye.

a., albuminuric. A. caused by kidney affection.

a., amaurotic. A. caused by the atrophy of optic nerve or vision centers.

a., cerebral. A. caused by brain malady.

a., congenital. A. from birth on.

a., diabetic. A. in connection with diabetes.

a., epileptoid. Sudden seizure of blindness, considered to be similar to epilepsy

a., lead. A caused by lead poisoning.

a., reflex. A due to reflex action caused by irritation of a remote part.

a., sabural. A in conjunction with acute gastritis.

a., tobacco. A. caused by tobacco poisoning

a., toxic. Blindness from optic neuritis caused by poison

a., uremic. A caused by uremic con-

amaurotic (am-ā-rot'ik). Pert to one afflicted with amaurosis

a., family idiocy. Form of idiocy in which the vision is imperfect. *See* idiocy, idiot.

amaxophobia (ā-maks-o-fō'bi-ā) [G. *amaxa*, carriage, + *phobos*, fear] Morbid dread of carriages and wagons or riding in them

amazia (ā-mā zi-ā) [G. *a-*, priv. + *mazos*, breast] Congenital lack of the mammary gland

ambi- [L.] Prefix both or both sides, around, about, as *ambidextrous*

ambidextrous [' + *dexter*, right] Ability to work effectively with either hand

ambilateral [' + *latus*, side] Pert to both sides

ambly'vous [' + *laevus*, left] Awkward in use of both hands

ambly'opia [' + *G ops*, eye] Double vision *SYN* *diplopia**

ambisinis'ter [' + *sinister*, left] Awkward in use of both hands *SYN* *ambilevous*

ambiten'dency [' + *tendere*, to stretch]. *Psy* The association of diverging impulses to action and opposite trends of thought or emotion with a central idea—an essential mechanism in conflict

ambivalence (am-biv'ā-lens) [' + *valere*, to be strong] 1 Possessing ability of equal power or value in two directions 2 *Psy* Linking of opposite or contrary emotional values (love and hate) to the same idea, or toward the same person The fluctuation from strong like to dislike found in schizophrenia

ambivalency. The condition of being ambivalent

ambiv'alent. Have equal power or value in both directions

a., feelings. Two opposite emotions, such as love and hate, for the same person at same time

ambivert (ām'bi-vért) [L. *ambo*, both, + *vertere*, to turn] One intermediate between an extrovert and an introvert

ambroma (am-blo'mā) [G. *ambroma*, an abortion] An aborted fetus

ambrosis (am-blo'sis) [G. *ambrosios*, an abortion] An abortion

amblyacusia (am'blī-ā-koo'sī-ā) [G. *amblys*, dull, + *akousis*, hearing] Dullness of hearing

amblyaphia (am-ble-af'ī-ā) [' + *aphē*, touch] Dull sense of touch

amblychromasia (am'blī-kro-ma'sī-ā) [' + *chromatikos*, pert. to color]. The state in which the cell nucleus stains faintly.

amblychromat'ic. Staining faintly.

amblygeusia (am-blī-jus'tī-ā) [G. *amblys*, dull, + *geusis*, taste]. Defective or blunted taste

amblyphonia (ām-blī-fō'nī-ā). Impaired hearing *SYN* *amblyacusia*

amblyopia (ām-blī-o'pī-ā) [' + *ōps*, sight]. Reduced or dimness of vision, not dependent upon visible changes in

the eye and not refractive (alcoholic, astigmatic, diabetic, *ex anopsia*, malarial, methyl alcohol, quinine, tobacco, toxic, uremic).

a., exanopsia. Dimness of vision resulting from inaccurate focusing on retina due to refractive errors, cataract

a., postmarital. A caused by excessive sexual activity

a., reflex. A due to irritation of peripheral area

amblyoscope (am'blī-os-kōp) [' + *skopein*, to view] Instrument for training an amblyopic eye for better vision

am'bo [G. *ambon*, edge of a dish] Annular fibrocartilage producing an elevation about a joint cavity, and the elevation itself

amboceptor (am-bo-sep'tor). So called by Ehrlich. An immune substance or antibody forming a union between an antigen and complement (agent that completes lytic action), as it is assumed it has one affinity for the antigen and one for the complement

RS agglutinins, anaphylaxis, antibody, antigen, immune bodies, opsonins, precipitin, Ehrlich's theory

a., unit. Smallest amount of amboceptor required in the presence of which a given quantity of red blood corpuscles will be dissolved by an excess of complement

ambon (am'bon) [G.] The ring which surrounds the sockets in which the heads of long bones are received, as the *glenoid cavity*

am'bos. Incus of anvil bone

ambrine (am'brīn) [F. *ambre*, amber] A preparation of paraffin used in treating extensive burns

ambulance [L. *ambulare*, to move about]. Wagon for transportation of the sick and wounded

ambulant, ambulatory. Able to walk, not confined to bed

a., typhoid fever. A mild attack of typhoid fever, in which the patient is not confined to bed *See* *typhoid*

ambustial (am-bus'shāl) [L. *amburere*, to scorch] Pert to a burn or scald

ambustion (am-bus'shun) A burn or scald

ame'ba [G. *amoebe*, change] A one-celled protozoan minute animal form of life that constantly changes its shape by sending out processes of its protoplasm, by which it moves about and obtains its nourishment

It is found in great numbers in pools, and in the green slime on the top of the water. It is also found in the mud at the bottom. It possesses an outer translucent substance called the *ectosarc*, but the inner substance is denser, contains a nucleus, and is the *endosarc*. It feeds by surrounding its victim and enclosing it in the so-called *food vacuole*. Oxygen is absorbed from the surrounding water, and CO₂ is eliminated through the plasma membrane. The organism moves by pushing out parts of the cell protoplasm. These projections are called *pseudopodia*, or false legs. Reproduction occurs either by binary fission or, more rarely, by a method of *encystment*. There are various types of amebae, but one type is especially well known as being parasitic to man, the *Entamoeba histolytica*, which causes amebic dysentery

amebiasis (am-e-bī-as'is) [' + *-iasis*, pathologic state] Infection with amebas, of which *amebic enteritis** is one form. Many forms are not recognized as being due to parasitic infection.

ame'bic. Pert to or caused by amebas.

a. carrier state. That in which an individual harbors a form of pathogenic ameba. At least one per cent of the population harbor *E. histolytica*. Often a subacute or chronic form will follow an attack.

a. dysentery. That caused by *Endameba histolytica*. Sfr *amebiasis*.

a. enteritis. Intestinal amebic infection. SEE *a. dysentery*.

ETIOI. Infection with *Endameba histolytica*.

PATH. Intestinal tissues are penetrated.

SYM. Diarrhea or dysentery, pain, temperature not high. Presence of the parasite in the feces is only certain diagnosis. May be complicated by liver abscess.

TREATMENT. Emetine.

NP Disinfect stools and linen before washing. Keep patient's utensils separate from others. Protect food from flies.

a. hepatitis. Abscess of the liver of amebic origin.

a. proctitis. Infection with amebas affecting the anus and rectum.

ame'bicide [G *amoibi*, change, + *L caedere*, to kill] Destructive to or any agent that kills amebas.

ame'biform | + *L forma*, shape | Formed like an ameba.

amebocyte (a-me'bo-sit) | + *G kytos*, cell | A cell showing ameboid movements.

ame'boid | + *G eidos*, resemblance | Having the appearance and characteristics of an ameba.

a. movements. Those possessed by leukocytes which "wander" through capillary walls into surrounding tissues, a process known as diapedesis.

ame'boidism. Ameba-like movements, noting a condition shown by certain nerve cells.

amebula (am-e'bu-lä) |dim *ameba*| The ameba-like spore of the malarial parasite.

amebu'ria [G *amoibē*, change, + *ouron*, urine] Amebas in the urine.

amelioration (a-me-li-ör-a'shun) [*L. ad*, to, + *meliorare*, to make better] Improvement, moderation of a condition.

ame'loblast [early English *amel*, enamel, + *G blastos*, germ] A cell from which tooth enamel is formed.

ameloden'tinal | + *L dens dent-*, tooth | Pert to both enamel and dentine.

Ameid's solution (a'mends) An organic iodine preparation, stable, and causing less gastric disturbances than Lugol's solution.

USES. In conditions where iodine therapy is helpful, as goiter, diseases of upper respiratory tract, and as an alterative.

DOSAGE. From 10 to 20 drops in glassful of water, 1/2 to 1 hour before meals.

ame'nia [G *a-*, priv + *mēn*, month] Absence of the menses, amenorrhea.*

amenomania (a-me-no-ma'ni-ä) [*L amacius*, pleasant, + *G mania*, frenzy] Insanity characterized by happiness.

amenorrhea (a-men-o-rē'a) [G *a-*, priv + *mēn*, month, + *rein*, to flow] Absence or suppression of menstruation, normal before puberty, after the menopause, during pregnancy and lactation.

ETIOI. Some of the more common causes for its suppression at other times are change of climate, febrile diseases, and chronic diseases such as nephritis,

tuberculosis, and diabetes. Also ovaritis, discharge from any cavity, endocrine disorders, overwork, emotional excitement, and mental disease.

SYM. Varied.

TREATMENT. Good hygiene, proper exercise and constitutional treatment, thyroid extract if there is thyroid deficiency.

a., partial. Appearing occasionally and at irregular intervals.

a., physiological. Periods when normally free from menstruation, prepuberty, pregnancy, lactation, postmenopause periods.

a., primary. *Emansio mensium*. That in which menses have never made their appearance.

a., secondary. *Suppressio mensium*. That in which, having appeared, they subsequently cease.

amenorrh'eic. Pert to amenorrhea.

ament (ä'ment) [*L ab*, from, + *mens*, mind] An idiot, one without evidence of mind.

amentia (am-en'shī-ä) 1 Psy Intellectual defect of varying degrees.

The 16 yr old idiot has intelligence less than that of a normal 4 yr old, if less than 16 yrs there is a corresponding grading down in terms of normal. The imbecile's mentality is less than 8 yrs, the moron's or feeble-minded individuals age is not more than 11 (sometimes arbitrarily set at 12). A large percentage of these cases are clearly familial. 2 Feeble-mindedness.

ameris'ic (a-mer-is'tik) [G *a-*, priv + *meros*, part] Not segmented.

ametrohemia (ah-mēt-ro-he'mi-ä) [G *a-*, priv + *metra*, uterus, + *aima*, blood]. Lack of uterine blood supply.

ametrom'eter [G *ametros* disproportionate, + *ōps*, sight, + *metron*, measure] Instrument for measuring ametropia.

ametropia (a-me-tro'pi-ä) | + *ōps*, vision | Imperfect refractive powers of eye (hyperopia, myopia, astigmatism), in which the principal focus does not lie on the retina.

amianthinops'y (äm-i-un'thin-op'si) [G *a-*, priv + *ianthinos*, violet, + *opsis*, vision] Violet blindness.

amicitin (äm-i-sēt'in) An antibiotic against certain TB Gram-positive bacteria.

amicro'bic [G *a-*, priv + *mikros*, small, + *bios*, life] Not due to microbes.

am'icron(e). A colloid particle unrecognizable through the ultramicroscope.

amicroscop'ic. Too small to be detected through the ultramicroscope.

amide. A chemical compound produced by the substitution of an acid radical for one of the hydrogen atoms of ammonia.

am'idin [F *amidon*, starch] 1 The part of starch soluble in water. 2 A monacid base. The group C NH NH₂.

amido- A prefix signifying amine, q.v.

amid'ulin [Fr *amidon*, starch]. Soluble starch.

am'igen. See p A-115.

amimia (a-min'i-ä) [G *a-*, priv + *mimos*, mimic] Loss of power to express ideas by signs or gestures, inability to comprehend gestures. ETIOI. A brain lesion.

amine (am'in) One of a group of organic compounds containing the amine (NH₂) group, substituted for ammonias, and possessing the general formula RNH₂, characterized by strong pharmacologic activity, and including the ptomaines and alkaloids.

amino- (a-mē'no, am'in-o). Prefix denoting compound containing amine

amino acid. One of the compounds, of which about 22 different ones are known, derived from the fatty acids by the exchange of a hydrogen atom of the hydrocarbon radical for an amino group. Intermediary products in the catabolism and anabolism of protein. Organic acids in which NH_2 has replaced one of the hydrogen atoms

In proteins they are the elements combined in units. They contain nitrogen and are found in plant and animal life, in the latter, a product of protein digestion by ferments or bacterial action

They are the end products of protein digestion, the chief constituents of casein of milk, gluten of flour, and eggs. Proteins are transformed into amino acids in the intestines and are found in the blood stream of the portal circulation and in the intestines. Their presence indicates the progress of digestion and place of same. Tryptophane, cystine, lysine, and histidine are amino acids necessary for tissue repair and growth. Hydroxyaminobutyric acid, isoleucine, leucine, and phenylalanine are other essential amino acids

All proteins do not contain all the essential amino acids as is the case with milk, cheese, eggs, and meat. Unused amino acids are converted into urea. They pass unchanged through the intestinal wall and portal vein into the blood, then through the liver into the general circulation from which they are absorbed by the tissues according to the specific protein for a specific tissue, each tissue making its own protein from the amino acid, and each deaminizing that which remains unused.

amino compound. Substance containing the group NH_2 , same as amines, *q. v.*

amino group. The NH_2 group which characterizes the amines

RS absorption of proteins, amino-acidemia, amivosis, tryptophane, tyrosin
aminoacetic acid (am-in-o-ā-se'tik) (glycocoll, glycine) One of the normal constituents of the bile

It may be prepared by boiling gelatin with hydrochloric acid. A light, white, odorless powder with sweetish taste

Uses. In certain cases of myasthenia gravis, and in progressive muscular atrophy

DOSAGE. Average, $\frac{1}{2}$ drams (5 grams) *t. i. d.*

amino acidemia (amino acid + *G. ama*, blood) Amino acids in the blood

amino'lysis [amino + *G. lysis*, a loosening] Splitting of amines

aminophyllin(e) (a-min'fē-flī'n) Mixture of theophylline inducing diuretic action and acting as a myocardial stimulant. See *Theophylline*

DOSAGE. $1\frac{1}{2}$ gr (0.1 Gm)

aminopyrine (am'in-o-pl'rin) (Pyramidon) USP

ACTION AND USES. Antipyretic and analgesic similar to antipyrine but with more lasting effects and effective in smaller doses. Same precautions should be used as in other antipyretics.

DOSAGE. 0.3 to 0.4 Gm. (5 to 6 gr)

INCOMPATIBILITIES. Sweet spirit of niter and tannic acid

amino'sis (am-in-o'sis) [amino + *G. -osis*, state]. Production or presence of amino acids in the blood.

aminosuria, aminuria (am-in-o-su'ri-ā, -u'ri-ā) [*u* + *G. ouron*, urine]. Amines in voided urine.

amito'sis [*G. a-*, priv + *G. mitos*, a thread] Multiplication by division or cleavage of cells. Cell and nucleus division without changes in the nucleus, occurring during regular processes of cell reproduction

amitotic (ah-mit-ot'ik). Characterized by amitosis

am'meter. PT. An instrument calibrated to read in amperes the strength of a current flowing in a circuit

For medical purposes the ampere is too large a unit, hence, it is divided into a thousand parts or milliamperes. A meter calibrated to read in milliamperes is called a *milliammeter*. See *ampere*.

ammo'e'mia. Ammonia in the blood due to urea decomposition. SYN *ammoniemia*

ammon'ia [Ammon, Egyptian deity] 1. A gas formed by decomposition of nitrogen-containing substances

Its formula, NH_3 , relates it to many poisonous substances (see *amines*) but also to the proteins and to many useful chemicals. Dissolved in water, it neutralizes acids and turns litmus blue

2. Water charged with the same is called *ammonia water*

a., aromatic spirit of. A stimulant or an inhalant

DOSAGE. $\frac{1}{2}$ to 2 drams by mouth

a. water. Solution of ammonia in water.

DOSAGE. (10%) 15 m (10 cc).

ammo'niac. Ammoniacal

ammon'iacal. Having the characteristics of or pert to ammonia

ammon'iated. Containing ammonia

ammoniemia (am-in-o-ni-e-mi-ā) [ammonia + *G. ama*, blood] Ammonia in the blood due to decomposition of urea. SYN Weak pulse, subnormal temperature, gastroenteric disturbances, coma

ammonium carbonate (am-o-ni'um) Occurs as hard mass with strong odor of ammonia. On exposure to air loses CO_2 and ammonia

INCOMPATIBILITIES. Acids

ACTION AND USES. Stimulating expectorant.

DOSAGE. 0.3 Gm. (5 gr.)

a. chlor'ide. White crystalline powder without odor

INCOMPATIBILITIES. Alkalal hydroxides and carbonates

ACTION AND USES. As an expectorant and diuretic

DOSAGE. 0.3 Gm. (5 gr.) As a diuretic $1\frac{1}{4}$ to 4 drams (5 to 15 Gm)

INCOMPATIBILITIES. Magnesium sulfate, sodium bicarbonate

a. hydrox'ide. This is a solution of ammonia gas in water, used about the house for cleaning purposes, used in artificial ice, and electric refrigerators.

POISONING FROM. Usually results from the effects of gas. SYN It has irritating effects upon eyes and respiratory tract, burning, choking, increased salivation, painful swelling and vomiting.

F. A TREATMENT AS IN potassium hydroxide poisoning. Weak vinegar, citrus fruit juices followed by oil, milk, and butter

ammoniu'ria (am-o-ni-u'ri-ā) [ammonia + *G. ouron*, urine] An over amount of ammonia in the urine

amnesia (am-ne'zi-ā) [*G. forgetfulness*]. A loss of memory.

This may be for recent experiences, those subsequent to the disease, and is then termed *anterograde*. When it involves more remote memory stores it is called *retrograde*. Amnesia is often applied to episodes during which the patient forgets his identity, though he may conduct himself properly enough, and following which no memory of the period persists. Such episodes are often hysterical, sometimes epileptic, while trauma, senility, alcoholism, and other organic reaction types account for a smaller number.

PSY In epilepsy it occurs because of feeble impressions. Partial a. is seen in confusional insanity, lack of retention in senility, and in hysteria there may be lack of recall. See *aphasia*, *ataxia*, *amnesia*, *labor*.

a., auditory. Loss of memory as to word meanings.

a., periodic. A occurring in a period of double consciousness.

a., traumatic. A. caused by injuries.

a., visual. Inability to remember the appearance of objects that have been seen or to be cognizant of printed words.

amnesic (am-ne'sik) Pert. to amnesia.

a. aphasia. Loss of memory. **SYN:** *amnesia*.

amnesic (am-nes'tik) Amnesic, or causing amnesia.

amniochorial (am'ni-o-ko'ri-äl). Rel. to both amnion and chorion.

am'niochorion'ic [G *amnion*, amnion, + *chorion*, skin] Rel. to both amnion and chorion. **SYN:** *amniochorial*.

am'nioclept'sis [amnion + *kleptein*, to do secretly] Gradual unperceived loss of amniotic fluid.

amniog'raphy [' + G *graphein*, to write]. Radiography of amniotic sac.

am'nion [G little lamb] Bag of waters. The inner of the fetal membranes, a thin, transparent sac which holds the fetus suspended in the *liquor amnii*, or amniotic fluid, *q. v.*

This liquid equalizes the pressure about the embryo and keeps it moist. It also acts as a pressure buffer. Premature rupture of the amniotic sac causes a dry birth. See "amnio-" words; *fluid*, *amniotic*, *liquor amnii*, *oligohydramnios*.

amniorrhea (am-ni-or-re'ä) [' + *roia*, flow] Premature escape of the *liquor amnii*.

amniorrhesis (am-ni-o-rek'sis) [' + *rêsis*, rupture] Rupture of the bag of waters, or amnion.

amnios (am'ni-os). The amnion, or the *liquor amnii*.

amniotic (am-ne-ot'ik). Pert. to the amnion.

a. fluid. *Liquor amnii*. The liquid or albuminous fluid contained in the amniotic sac, *q. v.* This fluid is transparent and almost colorless, assuming a milky appearance at full term. It varies from a few ounces to three or four pints. The principal purposes of this fluid are (a) to protect the fetus from blows, etc., that may be inflicted on the mother; (b) to allow the fetus freedom of motion; (c) to provide the fetus with water; (d) during labor and during each contraction of the uterus, to distend the sac at point of least resistance, which is in the cervical canal, thereby forming a pouch which assists in the dilation of the cervix; (e) when the membranes rupture, this fluid flushes the parturient canal, thereby cleansing, lubricating, and disinfecting it.

a. sac. The bag or sac formed by the amnion.*

am'niotin. Commercial estrogenic hormone product.

amniotitis (am-ni-o-ti'tis) [G *amnion* + *-itis*, inflammation]. Inflammation of the amnion.

amniotome (am'ni-o-töm) [' + *tomê*, cutting]. Instrument for puncturing fetal membranes.

amnitis (am-ni'tis). Inflammation of the amnion. **SYN:** *amniotitis*.

amok (am-ok') [Malay *amok*, furious]. A state of murderous frenzy.

amor (am'or) [L] Love.

a. insanus [L *mad*]. Unrestrained libido in the insane. **SYN:** *erotomania*.*

a. lesbicus [L *Lesbia*, fem. name]. Urningism* as practiced by the female sex. Sapphism.* Lesbianism.* It is less common than urningism among males. It is more frequent among prisoners. Intense jealousy and morbid love seem more important to such perverts than does tribadism.* *q. v.*

a. sul [L self] Vanity, love of self.

a. veneris [L *Venus*]. The clitoris.

amoralia (a-mô-ra'li-ä) [G *a-*, priv. + *L. moralis*, moral] Moral imbecility.

amoralis (a-mo-ra'lis) A moral imbecile.

amorphia (a-mor'fi-a) [G *a-*, priv. + *morphê*, form]. Without form. **SYN:** *amorphism*.

amorphism (a-mor'fizm). State of being without definite form. **SYN:** *amorphia*.

amorphous (a-mor'fus). Without definite structure.

amotio (am-o'shi-o) [L *amovere*, to move from] A detachment.

am'pelother'apy [G *ampelos*, grape vine, + *therapeia*, treatment] Grape cure.

amperage (äm-per'ä) PT Strength of the electrical current expressed in amperes or milliamperes.

ampere (äm'për) PT Practical unit of intensity of electric current, which is produced by 1 volt acting through resistance of 1 ohm.

The international ampere is practical equivalent of the unvarying current which deposits silver at the rate of 0.001118 Gm. per second, when sent through a standard solution of nitrate of silver in water.

a. meter. Instrument denoting in amperes the strength of a current. See: *ammeter*.

amperemeter (äm'per-me'ter) [*ampere* + G *metron*, measure] Apparatus for measuring amperage of an electric current.

amphet'amine sul'fate. Synthetic white powder employed as a vasomotor stimulant. **SYN:** *benzedrine sulfate*.

amphi- [G.]. Prefix. On both sides, as *amphibious*. **CHEM** Denotes certain positions or configurations.

amphiarthrosis (am-fi-ar-thro'sis) [G *amphi*, on both sides, + *arthrosis*, joint]. A form of articulation intermediate between diarthrosis and synarthrosis, in which the articulating bony surfaces are separated by an elastic substance to which both are attached, so that the mobility is slight, but may be exerted in all directions. The articulations of the bodies of the vertebrae are examples.

amphiaster (äm'fi-äs'ter) [' + *astêr*, star] Double star found during mitosis.*

Amphib'ia [G. *amphibios*, double life]. A class of animals which live on land and in water.

amphiblas'tula [G. *amphi*, both, + *blas-tula*, little sprout] A morula formed by unequal segmentation

amphiblestria'tis [' + *blēstron*, fish net, + *-itis*, inflammation] Inflammation of retina. SYN *retinitis*.

amphibol'ia [G. *amphibolos*, doubtful] The uncertain period of a fever, or disease.

amphibolic (am-fi-bol'ik). Uncertain, ambiguous

a. period, or stage. The critical period of a disease when the outcome cannot be certain

amphib'olous. Changeable, amphibolic

amphicelous (am-fi-sel'us) [G. *amphi*, both, + *kēlos*, hollow] Concave on each end

amphicentric (am-fi-sen'trik) [' + *ken-tro*, center] Centering at both ends

amphichroic, amphichromatic (am-fi-kio'ik, -kro-mat'ik) [' + *chroma*, color]. 1 Turning red litmus paper blue, and blue, red 2 Reacting both as an acid and an alkali

amphicra'nia [' + *kranion*, skull] Pain on both sides of head

am'phicreat'ine, amphicreat'inine. A leukomaine formed in muscles

amphicyte (am-fi-sit) [G. *amphi*, both, + *kutos*, cell] One of the capsule cells enveloping the body of ganglionic neurons

amphicyt'ula [G. *amphi*, both, + *L. cytula*, little cell] Impregnated ovum having unequal segmentation of the vitellus

amphidiarthrosis (am-fi-di-at-thro-sis) [' + *diarthrosis*, articulation] An articulation with amphiarthrosis and diarthrosis, such as that of the lower jaw

amphigast'ula [' + *L. gastrula*, little stomach] The human ovum in advanced gastrula stage

amphigony (am-fi-gō-ni) [' + *gonos*, begetting] The sexual process

amphimixis (am-fi-miks'is) [' + *G. mixis*, mingling] 1 Sexual reproduction 2 Psy Pre genital energies and mechanisms devoted to the genitals during psychosexual maturity

am'phimor'ula [' + *L. morula*, little mulberry] The morula in ovum with unequal composing cells

amphipyrenin (am-fi-pi'ren-in) [' + *pyrenos*, stone of a fruit] The basophile substance of the nuclear membrane of a cell

amphithe'atre [' + *theatron*, theater] An operating room with seats arranged around it for students and others

amphitrichate, amphitrichous (am-flit'ri-kāt, -kus) [' + *thrix*, hair] Pert. to certain organisms having flagella, or a flagellum at both ends [*diplopia*]

ampho- [G]. Prefix both, as *ampho-am'phodiplo'ia* [G. *ampho*, both, + *diploos*, double, + *ōps*, vision] Double vision in each eye

amphojel (am-fō-jel) [Alumina gel] A colloidal suspension of hydrated alumina, capable of neutralizing the free hydrochloric acid in not less than 12 volumes of gastric juice of average strength.

Uses. In control of hyperacidity, and as an absorbent

DOSAGE: Average, 1 teaspoonful

am'phopep'tone. First peptone formed by tryptic digestion of protein

amphophil, amphophilous (am-fo-flī, am-fō'il-us) [G. *amphō*, both, + *philos*, fond] Having affinity for either acid or basic dyes

amphor'ic [L. *amphora*, jar]. Pert. to a sound as that caused by blowing across the mouth of a bottle, a resonance; a

cavernous sound heard on percussion of a pulmonary cavity.

amphoric'ity. Producing amphoric sounds.

amphoriloquy (am-fō-ri'l'ok-wī) [L. *amphora*, jar, + *loqui*, to speak]. Having amphoric sounds in speaking

amphoroph'ony [' + *G. phōnē*, voice] Amphoric voice sound

amphoteric, amphot'eros [G. *amphoterōs*, both]. Affecting both red and blue litmus

a. compounds. Those which may act as a base or an acid, i. e., protein

a. reaction. A double reaction of certain liquids which turns red litmus paper blue, and blue, red

amphoterism (am-fō'ter-iz-m) Having both acid and basic properties

ampho'terodiplo'ia [G. *amphoterōs* both, + *diploos*, double, + *ōps*, vision] Double vision in each eye SYN *amphodiplopia*.

amphoton'ic [G. *ampho*, both, + *tonos*, tone] Pert to both vagotomy and sympathectomy

ampho'ony [' + *tonos* tone] Tonicity of the sympathetic and parasympathetic systems

amplexatio (am-pleks-a'shi-ō) [L. *amplectare*, to embrace] Sexual intercourse, coitus

ampliation (am-pli-a'shun) [L. *ampliare*, to make wide] Distention of a part or cavity

amplifica'tion [L. *amplificare*] 1 Enlargement of visual area in microscopy 2 Magnification of sound in telephony

amplifier. That which increases magnification of vision or sound

am'plitude [L. *amplitudo*] 1 In physics, the distance between extreme limits of an oscillation or vibration. Thus, the a of vibration of a pendulum is the chord of the arc through which it oscillates, the a of vibration of a wave is the distance from the crest to the trough of the wave

2 Of the pulse, its fullness, i. e., the extent of dilatation of the artery at each impulse of the heart

a. of accommodation. Total range of eye's accommodative power

ampoule, ampule (am'pōōl) [L. *ampulla*] A small glass that can be sealed and its contents sterilized. This is a French invention for containing hypodermic solutions. SEE *serule, ampulla*

ampul'a (pl. *ampullae*) [L. little jar] 1. Sac-like dilatation of a canal, as the mammary lactiferous ducts, or semicircular canals of the ear 2 A small, hermetically sealed flask containing a solution for parenteral use, an ampoule

a., Lieberkuhn's. Lacteal's blind end in intestinal villi [the peenial flexure]

a. of rectum. Portion situated above

a. of vagina. Upper vaginal area

a. of vas deferens. A underneath bladder near the termination of the vas.

a. of Vater. Enlargement at gateway of common bile duct and pancreatic duct into the duodenum

ampulli'tis [' + *G. -itis*, inflammation]. Inflammation of any ampulla, esp. dilated extremity of *vas deferens*.

amputation (am-pu-ta'shun) [L. *ambi*, around, + *putāre*, to trim] Surgical removal of a diseased member, part, or organ, or operation for correction of a deformity or malformation, or injury, or incision for drainage or treatment

a., primary. Before inflammation sets in

a., secondary. During period of sup-puration.

amuck' [Malay *amok*, furious]. State of murderous frenzy **SYN** *amok*.

amusia (a-mu'si-ä) [G *amousois*, unmusical]. Music-deafness, inability to produce or comprehend music, as loss of the ability to play a musical instrument. **ETIO**. Brain lesion, but cause not clearly understood.

Amussat's operation (am-u-sä's). One for formation of an artificial anus, by lumbar colotomy in ascending colon.

amychophobia (ä-mi-ko-fö'bi-a) [G. *amychē*, scratch, + *phobos*, fear]. **PSY**. Morbid fear of being scratched, fear of the claws of any animal.

amyctic (am-ik'tik) [G *amytikos* mangling]. 1 Irritating, caustic. 2 A caustic or corrosive agent.

amyeloneuria (ä-mi-el-o-nu'ri-ä) [G *a-*, priv. + *myelos*, marrow, + *neuron*, nerve]. Spinal cord paresis.

amyelotrophy (ä-mi-el-o'tro-fi) [G *a-*, priv. + *myelos*, marrow, + *atrophia*, atrophy]. Spinal cord atrophy.

amygdala (a-mig'da-lä) [L from G *amugdalē*, an almond]. 1 Tonsil. 2 A mass of gray matter in the ant. portion of the temporal lobe.

amygdalectomy (a-mig-dal-ek'to-mi) [+ G *ektomē*, excision]. Excision of a tonsil. **NP** **SEE** *tonsillectomy*.

amygdaline (a-mig-dal-in) 1 Pert to a tonsil. 2 A bitter tasting glucoside in bitter almonds and cherry laurel leaves. **a. fissure**. One on ventral side of temporal lobe, *incisura temporalis*.

amygdalitis (a-mig-dal-i'tis) [L *amygdala*, almond, + G *-itis*, inflammation]. Inflammation of a tonsil, tonsillitis.

amygdaloid (a-mig'da-loid) [+ G *eidos*, resemblance]. Resembling a tonsil or an almond.

a. fossa. A depression for the tonsil.

a. tubercle. A projection from the middle cornu of the lateral ventricle, marking area of the amygdaloid nucleus.

amygdalolith (a-mig'da-lo-lith) [+ G *lithos*, stone]. Stone in a distended crypt of a tonsil.

amygdalop athy [+ G *pathos*, suffering]. Any disease of a tonsil.

amygdalothrypsis (a-mig'dal-o-thrip'sis) [+ G *thrypsis* a crushing]. Crushing of a tonsil followed by excision.

amygdalotome (a-mig-dal-o-tom) [+ G. *tomē*, a cutting]. Instrument for excision of a tonsil.

amygdalotomy (a-mig-da-lot'o-mi) [+ G *ektomē* excision]. Removal of a portion of the tonsils.

amyl (am'il) [L *amylum*, starch, + G *ylē*, material]. A hypothetical univalent radical, C₂H₁₁, nonexistent in a free state.

amylaceus. Starchy.

amylase (am'il-laz) [L *amylum*, starch, + G *-asis*, pert to a colloid enzyme]. A ferment or amylolytic enzyme of the saliva, pancreatic juice and intestinal juice that hydrolyzes starch, producing achroodextrin and maltose.

These products are later acted upon by the maltase of the intestines and converted into dextrose before absorption.

Amylase is more powerful than ptyalin and it acts on uncooked as well as cooked starch. **SEE** *antiamylase*.

Examples of amylase are *ptyalin* and *amylotin*. **SEE** *enzymes*.

amylemia [+ G *aima*, blood]. Hypothetical presence of starch in the blood.

amylifer (am'il-in). 1 Part of starch soluble in water. 2 A monacid base. The group C NH₂ NH₂. **SYN** *amidin*.

amyl nitrite (am'il n'i'trite) A clear yellowish liquid. Etherial odor.

ACTION AND USES. Vasodilator with quick action but short duration. Used also in bronchial asthma.

DOSAGE. 3 m. (0.2 cc.) by inhalation.

amylodextrin [L *amylum*, starch, + *dextrin*]. Soluble substance produced during the change of starch into sugar.

amylodyspepsia [+ G *dys*, bad, + *pepsis*, digestion]. Inability to digest starchy foods.

amylogen (am-il'o-jen) [+ G *gennan*, to produce]. Soluble starch.

amylogenesis (am-il-lo-jen'es-i) [+ G. *genesis*, production]. The production of starch.

amylogenic (am-il-o-jen'ik) [+ G *gennan*, to produce]. Starch-producing.

amylloid [+ G *eidos*, resemblance]. Starch-like, somewhat resembling hyalin. **SEE** *chitinous*.

a. kidney. Enlarged, firm, smooth kidney usually associated with amyloid diseases of spleen or liver.

Error. Found in lung; continued bone suppuration or may be due to syphilis.

SYM. Face pale, waxy skin which may be edematous. Liver and spleen may also be enlarged. Not tender under pressure. Diarrhea if intestines are involved. Albumin, hyaline and waxy casts in urine. [and organs]

amyloidsis. Amyloid deposit in tissues.

amyolysis (am-il-o-lis-i) [+ G *lysis*, solution]. Changing of starch into sugar in the process of digestion.

amylolytic (am-il-o-lit'ik) 1 Having the qualities of a hydrolytic enzyme. 2. Pert to a starch-splitting enzyme converting polysaccharides* into disaccharides* such as ptyalin, q.

a. enzyme. A ferment that hydrolyzes starch, producing achroodextrin and maltose. **SYN** *amylase*.

amylor'sin [L *amylum*, starch, + G *opsis*, appearance]. Diastatic enzyme in pancreatic juice which changes starch into achroodextrin and maltose. **SEE** *digestion*, *duodenum*, *enzymes*.

amylase (am'il-lözi). A group of carbohydrates containing starch, cellulose, and dextrin. **SEE** *glycose*, *saccharose*.

amylosis (am-il-o'sis) [G *amylon*, starch]. Albuminoid degeneration of the cells.

amylouria [amylase + G *ouron*, urine]. Amylose in the urine.

amylum (am-il'um) [L]. Starch.

amyluria [L *amylum*, starch, + G *ouron*, urine]. Starch in the urine.

amycardia (ä-mi-o-kar'di-ä) [G *a-*, priv. + *mys*, muscle, + *kardia*, heart]. Weakness of the heart muscle. **SYN** *Myasthenia cordis*.

a'myon [G. *a-*, priv. + *mys*, muscle]. Absence of muscular tissue.

amyoastasia (am-i-o-stä'si-ä) [+ + + *stasis*, standing]. Difficulty in standing because of lack of coordination or because of muscular tremors. **SEE** *tremor*.

amyoasthenia (am-i-os-thē'ni-ä) [+ + + *sthenos*, strength]. Lack of muscular tone or power.

amyoasthenic. Pert to muscular weakness.

amyoataxy (am-i'o-taks-i) [G *a-*, priv. + *mys*, muscle, + *taxis*, order]. Muscular ataxia.

amyoatonia (am-i-o-to'ni-ä) [+ + + *tonos*, tone]. Failure of muscular tone.

a. congenita. Thomsen's disease, a disease, usually congenital and hereditary, characterized by tonic spasm and rigidity of certain muscles when an attempt is made to move them after a

period of rest or when mechanically stimulated. The stiffness disappears as the muscles are used.

amyotrophia (am-i-o-tro'fī-a) [" + " + *trophē*, nourishment] Muscular wasting. [muscular atrophy]

a., progressive spinal. Progressive

amyotrophic (am-i-o-tro'fīk). Pert. to atrophy.

a. lateral sclerosis. A progressive muscular atrophy. *SYM* Spastic irritability of muscles, increased reflexes.

amyotrophy (am-i-ot'ro-fi). Muscular wasting. *SYN* *amyotrophia*.*

amylous (ā-mī'ūs) [G *a-*, priv + *mys*, muscle] 1 Congenitally lacking in muscular tissue 2 Weak, deficient in muscular strength 3. Without muscle; fleshless.

amylal (am'it-al). A derivative of barbitol

ACTION AND USES. Sedative and hypnotic in control of insomnia and as a preliminary to surgical anesthesia.

Dosage. As sedative 1 3 to 3/4 gr. (0.02 to 0.05 Gm.). Hypnotic 1½ to 5 gr. (0.1 to 0.3 Gm.)

amylxia (a-miks'ī-a) [G *a-*, priv. + *myxa*, mucus] Deficient mucous secretion

amylorrhoea (a-miks-or-mī'ā) [" + " + *roia*, flow]. Lack of normal secretion of mucus

an- [G] Prefix negative, without or not, as *anemia*

An. *SYMS.* Actinon.

A. N. A. Abbr. *American Nurses Association*.

ana (an'ā) [G] Meaning "one of each" used in writing prescriptions as *āā*

SEE *prescription*.

anab'asis [G *anabaincin*, to go up]. Period of increase in a disease

anabatic (an-ā-bat'īk). Increased severity, pert to anabasis.

anabio'sis [G. *ana*, again, + *bios*, life]. Revival of a body which seemed lifeless. *SYN* *resuscitation*.

anabiotic (an-ā-bi-ot'īk) Restorative Any agent that resuscitates or restores

anabole (an-ab'o-le) [G a building up] Vomiting, regurgitation; expectoration

anabolic. Promoting or pert. to anabolism

a. nerve. Nerve controlling building processes

anab'olin. A product of anabolism

anabolism (an-ab'o-lizm) [G *anabolē*, a building up] The building up of the body substance, the constructive or synthetic chemical reactions included in metabolism, a process by which a cell takes from the blood the substance required for repair and growth, building it into a cytoplasm, thus converting a nonliving material into the living cytoplasm of the cell.

RS *anabolin*, *anastate*, *assimilation*, *catabolism*, *metabolism*, *nutrition*, *nutritorium*, *synthesis*.

anabrosis (an-ab-ro'sis) [G an eating up]. Superficial ulceration

anacampsis (an-ā-kamp'sis) [G. *anakampsis*, a bending back] A flexure

anacamp'tics [G. *anakamptein*, to bend back] Study of reflection of light or sound.

anacamp'tometer (an-a-camp-tom'et-er) [" + *metron*, measure] Device for measuring reflexes.

anacatharsis (an-ak-ath-ar'sis) [G. *anakatharsis*, upward cleansing]. Vomiting; expectoration.

anacathar'ic. That which causes vomiting.

anachlorhydria (an-ā-klor-hid'ri-ā). Absence of free hydrochloric acid in the gastric juice. *SYN*, *achlorhydria*.*

anacid (an-as'id) [G. *an*, priv., + *L. acidum*, sour] Subacid, slightly acid; lacking in acidity.

acidity (an-as-id'it-i). Abnormal lack or deficiency of acidity

anac'lasm'eter [G. *anaklasis*, refraction, + *metron*, measure] Instrument for measuring refraction of eyes

anac'lisis (an-ak'lis-is) [G. *anaklisis*, a lying back] Reclining

anac'lific choice. An early expression of psychosexual development, the opposite of narcissism,* in which the object of one's love is influenced by dependence upon the mother or whoever is responsible for the child's early care, more or less inhibiting other expressions of the sex instinct

anacroasia (an-ā-kro-a'sī-ā) [G *an-*, priv. + *akroasis*, hearing] Inability to understand spoken words

anacrotic (an-a-krot'īk) [G *ana*, up, + *krotos*, stroke] 1 Pert to a pulse with more than one expansion of the artery. 2 Pert to two heartbeats traced on the ascending line of a sphygmogram. *SEE*, *pulse*.

a. limb. Up-stroke of a pulse wave.

a. wave. A wave on the up-stroke of a pulse wave

anac'rotism. Existence of a double beat on ascending line of sphygmogram. *SYN* *anadicrotism*.*

anacusia, **anacu'sis** (an-ak-oo'sī-ā, -sis) [G *an*, priv + *kusis*, hearing] Complete deafness

anadenia (an-ad-e'nī-ā) [" + *aden*, gland] 1 Lowered glandular function. 2 Chronic lack of gastric secretion

anadicro'tic. 1 Pert to a pulse with more than one artery expansion 2 Pert to two heartbeats traced on the ascending line of a sphygmogram. *SYN* *anacrotic*, *q.v.*

anadicrotism (an-ā-dik'ro-tizm) [G *ana*, up, + *dikrotos*, double beating] Existence of a double beat on ascending line of the sphygmogram

anadipsia (an-a'dip'se-ā) [G *ana*, intensive, + *dipsa*, thirst] Intense thirst.

anadrome (an-ad'ro-me) [G *anadromos*, a running upward] 1 Ascending pain. 2 Globus hystericus 3 Upward determination of the blood

anaerobe (an-a'er-ōb) [G *an*, priv. + *aer*, air, + *bios*, life] A microorganism which thrives best or lives only without oxygen

anaerob'ic. Having the power to use oxygen for metabolism from oxygen compounds, having the ability to live without air as some microbes

anaerobiosis (an-a'er-o-bi-o'sis). Life in an oxygen-free atmosphere.

anaerobiotic (an-a'er-o-bi-ot'īk) Able to exist without free oxygen

anagnosasthenia (an'ag-no-sas-the'nī-ā) [G *anagnōsis*, reading, + *asthenia*, weakness] Distressing symptoms when trying to read

anagoge, **anagogia** (an-ā-go'je, -jī-ā) [G. *anagōgē*, a leading up]. Vomiting

anakates'thesia [G *ana*, up, + *kata*, down, + *asthesis*, sensation] A sensation as of hovering or bearing down upon one.

anaku'sis. Complete deafness. *SYN*, *anacusia*.*

anal (a'nal) [L. *anus*, a ring] Rel to the anus or outer rectal opening.

a. canal. The terminal portion of the colon, its external aperture being the

anus This is protected by an internal and external sphincter muscle, and remains closed except during defecation. It is about 2.5 to 3.8 cm. (1½ inches) long.

a. erotic (e-ro'tik). *Psy* One who indulges in anal erotism,* or that which pertains to it.

a. e. character. One who has persisted in anal erotism after childhood. *Syn* Orderliness in all habits, obstinacy, sometimes the manifestation of revenge, spite, and miserliness *See: erotism*

a. reflex. Contraction of anal sphincter following irritation of skin about anus *Reflex* is lost in lesions of posterior columns of cord and is exaggerated in anal fissures

analepsis (an-al-ep'sis) [*G* *analepsis*, a taking up] Gaining strength after an illness *Restoration* to health 2 Epilepsy accompanied by gastric aura 3 Suspension as in a swing

analeptic (an-a-lep'tik) [*G* *analeptikos*, restorative] 1. Invigorating 2 A restorative 3 That which restores health

analgesia (an-al-je'z-l-ä) [*G* *an-*, priv + *algos*, pain] Absence of normal sense of pain *See* *alganesthesia*, *Libor*.

a. algera, **a. dolorosa**. Severe pain with loss of sensitivity in a part

a. paretic. Complete a of upper limb, in conjunction with partial paralysis

analgesic (an-al-je'sik) A medicine which relieves pain when given by mouth

analgetic (an-al-je'tik) Analgesic, producing freedom from pain, or an agent that lessens pain

anaigia (an-al'ji-ä) [*G* *an-*, priv + *algos*, pain] State of being without pain

analgic (an-al'jik) Without pain

analogue (an-al'og) [*G* *analogos*, proportionate] An organ or part similar in function, but differing in structure

analosis (an-al-o'sis) [*G* *analosis*, expenditure] Wasting away, atrophy

analsand (an-al't-zand) *Psy* A patient who is being psychoanalyzed

analysis (ä-näl't-sis) [*G* *analysis*, a dissolving] 1 Separation of anything into its constituent parts 2 *CHEM* Determination of, or separation into, its constituent parts of a substance or compound. 3 *Psy* Diagnosis and treatment

a., qualitative. Determining the nature of the elements in a substance

a., quantitative. Determining the nature and the quantity of elements in a substance

a., spectrum. Determining the nature of a gas by use of the spectroscope.

analyst (an'al-ist) One who analyzes

analytic (an'al-it'ik). Pert to any analysis

analyze (an'al-iz). To make an analysis

anamnesis (an-am-ne'sis) [*G* *anamnēskēn*, to recall to memory]. 1 Recollection, faculty of remembering 2 That which is remembered 3 The personal and case history of a patient and his family history. *See* *catamnēsis*.

anamnes'ic. 1 Pert to previous medical history of patient. 2 Assisting the memory

anamniot'ic [*G* *an-*, priv. + *amnion*]. Without an amnion

ananabasia (an-an-ab-a'zi-ä) [*G* *an-*, priv + *anabasis*, an ascending]. An abulia in which the person seems unable to ascend heights

anaphylaxis (an-an-ä-fl-lak'sis) [*G* *an*, priv. + *a-*, priv. + *phylaxis*, protec-

tion] That which neutralizes anaphylaxis*

anastasia (an-an-as-la'zi-ä) [*G* *an-*, priv + *anastasis*, a rising up] An abulia in which the person is unable to rise from a sitting position

anandria (an-an-dri-ä) [*+* *aner-*, *andr-*, man] Impotence, lack in virility.

angioplas'ia [*+* *aggeion*, vessel, + *plassein*, to form]. Imperfect vascularization of a part

angioplas'tic. Pert to imperfect development of the vascular system.

anapeiratic (an-ä-pi-rat'ik) [*G* *anapeirasthai*, to try again] Pert. to a nervous affection arising from excessive muscular activity, as an occupational neurosis [*muscular activity*

a. cramp. One arising from excessive **a. c., cyclists.** Pain in scrotum, perineum, and thighs from excessive riding.

a. c., occupational. Writer's cramp

a. c., professional. Spasmodic disorder affecting groups of muscles used in special work or movements

anaphase (an'a-fäz) [*G* *ana*, up, + *phainein*, to appear] A stage in mitosis when the newly divided chromosomes move towards the opposite poles of the chromatic spindle to form the diaster.

anaphia (an-ä-fi-ä) [*G* *an-*, priv + *aphē*, touch] 1 Abnormal sensitiveness to touch 2 Defective sense of touch 3 Palpation that reveals no diagnosis

anaphoresis (an-ä-for-e'sis) [*+* *phoresis*, sweating] 1 Insufficient activity of the sweat glands 2 Transmission of electropositive bodies into tissues by passage of electric current, the flow toward the positive pole

anapheria (an-ä-for'i-ä) [*G* *ana*, up, + *pherein*, to carry] Tendency of eyeballs to turn upward *Syn* *anatrophia*

anaphrodisia (an-ä-ro-diz'i-ä) [*G* *an-*, priv + *Aphroditē*, goddess of love]. Diminished or absent sex desire

anaphrodisiac. An agent that will depress the sexual function *Ex* *bromides*, *opium*, *monobromated camphor*.

anaphrodite (an-äfro-dit) One with an impairment of sexual desire or with an absence of it

anaphylac'tia [*G* *an* again, + *a-*, priv. + *phylaxis*, protection] Any anaphylactic condition

anaphylactic (an-ä-fl-lak'tik). Pert. to increasing susceptibility to an infection.

a. shock. Intense symptoms often accompanied by a rash, as the result of a foreign protein injection *See* *shock*.

anaphylactin (an-ä-fl-lak'tin) The substances supposed to produce hypersensitivity following injection of a foreign protein.

anaphylac'togen [*G* *an*, again + *a*, priv. + *phylaxis*, protection, + *gennan*, to produce] That which produces anaphylaxis or anaphylactin [*ducing* anaphylaxis

anaphylactogen'esis. The process of producing anaphylaxis (an-ä-fl-lak-to-jen'ik). Producing anaphylaxis or the agent producing anaphylactic reactions.

anaphylatox'in [*anaphylaxis* + *G*, *tozikon*, poison] The poisonous element in anaphylaxis

anaphylatox'is. Anaphylatoxic reaction

anaphylaxis (an-ä-fl-lak'sis) [*G* *an*, again, + *a-*, priv + *phylaxis*, protection] The opposite of *prophylaxis** A condition produced artificially and experimentally in lower animals and dependent upon well defined antigen-antibody reaction. A hypersensitive state of the body to a

foreign protein or a drug, so that the injection of a second dose brings about an acute reaction, known also as *protein sensitization* and *serum sickness*. The term implies symptoms severe enough to produce serious shock.

The reaction does not occur if the initial dose has been administered not more than ten days previously. To prevent anaphylaxis the second dose of serum should be given gradually, i. e., it must be divided into small doses, with a short interval between. Some doctors prefer to give half the dose, and the remainder after half an hour's interval.

Such diseases as asthma, hay fever, urticaria (hives) are thought to be of an anaphylactic nature, being caused by the pollen of some plants and flowers, to which the individual may have become sensitized. Sometimes marked a following a blood transfusion, esp if the blood is not transferred immediately after its withdrawal from the donor.

SYM (a) *Mild* a Fever (slight), redness of skin, itching, urticaria (b) *Severe* a Dyspnea, violent cough, chest constriction, cyanosis, fever, skin eruption, pulse variations, collapse.

PROG Favorable if cause is removed early. Otherwise, may lead to death.

TREATMENT Hypodermic of some strong heart stimulant such as atropine or adrenalin.

NP Applications of heat, oxygen inhalations, treatment for shock.

RS *anaphylaxis*, *anaphylactia*, *anaphylactogen*, *anaphylactogenesis*, *anaphylatoxin*, *anaphylatoxin*.

anaplasia [G *ana*, again, + *plasis*, a molding] 1. Reversion of cells to a more embryonic type. 2. Alteration in cells which produces malignancy.

anaplas'fic. Pert to anaplasia or restoration of lost part.

anaplasty (an'-plas-tī) [G *ana*, again, + *plassein*, (to form)] Grafting or restoring lost parts.

anapler'o'sis [G *anaplerōsis*, a filling up] Transplantation of tissue.

anapnea (an-ap-ne'ā) [G *anapnein*, to breathe again] 1. Respiration. 2. Regaining the breath.

anapneic (an-ap-ne'ik) Pert to anapnea or relieving dyspnea.

anapnograph (an-ap'no-graf) [G *anapnoē*, respiration, + *graphein*, to write] An instrument for measuring pressure and speed of respiration.

anapnoic (an-ap-no'ik) 1. Pert to anapnea. 2. Relieving dyspnea.

anapnom'eter [G *anapnoē*, respiration, + *metron*, measure] Instrument for measuring respiratory movements.

anapnother'apy [' + *therapeia*, treatment] Any gas treatment.

anapophysis (an-ā-pof'ī-sis) [G *ana*, back, + *apophysis*, offshoot] An accessory spinal process of a vertebra.

anap'tic [G *an-*, priv. -] *aptein*, to touch] Pert to anaphia or diminished or lost tactile sense.

anarithmia (an-ā-rith'mī-ā) [' + *arithmos*, enumeration] Inability to count or to use numbers. Etiol. Brain lesion.

anarthria (an-ar'thī-ā) [' + *arthron*, joint]. 1. Loss of motor power to speak. Etiol. Motor innervation, of muscular apparatus defect. 2. State of being without vigor. 3. Condition of being without joints. [partial aphasia]

a. centralis. A central lesion causing

a. litalis. Stammering.

anasarca (an-ā-sar'kā) [G *ana*, through-out, + *sarz*, *sarkos*, flesh]. A general dropsical condition.

Etiol. (a) A chronic heart disease, and cirrhosis of the liver. (b) A local obstruction to circulation by clots within the veins. (c) A compression from without of the veins by a tumor or swelling. (d) A defective metabolism, whereby the water of the body is not excreted, as in nephritis. (e) A severe anemia wherein the quality of the blood is greatly impoverished.

a., acute. With natural color of skin.

anasarcous (an-ā-sar'kus) Dropsical.

anaspadias (an-ā-spa'di-ās) [G. *ana*, up, + *span*, to draw] Urethral opening upon upper surface of penis.

anastal'tic [G. *anastaltikos*, checking]. 1. Very astringent. 2. Afferent.

anastasis (an-as'tas-is) [G a rising up].

1. Convalescence. 2. Resuscitation. 3.

An upward flow of body fluids.

anastate (an-as'tāt) Anything characteristic of an anabolic process.

anastole (an-as'to-le) [G *anastolē*, laying bare a wound] Shrinking away or retraction of the lips of a wound.

anastomose (an-as'to-mōs) [G *anastomōsis*, opening] 1. Opening of one vessel into another, or the union of one nerve with another. 2. To make such a connection, surgically.

anastomosis (an-as'to-mō'sis) [G *anastomōsis*] 1. A communication between two vessels. 2. The surgical or pathologic formation of a passage between any two normally distinct spaces or organs. 3. An end-to-end union or joining together or intercommunication of parts of any network or set of fibers such as nerves, or connective tissue fibers.

a., antiperistaltic. Enterostomy in which the two parts are so joined that the peristaltic wave in each part is in opposite directions.

a., arteriovenous. Anastomosis between an artery and a vein.

a., collateral. A natural one, as that of the arteries at knee joint.

a., crucial. An arterial anastomosis in the proximal part of the thigh, formed by the anastomotic branch of the sciatic and internal circumflex, the first perforating, and the transverse portion of the external circumflex.

a., Galen's. The anastomosis between the sup and inf laryngeal nerves.

a., heterocladic. Anastomosis between branches of different arteries.

a., homocladic. Anastomosis between branches of the same artery.

a., Hyrtl's. An occasional looplike anastomosis bet right and left hypoglossal nerves in geniohyoid muscle.

a., intestinal. The establishment of a communication between two portions of the intestines.

a., isoperistaltic. Intestinal anastomosis in which the two parts are so joined that the peristaltic wave in each part is in the same direction.

a., Jacobson's. The union of a nerve from the petrous ganglion with the Vidian nerve, or with the tympanic branch of the glossopharyngeal.

a., precapillary. Anastomosis between small arteries just before they become capillaries.

a., Schmidel's. Abnormal communications between the vena cava and the portal system.

a., terminoterminal. Anastomosis between the peripheral end of an artery and the central end of the corresponding vein, and between the central end of the artery and terminal end of vein.

a., ureterotubal. An anastomosis between the ureter and the fallopian tube.

anastomotic. Pert to, or marked by, anastomosis.

anatherapeusis (an-ā-ther"ā-pū'sis) [G. *ana*, up, + *therapeia*, treatment] Treatment by steadily increasing doses.

anatomic (an-ā-tom'ik) [G. *anatomnēin*, to cut up]. Of or rel to the anatomy or structure of an organism.

anatomist (an-at'o-mist). A skilled student of anatomy.

anatomy (an-at'o-mī) [G. *ana*, up, + *temnēin*, to cut] The structure or study of structure of organs or a treatise on same.

a., applied. That applied to diagnosis and treatment, esp surgical treatment.

a., comparative. Comparison of structure of different animals.

a., descriptive. Study of physical structure.

a., gross. Study of structures seen with the naked eye.

a., morbid or pathological. That of abnormal structure.

anat'opism [G. *ana*, without, + *topos*, place] Inability to conform to social usage.

anatoxic (an-a-toks'ik) [G. *ana*, priv + *toxikon*, poison] 1 Pert to anatoxin. 2 Anaphylactic.

anatoxin (an-a-toks'in) [G. *ana*, priv, + *toxikon*, poison] A modified toxin retaining the antigenic properties with lessened toxic properties.

anatricrotic pulse (an-a-tri-krot'ik) [G. *ana*, up, + *treis*, three, + *krotos*, stroke]. Three beats on the ascending curve of a pulse wave.

anatripsis (an-at-rip'sis) [G. *friction*] 1 A centripetal, or upward movement in massage. 2 Inunction. Rubbing or removing by scraping. 3 Crushing as of a stone.

anatriptic (an-at-rip'tik). An agent to be rubbed in.

anatro'pia [G. *ana*, up, + *trōpē*, a turning] Tendency of eyeballs to turn upward, anaphoria.

anaxone (an-aks'on) [G. *an-*, priv + *axon*, axis] A nerve cell having no neuraxon as those of the retina.

anazoturia (an-az-o-tu'ri-ā) [" + *a-*, priv + *zōē*, life, + *G. ouon*, urine] Without urea or nitrogenous substances in the urine.

anchone (ang-ko-nē) [G. *agchein*, to strangle]. Spasm of the throat in hysteria.

anchorage (ang'ko-rā) 1. Operative fixation of displaced viscus. 2 The part to which anything is fixed, as a tooth to which a bridge is fastened.

anconad (ang'ko-nad) [G. *ankōn*, elbow, + *L ad*, to] Toward the elbow.

anconaagra (ang-ko-nag'rā) [" + *agra*, a seizure] Gout of the elbow.

anconal, anconal (ang'ko-nal, -ne-al). Pert to the elbow.

a. fossa. Fossa olecranti.

anconeus (an-kon'e-us) [G. *ankōn*, elbow]. Short-extensor muscle of forearm arising from external condyle of the humerus and inserting on olecranon and upper fourth of shaft of ulna.

anconitis (ang-ko-ni'tis) [" + *-itis*, inflammation]. Inflammation of the elbow joint.

Ancylos'toma [G. *agkylos*, crooked + *stoma*, mouth]. Old world hookworm, a genus of nematode parasites.

A. americanum. American hookworm.

A. duodenale. The hookworm infesting man.

ancylostomiasis (ang-kil-o-sto-mi'as-is). Disease caused by hookworms in the intestine, hence commonly called "hookworm."

The eggs are discharged in the feces.

Larvae develop from the eggs. The infection is acquired through food, water, or the skin of the feet or legs, causing an eruption called "ground itch."

Sym. Anemia, weakness, and emaciation, increased leukocytes, digestive disorders.

anctroid (an'sir-old) [G. *ankura*, anchor, + *eidōs*, resemblance]. Shaped like fluke of an anchor.

Andernach's ossicles (ān'der-nākh). Small bones found in cranial sutures. **Syn.** *Wormian bones.*

Anders' disease. One in which fat occurs in painful nodules. **Syn.** *adiposis tuberosa simplex.*

Andersch's ganglion. Ganglion petrosus.

A.'s nerve. *Nervus tympanicus.*

An'dral's decu'bitus. Lying on sound side during beginning of pleurisy.

andrase (an'drāz) [G. *andrōs*, man, + *ase*] The hypothetical substance determining male sex. **Opp.** of *gynase*.

andriatrics [" + *iatriā*, medical treatment] Study of diseases of male genitals.

andro- (an'drō) [G. *anēr*, man]. A prefix signifying man.

androgallactozemia (an-dio-gal-ak-to-ze-mi-ā) [" + *gala*, milk, + *zemia*, loss] Oozing of milk from male breast.

androgen (ān'drō-jēn) [" + *gennan*, to produce] Substance producing or stimulating male characteristics, as the male hormone.

androgynē (an'dro-jīn) [" + *gynē*, woman] One possessing genital and sexual characteristics of both sexes. **Syn.** *hermaphrodite*.

androgynoid (an-dro-jī-noyd) [" + " + *eidōs*, resemblance] A male of hermaphroditic sexual characteristics and tendencies mistaken for a woman.

androgynous (an-dro-jīn-us) [" + *gynē*, woman] 1 Resembling or possessing characteristics of both sexes, hermaphroditic. 2 Without definite sexual characteristics.

androg'ynus [" + "]. A hermaphrodite.

android (ān'droyd) [G. *aner*, andr-, man, + *eidōs*, resemblance]. Shaped like that of a man, as a female pelvis.

andrology (an-dro-lō-jī) [" + *logos*, study of] Study of diseases of the male.

andromania (an-dio-ma'ni-ā) [" + *mania*, frenzy] Abnormal sexual desire in the female. **Syn.** *nymphomania*.

andromimetic (ān'drō-mīm-ēt'ik) [G. *aner*, andr-, man, + *mimetikos*, imitative]. Simulating human processes, as certain types of protozoa.

androp'athy [" + *pathos*, suffering] Any disease peculiar to the male, as *prostatitis*.

an'drophile [" + *philos*, fond of] Preferring man, as parasitic organisms.

androphobia (an-dro-fō-bi-ā) [" + *phobos*, fear] Abnormal fear of the male sex.

androphonomania (an-dro-fō-no-ma'ni-ā) [" + *phōnos*, slaying, + *mania*, frenzy]. Psychothetic homicidal trends, esp. when violent.

androsterone (än-drös'ter-ön). Testicular hormone of male sex, found in urine, which regulates changes taking place at puberty.

It is responsible for development of hair upon face, under arms, and about the pubis, development of sexual organs, voice changes, etc. **SYN** male sex hormone.

-ane. Indicating a saturated hydrocarbon.

anebous (an-e'bous) [G. *anebous*, immature] Immature

aneilema (an-i-le'mä) [G. *ana*, up, + *eilein*, to roll]. 1. Flatulence 2. Colic.

anelectrotonus (an-el-ek-trot'o-nus) [G. *ana*, up, + *elektron*, electric, + *tonos*, tension] The state of diminished irritability of a nerve or muscle produced in region near the anode during the passage of an electric current

Anel's operation (äli-nelz') Ligation of an artery immediately above and on proximal side of an aneurysm

A.'s probe. A probe for the lacrimal and nasal ducts

anemato'sis [G. *an-*, priv + *aima*, blood, + *-osis*, condition] 1. General anemia 2. Pernicious anemia

anemia (an-e'mi-ä) [G. *an-*, priv + *aima*, blood] A deficiency of red blood corpuscles, hemoglobin, or both The total volume of the blood may or may not change Classified into 3 groups, due to (1) deficiency in materials, (2) disturbed production of red blood cells within bone-marrow, and (3) excessive loss of mature erythrocytes by either hemorrhage or destruction

Etiol. Hemorrhage, acute or continuous, following infectious diseases, from cancer, toxic conditions, as those of pregnancy, jaundice, nephritis, or from absorption of toxins from foci of infection, intestinal obstruction, chemicals, congenital causes, as hemolytic a., due to poor nutrition and iron deficiency Failure to produce an anti-anemic factor which is stored in the liver

When there is a high color index, the anemia is said to be *hyperchromic*, and if low, *hypochromic*

a., aplastic. This is a form of primary anemia in which bone marrow does not supply enough new red blood corpuscles

Etiol. Due to aplasia of bone marrow and destruction of same **SYM** Insidious in onset, profound anemia, may be jaundice and pyrexia

a., chlorosis (green sickness). Form of anemia in adolescent girls, perhaps due to faulty diet during puberty

a., drepanocytic. A in which red blood cells of person assume a sickle shape, legs ulcerate

a., essential, a., idiopathic. A caused by pathology of the blood or blood-building organs **SYM** *pernicious a.*

a., lymphatic. A in conjunction with tumors of the lymph glands. **SEE** *Hodgkin's disease*.

a., macrocytic. A marked by abnormally large erythrocytes.

a., microcytic. A with abnormally small erythrocytes

a., myelopathic. A caused by disruption in bone marrow function

a., myelophthisic. A in which blood-building tissues are mechanically displaced.

a., normocytic. A in which the hemoglobin content remains normal.

a., primary or pernicious. Disease of

the blood characterized by severe progressive anemia and achlorhydria.

Etiol. Unknown or failure to produce an antianemic factor, *qv* Possible microorganism reaching the bone marrow through the circulation which may cause subacute degeneration of the spinal cord Possible absence of some hormone in gastric juice that is stored in the liver

SYM These are about same as in all anemias dyspnea, palpitation, malaise, headache, edema of ankles. In this form lemon yellow skin, diarrhea, vomiting, tongue red and sore, mouth dry. Some pyrexia. Remissions and relapses Progressively worse if untreated Diminished hydrochloric acid Diminished red blood cells, some nucleated and some larger than others Hemoglobin low.

a., secondary. A which results from an injury or disease.

a., septic. A. due to septic condition in the body

a., sickle-cell. **SEE** *drepanocytic a.*

a., splenic. A. accompanied by an enlarged spleen

NP: The nursing care of patients with anemia provides adequate rest, proper care of the skin, mouth, and teeth, proper elimination, a regulated diet, and antianemic medication prescribed by the physician

Rest Patients with mild and moderately severe anemias are usually ambulatory, but patients with very severe anemias must be kept in bed and spared all possible exertion In acute anemia due to blood loss absolute rest is essential the foot of the bed should be elevated, the patient covered with blankets, and hot water bottles applied to the extremities **Wrm.** stimulating drinks may be given if the hemorrhage is not from the gastrointestinal tract

Care of the skin Daily warm baths and light massage are beneficial In very severe anemias, special care of the buttocks and heels may be necessary to prevent the formation of pressure sores Fresh air and sunshine are indicated, but chilling should be avoided

Care of the mouth and teeth Besides ordinary oral hygiene, special care of the mouth is indicated in anemic patients who have soreness of the tongue, mouth, and pharynx Alkaline mouthwashes are beneficial, if the gums are very sore, pledgets of cotton or gauze may be substituted for a toothbrush for cleaning the teeth.

Elimination This should be maintained through proper diet

In severe anemias the function of the kidneys may be impaired, for this reason fluids should be given freely to insure an adequate output of urine

Diet The nurse's principal function in this regard is to see that the patient takes the diet which has been prescribed for him This may be a difficult task, since he often has a poor appetite and his mouth and tongue may be sore Tact and gentle persuasion often necessary

Medicines If the patient is taking iron or liver, it is most important that he does not miss a single dose If he is given a transition, the nurse must watch carefully for reaction, and notify the doctor immediately if the patient complains of chilliness or pain in the chest or back, or shortness of breath, or if his temperature rises. Also if tenderness or swelling appears at the site of injection of liver extract.

Teaching the patient Throughout the patient's illness the nurse should never lose the opportunity to impress the patient with the importance of his continuing proper treatment after he leaves the hospital. He should be made to understand that in order to get well and stay well he must continue to follow his diet and to take his medicine. He must also understand that he must revisit his doctor at frequent intervals for checkups and blood counts so that relapse may be prevented.

anemia, words pert. to: anematosiis, anemotrophy, anencephaloheemia, antianemic, chloranemia, choremia, chlorosis, ischemia, sickle cell, sura

anemic (an-e'mik) Pert. to anemia, deficient in red blood cells, or in hemoglobin, or in amount of blood

a. factor. Also called hematinic principle

A substance obtained from livers which stimulates erythropoiesis. It is produced by the action of vitamin B₁₂. An *intrinsic* factor secreted by stomach glands upon an *extrinsic* factor, present in certain foods. It is stored in the liver

anemophobia (an-em-o-fo'bi-ä) ["" + *phobos*, fear]. Abnormal fear of drafts, or of the wind.

anemotrophy [G *an-*, priv. + *alma*, blood, + *trophē*, nourishment]. Anemia from deficient formation of blood

anencephalus (än-en-sef'al-us) [G *an-*, priv. + *enkephalos*, the brain]. A monstrosity characterized by absence of brain and spinal cord, the cranium being open throughout its whole extent and the vertebral canal converted into a groove

anopia (an-ep'i-ä) ["" + *epos*, word]. Inability to speak

anergasia (an-er-ga'si-ä) ["" + *ergon*, work]. Anergia, functional inactivity.

anergastic reaction (an-er-gas'tik). Disorders involving cerebral lesions, or organic psychoses

Sym. Physical. Palsy, coma, fits or muscular contractions [judgment, etc.

Psy Loss of memory, impairment of **anergia** (an-er'ji-a) [G *an-*, priv. + *ergon*, work]. Inactivity, sluggishness

anergic (an-er'jik) Sluggish, inactive. Deficient in energy, listless

a. stupor. Acute phase of dementia

aneroïd (än'er-oid) [G *an-*, priv. + *nēros*, wet, + *eidos*, form]. Operating without a fluid, as air. Ex *a. barometer*.

aneroïd (an-er'o-plas-ti) ["" + *aer*, air, + *plasis*, a molding]. Immersion of a wound to exclude air

anerythrocyte (än-cr'i-thrō-sit) ["" + *erythros*, red, + *kytos*, cell]. A red blood cell without hemoglobin

anerythroplasia (än-er'i-thiō-plā'zi-ä) ["" + "" + *plasis*, a molding]. Without formation of red blood cells

anerythroplastic (än-er'i-thrō-plas'tik). Marked by anerythroplasia

anerythroptosis (än-er'ith-iōp'si-ä) [G *an-*, priv. + *erythros*, red, + *opsis*, vision]. Inability to distinguish red clearly.

anesis (än-e'sis) [G *a*, relaxing]. A lessening of symptoms or of their severity

anesthescinesia (än-es-the'sin-e'si-ä) [G *an-*, priv. + *aisthesis*, sensation, + *kinesis*, movement]. Combined sensory and motor paralysis

anesthesia (än-es-the'zi-ä) Partial or complete loss of sensation, with or without loss of consciousness, as result of

ANESTHESIA

SCHEMATIC VIEW OF DIFFERENT FORMS OF LOCAL ANESTHESIA

(a) Spinal cord and branches, (b, b', and b'') regional anesthesia; (c, c', and c'') infiltration block anesthesia, (d) spinal anesthesia, (a' and d') spinal anesthesia (enlarged view). Branches, ultimate arborization of nerve infiltration anesthesia, direct infiltration.

disease, injury, or administration of a drug or gas.

STAGES OF ANESTHESIA: *First stage.* Preliminary excitement, until voluntary control is lost. Hearing is last sense to be lost. Avoid talking in presence of patient.

Second stage. Loss of voluntary control. Corneal reflex still present.

Third stage. Entire relaxation, no rigidity, deep regular breathing, sluggish corneal reflex, and conjunctival reflex lost.

TESTS FOR ANESTHESIA: *Reaction to light.* Exclude light by holding hand over eye, withdraw it quickly, when pupil will reduce in size if anesthesia is complete.

Conjunctival reflex. Place finger at corner of eye on conjunctiva when the eye will attempt to close. This reflex is lost during third stage.

Corneal reflex. If cornea is lightly touched with finger, the eyelid attempts to close. Reflex is brisk during first and second stages, sluggish during third stage, and only lost in deep anesthesia.

Danger signals. If too deep, due to overdose, corneal reflex is lost, pupils widely dilate and cease to react to light. Cardiac and respiratory centers fail, patient ceases to breathe, and heart action stops.

EMERGENCY MEASURES: Artificial respiration by anesthetist, injection of cardiac stimulant, inhalation of carbon dioxide, applications of hot, wet towels over heart, slapping over heart, injection of pure ether into heart muscle.

a., block. That resulting from nerve blocking by injection of alcohol or other substance into or very near to a nerve trunk.

a., bulbar. Pons lesion causing central a.

a., caudal. Spinal anesthesia induced by injection in region of cauda.

a., controlled. Dolitron. It is injected into the veins and although the patient has no sense of pain he can talk and obey orders, but will not remember anything of his experiences while under the drug. Recovery is very prompt. No cumulative effects. It may take the place of sleeping pills.

a., dolorosa. Painfulness of a part with anesthesia of that part, as in thalamic lesions.

a., general. One that is complete and affecting the entire body, with loss of consciousness, when the anesthetic acts upon the brain.

a., Gwathmey's. A induced by injecting an olive oil and ether solution into the rectum.

a., infiltration. Local anesthesia achieved by injecting a weak cocaine solution.

a., inhalation. General anesthesia achieved by inhaling ether or chloroform vapors, or the like, or nitrous oxide gas.

a., local. One affecting a local area only, the anesthetic acting upon nerves or nerve tracts. **See block anesthesia, infiltration anesthesia.**

a., mental. Failure to recognize sensory stimulations.

a., mixed. Production of general anesthesia by more than one drug, as nitrous oxide gas continued by ether.

a., neural. Injection of an anesthetic into a nerve or immediately around it (*intraneural and paraneural*).

a., primary. First stage of anesthesia, q v.

ANESTHESIA TECHNIC OF SKIN INFILTRATION

Subdermal painless method. (a) Initial wheal. (b) secondary wheal made from beneath (x and y show direction of force of needle hub); (c) subdermal infiltration made with needle advancing; (d) subdermal infiltration made with needle receding; (e) finger indentation of skin to meet needle point.

a., rectal. General anesthesia produced by introduction of anesthetic agent into rectum

a., regional. Nerve or field blocking, causing insensibility over a particular area

a., sexualis. Anaphrodisia or absence of sexual desire.

a., spinal or spinal* puncture. When the injection into the theca is up to level at which nerves of the area enter the spinal cord

a., surgical. When depth of anesthesia produces relaxation of muscles and loss of sensation and/or consciousness

a., twilight. State of light anesthesia induced to alleviate labor pains See *twilight sleep*.

anesthesia, words pert. to: a c e mixture, anesthesiology, anesthesiophore, anesthetic, anesthesiologist, anesthetization, anesthetize, anesthetizer, apothecine, avertin, barbitage, carbon dioxide, chloracetization, chloroform, chloryl, cocaine, cyclopropane, ether, ethyl chloride, ethylene, general a., labor, local a., neothesiin, nitrous oxide, novocain, para-anesthesia, paraldehyde, procaine, rectal a., spinal a., vinethene

anesthesiometer (an-es-thēz-mē'tēr) [G. *an-*, priv + *aisthesis*, sensation, + *metron*, measure] For measuring anesthetic administered

anesthesin (ān-es-thē-sin) [G. *an-*, priv + *aisthesis*, sensation]. Proprietary local anesthetic

ACTION AND USES Nontoxic local anesthetic May be used as a dusting powder in proportions of from 10 to 20%. Also in form of lozenges for laryngitis and to allay nausea

DOSEAGE 0.3 cc (5 gr)

anesthesiology (an-es-thē-zē-ol'ō-jī) [G. *an-*, priv + *aisthesis*, sensation, + *logos*, science] Science of anesthesia.

anesthesiophore (an-es-thē-zē-ō-fōr) [" + *phoros*, bearer] Carrying anesthetic action, as cocaine.

anesthetic (an-es-thet'ik). An agent that produces insensibility to pain or touch According to action, they are subdivided into general and local SEE *anesthesia*.

anesthetist (an-es-thet-ist) One who administers anesthetics, esp for general anesthesia

an'esthetiza'tion. Induction of anesthesia

anesthetize (an-es-thē-tiz). To place under an anesthetic

anesthetizer. One who administers an anesthetic

anetic (a-net'ik) [G. *anetikos*, relaxing]. 1 Relaxing, soothing 2 Anodyne

anetoderma (an-et-ō-der-mā) [G. *an-*, relaxed + *derma*, skin]. Relaxation of the skin

an'etus. Any intermittent fever.

aneuria (a-nū-ri-ā) [G. *a-*, priv + *neuron*, nerve] Defect in or deficiency of nervous energy

aneur'ic. Pert. to aneuria

aneurosis (a-nū-ro'sis). 1 Lacking in nervous susceptibility 2 Deficiency of nerve function

aneurysm (an'ū-rizm) [G. *aneurysma*, a widening]. Arterial dilatation due to pressure of blood on weakened tissues, forming sac of clotted blood

NP No exertion permitted. Absolute rest in bed. Later, patient may get up, but warn against vigorous effort. General care in heart conditions should be observed **POSTOPERATIVE CARE** Observe circulation of the affected part. Keep limb warm with an electric pad or blan-

ket, but, as sensation is impaired, apply heat with great care. Inspect affected part every 15 minutes, and adjust limb to help circulation in limb

See *Berard's a., Cardarelli's sign.*

a., aortic. Affecting any part of the aorta.

a. of arch of aorta. ETIOLOGIC Pressure on trachea, esophagus, veins, or nerves. SYM Dyspnea, cough, sputum, dysphagia, congestion of head and neck. Inequality in the two radial pulses

a., arteriovenous. One in which artery and vein become connected by a sacculle ETIOLOGIC Trauma Weak point, in walls of an artery, due to syphilis, sudden strain, or injury SYM Pain, expansile pulsation, bruit NP Avoid increasing heart action or raising blood pressure

a., dissecting. One in which the blood makes its way between the layers of a blood vessel wall, separating them

a., fusiform. All the walls of the blood vessels dilate more or less equally, creating a tubular swelling

a., sacculated. One due to the yielding of a weak patch on one side of the vessel and which does not involve the entire circumference, usually due to an injury.

a., varicose. A forming a blood-filled sac bet an artery and a vein

aneurysmal (an-ū-riz'māl) [G. *aneurysma*, a widening] Pert. to aneurysm

aneurysmectomy (an-ū-riz-mek'tō-mī) [" + *ektomē*, a cutting out] Extirpation of an aneurysm by removal of its sac.

aneurysmotomy (an-ū-riz-mot'ō-mī) [" + *tomē*, cut] Incision of the sac of an aneurysm, allowing it to heal by granulation

anfractuosity (an-frak-tu-ōs'i-tī) [L. *anfractus*, a winding] A cerebral sulcus

anfractu'ous (an-frak-tu'us). Bending; sinuous

ang'eitis (an-ge-i'tis) [G. *ageion*, vessel, + *-itis*, inflammation]. Inflammation of a blood vessel or a lymphatic. SYN: *angitis*

an'gel's wing. A very prominent scapula, due to deformity

Angelucci's syndrome (ān-jē-loot'che). Great excitability, palpitation, and vasomotor disturbance associated with ver-nal conjunctivitis

angl (an'gī). Inguinal buboes

anglasthe'nia [G. *ageion*, vessel, + *a-*, priv. + *sthenos*, strength]. Loss of vascular tone.

anglectasia, -sis (an-jī-ek-ta'zī-ā, -tas-is) [" + *ektasis*, stretching]. Enlarged capillaries or abnormal dilation of a vessel

anglec'tomy [" + *ektomē*, excision] Excision of section of a blood vessel.

angiectopia (an-jī-ek-to'pī-ā) [“ + *ek-tōpos*, out of place]. Displacement of a vessel

angiemphraxis (an-je-em-fraks'is) [“ + *emphraxis*, stoppage]. Obstruction of any vessel

angitis (an-jī-i'tis) [“ + *-itis*, inflammation]. Inflammation of a blood vessel or of a lymphatic.

angina (ān-jī'na, L. an'jī-na) [L. *quinsey*, from *angere*, to choke] 1. A sense of suffocation 2. Disease of the pharynx or fauces

a., acute. Simple sore throat.

a., cruris. A due to obstruction of an artery, causing pain and cyanosis of the affected limb, with periodic lameness

a., follicular. A of the larynx and pharynx from public speaking, excessive drinking of alcoholic liquors

a., laryngea. Inflammation of the larynx

a., ludovici, a., ludwigii. Purulent inflammation in the submaxillary region

a., Ludwig's. Phlegmonous cellulitis of the neck

a., maligna. Diphtheria.

a., necrotic. Form with gangrenous patches in the mucosa of the air passages, seen in scarlet fever and occasionally in diphtheria

a., parotidea. Inflammation of the parotid glands. *SYN mumps.*

a., pectoris. Pain and oppression about the heart, a paroxysmal affection characterized by severe pain radiating from the heart to the shoulder, thence down the left arm, or, rarely, from the heart to the abdomen, apparently dependent upon some lesion of the coronary arteries of the heart, its walls, or valves. Attacks may occur in lesions of the aortic valves. Generally afflicts males of middle age.

SYM. Severe pain in region of the heart; great anxiety, fear of approaching death, and fixation of the body, face pale, ashen, or livid, brow bathed in sweat. Dyspnea often noted, pulse variable, usually tense and quick. Blood pressure is raised during an attack. Attack lasts from a few seconds to several minutes.

PROG. May be grave. Attacks may be intermittent, and with proper rest and care recovery is possible.

TREATMENT. During attack, inhalation of amyl nitrite, nitroglycerin, and hot applications to the precordia. During intervals absolute rest of body and mind, carefully regulated diet, light but nutritious. General constitutional treatment.

A new method of arresting pain being tried is injection of a local anesthetic just below 3rd rib on left side.

a., simplex. Sore throat. *SEE acute a.*

a., streptococcus. A. caused by the streptococcus.

a., tonsillans. Quinsy.

a., trachealis. Croup.

a., Vincent's. Ulceration and inflammation of floor of mouth. *SEE trench mouth.*

anginal (an'jī-nal). Pert. to angina.

anginoid (an'jī-noid) [L. *angina*, choking, + *G eidos*, resemblance]. Resembling angina pectoris, or any angina.

anginophobia (an-jī-no-iō'fī-ā) [“ + *G. phobos*, fear]. Intense fear of an attack of angina pectoris.

anginose (an'jī-nōs). Pert. to or resembling angina.

anginous. Resembling angina. *SYN. anginose.*

angio- (an-gī-o) [*G. ageion*, vessel]. A prefix pert. to a vessel.

an'gioatāxia [“ + *G. aktōs*, out of order]. Variability in arterial tonus.

angioblast (an'jī-o-blast) [“ + *G. blastos*, germ]. Embryonic cells from which blood vessels develop.

angiocardiokinet'ic [“ + *G. kardia*, heart, + *kinesis*, movement]. Stimulating or that which affects movements of heart and blood vessels.

angiocarditis (an-jī-o-kar'di-tis) [“ + “ + *-itis*, inflammation]. Inflammation of the heart and large blood vessels. *SEE: carditis.*

angiocavernous [“ + *L. caverna*, cavern]. Rel. to conditions present in angioma cavernosum.

angiocholecystitis (an'jī-ō-kō-lēs-tis-ti'tis) [“ + *chole*, bile, + *kystis*, bladder, + *-itis*, inflammation]. Inflammation of gallbladder and bile vessels.

angiocholitis (an-jī-ō-kō-li'tis) [“ + “ + *-itis*, inflammation]. Inflammation of biliary vessels, cholangitis.

angiocrine (an'jī-o-kim) [“ + *endon*, within, + *krinein*, to secrete]. Marked by vasomotor disorders, resulting from disturbances of the endocrine glands.

angiodermatitis (an'jī-ō-der-mā-li'tis) [“ + *derma*, skin, + *-itis* inflammation]. Inflammation of cutaneous vessels.

angiodystrophia (an-jī-ō-dis-tro'fī-ā) [“ + *dys*, bad, + *trophē*, nourishment]. Faulty nutrition of vessels.

angiofibroma (PL. -fibromata) [“ + *L. fibra*, fiber, + *-oma*, tumor]. An angioma having connective tissue overgrowth.

angiogenesis (an'jī-ō-jen'ē-sis) [“ + *genesis*, origin]. Development of blood vessels.

angiogenic (an'jī-ō-jen'ik). Pert. to angiogenesis, of vascular origin.

an'gioglio'ma [*G. ageion*, vessel, + *glia*, glue, + *-oma*, tumor]. A mixed angioma and glioma.

angiograph (an'jī-o-graf) [*G. ageion*, vessel, + *graphein*, to write]. A variety of sphygmograph.

angiography (an-jī-og'rā-fī). A description of blood vessels and lymphatics.

angiohyalinosis (an'jī-ō-hī'al-in-ō'sis) [*G. ageion*, vessel, + *yalos*, glass, + *-ōsis*, production]. Hyaline or glassy degeneration of the muscular coat of blood vessels.

an'giohyperto'nia [“ + *yper*, over, + *tonos*, tension]. Angiospasm, spasmodic contraction of arteries.

an'giohypoto'nia [“ + *ypo*, under, + *tonos*, tension]. Angioparalysis, angio paresis, vascular relaxation.

angiod (an'jī-ōvd) [“ + *eidos*, resemblance]. Resembling a blood vessel.

a., streaks. Dark, wavy, anastomosing striae lying beneath retinal vessels.

angiokeratoma (an'jī-ō-ker-ā-to'mā) [“ + *keras*, horn, + *-oma*, tumor]. A skin disease occurring chiefly on feet and legs.

ETIOLOGY. Exciting cause unknown; predisposing cause circulatory weakness with external pressure a concomitant factor in localization.

SYM. Formation of telangiectases or warty growths (in groups), accompanied by thickening of the epidermis along the course of dilated capillaries.

TREATMENT. Local Destruction of lesions by galvanic needle or carbon dioxide snow. General Improvement of general circulation and removal of discoverable venous obstruction to prevent extension.

angiokinet'ic [' + *kinesis*, movement].

Pert to action of blood vessels
angioleukasia (an-gi-o-lū-ka'si-ā) [' + *leukos*, white, + *asia*, condition]. Dilation of lymphatics

angioleukitis (an-jī-o-lu-ki'tis) [' + *leukos*, white, + *-itis*, inflammation]. Inflammation of lymphatics

angiolipo'ma [' + *lipos*, fat, + *-oma*, tumor] A mixed angioma and lipoma

angiolith (an'jī-o-lith) [' + *lithos*, stone]. 1 A venous calculus 2 Calcareous deposit in wall of a blood vessel

angiology (an-jī-o-lō-jī) [' + *logos*, science] The science of the blood vessels and lymphatics

angiolymphitis (an'jī-ō-lim-flī'tis) [' + *L. lymph.*, lymph, + *-itis*, inflammation]. Inflammation of the lymphatics *SYN.* *lymphangitis*.

an'giolympho'ma [' + " + *-oma*, tumor]. Tumor of dilated lymphatics

angiolysis (an-jī-olī'sis) [' + *lysis*, destruction] Obliteration of blood vessels in newly born infants after tying of the cord

angioma (an-jī-o-mā) [' + *-oma*, tumor]. A growth made up of dilated blood vessels *SYN.* *'angio-* words, *cavernoma*, *chorioangioma*.

a. cavernosum. Is congenital and appears as an elevated dark red tumor, ranging in size from a pea to that of the hand. It frequently has pulsation; commonly involves the subcutaneous or submucous tissue. *TREATMENT* Surgical ligation or electrolysis

a. simplex (port wine mark). One that is congenital, made up of capillaries, nonelevated, bright red or purple-red in color, may cover a large surface, usually found on the face, commonly called "Mother's mark." *TREATMENT* Electrolysis or application of carbon dioxide snow may be used.

a., telangiectatic. Is acquired. Appears as bright spot composed of dilated capillaries. Is associated with acne rosacea, gouty predispositions, and exposure to weather.

angiomalacia (an-jī-o-ma-la'si-ā) [' + *malakia*, softness]. Softening of blood vessel walls

angiomatosis (an-jī-o-ma-to'sis) [' + *-oma*, tumor, + *-osis*, condition]. Condition of multiple angiomata

a. retinae. Primary angioma of retina.
angiomatous (an-jī-om-ā-tus) Like an angioma

angio meg'aly [G. *aggeion*, vessel, + *megas*, large]. Enlargement of blood vessels, esp. in the eyelid

angiometer (an-jī-om-et-er) [' + *metron*, measure]. Instrument for measuring tension and diameter of vessels

angiomycardiac (an-jī-o-mi-o-kar'di-ak) [' + *mys*, muscle, + *kardia*, heart]. Pert to blood vessels and cardiac muscle

angiomoma (an'jī-o-mī-o-mā) [' + " + *-oma*, tumor]. An angioma mixed with a myoma

angiomosarco'ma [' + " + *sarx*, flesh, + *-oma*, tumor]. Tumor containing elements of angioma, myoma, and sarcoma.

angioneurectomy (an-jī-o-nu-ek'tō-mī) [' + *neuron*, nerve, + *ektomē*, excision] Excision of vessels and nerves

angioneuroedema (an'jī-ō-nu-ro-ē-de-mā) [' + " + *oedema*, swelling]. Acute swelling of subcutaneous or submucous tissue due to vasomotor lesion.

angioneurosis (an-jī-o-nū-rō'sis) [' + " + *-osis*, condition]. Spasm or paralysis of blood vessels

ETIOL. Disturbance of vasomotor system.

angioneurotic (an-ge-o-nū-rot'ik). Pert. to angioneurosis

a. edema. Swelling of submucous or subcutaneous tissues. Sometimes periodic with gastric disturbances. *ETIOL.* Probably a toxemia

angioneurotomy (an-jī-o-nu-rot'o-nī) [G. *aggeion*, vessel, + *neuron*, nerve, + *tomē*, cutting] Cutting of vessels and nerves

angionoma (an-jī-on-o-mā) [' + *nomē*, ulcer]. Ulceration of a vessel

angio paral'ysis [' + *paralyein*, loosen, dissolve] Vasomotor relaxation of blood vessel tone

angio paresis (an-jī-ō-pā-rē'sis) [' + *pare-sis*, weakness] Partial paralysis of the vasomotor system

angio pathol'ogy [' + *pathos*, suffering, + *logos*, science] Morbid changes of the blood vessels

angiopathy (an-jī-op-a-thī) [' + *pathos*, disease] Any disease of blood vessels or lymphatics

angioplania (an'jī-o-plan'i-ā) [' + *planē*, wandering] Abnormality or irregularity in course of a blood vessel

angioplas'ty [' + *plassein*, to form]. Plastic surgery upon blood vessels

angio poietic (an'jī-ō-poy-et'ik) [' + *poiein*, to make] Causing the formation of blood vessels, pert to certain cells

angio pres'sure. Control of hemorrhage by pressure

angiorhigosis (an-jī-ō-rī-go'sis) [G. *aggeion*, vessel, + *rigos*, cold] Rigidity of vessels

angiorrhaphy (an-jī-or-af-i) [' + *raphē*, seam] Suture of a vessel or vessels

angiorrhesis (an-jī-or-eks is) [' + *rēxis*, rupture] Rupture of a blood vessel.

angiosarco'ma [' + *sarx*, flesh, + *-oma*, tumor] Mixed sarcoma and angioma

angiosclero'sis [' + *sklērōsis* hardening]. Hardening of the walls of the vascular system

angioscope (an'jī-o-skōp) [' + *skopein*, to view]. A microscope for studying capillary vessels

angiosialitis (an'jī-ō-si-al-i'tis) [' + *sialon*, saliva, + *-itis*, inflammation]. Inflammation of a salivary duct

angiosis (an-jī-o'sis) [' + *-osis*, condition] Any disease of the lymphatics or blood vessels

angiospasm [' + *spasmos*, tension] Excessive blood vessel tone

angiospas'tic. Pert to angiospasm

angio staxis (an'jī-o-stax'is) [G. *aggeion*, vessel, + *staxis*, trickling]. 1 Hemophilia 2 Oozing of blood.

angio sten'o'sis [' + *stenoiein*, to make narrow, + *-osis*, condition]. Contraction of caliber of blood vessels.

angio steosis (an'jī-os-te-o'sis) [' + *osteon*, bone]. Calcareous degeneration of arteries

angio stomy [' + *stoma*, mouth] Artificial fistulous opening into a blood vessel

angio strophy (an-jī-os'tro-fī) [' + *strophē*, twist]. Twisting cut end of a vessel

angiosynzesis (an'jī-ō-sin-i-ze'sis) [' + *synzesis*, contraction]. Collapse of walls of a vessel and their subsequent adhesion.

angioelectasis (an'ji-6-tel-ek'ta-sis) [⁺ + *telos*, end, + *eklasia*, stretching out]. Dilation of terminal arterioles.

angiotitis (an'ji-6-tri'tis) [⁺ + *ous*, ear, + *-itis*, inflammation]. Inflammation of blood vessels of the ear.

angiotome (an'ji-6-t6m) [⁺ + *tomē*, cutting]. One of the segments of the vascular tissues of the embryo.

angiotomy (an'ji-6-t6-mi) [⁺ + *tomē*, a cutting]. Dissection of blood vessels.

angiotonic [⁺ + *tonos*, tension]. Pert. to increase of arterial tension.

angiotribe (an'ji-6-trib) [⁺ + *triben*, to bruise]. Instrument for crushing the end of an artery to check hemorrhage.

angiotripsy (an'ji-6-trip-si) [⁺ + *tripsis*, friction]. The use of an angiotribe.

angiotrophic [⁺ + *trophē*, nourishment]. Pert. to nutrition of blood vessels.

angitis. Inflammation of the blood vessels or lymphatics. *Syn anguitis*

angle (ang'gl) [L *angulus*] A point or corner where two lines meet.

a., alpha. One found by intersection of visual line with optic axis.

a., alveolar. Meeting point of the base of the nasal spine and the middle point of the alveolus of the upper jaw.

a., basilar. Formed by the intersection of a projection line from the nasal point to a line drawn at the base of the nasal spine.

a., biorbital. Formed by the meeting of the axes of the orbits.

a., cerebellopontine. Junction of the cerebellum and pons.

a., costal. Meeting point of the lower border of the false ribs with the axis of the sternum.

a., craniofacial. The angle formed at the point where the basifacial and basiscranial axes join at the midpoint of the sphenothmoidal sutures.

a., facial. The angle made by lines from the nasal spine and external auditory meatus meeting between the upper middle incisor teeth.

a., gamma. Angle formed by line of fixation with optic axis.

a., of incidence. The angle between a ray incident on a surface and a line drawn perpendicular to the surface at the point of incidence.

a., of iris. Angle between the cornea and iris at the periphery of the ant chamber of the eye.

a., of jaw. The angle at the point where the post edge of the ramus of the mandible and the lower surface of the body of the mandible join.

a., of mandible. Angle of the jaw.

a., metafacial. Angle between the base of the skull and the pterygoid process.

a., occipital. Formed by the intersection of lines from the basion and from the lower border of the orbit at the opisthion.

a., ophryospinal. Angle formed by the joining of lines drawn from the auricular point and the glabella at the ant. nasal spine.

a., parietal. Formed by the meeting of the prolongation of the two lines tangent to the prominent portion of the zygomatic arch and the parietofrontal suture.

a., pontine. Same as cerebellopontine angle.

a., pubic. Junction of the rami of the pubes.

a., sphenoid. Formed by the intersection of lines coming from the nasal

point and the tip of the rostrum of the sphenoid, at top of the sella turcica.

a., sternal. Angle between the manubrium and body of the sternum.

a., venous. Angle of the internal jugular and subclavian vein.

angophrasia (an-go-fra'zi-ā) [G *agchein*, to choke, + *phrasis*, utterance]. Drawing, choking speech in paralytic dementia.

angor (ang'gor) [L *quinsy*, anguish]. Violent distress as in angina* pectoris.

Angstrom unit (6ng'strum) **PT** An internationally adopted unit of measurement of wave length, one ten-millionth of a millimeter, or one two hundred and fifty-four millionth inch.

Anguil'ula [L eel] Genus of nematode worms.

A. aceti. Vinegar eel.

A. intestinalis. Parasitic form of nematode infesting intestine in tropics and near tropics.

A. stercoralis. Free stage of *A. intestinalis*.

anguillul'asis. Infestation with *Anguil'ula intestinalis*.

angular [L] Having corners or angles.

a. artery. The artery at the inner canthus of the eye, facial artery.

angulation (ang-gu-la'shun) Formation of angular loops in the intestine.

anhaphia (an-ha'fi-ā) [G *an-*, priv + *aphē*, touch] Abnormal or defective sense of touch. *Syn anaphia*.

anhedonia (an-hed-o'nī-ā) [G *an-*, priv + *ēdonē*, pleasure] Psy Lacking in interest or pleasure, apathy.

anhedonic (an-he-don'ik) Pert. to anhedonia.

anhelation (an-hel-a'shun) [L *anhelare*, to pant] Dyspnea, shortness of breath.

anhelitus (an-hel-it'us) [L] 1. Asthma, difficult breathing.

anhelose, anhelous (an'hel-6s, -us) [L] 1. Panting.

anhemato'sis [G *an*, priv. + *aimat6cin*, to change into blood] Defective or insufficient blood formation.

anhemolytic (an-hem-o-lit'ik). Not destructive to the blood cells.

anhepatia (an-he-pa'shi-ā) [G *an*, priv. + *ēpar*, liver] Failure or lack of liver function.

anhepatic. Not produced by the liver.

anhepatogenic (an-hep-at-o-jen'ik) [G *an-*, priv + *ēpar*, liver, + *gennan*, to produce] Not produced by the liver.

Syn anhepatic.

anhidrosis (an-hi-dro'sis) [G *an-*, priv. + *idros*, sweat] Abnormal deficiency of sweat, general or localized, temporary or permanent, accompanying disease conditions.

TREATMENT In symptomatic cases, temporary relief by pilocarpine and hot drinks. Temporary relief only, in generalized forms. Soft, warm clothing, bland, soothing ointments, and lubricants to protect skin.

anhidrotic (an-hi-drot'ik). Checking or anything that checks or prevents perspiration.

anhis'tic, anhis'tous [G *an-*, priv + *istos*, tissue] Seemingly without structure.

anhydra'tion [⁺ + *yd6r*, water] The state of not being hydrated.

anhydremia (an-hi-dre'mī-ā) [⁺ + *aima*, blood] A lessening of the normal quantity of fluids in the blood.

anhydride (an-hi'drid) [G *anhydros*, waterless] A substance from which the hydrogen and oxygen in the ratio in which they exist in water have been removed.

anhydrochloric [' + *chlōros*, green]. Lacking in hydrochloric acid.

anhydromyelia (an-hi-dro-mi-e'lli-ā) [' + *myelos*, marrow]. Deficiency in spinal fluid.

anhydrous. Containing no water.

anhyopia (an-hi-p'i-ā) [G. *an-*, priv. + *ypnos*, sleep]. Insomnia, sleeplessness, anhyposis.

anhyposis. Insomnia.

aniantbinops (an-i-an'thin-op'si) [G. *an-*, priv. + *ianthinos*, violet, + *opsis*, vision]. Inability to recognize violet tints.

anidros (an-id'ros) [G. *anidros*, waterless]. Exhibiting no perspiration.

anidrosis (an-id-ro'sis) [G. *an-*, priv. + *idros*, sweat]. Abnormal deficiency of sweat. SYN *anhidrosis*.

anidrotic (an-i-drot'ik) [Pert. to anidrosis]. SYN *anhidrotic*.

anidrus [G. *anidros*, waterless]. Showing no perspiration. SYN *anidros*.

anile (an'il) [L. *anus*, an old woman].

Infirm, like an old woman.

aniline (an'i-lin) [Ar. *an-nil*, the indigo plant]. The simplest azomatic amine, $C_6H_5NH_2$, an oily liquid derived from benzene.

Dosage 1 gr. (0.06 Gm.)

anilinophil, **anilinophilous** (an'i-lin'o-fil, -fil-us) [' + G. *philos*, fond]. A structure staining readily with aniline dyes.

anilism (an'il-i-zm) Chronic aniline poisoning.

SYN Cardiac and gastric weakness, intermittent pulse, vertigo, muscular depression, cyanosis [in females].

anility [L. *anus*, an old woman]. Old age.

anima (an'im-ā) [L. *an*, breath]. The vital principle, breath, air, mind, consciousness.

animalcule (an-i-mal'kul) [L. *animalculum*, little animal]. Unicellular animal organism, protozoan.

aninctenosis (an-in-krē-tin-o'sis) [G. *an-*, priv. + *inctis* + *-osis*, condition]. A disorder due to failure of some organ of internal secretion.

anion (an'i-on) [G. *ana*, up, + *ion*, going]. PT. An ion carrying a negative charge. Since unlike forms of electricity attract each other, the ion is attracted by, and travels to, the positive anode. Examples are acid radicals and corresponding radicals of their salts. SEE *ion*.

aniridia [G. *an-*, priv. + *iris*, rainbows]. Congenital absence, complete or partial, of iris, iridderema.

anischuria (an-is-ku'ri-ā) [' + *ischouria*, retention of urine]. Incontinence of urine.

aniseikon (an-is-i-ko'ni-ā) [G. *anisos*, unequal, + *eikon*, image]. A condition in which the size and shape of the ocular image of one eye differs from that of the other.

anis'ergy [' + *ergon*, work]. Varying degrees of blood pressure in different parts of the system.

aniso- (an'is-o) [G. *anisos*]. Prefix Unequal, unsymmetrical in combination.

anisochromatic (an-i-so-kro-mat'ik) [G. *anisos*, unequal, + *chrōma*, color]. Not of uniform color.

anisocoria (an-is-o-ko'ri-ā) [' + *korē*, pupil]. Inequality of the diameter of the pupil, may be normal or congenital.

Often seen in early stages of insanity, each pupil alternating in contraction and dilation. Found in *aneurysms*, *head trauma*, *diseases of the nervous system*, *sclerosis*, *brain lesion*, *paresis*, and *locomotor ataxia*.

anisocytosis (an-i-so-si-to'sis) [' + *kytos*, cell, + *-osis*, condition]. Inequality in size of cells, esp. erythrocytes. An abnormal condition.

anisog'amy [' + *gamos*, marriage]. Sexual fusion of two gametes of different form and size.

anisognathous (an-i-sog'na-thus) [' + *gnathos*, jaw]. Having upper jaw wider than lower one.

anisoheparyctosis (an-is-o-hi-per-si-to'sis) [' + *yper*, above, + *kytos*, cell]. Increase in number of leukocytes with altered proportion of the different varieties. Opposite of *anisoheparyctosis*.

anisohepocytosis [' + *yper*, above, + *kytos*, cell]. Increase in number of leukocytes with altered proportion of the different varieties. Opp. *anisoheparyctosis*.

anisoiconia (an-i-so-i-ko'ni-ā) [' + *eikon*, image]. Failure of retinal images to coalesce.

an'isomas'tia [' + *mastos*, breast]. Breasts unequal in size.

an'isome'lia [' + *melos*, limb]. Inequality between two paired limbs.

anisometrop (an'i-so-me'trōp) [' + *metron*, measure, + *ops*, vision]. One afflicted with anisometropia.

anisometropia (an-i-so-me'trō-pi-ā) Inequality in refractive power of the two eyes.

anisometrop'ic. Having unequal refractive power.

anisonormocytosis [G. *anisos*, unequal, + *L. norma*, rule, + G. *kytos*, cell]. Abnormal relation in numbers of different forms of leukocytes but with normal number of total leukocytes.

aniso'pia [' + *ops*, vision]. Inequality of visual power of both eyes.

anisiopesis (an-i-so-pi-e'sis) [' + *piesis*, blood pressure]. Apparent inequality of blood pressure in different parts of the body.

anisorhythmia (an-i-sō-rith'mi-ā) [' + *rythmos*, rhythm]. Absence of synchronism in rate of the auricles and ventricles or irregular heart action.

anisospore (an-i-so-spōr) [' + *sporos*, seed]. A sexual cell. Opp. of *isospore*.

an'isosthen'ic [' + *sthenos*, strength]. Not of equal muscle strength.

anisotropal (an-is-ō'trō-pāl) [' + *tropos*, a turning]. 1 Not equal in every direction. 2 Unequal in power of refraction.

anisotrop'ic. Having different optical properties in different directions, as have certain crystals; double polarizing.

anisotropic (an-i-sō'trō-pus) 1 Not equal in every direction. 2 Unequal in refractive power. SYN *anisotropal*.

anisia (an-is-u'ri-ā) [G. *anisos*, unequal, + *ouron*, urine]. Alternate polyuria and oliguria, *q. r.*

ankle (āng'kl) [A. S. *ancle*fow]. The part between the foot and lower end of leg.

SEE *astragalus*, *malleolus*.

a. bone. The astragalus.

a. clonus. A rhythmic extension-flexion of the ankle induced by its sudden dorsiflexion, evidencing upper motor neuron disease, such as spastic paraplegia, hemiplegia, etc. NP. Keep patient's feet at right angles on a rectangular foot splint. When splint is removed to wash the feet daily, avoid dorsiflexion of foot to prevent movement of ankle clonus or spasm.

a. c. reflex. Succession of rapid contractions and relaxations when foot is pressed dorsally. Occurs in lateral tract disease and disseminated sclerosis.

a. joint. A hinge joint. Lower part of tibia, its medial malleolus and lateral

malleolus of fibula forming socket for the *astragalus*.

a., tailor's. An abnormal bursa over the head of the fibula in tailors from pressure caused by sitting cross-legged on the floor

ankyloblepharon (ang-ki-lo-blef'ar-on) [G *ankylē*, a stiff joint, + *blepharon*, eyelid] Adhesion of ciliary edges of lids to each other

ankylochilia (ang-ki-lo-ki'li-ā) ["" + *cheilos*, lip] Adhesion of lips to each other.

ankylocolpos (ang-ki-lo-kol'pos) ["" + *kolpos*, vagina] Imperforation or atresia of the vagina

ankyloctylia (ang-ki-lo-dak-till'e-ah) ["" + *daktylos*, finger] Adhesion of two or more fingers or toes to one another

ankyloglossia ["" + *glōssa*, tongue]. Tongue-tie

ankyloproctia (ang-ki-lo-prok'shi-ā) ["" + *proktos*, anus]. Stricture or imperforation of the anus

ankylosed (ang-ki-lozd). Denoting fixation of a joint. Stiffened, held by adhesions.

ankylosis (an-ki-l-o'sis) [G *agkylos*, stiff joint] Abnormal immobility and consolidation of a joint

Etiol. May be result of disease in which the articular cartilage has been destroyed, the raw bone surfaces coming into contact and bony union taking place. Seen in many joint conditions. May be performed surgically

NP Maintain complete immobility until bone has firmly united, which may be from 6 to 12 weeks. Keep joint in perfect position.

SEE *arthrokleisis*, *arthrolysis*.

a., artificial. The surgical fixation of a joint

a., bony. The abnormal union of the bones of a joint, also called true ankylosis

a., extracapsular. That caused by rigidity of parts outside a joint

a., false. Spurious ankylosis; that due to rigidity of the surrounding parts.

a., fibrous. That due to the formation of fibrous bands within a joint only.

a., intracapsular. That due to the undue rigidity of structure within a joint.

a., ligamentous. Ankylosis by ligaments or fibrous structures

a., true. Same as bony ankylosis.

Ankylos'toma. Ancylostoma

ankylos'toma [G. *agkylē*, stiff joint, + *stoma*, mouth]. Trismus, lockjaw.

ankylostomiasis. Ancylostomiasis

ankylostia (ang-ki-lo'shi-ā) [G. *agkylos*, crooked, + *ot-*, ear]. Closure or imperforation of external auditory meatus of ear.

ankylotome (ang'kil-o-tōm) [G. *agkylos*, bent, + *tomē*, a cutting] An instrument for cutting *fraenum linguae*.

ankylurethria (ang-ki-lū-re'thri-ā) ["" + *ourethra*, urethra]. Stricture or imperforation of the urethra.

ankyroid (ang'ki-royd) [G. *agkyroëides*, anchor-shaped] Hook-shaped.

a. cavity. The posterior or descending cornu of lateral ventricle.

anlage (ahn'lāg-ē). 1. Rudiments in a developing embryo. 2. The embryonic part in which differentiation first appears.

annatto (an-at'o). Reddish coloring matter obtained from the pulp of *Bixa orellana*, a tropical tree. SYN: *annotto*, *arnotto*.

annec'tent [L. *annectens*, tying or binding to] Linking together.

annex'a [L. *annectere*, to tie or bind to]. Accessory parts. SYN *adnexa*.

annex'itis ["" + G. -*itis*, inflammation]. Inflammation of *adnexa uteri*. SYN: *adnexitis*.

annex'opexy ["" + G. *pexis*, putting together]. Fixation of fallopian tubes and ovary to abdominal wall. SYN *adnexopexy*.

annot'fo. Reddish coloring matter obtained from pulp of *Bixa orellana*, a tropical tree. SYN *annatto*, *arnotto*.

annuens (an'u-enz) [L. *annuens*, nodding]. *Rectus capitis anterior minor*.

ann'ular [L. *annulus*, ring] Circular; ring-shaped.

annulorr'haphy (an-u-lor'ā-fl) ["" + G. *rhaphe*, seam]. Closure of a hernial ring by suture

ann'ulus [L.]. A ring-shaped structure; a ring

a. abdominalis. Either the internal or the external opening of the inguinal canal

a. abdominalis abdominis. The internal inguinal ring

a. femoralis. The femoral ring.

a. ciliaris. Boundary between choroid and iris

a. tympanicus. The tympanic ring

a. umbilicalis. Umbilical ring. SEE *abdominal*.

anoci-association (a-no'si-as-o-si-a'shun). The blocking or exclusion of neuroses, fear, pain and harmful influences or associations to prevent shock, by injection of narcotics hypodermically

anococcygeal (a-no-kok-sij'e-al) [L. *anus* + G. *kokkyx*]. Rel. to both anus and coccyx

a. body. The muscle and fibrous tissue lying between the coccyx and anus

a. ligament. A band of fibrous tissue joining the tip of the coccyx with the external sphincter ani

anod'al [G. *ana*, up, + *odos*, way]. Pert. to the anode

a. closure contraction. Contraction of muscles at anode on closure of circuit

anode (an'od) [G.] The positive pole of an electrical source. Only galvanic (direct current) and static electricity have distinct polarity.

anodinia (an-o-din'i-ā) [G. *an-*, priv. + *dinos*, dizziness]. Absence of vertigo

anodmia (an-od'mi-ā) ["" + *odmē*, stench]. The want or absence of the sense of smell, anosmia, *q.v.*

an'odyne ["" + *odynē*, pain]. An agent that will relieve pain, milder in form than an analgesic, *q.v.* Ex *morphine*, *codeine*, *acetylsalicylic acid*. SEE *anetic*, *apone*, *antalgic*, *antalgic*.

anodyn'ia. 1 Cessation or absence of pain 2 Loss of sensation

anoesia (an-o-e'si-ā) [G. *anoësia*, want of understanding]. Without power of comprehension; *anola*,* imbecility, idiocy.

anoetic [G. *anoëtis*, unthinkable]. Rel. to the borderline of consciousness; not fully conscious

anola (an-o'yā) [G. *a-*, priv. + *noos*, understanding]. Anoesia, *q.v.* Idiocy.

anomalous (an-om'al-us) [G. *anómalos*, uneven] Irregular. Contrary to the normal.

anom'aly [G. *anomalía*, irregularity]. Anything contrary to general rule.

anomia (an-o'mi-á) [G. *a-*, priv. + *ónoma*, name]. Inability to remember names of persons and objects.

anonychia (an-o-nik'i-á) [' + *onyx*, nail].

Absence of the nails.

anonymous (an-on'im-us). Nameless.

a. artery. *Arteria anonyma*.

a. veins. *Venae anonymae*.

anopsia (an-o-op'si-á) [G. *anó*, upward, + *opsis*, vision]. Tendency of one eye to turn upward. SYN. *hyperphoria*.*

Anopheles (an-of-el-ez) [G. *anóphēlēs*, harmful, useless]. The mosquito whose bite is responsible for the malaria parasite in man.

anophoria [G. *ana*, up, + *phoros*, tending]. Tendency of one eye to turn upward. SYN. *hyperphoria*.* *anopia*.*

anophthal'mia [G. *an-*, priv. + *ophthalmos*, eye]. Congenital absence of eyes.

anopia (an-o'pi-á) [G. *an-*, priv. + *ops*, eye]. 1 Anophthalmos, lack of one eye or both. 2 Anopsia. 3 Tendency of one eye to turn upward, hyperphoria.

anop'sia [G. *an-*, priv. + *opsis*, sight]. 1 Hyperphoria. 2 Inability to use the vision as in those confined in the dark, or from disuse of an eye in strabismus, or resulting from cataract, or in refractive errors.

anorectal (an-o-íekt'al) [L. *anus* + *rectum*]. Pert. to the anus and rectum.

anorectic, anorectous (an-o-íekt'ic, -tus). Having no appetite.

anorexia (an-or-éks'i-á) [G. *an-*, priv. + *orexis*, appetite]. Loss of appetite.

Seen in malaria, commencement of all fevers and illnesses, also in disorders of alimentary tract, esp. of stomach, and as a result of alcoholic excesses and drug addiction, esp. cocaine. Also result of food fads and faulty feeding.

RS *acoria, agensia, bulimia, hyperorexia, nausea, parageusia, parorexia, pica, polyphagia, pyrosis, taste*.

a. nervo'sa. Loss of appetite for food not explainable by local disease. It may be a part of a psychosis.*

anoria (an-or'i-á) [G. *anoria*, untimeliness]. Immaturity.

anor'mal [G. *a-*, priv. + *L. normalis*, according to pattern]. Abnormal.

anorrhorrhea (an-or-or-e-á) [G. *an-*, priv. + *orrhos*, serum, + *roia*, a flow]. Diminished or imperfect secretion of serous fluid.

anorthography (an-or-thog'rā-fi) [G. *an-*, priv. + *orthos*, straight, + *graphein*, to write]. Agraphia,* esp. motor agraphia, loss of power to express oneself in writing. SEE *agraphia*.

anorthopia (an-or-tho'pi-á) [' + + *ops*, eye]. 1 Vision in which straight lines do not appear straight, symmetry and parallelism not properly perceived. 2. Squinting.

anorthosis (an-or-tho'sis) [' + + *osis*, condition]. Absence of or diminished erectility.

anosia (an-o'si-á) [G. *a-*, priv. + *nosos*, disease]. Normal, without disease.

anosmatic (an-oz-mat'ik) [' + *osmē*, smell]. Deficient sense of smell.

anosmia (an-oz'mi-á). Absence of the sense of smell, anosmia,* anosphrasia.* Frequent in neurasthenia, hysteria, and sometimes in ataxia.

anosmic (an-oz'mik). Lacking in sense of smell.

anos'mous. Anosmic. Pert. to anosmia.

anosodiaphoria (an-o-so-di-af-or'i-á) [G. *a-*, priv. + *nosos*, disease, + *diaphoria*,

difference]. Real or pretended indifference to presence of disease, esp. paralysis.

anosognosia (an-o-sog-no'zi-á) [' + + *gnosis*, knowledge]. Real or pretended ignorance of the presence of disease, esp. paralysis. Opp. of *pathodixia*, q.v.

anosphrasia (an-os-fra'zi-á) [' + G. *osphresis*, smell]. Absence or imperfect sense of smell.

anosp'inal [L. *anus* + *spina*, thorn]. Pert. to enter in the spinal cord which controls the contraction of the anal sphincter.

anostosis (an-os-to'sis) [G. *an-*, priv. + *osteon*, bone]. A defective formation or development of bone; failure to ossify.

anotro'pia [G. *ana*, up, + *trópē*, a turning]. Farsightedness. SYN. *hyperopia*.*

anoves'ical [L. *anus* + *vesica*, bladder]. Rel. in any way to both anus and urinary bladder.

anov'ular, anovulatory [G. *an-*, priv. + *L. ovarium*, ovary]. Not pait to ovulation. Without ovarian bleeding.

anoxemia (an-oks-e'mi-á) [' + *oxys*, sharp, + *gennan*, to produce, + *ama*, blood]. Lack of oxygen in the blood.

General anoxemia occurs at high altitudes, at reduced pressures, during inhalation of gaseous mixtures low in oxygen, in strangling, and in circulatory failure.

SYN. cyanosis, mental confusion, shock, and sudden collapse. Local anoxemia occurs in passive congestion.

anoxia (an-ox'i-á) [' + *oxigen*]. Deficiency of oxygen.

a., anemic. Deficiency in the oxygen carrying power of the blood.

a., anoxic. Lessened oxygen tension in arterial blood, but with normal oxygen capacity.

Insufficient supply of oxygen to tissues can result from other causes, hence one distinguishes between the anoxic type of tissue asphyxia on the one hand and the ischemic (stagnant) and anemic (alteration or destruction of hemoglobin) types on the other hand.

a., stagnant. Decrease in oxygen from the blood due to insufficiency of circulation.

anox'ic. Pert. to or caused by a general lack of oxygen, and characterized by a generally subnormal oxygen tension of the blood.

an'sa [L. a handle]. Any anatomical structure in the form of a loop.

a. capitis. The zygomatic arch.

a. hypoglos'si. Loop of the hypoglossal nerve.

a. lentic'ular. Fibers entering the lenticular nucleus from the thalamus by way of the thalamic radiation.

a. of the spinal nerves. Connecting loops of fibers between the ant spinal nerves.

a. peduncularis. Fibers passing from the thalamus through the thalamic radiation, under the lenticular nucleus to the cortex of the temporal lobe and insula.

a. sacralis. Nerve cord connecting the sympathetic trunk with the ganglion impar.

a. subclavia. Loop of nerve fibers winding around the ant. aspect of the subclavian artery.

anselaphesia (an-sel-af-e'zi-á). Absence of sense of touch or feeling or sensation, esp. of tactile sensibility.

anserine (an'ser-in) [L. *anser*, goose]. Pert. to a goose.

ant-, anti- [G]. Prefixes Opposed to; counteracting, against, as *antifebrile*.

antabuse (än-*t*-büz) Tetraethylthiuram. Also called disulfiram. Administered to alcoholics to cause violent illness if liquor is taken by patient.

antacid (ant-as'id) [G. *anti*, against, + L. *acidum*, acid] An agent that will neutralize acidity, esp. in digestive tract. Ex: *magnesium oxide*, *sodium bicarbonate*.

antag'onism [G. *antagōnizesthai*, to struggle against] Opposition or contrary action, as bet. muscles or medicines.

antag'onist That which counteracts the action of anything, as a muscle or drug.

antalgic [G. *anti*, against, + *algos*, pain] Pain-relieving agent. SYN *anodyne*.

antalgic (ant-al'jik). An anodyne or analgesic.

antalkaline (ant-al'kal-in) [G. *anti*, against, + *alkaline*]. Neutralizing or reducing alkalinity.

antaphrodis'iac [+ *aphrodisiakos*, sexual] Lessening sexual desire.

antarthritic (ant-ar-thrit'ik) [+ *arthritikos*, gouty] Remedy for gout.

asthenic (ant-as-then'ik) [+ *astheneia*, weakness] 1 Strengthening, invigorating. 2 Agent which invigorates.

asthmatic [+ *asthma*]. 1. An agent that prevents an asthmatic attack. 2. Relieving asthma.

atrophic (ant-ä-trof'ik) [+ *atrophia*, atrophy] Preventing or curing atrophy.

ante- [L] Prefix. Before, as *antenatal*.

antebrachium (an-te-bra'ke-um) [L *ante*, before, + *brachium*, arm] The forearm.

anterior (an-te-ri-or) [+ *curvatura*, bend] Bending forward abnormally. SYN *anterior*.

antedating [L *ante*, before, + *datum*]. The theory that hereditary defects manifest themselves earlier with each successive generation and often more severely though the clinical picture may change.

antefeb'ile (an-te-feb'ril) [+ *febris*, fever] Pert. to the period before a fever.

anflexion [+ *flexura*, to bend] Abnormal bending forward, i. e., uterus, bending forward at its body and cervix.

anteloca'tion [L *ante*, before, + *locare*, to place] Forward displacement of an organ or part of the human body.

antemet'ic (an-tem-et'ik) [G. *anti*, against, + *emetikos*, emetic] 1 Arresting vomiting. 2 Remedy that controls vomiting and nausea.

ante mor'tem [L] Before death.

a.-m. statement. One made immediately preceding death.

If made with belief that death is approaching, it is held in law as equally binding with a statement made on oath. SYN *death-bed statement*.

antenatal (än'te-nat'al) [L *ante*, before, + *natus*, birth] Occurring before birth.

an'te par'tum [L]. The time before the onset of labor.

antephal'ic (ant-e-fi-al'tik) [+ *ephal'tes*, nightmare] Preventing nightmare.

anteposition [L *ante*, before] Anterior displacement of the uterus.

anteprostati'tis [L *ante*, before, + *prostate* + G. *-itis*, inflammation]. Inflammation of glands of Cowper.

antepyre'tic [+ *G. pyretos*, fever]. Before the development of fever, antefeb'ile. SEE *antipyretic*.

anteresis (ant-er'e-sis) [G. *anteresis*, resistance]. Resistance during reduction of a dislocation.

an'erethic (an-ter-eth'ik) [L *anti*, against, + *erethismos*, irritation]. Soothing.

an'te'rior [L]. Before, or in front of.

a. chamber. Aqueous chamber. Bounded in front by cornea, behind by iris and lens.

antero- [L] Prefix: Anterior, front, before, as *anterosuperior*.

anterograde (an'ter-o-gräd) [L. *antero*, anterior, + *gradior*, to step] Extending forward.

antero-infe'rior [+ *inferior*, below]. In front and below.

anterolat'eral [+ *latus*, side] In front and to one side.

anterome'dian [+ *median*]. In front and toward the central line.

anteropos'terior [+ *posterior*, rear]. Passing from front to rear.

anterosuper'ior [+ *superior*, above] In front and above.

antevers'ion [L *ante*, before, + *vertere*, to turn] 1. A tipping or bending forward of an organ. 2. A forward placement of the uterus, the normal position of the healthy uterus.

a. uteri. A forward tipping of the antevert'ed. Inclined or bent forward, said of uterus.

an'thelix (an'the-lik's) [G. *anti*, against, + *chra*, coil] External ear's inner curved ridge. SYN *antihelix*.

anthelmintic (an-thel-min'tik) [G. *anti*, against, + *elmus*, worm] An agent used to expel intestinal worms. Ex *santonin*, *phenyl salicylate*, *thymol*.

a. enema. One given to expel worms. SEE *enema*.

Anthem'is (an'them-is). Chamomile.

an'themorra'h'ic [G. *anti*, against, + *aima*, blood, + *rhēgnunai*, to discharge]. Agent for preventing or arresting hemorrhage.

anthocy'anin. Pigment of red beet root.

anthocyanine'mia [anthocyanin + G. *aima*, blood] Anthocyanin in the blood.

anthocyanin'u'ria [+ *G. ouron*, urine] Anthocyanin in urine.

Anthomy'ia canicula'ris [G. *anthos*, flower, + *myia*, fly] A small black horse fly, whose larvae may infest the human intestine, often resulting in alarming gastrointestinal symptoms.

Anthony's fire. St. Name given to erysipelas.

anthopho'bia [G. *anthos*, flower + *phobos*, fear] Morbid dislike of flowers.

anthorism, anthorisma (an'thor-izm, -iz'mä) [G. *anti*, against, + *orisma*, a boundary] A diffuse swelling.

anthracemia (an'thra-se'mi-ä) [G. *anthrax*, carbuncle, + *aima*, blood] Presence in the blood of *B. anthracis*.

anthrac'ia (an'thra-si-ä) [G. carbuncle]. Presence of carbuncles.

anthracoid (an'thra-koid) Like or pert to anthrax.

anthracoma (an-thrak-o-mä) [G. *anthrax*, carbuncle, + *-oma*, tumor] Carbuncle.

anthracometer (an-thru-kom'e-ter) [G. *anthrax*, coal, + *metron*, measure] An instrument for measuring the carbon dioxide in the air.

an'thraconecro'sis [+ *nekrosis*, deadness] Necrosis of tissue into dry, black gangrene.

anthraco'sis [+ *-osis*, condition] 1. Miner's phthisis. A condition of the pulmonary organs due to coal dust inhalation, a pneumoconiosis. 2. A carbuncle, or a corroding ulcer.

anthrax (än'thräks) [G. coal, carbuncle]. 1. A carbuncle. 2. Acute, infectious dis-

ease caused by *Bacillus anthracis*, usually attacking cattle and sheep.

Man contracts it from animal hair or hides.

Etiol. *B. anthracis*. Workers in wools, hides, and bushes are commonly affected. The disease may attack the lungs (*wool sorter's disease*), the alimentary tract (*gastrointestinal type*), or the loose cellular tissue, giving rise to *anthrax edema*, more commonly it occurs in the form of a pustule known as an *anthrax boil* or *malignant pustule*. The disease often proves fatal.

TREATMENT Anti-anthrax serum.

NP Strict isolation. Old bedding and clothing should be destroyed after use. Other articles adequately disinfected, an hour each for three days by steam, otherwise soak in pure lysol and boil one hour on each successive day. Nurse must keep her hands free from abrasions, and disinfect them after handling patient. She should not attend other patients at same time, esp. surgical or obstetrical cases.

SEL *Anthraxoid*, *Ascoli's reaction*, *vacanthrax*, *charbon*.

anthropo- (an'thro-po) [G.]. Prefix. Pert. to man.

anthropogeny (an-thro-po'je-ni) [G *anthropos*, man, + *gennan*, to produce]. Origin and development of man.

anthropoid (an'thro-poid) [' + *eidos*, resemblance]. 1 Resembling a man. 2. An ape.

anthropology [' + *logos*, study of]. The science which treats of man.

anthropometry (an'thro-pom'e-t-i) [' + *metron*, measure]. Science of measuring the human body and its parts and functional capacities.

Human measurements and types and their relation to psychiatric variants as well as to disease in general is still little understood.

anthrophagy [' + *phagēn*, to eat]. The eating of human flesh.

anthrophobia [' + *phobos*, fear]. A morbid fear of society or of a particular man.

An early symptom of mental disorder. **anthroposomatology** (an'thro-po-so-mat'o-lō-jī) [' + *sōma*, body, + *logos*, study of]. Branch of anthropology dealing with human body.

anthropotoxin [' + *toxikon*, poison]. Supposed poison exhaled by human lungs.

anthydropic (ant-hi-drop'ik) [G *anti*, against, + *ydrops*, dypsyl]. 1 Correcting dypsyl. 2 Agent for relieving dypsyl.

anthypnotic (ant-hip-not'ik) [' + *ypnos*, sleep]. 1 Preventing sleep. 2. Agent hindering sleep.

anthysteria (ant-his-ter'ik) [' + *ystera*, womb]. 1 Relieving hysteria. 2. Agent soothing hysteria.

anti- [G.]. Prefix. Against, as *antibody*.

antiagglutinin. A specific antibody opposing action of agglutinin.

antialbumate, **antialbuminate**. A product resulting from incomplete proteolysis of albumin, parapectone.

antialbumin. An albumin constituent; supposed to be source of antialbumose.

antialbumose. A product formed by peptic digestion of albumin, becomes antipectone by further hydrolysis.

antialexin. Anticomplement.

antiamboceptor. Substance inhibiting action of an amboceptor.

antiamylase. Substance neutralizing action of amylase.

antianaphylactin. An antibody specific to anaphylactin.

antianaphylaxis. A state of immunity.

antianemic [G *anti*, against, + *an-*, priv. + *ama*, blood]. Curing or preventing anemia.

antianfibody. An antibody counteracting effect of antitoxin which produced it.

antiapoplectic. Relieving or preventing apoplexy.

antiarthritic (an-ti-ar-thrit'ik) [G *anti*, against, + *arthritikos*, gouty]. Medicine given to relieve gout.

antibacterial. Destroying or stopping the growth of bacteria.

antibacterin (an-ti-bak'ter-in) [G *anti*, against, + *bakterion*, little rod]. An antibody injected to prevent further germ growth in the body. See *germ theory*.

antibechic (an-ti-bek'ik) [G *anti*, against, + *bea*, cough]. 1. Relieving cough. 2. A cough remedy.

antibilious (an-ti-bil'yus). Relieving bilious conditions.

antibiosis [G *anti*, against, + *bios*, life]. An association of two organisms detrimental to one of them.

antibiotic (an-ti-bi-ōt'ik) 1 Tending to destroy life. 2 A substance produced by a living organism which has power to inhibit the multiplication of, or to destroy other organisms, especially bacteria. Some affect only gram-positive bacteria, others also the negative forms. Some are effective against fungi and rickettsiae, and a few affect viruses. Antibiotics are produced by bacteria, molds, and other fungi.

A Antibiotics of Bacterial Origin
bacitracin *Bacillus subtilis*
polymyxins *Bacillus polymyxa* (*aerosporus*)

Bacillus subtilis
subtilin *Bacillus subtilis*

tryothricin { *gramicidin* } — *Bacillus brevis*
{ *tyrocidin* }

B Antibiotics derived from molds or mold-like organisms

achromycin *Streptomyces achromogenes*
aureomycin (chlorotetracycline)

Streptomyces aureofaciens
chloromycetin (chloramphenicol)

Streptomyces venezuelae
erythromycin

Streptomyces erythreus
flavacidin (flavacin)

Aspergillus flavus
magnamycin (carbomycin)

Streptomyces halstedii
neomycin *fradiseae*

penicillin *Penicillium notatum*
streptomycin

Streptomyces griseus
terramycin (hydroxy-tetracycline)

Streptomyces rimosus

antiblennorrhagic (an-ti-blen-o-raj'ik) [G *anti*, against, + *blennos*, mucus, + *rhennagēn*, to burst forth]. 1. Preventing or curing gonorrhea or catarrh. 2. Remedy for these diseases.

antibody. A substance in the body which incites immunity (antagonistic to invading bodies) such as the reacting agents in the serum.

Antibodies resemble enzymes in that they are associated with proteins of the serum. Bacteria entering the body stimulate the production of antibodies. Antibodies do not seem to be activating agents except as they accelerate the action of other agents.

They consist of (a) *antitoxins*, which neutralize toxins; (b) *cytolysins* (bacteriolysins) which dissolve cells, (c) *agglutinins*, which cause cells to clump together, (d) *precipitins*, which bring about precipitation of substances; and

(e) opsonins, which enhance the phagocytic activity of leukocytes by making bacteria more readily ingested. A substance which induces the production of antibodies is called an **antigen**. Antigen-antibody reaction is generally specific, i.e., an antibody will act only against the antigen which induces its production.

The antibody fighting element is carried by the blood protein, or globulin, of which there are three types: *alpha*, *beta*, and *gamma*. The latter carries the antibodies in pneumonia.

antibody, words pert. to: antianaphylactin, antiantibody, anticutin, anticytost, anticytotoxin, antirubin, antiserum, antitrypsin, autoantibody, autohemolysin, isoagglutinins, lysin, opsonin.

antibrachium (an-te-bra'ki-um) [G *anti*, against, + *brachion*, arm] (BNA) The forearm.

antibromic [' + + *bromos*, smell] 1 Deodorizing 2 A deodorant.

antical'culous [' + + *L calculus*, a pebble]. Antilithic.

anticancer'crin [' + + *L cancerum*, cancer] Canceroin. Supposed cancer antibody.

anticard'ium [' + + *kardia*, heart]. Pre-cordial depression.

anticarious (an-ti-ka're-us) [' + + *caries*, decay]. Preventing decay of teeth.

anticathode (an-ti-kath'od) Portion of vacuum tube opposite cathode. **SYN target**.

antichiropronus (an-ti-ki-ro't'o-nus) [G *antichair*, thumb, + *tonos*, tension] Spasmodic bending inward of thumb in epilepsy or before attack.

anticholagogue (an-ti-ko-la-gog) [G *anti*, against, + *cholē*, bile, + *agogos*, drawing forth] Depressing hepatic function.

anticholerin (an-ti-kol-er-in) [' + + *cholera*] Substance from cultures of *Spizidium cholerae asiaticae* employed against cholera.

anticipating intermittent. Intermittent with paroxysms recurring earlier each day before the regular time.

anticipa'tion. Theory that hereditary defects manifest themselves earlier in each successive generation and often more severely. **SYN antedating**.

anticlin'al [G *anti*, against, + *klinein*, to incline] Leaning in opp. directions.

anticoagulant (an-ti-ko-ag'u-lant) 1 Preventing the process of clotting. 2 An agent which prevents or delays blood coagulation.

anticomplement (an-ti-kom'ple-ment) A substance combining with and thus neutralizing a complement.

anticonvul'sive [G *anti*, against, + *L convulsio*, pulling together] 1 Relieving convulsions. 2 Agent preventing convulsions.

anticeatinine (an-ti-ke-ra't'in-in) A leukomaine from creatinine.

anti'cus [L foremost] (BNA) Anterior. That part nearest the ventral or front surface.

anticu'tin. An antibody neutralizing tuberculin to prevent cutaneous tuberculin reaction. [pyretic drug]

anticyclic acid (an-ti-sik'lik) An anti-anticytol'ysin [G *anti*, against, + *kytos*, cell, + *lysis*, dissolution] Antibody inhibiting cytotoxin. **SYN anticytotoxin**.

anticy'tost. An antibody which gives immunity to cytotost, named by Turck.

anticytotox'in [G *anti*, against, + *kytos*, cell, + *toxikon*, poison] An antibody specifically inhibiting cytotoxin.

antiarrhe'ic en'emas. These include the demulcents, astringents, antiseptics, carminative, or sedative enemas, *q v*.

antidinic (an-ti-din'ik) [G *anti*, against, + *dinos*, dizziness] 1 Relieving giddiness. 2 Agent preventing vertigo.

antidiphtherin (an-ti-dif'ther-in) A substance taken from the culture of diphtheria bacillus and used to prevent the disease.

antidiuretic (an'ti di-u-ret'ik) [G *anti*, against, + *G dia*, intensive, + *ourēsis*, urination] 1 Lessening urine secretion. 2 A drug having such an action.

antido'tal [G *antidotos*, given against]. Acting as or pert. to an antidote.

antidote (an'ti-dōt). A substance which neutralizes poisons or their effect.

Antidotes may be **mechanical**, **chemical**, or **physiological**.

MECHANICAL OR PHYSICAL ANTIDOTES Those that envelop the poison inside the stomach or coat the mucous membrane of the stomach. These are fats, oils, milk (casein coagulum), whites of eggs, finely divided charcoal, fuller's earth, or mineral oil. (Fats and oils are not desuible as in phosphorus, camphor, aspidium, and cantharides. *p*.)

CHEMICAL ANTIDOTES These act chemically by reacting with the poison to produce an insoluble compound which is inert or less toxic. For example, table salt precipitates silver nitrate and forms an insoluble, harmless silver chloride. Chemical antidotes should be used sparingly and should be removed, as they may produce serious results if allowed to remain in the stomach.

PHYSIOLOGICAL ANTIDOTES These produce opposite physiological effects or neutralize the effects of the poison. *e g.*, sedatives are given for convulsives and hypnotics. These should not be given without physician's definite instructions.

UNIVERSAL ANTIDOTES Many of these have been recommended, the simplest being pulverized charcoal, tannic acid, and magnesium oxide. The charcoal acts physically by *absorption*, the tannic acid *precipitates* metals, alkaloids, and some glucosides, and the magnesia *neutralizes* acids and is an excellent antidote for arsenic. **DOSAGE** Mix equal parts and give a teaspoonful well stirred up with water.

antido'tum. An antidote.

antidromic (an-ti-diom'ik) [G *anti*, against, + *dromos*, running] Running in a direction opposite the usual stream, as when a nervous impulse runs along a sensory fiber in the direction of the sense-organ.

antidyscratic (an-ti-dis-krat'ik). Relieving dyscrasia.

antidysenteric. 1 Relieving or preventing dysentery. 2 An agent curing dysentery.

antiemet'ic [G *anti*, against, + *emetikos*, nauseated] An agent that will prevent or arrest vomiting. Ex. cocaine, peppermint, bismuth, subnitrate, cerium orotate.

antienzyme (an-ti-en'zim) 1 Enzyme neutralizer. 2. An enzyme retarding the activity of another.

antiephial'ic [G *anti*, against, + *ephaltes*, nightmare] Hindering nightmare. **SYN antephalic**.

an'tifat. An agent which lessens accumulation of fat.

antifebr'ile [G. *anti*, against, + *L febris*, fever] 1. A medium reducing fever. 2. Reducing or relieving fever.

antifebrin (an-ti-feb'rin). Acetanilid. **DOSAGE** 3 gr. (0.2 Gm.).

a. salicylate. Salicylfebrin

antiferment [G *anti*, against, + L. *fermentum*, leaven]. Hindering, or an agent which hinders, the action of an enzyme. SYN. *antienzyme*.

antifermentative. Preventing the fermentation process SYN *antizymotic*.

antilactagogue (an-ti-gal-ak'tā-gog) [G *anti*, against, + *gala*, milk, + *agogos*, drawing forth] An agent that lessens the secretion of milk Ex *belladonna*, probably all *hydragogue purgatives*.

antigalactic (an-ti-gal-ak'tic) [“ + *gala*, milk] Diminishing or retarding the secretion of milk.

antigen [“ + *gennan*, to produce] A substance which induces the formation of antibodies. An antigen may be introduced into the body or it may be formed within the body. Examples are bacteria, bacterial toxins, foreign blood cells

a. unit. Smallest quantity of antigen required to fix 1 unit of complement, preventing hemolysis

antigenic (an-ti-jen'ik) Capable of causing the production of an antibody

antigenophil (an-ti-jen'ō-fil) [“ + “ + *philos*, fond] Having an attraction for the antigen SYN *antigenophil*

antigenophil (an-ti-jen'ō-fil). Having affinity for antigen

antigenoetherapy [“ + “ + *therapeia*, treatment] Stimulating antibody formation by injecting antigens

antiglobulin. A precipitin which precipitates globulin

an tigonorrhoea. 1. Curing gonorrhoea. 2. An agent relieving gonorrhoea

antihelix [G *anti*, against, + *elix*, coil]. Inner curved ridge of external ear

antihemolysin. A substance which neutralizes hemolysin

antihidrotic [G *anti*, against, + *hidrotikos*, sweating] Preventing or checking perspiration. SYN *anhidrotic*.

antihistaminic. 1. Inhibiting the production of or neutralizing the effect of histamine 2. An agent used to counteract histamine

antihormone (an-ti-hor'mōn). An inhibitor or autacoid opposing hormone action

antihydropic [G *anti*, against, + *ydrops*, dropsy] 1. Relieving dropsy 2. Agent causing disappearance of dropsy

anti-icteric [“ + *ikteros*, jaundice] 1. Relieving icterus 2. Agent for curing jaundice

anti-immune. Preventing immunity

anti-isolyisin. A substance inhibiting action of an isolyisin

antikenotoxin. A substance counteracting fatigue toxins

antiketogenesis [G *anti*, against, + *ketone* + *gennan*, to produce] Lowering of acidosis through body oxidation of sugar, alcohol, glycerin, and allied substances

antiketogenetic, antiketogen'ic. Pert. to antiketogenesis

antilactase [G. *anti*, against, + *lac*, milk]. An antibody counteracting lactase

antilemic (an-ti-le'mik) [“ + *toimos*, plague]. 1. Preventing plague. 2. An agent curing the plague

antilepsia (an-ti-lep'sis) [“ + *lepsis*, a seizing] 1. Application of a remedy to a healthy part 2. An attack or seizure. 3. Taking effect or root. 4. Support of a bandage.

antileptic (an-ti-lep'tik) [G *antileptikos*, able to check] 1. Assisting, supporting. 2. Revulsive

antilethargic (an-ti-leth-ar'jik) [G. *anti*,

against, + *lethargos*, forgetfulness]. Preventing sleep

antilitic [“ + *lithos*, stone]. An agent that prevents the formation of, or favors the removal of stones or calculi in the urinary or biliary tracts Ex *lithium citrate*, *methenamine*, *alkaline waters*, and *glycerin*

antilo'bium [“ + *lobos*, ear lobe] The tragus

antilogia (an-ti-lo'ji-ā) [“ + *logos*, science] Contradictory symptoms which render diagnosis uncertain

antiluetic (an-ti-lu-et'ik) [“ + L. *lues*, pestilence] Antisyphilitic

antilysin (an-ti-li'sin) A substance neutralizing the lysins of a disease against which an animal has been immunized

antilysis (an-ti'is-is). The result of the action of antilysin

antilysis'ic [G *anti*, against, + *lyssa*, frenzy] Preventing or checking rabies. SYN *antirabic*

antimalarial. An agent that will prevent or relieve malaria Ex *quinine*.

antimere (an'ti-mēr) [G *anti*, against, + *meros*, a part] Any body segment bounded by planes at right angles to the long axis of the body.

antimetropia. An ocular disorder in which one eye is hypermetropic, the other myopic

antimiasmatic [G *anti*, against, + *mi-asma*, stain] Preventing or checking malaria SYN *antimalarial*.

antimicrobic [“ + *mikro*, small, + *bios*, life] 1. Not believing in the pathogenicity of microorganisms 2. Preventing the development or pathogenic action of microbes

antimicrobin. Antibody used to prevent further germ growth in the body SEE *germ theory*.

antimomial. Pert. to or containing antimony

antimony (an'ti-mo'ni) SYMB Sb An element of metallic appearance and crystalline structure Atomic weight 121.77. Its salts form various poisons and medicinal drugs

POISONING SYM Acrid metallic taste Cardiac and arterial depressants with additional properties of inducing sweating and vomiting about 30 minutes after injection In large doses they irritate lining of alimentary tract, resembling arsenic

P A TREATMENT Vomiting caused by the poison may be sufficient emesis. Wash stomach with strong tea, or dilute tannic acid Otherwise treat symptomatically SCR *tartar emetic*.

antimycotic (an-ti-mi-kot'ik) [G. *anti*, against, + *mykes*, fungus]. Checking or destroying bacteria SYN *antibacterial*.

antinarcotic. Relieving stupor caused by a narcotic

antinephritic (an-ti-nef-rit'ik). Serviceable in renal inflammation.

antiner'vin. Bromacetanilid and salicylanilid used as an antineuralgic.

antineuralgic (an-ti-nu-ral'jik). 1. Relieving neuralgic pain 2. Agent curing neuralgia

antineuritic. Counteracting nerve inflammation.

antineur'itin. Antineuritic vitamin or Vitamin B.

antin'ion [G *anti*, against, + *inion*, nape of the neck]. Frontal pole of the skull.

antiop'sonin. A substance that retards opsonin action.

antioxi'dation. Prevention of oxidation.

antiox'ygen. A substance hindering oxidation.

antiparalytic. Reputedly relieving paralysis.

antiparasitic. 1. Destructive to parasites. 2 Insecticide *

antiparastatis [G. *anti*, against, + *parastates*, testicle, + *-itis*, inflammation] Inflammation of Cowper's glands

antipathic (an-ti-path'ik) [+ *pathēn*, to feel] Opposite, unlike

antipathy [+ *pathos*, suffering]. 1. Aversion, disgust, or that which excites repugnance 2 Chemical incompatibility

antipepsin (an-ti-pep'sin). An antibody counteracting pepsin

antipeptone (an-ti-pep'tōn) Peptone derived from antialbumose through hydrolysis

antiperiodic [G. *anti*, against, + *periodos*, a circle] Antimalarial, preventing regular recurrences

antiperistaltic [+ *peri*, around, + *stalsis*, constriction] A wave of contraction in the gastrointestinal tract moving towards the oral end

In the duodenum it is associated with vomiting, in the ascending colon it occurs normally. It may occur in diverticulitis. SEE *peristalsis*.

antiperistaltic. 1 Pert to antiperistalsis * 2 Impeding peristalsis *

antiphlogistic (an-ti-phlo-jis'tik) [G. *anti-*, against, + *phlogistos*, on fire] An agent that tends to relieve inflammation. Ex *cataplasma of kaolin*, *ichthyol*

antiphthisic (an-ti-tiz'ik) [+ *phthisis*, a wasting] Checking or relieving phthisis

antiphtisin. Modified tuberculin

antiplastic [G. *anti*, against, + *plastikos*, pert to molding]. 1 An agent preventing granulation of tissue 2 One which thins the blood

antipneumotoxin [+ *pneumon*, lung, + *toxikon*, poison]. An antitoxin opposing pneumotoxin

antipodal cell [G. *antipous*, with feet opposite] One of two nuclear cells at the base of embryo sac in a seed

antipraxis (an-ti-praks'i-ā) Functions or symptoms antagonistic to each other

antiprostata (an-ti-pros'tat). Cowper's glands.*

antiprostatitis. Inflammation of Cowper's glands

antiprothrombin [G. *anti*, against, + *prō*, before, + *thrombos*, clot] Agent preventing formation of thrombin, anticoagulant. SEE *clotting*.

antiprotozoal. Destructive to protozoa.

antipruritic (an-ti-piu-rit'ik) [G. *anti*, against, + *L. prurire*, to itch]. That which relieves itching

antipsoric (an-tip-so'rik) [+ *psōra*, the itch] An agent used to prevent or arrest itching. It may be local or general.

antiputrefactive. Preventive of putrefaction

antipyic (an-ti-pi'ik) [G. *anti*, against, + *pyon*, pus]. Checking suppuration, antipyogenic

antipyogenic (an'ti-pi-o-jen'ik) [+ *pyon*, pus] Preventing or checking pus formation

antipyretic [+ *pyretos*, fever]. Use of antipyretics in fever

antipyretic. An agent that reduces febrile temperatures. Ex *quinine*, *antipyrene*, *acetylsalicylic acid*.

antipyrine (ān'ti-pi'rīn) [G. *anti*, against, + *pyr*, fever]. White crystalline powder, odorless and having a slightly bitter taste.

One of the safest coal tar derivatives, which is much less toxic than acetanilid.

A. is incompatible with many other drugs and list should be noted.

Action Sedative, analgesic, antipyretic

Urs Fevers, headache, neuralgia, whooping cough, etc

Dosage 5 gr (0.3 Gm)

INCOMPATIBILITIES Acids and drugs containing tannic acid, alkalies, salts of iron, mercury, lead and arsenic, iodine and iodides, sodium bicarbonate and salicylate, alum, benzoates, phenol, cinchona alkaloids, resorcin, spirit of ethyl nitrite

antipyrotic (an-ti-pi-rot'ik) [G. *anti*, against, + *pyrotikos*, burning] That which allays the pain from burns.

antirabic. Preventive of, or curing, hydrophobia, antilyssic

antirachitic [G. *anti*, against, + *rachitis*]. 1 Helping to cure rickets 2 Agent for treating rickets

a. **vitamin**. Vitamin D. SEE *vitamins*.

antireticular cytotoxic serum. One prepared by Dr Alexander A Bogomolets (d 1946) of Russia (Abbr. ACS.) A serum made from endothelial cells which line the blood vessels first tested by Bogomolets. Used successfully in war wounds, treatment after surgery, some types of rheumatism, headaches, insomnia, reducing high blood pressure and in warding off diseases of the aged, thus prolonging life

antirheumatic. An agent that will prevent or relieve rheumatism. Ex *sodium salicylate*, *acetylsalicylic acid*, *colchicum*

antiricin (an-ti-ri'sin) An antibody to ricin

antiscabious (an-ti-ska'bi-us) Preventing or relieving scabies

antiscorbutic (an-ti-skor-bu'tik) An agent effective against or a remedy for scurvy. Vitamin C is antiscorbutic. Ex *citric acid*, *orange juice*, *ascorbic acid*.

antiseptic. SEE *asepsis*

antiseptic [G. *anti*, against, + *sepsis*, putrefaction] The exclusion of putrefactive germs

antiseptic (an-ti-sep'tik) An agent that will prevent the growth or arrest the development of microorganisms. Ex *sodium benzoate*, *boric acid*, *carbolic acid*, or almost any germicide in diluted form.

Chemically, antiseptics may be *inorganic*, such as the mercury preparations, or *organic*, such as carbolic acid (phenol). Oxidizing disinfectants liberate oxygen when in contact with pus or organic substances. When in use they should be changed frequently to free them of pus, blood, and other substances. Different types of bacteria require different antiseptics. They are more or less destructive to tissue. They should cause the serum to enter the wound rather than flow from it, and they should prevent absorption of infectious substances

RS *asepsis*, *disinfectant*, *deodorant*, *germicide*, *sterilization*.

antisepticism. Therapeutic employment of antiseptic measures

antiserum (an-ti-se'rūm) A serum containing an antibody specific in relation to the substance which has produced it through repeated injections

antisialic (an-ti-si-al'ik) [G. *anti*, against, + *sialon*, saliva] Checking or that which checks the secretion of saliva.

antisialogogue (an-ti-si-al'o-gog) [+ *agogos*, drawing forth] An agent that lessens or checks the flow of saliva.

Ex *belladonna*, *sodium bicarbonate*, *atropine*.

antispasmod'ic [" + *spasmos*, convulsion]

An agent that will relieve muscular spasm. Ex: *morphine*, *atropine*, *asa-fetida*, *bromides*. SEE *spasm*.

antispas'tic. Agent relieving muscular spasm. SYN *antispasmodic*.

anti-stain formulary. An anti-stain formulary for removing stains from linens is as follows

ARGYROL Rinse well while stain is fresh in clear, cold water. For old stain, soak in 1 1000 bichloride of mercury solution. Rinse in cold water.

BALSAM OF PERU Use waste ether to dissolve it before laundering.

BLOOD Soak in cold water, then wash. For old stains, use peroxide of hydrogen and ammonia water, persistently.

CHOCOLATE OR COCOA Use glycerine, then cold water and borax, then boiling water. Soak in these successively while fresh.

COD LIVER OIL Soak stained fabric in kerosene oil for 1 hour, rubbing lightly occasionally. Then place article in water in which a naphtha soap has been shaved and boil 10 minutes. Rinse in clear water.

FECES Soak in cold water, rinse, then wash with soap and water (hot). Use a brush to scrub.

FRUIT-STAINS Stretch stained article over a basin, pour boiling water directly over the spot until it disappears. If this fails, use Javelle water (a preparation of washing soda and chloride of lime), rinsing bet. each application.

GRASS-STAINS Use alcohol, kerosene, or gasoline, afterwards washing soda and hot water. Put in the sun to bleach.

INK If fresh, immerse in cold or tepid water, or skimmed milk. Long soaking will bring it out of the goods. Oxalic acid may be applied if care is taken not to leave on too long. It may rot the cloth, though; soak and rinse well. Turpentine may be used on colored fabrics. Old ink-stains respond well to lemon juice, salt and sunlight. Whatever is used, the material should be rinsed and rinsed after using to remove all of the solution.

IODINE Use alcohol, then rinse well in clear, cold water. Ether or ammonia may be used, rinse well after using.

IRON-RUST Use lemon juice and salt; expose to the sunlight. For firm fabrics, use strong solution of oxalic acid. Rinse very thoroughly.

MEAT-JUICES Soak in clear, cold water.

MEDICINES Use alcohol or cold water.

MERCROCHROME Pour hot water through the material. Acid alcohol does very well, or Dakin's Solution and 5% acetic acid (vinegar), equal parts of each. Mix with a stick and when the material has been soaked and the color of the stain removed, wash thoroughly.

MILDEW If fresh, use strong soapsuds and hang in the sunlight. If an old stain, use Javelle water, rinse thoroughly and repeat the washing if indicated.

NAIL POLISH, LIPSTICK AND ROUGE Ordinary washing or carbon tetrachloride

ANTISEPTICS

Used For	Chemicals	Uses
HANDS	Bichloride of mercury (mercuric chloride)	One tablet (7½ grains) in one pint of water makes a 1 1000 solution, chiefly used to disinfect hands previous to an operation. Continued use irritates skin. Not used to disinfect instruments as it <i>corrodes the metal</i> .
	Alcohol (ethyl alcohol)	A 50 to 70 per cent solution will penetrate bacteria, but stronger solutions are not as active. Green soap owes its germicidal action to the alcohol (43 per cent) contained in it.
SKIN	Sulfur	Used as ointment to check growth of bacteria and destroy parasites, as in scabies.
	Ichthyol	An antiseptic in various skin diseases to relieve itching and soften skin.
WOUNDS AND ULCERS	Hypochlorite solutions	Dakin's solution contains 45 to 50 per cent sodium hypochlorite. Free chlorine is liberated to combine with NH ₂ radical of proteins in tissues to form chloramine, as an antiseptic about 15 times as effective as phenol, besides not being injurious to tissues.
	Potassium permanganate	An oxidizing disinfectant in 1 to 3 per cent solutions for wounds, and in 1 1000 to 1 per cent solutions for gargles and douches.
	Iodoform	Mostly used in gauze soaked with a 5 to 10 per cent solution of iodoform.
MUCOUS MEMBRANES	Picric acid	Used chiefly in treatment of burns or scalds.
	Boric acid	A 2 to 5 per cent solution used in eyes, nose or sensitive membranes without any irritation.
	Dobell's solution	A 1½ per cent sodium borate, phenol, sodium bicarbonate, glycerine and water solution, mostly used as an alkaline gargle and as an antiseptic nasal douche.
	Silver nitrate	A 2 per cent solution in eye of the newborn prevents gonorrheal infection. In strong solutions very destructive to tissues.
	Argyrol	As a combination of silver and albumin it is used in 10 to 25 per cent solutions for antiseptic and astringent purposes.

or acetone, followed by a warm chlorine bleach.

PAINTS, VARNISHES Turpentine, gasoline or benzine applied in the open air. If old stain, soak well in grease to soften, then apply turpentine or the other solutions. Chloroform dissolves lacquer paint stains. Acetone sponged on fabric removes varnish.

PERSPIRATION Wash in strong soap solution and hang in the sunlight.

PICRIC ACID. Make a solution of one part of boric acid, one part of sodium benzoate, and 98 parts of water. Soak the material in this solution and then rinse well or else boil fabric in strong sodium hydroxide solution for ½ hr and bleach in Javelle water.

SCORCH Peroxide of hydrogen applied to the area, then rub well with the material soaked in strong soap solution. Hang in the sunlight.

SILVER NITRATE Soak in normal saline solution, or soak in a solution of bichloride of mercury 1 1000 to 25 parts of sodium chloride in 2000 cc of water.

TEA OR COFFEE If fresh, pour boiling water through it. If old, soak in borax before pouring boiling water over it.

URINE Soak in boiling water, then pour 5% lysol solution over it.

VASELINE Wash well with cold water and plenty of mild soap (Ivory). Hot water sets the stain. Use soap freely and rinse thoroughly.

antistalsis [*G anti*, against, + *stalsis*, constriction] Backward movement of bowel contents. Opp *peristalsis*, *q.v.*

antistaphylococ'cic. Destructive to staphylococcus.

antistaphylo'ysin. Blood serum substance counteracting staphylo'ysin.

antistatic [*G anti*, against, + *statis*, standing] Counteracting, hostile *SYN* antagonistic.

antistreptococ'cic. Destructive to streptococcus.

antistreptococ'cin. The antitoxin of any type streptococcus.

antisudoral [*G anti*, against, + *sudor*, sweat] Checking perspiration *SYN* antihidrotic.

antisudorin. Commercial name of remedy to correct sweating.

antisiphilit'ic. An agent that will prevent or relieve syphilis. Ex *mercury*, *arsenic*, *bismuth*.

antitabetic (an-ti-ta-bet'ik). 1. Preventing tabes dorsalis. 2. Agent which mitigates tabetic symptoms.

antithenar (an-ti-thē'nar) Placed opposite to the thenar.

antithermic [*G anti*, against, + *thermē*, heat]. 1. Reducing temperature. 2. Agent lowering temperature. *SYN* antifebrile, *antipyretic*.

antithrombin (an-ti-throm'bin). A substance in the blood which prevents or retards coagulation.

antithyro'din. A serum from sheep's blood after thyroid has been removed.

USFS Exophthalmic goiter and other diseases due to hypersecretion of thyroid gland.

Dosage 0.5 to 1 cc.

antiton'ic. Diminishing tone or tonicity.

antitoxic (an-ti-tox'ik) [*G anti*, against, + *toxikon*, poison]. Neutralizing a poison, specifically an antitoxin.

a. unit. Sufficient quantity of antitoxin to neutralize 100 toxic units *SYN*: immunizing unit.

antitoxigen [' + + *gennan*, to produce]. An antigen stimulating antitoxin production in the blood.

antitox'in. An antibody capable of neutralizing a specific toxin. It is produced by the body cells in response to the presence of a toxin. Examples are *diphtheria antitoxin* and *tetanus antitoxin* which counteract the toxins produced by the diphtheria and tetanus bacteria. Antitoxins are used for prophylactic and therapeutic purposes.

a. serum. A serum which contains the antitoxin of a disease organism. The serum is obtained from the blood of an animal. It is given in toxic diseases, either (a) subcutaneously, (b) intramuscularly, (c) intravenously.

antitoxin'ogen [*G anti*, against, + *toxikon*, poison, + *gennan*, to produce] An antigen promoting production of antitoxin in the blood *SYN* antitoxigen.

antitragicus (an-ti-traj'ik-us) A small muscle in the pinna of the ear.

antitragus (an-ti-tra'gus) A projection on the ear of the cartilage of the auricle in front of the tail of the helix, post. to the tragus.

antitrismus (an-ti-tris'mus) A condition in which the mouth cannot close because of tonic spasm.

antitrope (an-ti-tröp) [*G anti*, against, + *tröpē*, a turn] 1. A symmetrical pair of organs. 2. Antibody.

antitro'pin. An antibody.

antitryp'sin. An antibody or antiferment inhibiting tryptic action.

antitryp'tic. Counteracting trypsin.

antituberculo'fic. Inhibiting the advance of tuberculosis.

antitula'se. A serum used in treating for tuberculosis.

antiuratic (an-ti-u-rat'ik). Preventing the precipitation of urates.

antivaccina'tion. Opposition to vaccination.

antivaccina'tionist. One who is opposed to vaccination.

antiven'ene. Blood serum of an animal rendered immune to snake bite.

USFS A specific in treating certain poisonous snake bites.

antivene'real. Preventing or curing venereal diseases.

antivenin (an-ti-ven'in) An antigenic substance prepared from immunized animal sera used by injection to overcome the effects of snake bite.

Special types are used for each variety of snake. Mixed types (polyvalent antivenins) are also available *SYN* antivenene.

antiven'om. A snake venom antitoxin.

antiven'omous. Inhibiting venom.

antiv'iral. Inhibiting a virus.

antiv'rus. A bacterial filtrate from a broth medium heated to reduce toxicity, used in the Besredka local immunity method.

antix'e'nic. Pert. to living tissue reaction to any foreign substance.

antizymo'tic. An agent that will prevent or arrest fermentation. Ex *salicylic acid*, *alcohol*.

antlia (ant'lli-ä) [*L.* a pump]. A pump or syringe.

antodontalgic (ant-o-don-tal'jik) [*G. anti*, against, + *odont*, tooth, + *algos*, pain].

1. Relieving toothache. 2. Remedy for toothache.

an'fozone. Hydrogen peroxide.

an'tra [*L.* Pl.] of antrum.

antrac'ele (an'tra'sel) [*L. antrum*, cavity, + *G. kēlē*, tumor] Accumulation of fluid in Highmore's antrum.

antral (an'tral). Pert. to an antrum.

anrectomy [L. *antrum* + G. *ektomē*, excision. Excision of the walls of an antrum.

antritis (an-tri'tis) [' + G. *-itis*, inflammation] Inflammation of an antrum, esp. that of the a. of Highmore.

antroatticotomy (an-tro-at-i-ko'to-mi) [' + *atticus*, + G. *tomē*, cutting] Operation to open and remove contents of the antrum and the attic of the tympanum.

antrocele (an'tro-sēl) [' + G. *kēlē*, tumor Fluid accumulation in Highmore's antrum SYN. *antracèle*.*

antrona'sal [' + *nasalis*]. Rel. to the maxillary sinus and nasal fosse

antrophore (an'tro-fōr) [' + G. *phorein*, to carry] A medicated bougie for local treatment of any accessible cavity or canal

antroscope (an'tro-skop) [' + *skopein*, to view] An instrument for examining the maxillary sinus

antros'copy. Examination of any cavity by the antroscope

antros'tomy [L. *antrum*, cavity, + G. *stoma*, mouth]. Operation to open an antrum for drainage

antrotome (an'tro-tōm) [' + G. *tomē*, incision] An instrument for cutting open a cavity, esp. in bone

antrotomy. Opening an antral wall

an'trotympan'ic [L. *antrum*, cavity, + G. *tympanon*, drum] Rel. to the mastoid sinus and the tympanic cavity

an'trotympani'tis. Chronic inflammation of middle ear and mastoid antrum

an'trum [Pl. *antra*] [L. from G. *antron*, cavity] Any nearly closed cavity or chamber in a bone

a. auris. External acoustic meatus

a. cardiacum. Cardiac portion of the stomach, proximal or superior portion.

a. mastoideum. Tympanic antrum

a. maxillary. The maxillary sinus.

SEE *sinus*

a. of Highmore. The air sinus in the maxillary bone.

a. puncture. Made near floor of nose 1½ inches from external opening Pus is then diamd NP Douche antrum 24 hours after puncture May be necessary for first few days to cocaine nose before passing cannula Attach syringe to cannula when placed Teach patient to hold it and to treat self at home

a. pyloricum. Bulge in the pyloric portion of the stomach along the greater curvature on distention

a. tympanicum. The mastoid antrum.

an'tro'trin. Extract of anterior lobe of pituitary body.

a. G. a. growth. Commercial product derived from the ant. pituitary, containing the growth stimulating element.

a. gonadotropic. Commercial product derived from the ant. pituitary, containing the gonadotropic hormone.

a. S. A gonadotropic hormone extracted from the urine of pregnant women.

a. T. a. thyrotropic. Commercial product derived from the ant. pituitary, containing the thyrotropic element

anure'sis [G. *an-*, priv + *ouresis*, urination] Failure of kidney to secrete sufficient urine, suppression or failure to reach bladder if secreted; found in nephritis (if acute), or congestion, renal abscess, and last stages of chronic nephritis.

EROL Inhalation of ether; lead, phosphorus, cantharides, or turpentine poisoning, Asiatic cholera; cholera infantum; cholera morbus; gastrointestinal

perforation; shock; collapse; typhoid fever, yellow fever, pernicious anemia, hysteria, acute yellow atrophy of the liver. Obstructive suppression is the result of occlusion of one or both ureters.

NP Aid action of skin and bowels. Care as in nephritis. Wash skin with hot water, 116° to 120° F., twice a day. Hot drinks. Cover patient well. Prevent chilling and keep out of drafts

anure'tic. Pert to anuresis, *q.v.*
anu'ria [G. *an-*, priv + *ouron*, urine]. Failure of kidney function. SYN. *anuresis*.

a'nus [L.]. The outlet of the rectum lying in the fold bet the nates

The end of the anal* canal (2.5 to 3 cm). Fissures of anus in newly born indicative of congenital syphilis

a., artificial. Opening of the bowel (usually surgical)

a., fissure in. A crack in mucosa of rectum

a., fistula in. A fistulous connection bet lumen of rectum and perianal skin.

a., imperforated. Where the natural opening is closed.

a., vulvovaginal. An opening into the vulva from the anus

anvil (an'vīl) [AS *anfil*]. Middle ossicle of ear. SYN. *incus*

anxi'etas (ang-zī-et-ās) [L. *angere*, to vex, trouble] Anxiety, apprehension, restlessness

a. tibia'rum. Tiredness, twitching, and unrest in legs when in bed. EROL Increase of the muscular sense

anxi'ety neuro'sis. A functional disease in which fear (or the somatic evidences of fear) is the essential part of the picture.

A symptomatic fear state can be differentiated by recognizing primary disease such as thyrotoxicosis. Fear may exist consciously, or present a group of somatic symptoms not recognized for what they are, in fact, even denied as representing anxiety. Ordinarily, fear as a response to an environmental threat is quite conscious. It may be equally conscious without the patient having the slightest insight as to its causation.

Fear may be an emotional correlate of organic brain disease. It is outstanding in certain toxic states (notably delirium tremens), may coexist with depression, and occur as night waves.

Anxiety neurosis is manifested when an intact personality without organic disease, during clear consciousness, complains of palpitation; heart pain, dyspepsia, cold, sweaty, tremulous extremities, constriction of the throat, bandlike pressure about head, among other symptoms. Often these are interpreted as meaning regional disease.

The real significance is a feeling of inadequacy in meeting some situation, *e.g.*, a looming situation which is so completely repressed as to be totally unacceptable to the patient as of significance. *Homosexuality** is such a frustrated impulse that may lead not only to an anxiety state but to the much more intense picture of panic—psychotic terror. It is always very important not to rationalize the symptoms as some physical disease, although analysis is not always indicated.

anxious agitated depression. PSY: Depression accompanied by worry, uneasiness, and agitation, esp. rel. to poverty and want, or ruin

SYM Hallucinations may be present but generally they are absent. Delusions

that a well-known phenomenon of nature has ceased to exist, such as the day or the night, the sun or the moon, aversion to eating, or the hearing of voices accusing the subject, are other symptoms

anhydremia (an-i-dre'mi-ā) [G *an-*, priv. + *ydor*, water, + *aima*, blood]. Decrease in normal fluid content of the blood. SYN *anhydremia*.*

apnyia (an-ip'ni-ā) [G *an-*, priv. + *ypnos*, sleep] Condition of sleeplessness.

A. O. C. Abbr. for Anodal Opening Contraction

ochlesia (a-ok-le'zi-ā) [G. *a-*, priv. + *ochleisis*, disturbance]. Tranquility; rest, catalepsy

aolan (ā'o-lan). A sterile solution of lactalbumin in colloidal form

Uses In nonspecific protein therapy, to relieve pain in gonorrheal complications

DOSAGE From 5 to 10 cc, at intervals of 5 to 6 days, intramuscularly

aor'ta [G *aortē* aorta] The main trunk of the arterial system of the body. It is $\frac{1}{2}$ to $\frac{3}{4}$ inch in diameter at its origin. It arises from the upper surface of the left ventricle, passes upward as the *ascending aorta*, turns backward and to the left (arch of the *aorta*) at about the level of the fourth thoracic vertebra and then passes downward as the *descending aorta*, which is divided into the *thoracic* and *abdominal aorta*. The latter terminates at its division into the two common iliac arteries. At its exit from the ventricle, the aortic orifice is guarded by three semi-lunar valves. The divisions and branches of the *aorta* are as follows

THE AORTA

Its 3 Divisions and 58 Branches

		Name of Arteries	
AORTIC ARCH, 5 Arteries	•	†	†
	1	2 Coronary (Right and Left)	†
	2	1 Innominate	2
	3	1 Carotid (Left Common)	2
THORACIC, 31 Arteries	4	1 Subclavian (Left)	54
	5	3 Bronchial	
	6	4 Esophageal	
	7	2 Pericardial	
	8	20 Intercostal	
	9	2 Posterior Mediastinal	
	10	2 Phrenic	2
	11	1 Celiac Axis	3
	12	1 Superior Mesenteric	5
ABDOMINAL, 23 Arteries	13	2 Suprarenal	5
	14	2 Renal	
	15	2 Spermatic and Ovarian	
	16	1 Inferior Mesenteric	3
	17	8 Lumbar	16
	18	1 Middle Sacral	
	19	2 Iliac (R & L Com)	42
	58		
	(See Blood and Circulation)		

* No. Heads. † No Arteries.

‡ Branches.

THE AORTA

Distribution of Branches of the Aorta

Branches of Arteries and Parts Supplied

- 1 To muscular tissues of heart
- 2 Divides into right subclavian and right common carotid.
- 3 Internal and external, 8 branches each, supplies head
- 4 1st Div { Vertebral, with 7 br.
Thyroid Axis, with 3 br.
Int. Mammary, with 8 br.
2nd Div { Sup. Intercostal, with... 2 br.
(Head, Up Ext., Arms)
3rd Div—Axillary, with 7 br.
becomes Brachial, with 7 br.
Thus divides into
Ulnar, with ... 8 br.
Radial, with 12 br.
54 br.

- 5 Nutrient of lungs
- 6 To Esophagus, Anastomoses with brs. of inf. Thyroid, Phrenic and Gastric.
- 7 To Pericardium
- 8 To upper and lower border ribs, tissues of sides and back, vertebrae and spinal cord, Anas. br. of Int. Mammary and Axillary
- 9 To glands in Mediastinum
- 10 Int. and Ext. to Diaphragm, front and sides of Thorax
- 11 GASTRIC, to cardiac orifice, end and lesser curvature of stomach
HEPATIC, to greater curvature, Pancreas, Duodenum, Gallbladder and Liver
SPLENIC, Greater Curvature, Stomach, Pancreas, Spleen
- 12 Pancreas, Duodenum, Mesentery, Ileum, Jejunum, asc. and trans. Colon.
- 13 To Suprarenal Capsules
- 14 To substance of Kidneys, Ureters and capsules
- 15 To Testes or Ovaries
- 16 To descend. Colon, Sigmoid Flexure, sides of rectum
- 17 { Thoracic to muscles of back
Abdominal to abdominal muscles.
Spinal to canal.
- 18 To Coccyx, anast. with lateral sacral, to rectum
- 19 Divides into Int. Iliac, which gives off, Ant. Trunk with 8 br. Post. Trunk with 4 br. These supply Bladder, Prostate Gland, Rectum, Uterus, Ureters, Vagina, Penis, Iliac Bone and Muscle, Hip-joints and Muscles, Cord and Membranes, Sacrum, Glutei muscles. Divides into Ext. Iliac which gives off 3 brs., becomes Femoral which gives off 8 brs., becomes Popliteal, gives off 7 brs., divides into Ant. Tibial, gives off 5 brs., and Post. Tibial gives off 7 brs.

aor'tal, Pert. to the aorta

aortalgia (a-or-tal'ji-ā) [G *aorte*, aorta, + *G algos*, pain] Pain due to pathological aortic conditions

aortartia (a-or-tark'shi-ā) [“ + *L. artare*, to narrow] Aortic narrowing.

aortectasia (a-ort-ek-ta'zi-ā) [“ + *ek*, out, + *tasis*, a stretching] Dilatation of the aorta.

aor'tic, Pert. to aorta or its orifice in the left ventricle of the heart [disease.

a. murmur, Symptom of a valvular

a. opening, 1. Path through diaphragm for aorta 2 Post. opening in the diaphragm

a. regurgitation.* Leakage of the blood from the aorta back into the left ventricle at the recoil of the aorta's elastic walls. ETIO. Diseases of the heart or aortic valves with defects or weakness of heart muscle.

a. stenosis. Narrowing of *a.* or its orifice due to (1) lesions of the wall with scar formation, (2) infection as in rheumatic fever, or (3) embryonic anomalies. Hypertrophy of the heart is a common result.

a. valves. Three valves in left ventricle at the a. opening

aortitis (a-or-ti'tis) [G. *aortē*, aorta, + *-itis*, inflammation]. Inflammation of the aorta

Associated with syphilis in which vascular changes have taken place. A common cause of aortic aneurysm

Sym. Possible cough, cyanosis, dyspnea, cardiac asthmatic attacks, hemoptysis.

aortocla'sia [' + *klasis*, a breaking]. Aortic rupture.

aortog'raphy [' + G. *graphein*, to write]. Examination of abdominal aorta by x-ray after injection of contrast fluid

aortolith (a-or'to-lith) [' + G. *lithos*, stone]. Calcareous deposit in the aortic wall

aortomalacia (a-or-to-mal-a'-si-ā) [' + G. *malakia*, softness]. Softening of the aorta's walls

aortopathy [' + G. *pathos*, disease]. Any aortic disease

aortopto'sia, **aortopto'sis** [' + G. *ptosis*, a falling]. Sinking down of abdominal aorta

aortorrhaphy (a-or-(or'a)-f-i) [' + *raphē*, suture]. Suture of the aorta

aortosclero'sis [' + *sclerosis*, hard]. Aortic sclerosis

aortostenosis (a-or-to-sten-o'sis) [' + G. *stenosis*, a narrowing]. Narrowing of the aorta

aortot'omy [' + G. *tomē*, a cutting]. Incision of the aorta [out odor.]

aos'mic [G. *a-*, priv + *osmē*, smell] With-
A. O. T. A. Abbr. American Occupational Therapy Association.

apallesthesia (ā-pāl'es-the'zī-ā) [G. *a-*, priv + *pallein*, to tremble, + *aisthēsis*, feeling]. Inability to detect vibrations of a tuning fork placed against the body

apan'dria [G. *apo*, from, + *anēr* (andr-), man]. Aversion to males

apan'thropia, **apan'thropy** (a-pan-thro'pi-ā, -i) [' + *anthrōpos*, man]. Morbid aversion to society or to man

apara'lytic [G. *a-*, priv + *paralyein*, to loosen]. Marked by lack of paralysis.

aparthrosis (ā-par-ā-thi-ro'sis) [' + *para*, near, + *thyrōs*, an oblong shield, + *osis*, denoting increase]. Parathyroid deficiency

apareunia (a-pa-ru'ni-ā) [' + *pareunos*, lying beside]. Impossibility or absence of coitus.

Etiol. Rudimentary development of vagina, imperforate hymen, stenosis of vagina.

aparthrosis (ap-ar-thro'sis) [G. *apo*, from, + *arthron*, joint, + *osis*, denoting increase]. 1. Diarthrosis 2. Dislocation.

apastia (ap-as'ti-ā) [G. *apastia*, fasting]. Abnormal refusal to eat

apathetic (ap-ā-thet'ik) [G. *a-*, priv. + *pathos*, disease]. Indifferent, without interest. **Syn.** *apathic*.

apath'ic. Indifferent **Syn.** *apathetic*.

apathism (ap'ath-izm) [G. *a-*, priv + *pathos*, disease, + *ismos*, condition]. Slow to react; opp. to erethism *

ap'athy. Indifference; insensibility; without emotion, sluggish, opp. of erethism. *

apectomy (a-pek'to-mi) [L. *apex*, tip, + G. *ektomē*, incision]. Eradication of apex of a tooth root. **Syn.** *apicoectomy*.

ape-hand [A. S. *apa*, ape, + *hand*, hand].

Nerve lesion in which the thumb remains at right angle from hand.

apeidosis (ap-e-i-do'sis) [G. *apo*, away, + *eidos*, form]. Slow disappearance of characteristic form in a disease.

apella (ap-el'ā) [G. *a-*, priv. + L. *pellis*, skin]. A circumcised male 2. One with a short prepuc.

apellus (ā-pel'us) [G. *a-*, priv + L. *pellis*, skin]. 1. Without skin. 2. Circumcised

apenteric (ap-en-ter'ik) [G. *apo*, from, + *enteron*, intestine]. Away from the bowels

apep'sia [G. *a-*, priv + *pepsis*, a digesting] 1. Absence of pepsin in the gastric juice 2. Imperfect digestion or its cessation

apepsin'ia. Absence of pepsin in the gastric juice

apeptous (a-pep'tus) [G. *a-*, priv + *peptein*, to digest]. 1. Indigestible, crude 2. Apeptic

aper'ient [L. *aperire*, to open]. A very mild purgative, particularly applied to mild purgative waters. *Ex honey, potassum bitartrate, magnesium oxide.*

NP. Usually given at night on an empty stomach if the drug acts slowly (10 to 12 hours). Saline a and those having rapid action are given first thing in morning on an empty stomach, half-hour before first drink

Strong purgatives. (castor oil, colocyath, etc.) act in 4 to 6 hours

Hydragogues. (salines and jalap) within 2 hours

Aperients should not be given in suspected appendicitis, in colic as a rule, in enteritis if diarrhea and vomiting are present

aperistal'sis [G. *a-*, priv + *peri*, around, + *stalsis*, constriction]. Absence of peristalsis

aper'itive [L. *aperire*, to open]. 1. An appetizer 2. Mild purgative. **Syn.** *aperient, q.v.*

apertura (ap-er-tu'ra) [L. *apertura*, opening]. An opening

aperture (ap'er-chure). An orifice or opening

a'pex (pl. *apices*) [L. *apex*, tip]. The summit or extremity of anything

a. beat. The point of maximum impulse of the heart against the chest wall felt in the 5th left intercostal space, 3½ inches from middle of sternum about an inch within a line drawn from middle of clavicle parallel with sternum (the mammary line)

Generally may be detected by inspection or palpation, when these fail may be localized by auscultation. In recumbent position apex beat may be elevated an inch or more. When body is inclined to right, beat may be detected in mammary line or even some distance outside. During forced inspiration may become imperceptible or be found below its usual place. During forced expiration, beat becomes more forcible and position elevated. Patient as a rule should be examined in erect or sitting posture, while breathing quietly.

A weak apex beat may be noted: 1. In healthy people 2. Degeneration or dilatation of the heart 3. Pericardial effusion 4. Emphysema. 5. Shock or collapse

CHANGES IN FORCE AND EXTENT OF. May be increased by 1. Hypertrophy of heart. 2. Excited action of heart from drugs, reflex irritation, excitement or disease, as exophthalmic goiter. 3. Shrinking of the lungs, as in phthisis.

DISPLACEMENT TO THE LEFT. May result from 1. Hypertrophy and dilatation of the heart (down and to the left). 2. Pericardial effusion (up and to left). 3. Chronic diseases of left lung and pleura, associated with retraction—as fibroid phthisis and pleural adhesions 4. Abdominal tumors and effusions (up and to left) 5. The pressure of a pleural effusion on the right side (up and to left)

DISPLACEMENT TO THE RIGHT. May be caused by 1. Chronic disease of the right lung or pleura, associated with retraction. 2. Pressure of a pleural effusion on left side

DISPLACEMENT DOWNWARD. May result from 1. Hypertrophy and dilatation of heart, chiefly the left ventricle 2. Pressure of solid growths in upper mediastinum 3. Aneurysm of aortic arch 4. Enlargement of liver, causing traction through central tendon of diaphragm. Deformity of chest may cause displacement in any direction

PRECORDIAL PROMINENCE. May result from 1. Deformity 2. Enlargement of heart. 3. Pericardial effusions

a. murmur. One over the apex of the heart

a. roof. The end of the root of a tooth.

apexograph [“ + G *graphein*, to write] An instrument for determining apex of a tooth root.

A. P. H. A. 1 Abbr. American Public Health Association. 2 American Protestant Hospital Association.

aphacia (a-fa’si-ä) [G *a-*, priv. + *phakos*, lentil] Lack of eye lens

apha’cic. Pert to aphacia.

aphagia (a-fa’ji-ä) [G *a-*, priv. + *phagēin*, to eat] Inability to swallow

aphakia (a-fa’ki-ä) [G *a-*, priv. + *phakos*, lentil] Absence of eye’s crystalline lens.

Syn *aphacia*

apha’kik. Pert to aphakia

aphasia (a-fa’zi-ä) [“ + *phasis*, speaking] Inability to express oneself properly through speech, or loss of verbal comprehension

It is complete or total when both sensory and motor areas are involved. **Syn** *loganosis*.

RS *Agraphia, alalia, anarthria, aphemia, atactic, mind blindness, mind deafness, motor, paraphasia, word blindness.*

a., amnesic. Loss of memory for words.

a., afaxic. Inability to articulate. Similar to *a. motor*.

a., auditory. A. due to pathology of center of hearing

a. conduction. Eriol. Due to lesion of conduction path bet motor and speech centers

a. gibberish. Utterance of meaningless phrases

a., motor. Patient knows what he wants to say but cannot say it. Muscles coordinating speech unable to coordinate. May be complete or partial. Broca’s area is disordered or diseased

a., optic. Inability to call name of an object recognized by sight without the aid of sound, taste, or touch, a form of *agnosis*.

a., sensory. Inability to understand spoken words, if word center is involved (auditory a.) or the written word if visual word center is affected (visual a.). If both centers are involved, will not understand spoken or written word

a., traumatic. A. caused by head injury

apha’sic, apha’siac. Pert to aphasia.

aphelotic (af-el-ot’ik) [*aphelkein*, to draw away]. Absent minded, given to reverie.

aphelxia (af-elks’i-ä). Absent minded; oblivious of external conditions.

aphemesthesia (a-fem-es-the’zi-ä) [G *a-*, priv. + *phēmē*, speech, + *asthēsis*, sensation]. Word deafness, or word blindness

aphemia (a-fe’mi-ä) [“ + *phēmē*, speech]. Loss of speech due to impairment of the word memory center, amnesic aphasia. * **SEE** *alexia, amnesia, anarthria*.

aphephobia (af-e-fō’bi-ä) [G *aphē*, touch, + *phobos*, fear] Abnormal aversion to being touched by anyone

aphlogistic (a-flo-jist’ik) [G *a-*, priv. + *phlogistos*, inflammable] 1 Not inflammable 2 Burning without flame

aphonia (a-fon’i-ä) [“ + *phōnē*, voice]. Loss of voice with intact inner speech and not due to central lesion. May occur in chronic laryngitis

Eriol. Disease of vocal cords, paralysis of laryngeal nerves, pressure on recurrent laryngeal nerve, or it may be functional due to hysteria or psychiatric causes

a. clericorum. Clergyman’s sore throat

a. paranoica. The silence of the insane

aphoresis (a-for-e’sis) [“ + *phorēsis*, being transmitted] 1 Lack of endurance, esp. of pain. 2 Any separation of a part

aphoria (a-fō’ri-ä) [“ + *phoros*, carrier]. Sterility in the female

aphose (ä’fōz) [“ + *phōs*, light]. A subjective perception of darkness, or of a shadow

aphrasia (a-fra’zi-ä) [“ + *phrasis*, speech] Morbid refusal to speak; seen in dementia precox, q.v.

a., paralytic. Due to paralysis of the faculty of ideation

a., superstitious. Avoidance of certain words because of scruples or aversion to their use

aphrenia (a-fre’n’i-ä) [“ + *phrēn*, mind]. An apparent lack of intellect seen in some forms of dementia

a. apoplexy. Unconsciousness.

aphrenic, aphrenous (ä-fren’ik, -us). Insane

aphrodisia (af-ro-dis’i-ä) [G. *aphrodisios*, rel to *Aphrodite*, goddess of love] Sexual desire, esp when morbid, or s. congress

aphrodisiac (af-ro-diz’i-ak). An agent which stimulates sexual desire

Alcohol is said to inhibit control of sexual impulses, but constant use impairs the sexual powers without lessening desire. Theelin obtained from the urine of pregnant females is being tried for frigidity. Ex *nux vomica, phosphorus, alcohol, and cantharides* are usually classed as aphrodisiacs.

aphronesia (ä-fro-ne’si-ä) [G *a-*, priv. + *phronesis*, common sense]. 1 Silliness. 2 Dementia

aphronia (ä-fro’n’i-ä) [G. *aphrōn*, foolish]. Mental deficiency; defective functional activity of cerebrum

apththa (af’tthä) (pl *apththae*) [G small ulcer]. 1 Very small ulcer on a mucous membrane of the mouth. 2 Thrush.

aphthenxia (af-thengks’i-ä) [G *a-*, priv. + *phthēgxis*, utterance]. An aphasia with articulate sounds imperfectly expressed.

aphthongia (af-thon’gi-ä) [G *a-*, priv. + *phthoggos*, voice]. Aphasia due to spasm

of muscles controlled by the hypoglossal nerve.

aphthous (af'thus) [G. *aphtha*, small ulcer]. Pert. to, or characterized by, ulcers.

aphylac'tic [G. *a-*, priv. + *phylaxis*, a protecting]. Having no immune power.

aphylaxis (a-fī-laks'is). Without immunity against disease

apical [L. *apex*, tip]. Pert. to the apex.

apices (a'pīs-ez). Pl of apex.

apiceotomy (ap'is-e-ot'o-mī) [L. *apex*, tip, + G. *tomē*, incision]. Eradication of apex of a tooth root. SYN *apicoectomy*

apicitis (ap-i-sī'tis) [' + G. *-itis*, inflammation]. Inflammation of any apical structure, esp apex of lung or tooth root

apicoectomy (ap-i-ko-ek'to-mī) [' + G. *ektomē*, incision]. Amputation of apex of a tooth root.

apicoloca'tor [' + *locare*, to place]. Instrument for locating apex of a tooth root. SYN *apexograph*.

apicolysis (ap-i-kol'is-is) [' + G. *lysis*, solution]. Artificial collapse of the apex of a lung by making an opening through the anterior chest wall.

NP Keep patient on affected side and watch for shock and hemorrhage

apico'tomy (ap-i-ko'to-mī) [' + G. *tomē*, incision]. Removal of apex of a tooth root. SYN *apicoectomy*

aplectomy (ap-i-ek'to-mī) [' + G. *ektomē*, incision]. Eradication of apex of a tooth root. SYN *apicoectomy*.

apinealism (ā-pin'e-al-izm) [G. *a-*, priv. + G. *pinus*, pert. to pine, + *ismos*, condition of]. Syndrome due to absence of pineal gland

ap'ino'id [' + *pinos* filth, + *eidōs*, appearance]. Free from dirt, clean.
a. cancer. Hard cancer

apiphobia (ā-pī-to'fī-ā) [L. *apis*, bee, + G. *phobos*, fear]. Abnormal fear of bees or of insects which buzz like a bee

apisination (ap-is-in-a'shun) [L. *apis*, bee]. Poisoning from bee stings

apituitarism (ā-pīt-u'it-ar-izm) [G. *a-*, priv. + L. *pituita*, phlegm, + *ismos*, condition of]. Condition due to total abeyance of function or removal of pituitary body. Leads to cachexia thy-reopriva *

aplanatic lens [' + *planētōs*, wandering]. Free from spherical or chromatic aberration. Not wandering.

aplasia (a-pla'zī-ā) [' + *plasis*, a developing]. Failure of an organ or part of the body to develop naturally.

aplas'tic [' + *plastikos*, shaped]. Having deficient or arrested development

apnea (ap-ne'a) [' + *pnoē*, breath]. 1. Temporary absence of respiration following a period of overbreathing or overabundance of oxygen and a decrease of carbon dioxide, a feature of some types of dyspnea * 2. Asphyxia 3. Temporary cessation of breathing seen in the Cheyne-Stokes breathing, named after the first two physicians who noticed this type of breathing.

It is a serious symptom esp. in such conditions as arteriosclerosis, meningitis, conia, heart and kidney diseases, and also following an injury to the brain where concussion results. Sometimes this type of breathing is noticed in perfectly healthy children and in the aged during profound sleep

SYM It is characterized by a gradual increase in the rate until it ends in a gasp followed by a gradual decrease until the respiration ceases, then it begins

again. Another form is sometimes noticed when the respirations gradually increase in force and frequency and then suddenly cease.

apneumat'osis [G. *a-*, priv. + *pneuma-toem*, to inflate, + *ōsis*, denoting increase]. Noninflation of air cells.

apo- (ap'o) [G. *apo*, from]. Gr prefix: From, away, separation, as *apophysis*.

ap'ocain. Local anesthetic, mildly toxic, employed for surface anesthesia and infiltration. SYN *tutocain*.

apocammosis (ap-o-kam-no'sis) [G. *apokamnein*, to grow weary]. Weariness, easily induced fatigue.

apocenos'is (ap-o-sen-o'sis) [G. *apokenoem*, to drain]. 1. Increased flow of blood or body fluids. 2. Partial evacuation.

apochromat'ic [' + G. *chrōmatikos*, colored]. Without color. SYN *achromatic*.

apocope (ā-pok'o-pe) [G. *apokopē*, a cutting off]. Amputation

apocopous (ā-pok'o-pus) [G. *apokopos*, cut off]. Castigated

apocoptic (ap-o-kop'tic) [G. *apokoptein*, to cut off]. The effect resulting from the removal of a part

apocrine (ap'o-krīn) [G. *apo*, from, + *krinein*, to separate]. Pert. to cells which lose part of their cytoplasm while functioning.

apocrustic (ap-o-krus'tik) [G. *apokroustikos*, able to ward off]. 1. Astringent. 2. Repellent 3. Defensive

apodemialgia (ap-o-de-mī-al'gī-ā) [G. *apodemia*, away from home, + *algos*, pain]. 1. An abnormal desire to wander from one's abode or environment, wanderlust 2. Morbid dislike of a home

apogee (ap'o-ge) [G. *apo*, from, + *gē*, earth]. Highest stage of a disease

apokammosis (ap'o-kam-no'sis) [G. *apokamnein*, to grow weary, + *ōsis*, denoting increase]. Abnormal tendency to fatigue, as in neurasthenia

apolarthron (ap-o-lar'thrōn). A natural fish liver oil, of great concentration, each capsule containing 25,000 USP units of Vitamin D, and 30,000 units of Vitamin A

DOSAGE. From 2 to not more than 6 capsules per day.

USES In any condition where large doses of these vitamins would be indicated, as in arthritis

apolepsis (ap-o-lep'sis) [G. *apolepsis*, a leaving off]. 1. Cessation of a function. 2. Retention or suppression of an excretion or secretion

apolexis (ap-o-leks'is) [G. *apolexis*, a declining]. 1. The catabolic condition or process. 2. Decline of life

apomorphine (ap-o-mor'tēn). A morphine derivative prepared from the alkaloid by extraction of one molecule of water

a. **hydrochloride**. A grayish white powder, should not be used if it at once imparts a greenish color when dissolved in 100 parts distilled water

ACTION and USES. Emetic, sometimes valuable in cases of poisoning when stomach pump cannot be employed

DOSAGE $\frac{1}{12}$ gr. (0.005 Gm.) *hypodermically*, as *expectorant*, $\frac{1}{60}$ gr. (0.001 Gm.)

apomyelin (ap-o-mī'el-in) [G. *apo*, from, + *myelos*, marrow] A brain substance containing no glycerol.

apone (a'pōn) [G. *a-*, priv. + *pomos*, pain]. An anodyne.

ap'oneurology [' + *logos*, word]. The science of aponeuroses.

ap'oneurorrhaphy [' + *raphē*, suture]. Aponeurotic suture.

aponeurosis (ap-o-nu-ro'sis) [G. *apo*, from, + *neuron*, sinew] Extension of connective tissue beyond a muscle in round or flattened tendons, or expanded sheets for the attachment of muscular fibers, or means of insertion or origin of a flat muscle, or as a fascia for other muscles

RS *aponeurology*, *aponeurosis*, *aponeurotic*, *apophyseal*, *unbricate*, *unbrication*.

aponeurosis (ap-on-ū-ro-si'tis) [+ *itis*, inflammation]. Aponeurotic inflammation.

aponeurotic. Pert to, or rel to, an aponeurotome (ap-on-ū-ro-tōm) [G. *apo*, from, + *neuron*, sinew, + *tome*, cutting] Knife for dividing an aponeurosis

aponeurotomy (ap-on-ū-ro-tōm-i). Surgical cutting of an aponeurosis

aponia (a-pon-i-ā) [G. *a-*, priv + *ponos*, pain] 1. Abstaining from labor. 2. Absence of pain

aponic (ap-on'ik) Rel to aponia

aponia, **aponea** (a-pon-oy-ā, ā-pon-e-ā) [G. *apo*, from, + *nous*, mind] Amentia

apophlegmatic (ap-o-fleg-mat'ik) [+ *phlegmatikos*, abounding in mucus]. Producing a mucous discharge, expectorant

apophyseal (ap-o-fiz'e-al) [+ *physis*, growth] Rel or pert to an apophysis

apophysis. 1. A projection esp from a bone, an outgrowth without an independent center of ossification

a. *cerebri*. The pineal body.

a. of *Ingrassias*. Smaller wing of sphenoid bone

a. *lenticularis*. Temporal bone's orbicular process

a. of *Rau*. Long process of malleus

a. *raviana*. Gracile process of malleus

apophysitis (a-pof-i-si'tis) [G. *apo*, from, + *physis*, growth, + *itis*, inflammation] Inflammation of a bony process which has never been entirely separated from the bone of which it forms a part.

apoplasma (ap-o-plaz-ni-ā) [+ *plasma*, formation] Deficiency of blood plasma

apoplectic (ap-o-plek'tik) [G. *apoplektikos*, crippled by stroke] Pert to apoplexy

apoplecticiform [G. *apoplexia*, stroke, + *L. forma* appearance] Like apoplexy

apoplectic/enous [+ *genos*, origin]. Causing apoplexy

apoplecticoid [+ *oidos*, form] Like apoplexy SYN *apoplectiform*

apoplexy (āp'ō-plēk-si) [G. *apoplexia*, a stroke] 1. Sudden diminution of, or loss of, consciousness and paralysis, due to hemorrhage into brain or spinal cord, or formation of an embolus or thrombus, which occludes an artery SYN *stroke* * 2. Condition of an organ marked by a hemorrhage into its substance, as apoplexy of the lung

SYM Onset acute Unconsciousness. Stertorous breathing due to paralysis of portion of the soft palate, expiration puffs out the cheeks and mouth. Pupils sometimes unequal, the larger one being on the side of the hemorrhage. Paralysis usually involves one side of the face, arm and leg of one side, with eyeballs turned away from the side of the body-paralysis, unequal pupils, skin covered with clammy sweat, the surface temperature of which is often subnormal, speech disturbances, onset more gradual if due to a *thrombosis* *

Proc. Depends upon symptoms. Often grave.

NP: As patient recovering from unconsciousness has admitted hearing all that was said in the room, care should be exercised about talking in presence of patient. Complete quiet. Guard against self-inflicted injuries to non-paralyzed side from movements due to irritation. Supine position. Head and body on same plane. Avoid pressure sores by moving patient frequently. Ease breathing by change of position once an hour, turning from paralyzed side to back and reverse. To lie on paralyzed side may require much effort to breathe. Turn body as a whole, not in part, flexing a paralyzed arm across chest, lower extremities flexed. Frequent cleansing of oropharyngeal passages.

External heat if pulse is weak, skin clammy, and temperature lowered. Ice bag if congestion is present, high tension pulse and dusky skin of head and face. Avoid blistering or burns by not allowing container to come in contact with surface. Guard against sacral bed sores (not due to pressure, a cutaneous indication of lowered vitality). This is indicated by redness of skin which may be followed by superficial blisters, resulting in a gangrenous ulcer. Constant asepsis and antiseptics if break occurs in skin. Binders to hold dressings, no adhesive plasters.

Use catheter to avoid bed-wetting; enemata instead of purgatives. Avoid pressure of bed clothes by using a bed cradle. Watch for contractures of muscles and avoid by change of position.

Convalescence. Liquid or soft foods, solid ones as patient begins to masticate. Slight elevation of head, when feeding which should be done from the paralyzed side unless patient exhibits imperfect sight, when position should be reversed to accommodate.

Feed slowly to avoid stoppage of windpipe. Loss of muscular power of pharynx, of tongue and cheeks must be considered. Frequent bathing, emollients or cocoa butter applied afterward. Watch for danger from heat or cold if loss of sensation is manifested in any part. Systematic massage. No strenuous rubbing. Passive exercises until active movements are possible.

Hemiplegic or chronic state. Careful training of muscles and organs of speech is necessary, later followed perhaps by occupational therapy. Confidence must be inspired, memory trained and emotions controlled by patient. Nurse should teach patient how to sit and how to stand and walk.

F A TREATMENT. Keep patient quiet and sitting up or lying down with head and shoulders elevated. Do not give stimulants. Apply cooling applications to head and neck. Do not transport unless absolutely imperative—and then very carefully.

RS *Aaron's sign*, *antiapoplectic*, *aphronia*, *apoplectic*, *apoplectiform*, *apoplectogenous*, *cataplexis*, *coma*, *hemiplegia*, *ictus*.

apopsychia (ap-op-sik'ti-ā) [G. *apo*, away, + *psychē*, mind] Fainting, syncope

apoptosis (ap-op-to'sis) [+ *ptōsis*, a falling] Falling off or out, as a scab or hair.

aporioneurosis (ap-or-i-o-nu-ro'sis) [G. *aporia*, doubt, + *neuron*, nerve, + *osis*, increased]. Anxiety neurosis.

aporrhagma (ap-o-reg'mā) [G. *apo*, away, + *rēgma*, separation]. 1. A biological separation of one substance from an-

other. 2. Any nitrogen-containing substance formed by the removal of carbon dioxide from protein-derivatives, as when histamine, $C_4H_9N_2(CH_2)_2NH_2$, is formed by putrefaction from histidine, $C_4H_9N_2CH_2CH(NH_2)COOH$.

aporrhinos (ap-or-in-ō'sis) [*''* + *ris*, nose, + *osis*, increased]. Nasal discharge.

aporrhipsis (ap-or-ip'sis) [*''* + *ripten*, to throw]. Removal of clothing or bed clothes, seen in some psychotic conditions or in delirium.

apasia (a-po'zi-ā) [*G. apo*, priv. + *posis*, drink]. Absence of thirst.

apostia (ap-o-sit'i-ā) [*G. apo*, away, + *situs*, food]. Anorexia* associated with disgust for food.

apospory [*''* + *sporos*, seed]. Absence of spore-producing ability.

apostasis (ap-os'tā-sis) [*G. apostasis*, departure from] 1 The crisis or end of a disease. 2 Termination by crisis. 3 An abscess. 4 An exfoliation.

apostaxis (ap-o-staks'is) [*G. apo*, from, + *staxis*, to drop] 1 Epistaxis. 2 Discharge by drops.

apostem (ap'o-stēm) [*G. apostēma*, abscess]. An abscess.

apostema (ap-os-tē'mā). An abscess.

aposthia (ah-pos'thi-ā) [*G. apo*, priv. + *posthe*, foreskin]. Congenital absence of the prepuce.

apothanasia (ā-poth-ā-na'zi-ā) [*G. apo*, away, + *thanatos*, death]. Prolongation of life.

apothecaries' measure. A system of measuring drugs in English speaking countries rapidly being displaced by the metric system. *q.v.*

The scruple and the pound are now seldom used. A portion of a grain is expressed fractionally, as gr $\frac{1}{2}$, not decimally. The quantity is written in Roman numerals, *q.v.*, with the symbol before it, as gr. v.

Weight

20 grains (gr) = 1 scruple (℥)
60 grains (gr) (3 ℥) = 1 dram (ʒ)
8 drams (ʒ) = 1 ounce (℥)
12 oz (ʒ) (5760 gr) = 1 pound (lb)

Volume

60 minims (ʒ) = 1 fluidram (f ʒ)
8 fluidrams (f ʒ) = 1 fluidounce (f ʒ)
16 fluidounces (f ʒ) = 1 pint (pt)
2 pints (pt) = 1 quart (qt)
4 quarts (qt) = 1 gallon (G)

Some points to remember are. The character ʒ represents 60 grains, while f ʒ represents 60 minims. 3 represents 480 grains only, while f ʒ is necessary to express 480 minims. A minim is not the equivalent of a grain. 480 minims (1 f ʒ) of water weighed at the standard temperature weigh 456.37 grains. This should be remembered for percentage solutions. Specific gravities of liquids vary, a pint of a liquid is not necessarily a pound.

apothecary [*G. apothēkē*, storing place]. A druggist or pharmacist. In England and Ireland one licensed by the Society of Apothecaries as an authorized physician and dispenser of drugs.

apothem, **apotheme** [*G. apo*, away, + *thema*, deposit]. The brown precipitate which appears when vegetable decoctions or infusions are exposed to the air, or are boiled a long time.

apothesine (ap-oth'es-in). A local anesthetic of the procaine type (in that it is relatively ineffective when applied to the mucous membrane), but slower in action than procaine. Its toxicity is

about equal to that of cocaine, but twice that of procaine.

Dosage 0.08 Gm. (1½ grains).

apothesis (ap-oth'es-is) [*G. apothesis*, a placing back]. Reduction of a fracture or dislocation.

apotheter (a-poth'e-ter) [*G. apothetēm*, to stow away]. Navel string repositor.

apotoxin [*G. apo*, away, + *toxikon*, poison]. The anaphylactic substance due to action of toxigen on injected toxin.

apotropis [*G. apotribēn*, to abrade]. Removal of opacity in cornea.

apozem (ap'o-zēm) [*G. apo*, away, + *zein*, to boil]. A decoction.

apparatus [*L. apparare*, to prepare] 1. A number of parts acting together in the performance of some special function. 2. A mechanical appliance or appliances, used in operations and experiments.

a., acoustic. Auditory apparatus, the assemblage of parts essential for hearing.

a., Clover's. A device used in administering ether or chloroform.

a., Desault's. Desault's bandage.

a., Fell-O'Dwyer's. An instrument for performing artificial respiration, and for preventing collapse of the lung in chest operations.

a., ligamentosus colli. The occipito-axoid ligament.

a., major. Median lithotomy.

a., minor. Lateral lithotomy.

a., sound conducting. Those parts of the acoustic apparatus that transmit sound.

a., sound perceiving. Those central parts of the acoustic apparatus that are essential for the perception of sounds.

a., vocal. The various organs collectively that subserve phonation.

appendalgia [*L. appendere*, hang to, + *G. algos*, pain]. Pain in lower right quadrant in region of vermiform appendix.

appendectomy (ap-en-dek'to-mī) [*L. ad*, to, + *pendere*, hang, + *G. ektomē*, cut out]. Surgical removal of the vermiform appendix.

appendical, **appendiceal**. Pert. to an appendix.

a., reflex. Tenderness at McBurney's point accompanied by rigidity considered a reflex expression by way of sympathetic cerebrospinal arc.

appendicectasis (ap-pen-dis-ek'tā-sis) [*L. appendere*, hang to, + *G. ektasis*, a stretching]. Appendiceal dilatation.

appendectomy (ap-en-dis-ek'to-mī) [*''* + *G. ektomē*, a cutting]. Surgical removal of the appendix.

appendices (ap-pen'di-sēz). Plural of appendix.

a., epiploicae. Pouches of peritoneum, filled with fat and attached to the colon.

appendicial (ap-pen-dis'i-al). Pert. to the appendix. *Syn.* *appendical*.

appendicitis (ap-pen-di-si'tis) [*L. appendere*, hang to, + *G. -itis*, inflammation]. Inflammation of the vermiform appendix.

It generally occurs between the ages of five and twenty, very rarely before the fifth year or after the fiftieth. It is more common in male adults than in female adults. The disease may be acute, subacute, or chronic.

a., acute. *Syn.* (a) Abdominal pain, usually severe and generally throughout the abdomen followed by (b) nausea and vomiting, (c) localization of pain in the right lower quadrant of abdomen.

with tenderness and rigidity over right rectus muscle or McBurney's point, (d) fever usually rising within several hours, 99° F to 101° F, (e) pulse increasing with temperature, (f) patient lying on back with right lower extremity frequently flexed to relieve muscle tension, (g) leukocytosis present shortly after onset; (h) in mild cases symptoms begin to subside on the second day, but in more severe cases there may be a cessation of pain indicating that the appendix has ruptured. After a few hours a well defined abscess may be felt in the right iliocecal region showing that nature has walled off the area.

TREATMENT (1) Notify physician as soon as symptoms do not subside (2) Refrain from giving foods, liquids, cathartics, enemas, and from applying heat (3) Surgery within 24 hours of onset is safest procedure.

a., chronic. May follow an acute attack leaving a cicatricial narrowing of the lumen of the appendix, or adhesions. **Sym.** Gastric indigestion, frequently simulating a gastric ulcer, duodenal ulcer, or gallbladder disease. Tenderness manifested in the right lower abdomen. **TREATMENT:** Surgical

a. obliterans, a., protective. A with adhesions closing the appendiceal cavity.

appendico-enterostomy (ap-pen-dik-o-enter-os'to-mī) [**+** *G enteron* intestine, **+** *stoma*, mouth] 1 Appendicostomy. 2 The establishment of an anastomosis bet appendix and intestine

appendicolithiasis [**+** *G lithos*, stone]. Formation of calculi in the vermiform appendix

appendicolysis (ap-pen-dī-kol'ī-sīs) [**+** *G lysis*, a loosening] Operation which frees appendix from adhesions by a slit in the serosa at its base

appendicopathy (ap-pen-dī-ko'path-ī) [**+** *G pathos*, disease] Any disease of the vermiform appendix

a. oxyurica. Lesion of the appendiceal mucosa supposedly due to oxyurias *

appendico'sis [**+** *G -osis*, increased]. Noninflammatory state of the appendix. **Sym:** Dull pain, local soreness, afebrile, but continual discomfort

appendicostomy (ap-pen-dik-os'to-mī) [**+** *G stoma*, mouth] Operation for irrigating cecum and colon

appendicular. 1 Appendical 2 Pert. to limbs or that appended to another part.

appen'dix [L.] An appendage

a., auricular. A forward prolongation of the heart-auricle

a., ensiform. The third or lowest portion of the sternum

a., gangrenous. When inflammation is extreme, blood vessels are blocked in the mesentery, circulation to appendix cut off, and diffuse peritonitis ensues.

a., ventricular. SEE *sacculæ of larynx*.

a. vermiformis (a., *vermiform* or *processus vermiformis*). A worm-shaped process projecting from the cecum, whose mucous membrane also lines the appendix, which contains many solitary glands. Its average length is 75 cm., and its position is variable. It secretes 1 to 2 cc of fluid per day

SEE *Aaron's sign*, *appendalgia*, "*appendi-*" words, *vermiform*, *voracious*.

appen'dotome [L. *appendere*, hang to, **+** *G tomē*, a cutting]. An instrument for excision of appendix

apperception (ap-per-sep'shun) [L. *ad*, to, **+** *percipere*, to receive] The mental process whereby new knowledge is or-

ganized and interpreted in the light of past knowledge and experiences.

appercep'tive. Pert to apperception.

app'etency [L. *appetere*, to strive for]. An appetite or desire

app'etite [L. *appetitus*, longing for]. Desire, esp for food, not necessarily hunger

a. juice. Gastric secretion brought about by psychic causes such as sight or odor of food, and by tasting and chewing. It ceases 15 to 20 minutes after mastication is completed

appetite, words perf. to: Acoria, anorectic, anorectous, anorexia, apopleia, appetency, appetizer, asitia, avulsion, bulimia, canine a., dysorexia, emesis, hiccup, hyperorexia, malacia, inacomania, nausea, parageusia, parorexia, phagomania, pica, polyphagia, pyrosis, regurgitation, rumination, satiety, taste.

app'etition (āp-pē-tish'ūn) [L. *ad*, toward, **+** *petere*, to seek] Desire for some object

app'etizer. That which promotes appetite

applanatio (ap-plan-a'shī-o) [L.]. A flattening, as the corneal surface

a. cornea. Flattened cornea

apple (ap'l) [A S *appel*]. Most widely used of fleshy, many celled fruits having a core from the pome family

Dried. Average serving 60 grams. **Pro.** 10, Fat 13, Carbo 39.7, Ca 0.032, Mg. 0.037, K 0.623, Na 0.050, P 0.048, Cl. 0.025, Fe 0.0015. Contains Vitamin A.

Fresh. Average serving 130 grams. **Pro** 0.5, Fat 0.7, Carbo 16.9, Ca 0.007, Mg. 0.008, K 0.127, Na 0.011, P 0.012, Cl 0.005, S 0.006, Fe 0.0003. Contains Vitamin A. Good source Vitamins B, C, and G

ap'ple-head [**+** *head*, head]. Dwarf's broad, thick skull

applicator (āp'lī-kā-tēr) [L. *applicāre*, to attach] Device, usually a slender rod of glass or wood, used with a pledget of cotton on the end, to apply medicine to the nose, throat, uterus, or any other body cavity

ap'position [L. *ad*, to, **+** *ponere*, to place]. 1 Development by accretion. 2 Addition of parts. 3 Fitting together, as the edges of two surfaces

approximal (ap-proks'im-āl) [L. *ad*, to, **+** *proximus*, nearest] Contiguous; next to

approximate (ā-p'pōks'im-āt) [L. *ad*, toward, **+** *proximus*, nearest] To bring a part toward another, as when bringing the fingers together or an arm toward the body

apraxia (a-praks'ī-ā) [G *aprazia*, inaction] 1 Inability to perform certain purposive movements without loss of motor power, sensation, or coordination. 2 Ridiculous and out of the ordinary acts performed by the insane. Inability to understand the meaning of things.

a. algera. Induction of severe headache by a hysterical attack, thus preventing motion.

a., ideational. Misuse of objects due to failure to identify them.

a., motor. Inability to willfully perform acts.

aprication (ap-rī-kā'shun) [L. *apricare*, expose to sun]. 1 Sunstroke. 2 Sunbath. Basking in the sun.

apricot (ā'p'ri-kot) [L. *praecoquum*, early ripe] Fruit resembling small peach in appearance

Dried. Average serving 25 grams. **Pro.** 1.2, Fat 0.3, Carbo. 15.7, Ca. 0.086, Mg. 0.047, K. 1.157, Na. 1.177, P. 0.117, Cl.

- 0.009, Fe. 0.0014. Good source Vitamin A.
 Fresh: Average serving 50 grams. Pro.
 0.6, Carbo. 6.7, Ca. 0.014, Mg. 0.010, K.
 0.248, Na. 0.038, P. 0.025, Cl. 0.002, S.
 0.010, Fe. 0.0003. Good source Vitamins
 A, C, and G
- aprectia** (ă-prok'shî-ă) [G. *a-*, priv. +
prôktos, anus]. Imperforation or ab-
 sence of anus.
- aprectous** (ă-prok'tus). Having an im-
 perforate anus
- apron** [O F. *naperon*, cloth] Garment
 to cover front of the body, for protec-
 tion of clothing during surgical opera-
 tions, etc
- a., Hottentot.** Hypertrophy of labia
 minora
- aproxia** [G. *aproxia*, wart of atten-
 tion] Unintentional inattention, esp
 from defective hearing, sight, or mental
 weakness. Inability to concentrate on
 anything
- apselaphesia** (ap-sel-af-e'zî-ă) [G. *a-*,
 priv + *pselaphesia*, feeling]. Absence
 of tactile sense
- apsithyria**, **apsithyrea** (ap-sith-i'tî-ă, -u'
 re-ă) ["" + *psithyria*, to whisper].
 Hysterical loss of voice with inability
 to whisper
- apsychia** (ap-sî'kî-ă) ["" + *psychê*, mind].
 Unconsciousness, a faint
- aptychosis** (ap-sî-ko'sis) ["" + -*ôsis*,
 increased] Inability to think.
- aptyalia**, **aptyalism** (ap-tî-ă'tî-ă, -tî'al-
 izm) ["" + *ptyalon*, saliva]. 1. Absence
 or deficiency of saliva. 2. A condition
 due to excessive expectoration through
 loss of oxydases
- apulosis** (ap-u-lo'sis) [G. *ouleim*, to cica-
 trize] A cicatrix
- apyetous** (ă-pî-et-us) [G. *a-*, priv + *pyê-*
sis, suppuration]. Nonsuppurative, non-
 purulent
- apynkormorphous** (ă-pîk'no-mor'fus) ["" +
pyknos, thick, + *morphe*, form] Pert.
 to a cell which stains lightly as its stain-
 able material is scattered.
- apyrogenous** (ă-pî-oj'en-us) ["" + *pyon*,
 pus, + *genos*, origin] Not due to pus
- apyous** (ă-pî-us) Without pus
- apyretic** (ă-pî-ret'îk) [G. *a-*, priv +
pyretos, fever]. Without fever. SYN:
afebrile.
- apyrexia** (ă-pî-reks'î-ă) ["" + *pyrexia*,
 feverishness]. 1. Absence of or inter-
 mission of fever 2. Nonfebrile period
 of an intermittent fever
- apyrogenetic**, **apyrogenic** (ă-pî-ro-jê-net'-
 îk, -jen'îk) ["" + "" + *genos*, origin].
 Not causing fever.
- agua** (ăk'wă) (pl. *aguae*) [L. *aqua*, water].
 Water
- a. ammoniae.** Water charged with am-
 monia and stimulants
- a. chlori.** Water charged with chlorine
 for antiseptics and cleaning.
- a. communis.** Faucet water
- a. destillata.** A water obtained by dis-
 tillation
- a. fortis.** Nitric acid
- a. labyrinthi.** The fluid in the laby-
 rinth of the ear.
- a., medicated** (water). An aqueous
 solution of a volatile substance. Us-
 ually contains only a comparatively small
 percentage of the active drug. Many of
 them are merely water saturated with
 a volatile oil. They are used more as
 vehicles and to give odor and taste to
 solutions. There are 14 official waters.
- a. menthae piperitae.** Peppermint
 water
- a. oculi.** The fluid (aqueous humor)
 of the eye.

- a. pura.** Purified water.
- a. re'gia.** Nitrohydrochloric acid, ni-
 tromuratic acid, *q.v.*, for F. A. Treat-
 ment.
- a. rosae.** Rosewater, used mainly as
 a flavor
- a. sedativa.** Sedative lotion contain-
 ing ammonia water and spirit of cam-
 phor.
- a. vitae.** Brandy.
- aquacapsulitis** ["" + *capsula*, a small box,
 + G. -*itis*, inflammation]. Serous iritis.
 SYN *aquocapsulitis*.
- aquaeductus** (ăk-we-duk'tus) ["" + *ductus*,
 duct] A channel or canal to convey
 fluids
- a. cerebri.** Canal lined with ciliated
 epithelium and going from the third
 ventricle through the mesencephalon to
 the fourth ventricle
- a. cochleae.** Canal connecting sub-
 arachnoid space and the perilymphatic
 space of the cochlea
- a. Fallopi.** Canal for facial nerve in
 petrous part of temporal bone
- a. Sylvii.** *a. cerebri*.
- aquamedin** (ăk-wa-med'in). A preparation
 from the isolation of a hormone from
 the ant lobe of the pituitary gland
 which seems to control the water bal-
 ance in the tissues as insulin controls
 the balance of sugar in the body
 In diabetes insipidus in which the
 water balance of the body is upset,
 aquamedin should be of inestimable
 benefit
- aquapuncture** (ăk'wă-pungh'chur) [L.
aqua, water, + *punctura*, puncture] 1.
 Injection of water hypodermically as a
 placebo 2. A fine jet of water sprayed
 on the skin as a counterirritant
- aqueduct** (ăk'we-duk't) ["" + *ductus*, duct].
 Canal or passage SYN *aquaeductus*.
- a. vestibuli.** Small passage reaching
 from the vestibule to the post surface
 of the temporal bone's petrous section
- aqueous** (ăk'wê-ăs) [L. *aqua*, water]. Of
 the nature of water, watery.
- a. chamber.** Ant. chamber of the eye.

MOVEMENT OF AQUEOUS HUMOR
 IN THE EYE

Formed by the ciliary body in the
 posterior chamber, the aqueous humor
 streams out through the pupil into the
 anterior chamber and disappears into
 the sinus venosus sclerae. (Schematic).
 A, Ciliary body, with ciliary glands; B,
 posterior chamber, C, anterior cham-
 ber, D, pupil, E, lens, F, iris, G, cor-
 nea, H, sinus venosus sclerae (canal of
 Schlemm), I, sclera.

- a. humor.** Watery liquid, transparent, containing trace of albumin and small amount of salts. Produced by the iris, ciliary body, and cornea. It circulates through the anterior and posterior chambers of the eye and leaves the eye through one of three routes, (a) the posterior route through the zonula, (b) the iris, and (c), the canal of Schlemm. To enter the latter, it passes through the spaces of Fontana to the pectinate villi through which it is filtered.
- aquiferous** (ak-wif'er-us) [L. *aqua*, water, + *ferre*, to bear]. Carrying water or lymph.
- aquocapsulitis.** Serous iritis.
- arabinose** (ar'ab-in-ös) Gum sugar, a pentose, obtained from boiling gum arabic and 0.5 per cent sulfuric acid.
- arabinoxuria** [arabinoose + G *ouron*, urine]. Arabinose in the urine.
- Arachnida** (ar-äk-ni-dä) [G *arachne*, spider]. A class of the *Arthropoda*, including the spiders, ticks, and mites.
- arachnidism** (ar-äk-nid-izm) [G *arachnê*, spider, + *eidos*, form, + *ismos*, condition of]. Systemic poisoning from spider bite.
- arachnitis** (ar-ak-ni'tis) [i' + *itis*, inflammation]. Inflammation of the arachnoid membrane. Syn. *arachnoiditis*, *q.v.*
- arachnodactyly** (ar-ak-no-dak'til-i) [i' + *dactylus*, finger]. Spider fingers; a state in which fingers and sometimes toes are abnormally long, slender, and curved.
- arachnoid** (ar-ak'noid) [G *arachne*, web, + *eidos*, form]. Resembling a web.
- a. cavity.** (a) The space between the arachnoid membrane and the dura mater (*cavum subdurale*). (b) The space between the arachnoid membrane and the pia mater (*cavum subarachnoidale* or *subarachnoid space*). The latter contains the cerebrospinal fluid.
- a. membrane** (*arachnoida encephali*) The middle (bet the dura and pia mater) or serous membrane of the brain and spinal cord. SEE *basilarachnitis*.
- arachnoidea** (ar-ak-noid'e-ä) A thin, fibrous, middle membrane covering the brain and spinal cord, *a. encephali* and *a. spinalis*.
- arachnoidism** (a-räk-noyd'izm) [G *arachnê*, spider]. The result produced by the bite of poisonous spiders.
- arachnoiditis** (ar-ak-noid-i'tis) [G. *arachnê*, spider, + *eidos*, form, + *itis*, inflammation]. Arachnitis, inflammation of the arachnoid membrane.
- arachnopia** (ar-ak-no'pi-ä) [i' + L *pia*, protective membrane]. Pia and arachnoid considered as one membrane.
- Aran-Duchenne's disease** (ar-ahn-dushen's) Muscular atrophy beginning in the upper extremities and progressing to other parts of the body.
- araneous** (ä-ra'ne-us) [L *aranea*, cobweb]. Arachnoid, resembling a cobweb.
- Arantius's body, A.'s nodule** (ar-an'shi-us). Nodule at center of free border of a semilunar valve leaflet.
- A.'s ventricle.** Small sac on floor of fourth ventricle.
- arbor vitae** [L *arbor*, tree, + *vita*, life]. ANAT 1 A tree-like structure, a tree-like outline seen in a section of the cerebellum and the inferior fold of the cervix. 2 A series of branching ridges within the cervix of the uterus.
- arborescent** (ar-bor-es'ent) [L *arborescere*, to become a tree]. Branching, tree-like.
- arborization** (ar-bor-i-za'shun) [L. *arbor*, a tree]. Interlacing; ramification, applied to nerve process terminations, fibers and arterioles. SEE *nerve*.
- arc.** A curved line, portion of the circumference of a circle.
- a. reflex.** The path followed by a nerve impulse in a reflex action. The impulse originates in a receptor at the point of stimulation, passes through an afferent neuron or neurons to a reflex center in the brain or spinal cord and from the center out through efferent neurons to the effector organ, a muscle, or gland where the response occurs.
- arcade** (ar-käd') Any anatomic structure composed of a series of arches.
- a., Flint's.** The arteriovenous anastomosis at the base of the pyramid of the kidney [remedy or nostrum].
- arcanum** [L *arcanus*, a secret]. Secret.
- arcate** (ar'kät) [L *arcatus*, bow shaped]. Arched, bow shaped.
- arch-, archi-** [G *archê*, primitive]. Prefix. First, principal, or chief. Beginning, as *archetype*.
- arch, arches** [L *arcus*, a bow]. Any structure or structures of a curved or bow-like outline.
- a., abdominothoracic.** The lower boundary of the front of the thorax.
- a., alveolar.** The arch of the alveolar process of either jaw.
- a., ant. metatarsal.** Formed by the inferior surfaces of the heads of the metatarsal bones of the foot.
- a. of the aorta.** Proximal curved part of aorta extending to 3rd dorsal v.
- a.'s, aortic.** 1 Same as arch of the aorta. 2 A series of six pairs of vessels which develop in the embryo. They connect at the truncus arteriosus with the dorsal aortae. During the fifth to seventh weeks, the arches undergo transformation, some persisting as functional vessels, others persisting as rudimentary structures, and some disappearing entirely.
- a.'s, branchial.** Also called visceral or gill arches. A series of arches which support the gills of fishes. They occur in the human embryo and play an important role in the development of the head and neck. First is the *mandibular*, second, the *hyoid*. The third, fourth and fifth are transitory.
- a.'s of Corti.** A series of arches made up of the rods of Corti [ligament].
- a., crural.** Femoral arch. Poupart's.
- a., deep crural.** A band of fibers arching in front of sheath of femoral vessels.
- a., dental.** An arch formed by the alveolar process on either jaw, containing teeth and covered by the gums.
- a.'s, embryonic.** Fetal arches, the aortic, branchial, mandibular, hyoid, pulmonary, and thyrohyoid arches.
- a., femoral.** Poupart's ligament.
- a., hemal.** Arch formed by the body and processes of a vertebra, a pair of ribs and the sternum, or other like parts, also the sum of all such arches.
- a., hyoid.** The second fetal arch which persists in the styloid process, the stylohyoid ligament, and lesser cornu of the hyoid bone.
- a., Langer's axillary.** A thickened border of fascia forming a bridge across the occipital groove.
- a., longitudinal.** One of the two anteroposterior arches of the foot; the medial formed by calcaneus, talus, navicular, cuboids, and first three metatarsals; the lateral by the calcaneus, cuboid, and fourth and fifth metatarsals.
- a., mandibular.** The fetal arch whence

- are developed the jawbones, with the malleus and incus.
- a., nasal.** The arch formed by the nasal bones and by the nasal processes of the superior maxilla
- a., neural.** The arch of a vertebra formed by its pedicles and laminae, also the sum of all such arches
- a., palmar.** *BNA arcus polaris.* Deep, an arch formed in the palm by the communicating branch of the ulnar and the radial artery. *Superficial,* an arch in the palm forming the termination of the ulnar artery. [of the fetus]
- a.'s, pharyngeal.** The branchial arches
- a., plantar.** *BNA arcus plantaris.* The arch formed by the external plantar artery and the dorsalis pedis
- a.'s, postaural.** The branchial arches.
- a., pubic.** The portion of the pelvis formed by the rami of the ischia and the ossa pubis on either side
- a., pulmonary.** The fifth of the aortic arches on the left side. It becomes the pulmonary artery
- a., stylohyoid.** One of the embryonic aches made up of four segments, viz: the pharyngobranchial, which develops into the styloid process, the epibranchial, developing into the stylohyoid ligament, the ceratobranchial and hypobranchial which together develop into the lesser cornu of the hyoid bone.
- a., supraorbital.** A bony arch formed by the prominent margin of the orbit
- a., thyroid.** The third fetal arch, its cartilage is represented by the greater cornu of the hyoid bone
- a., transverse.** Articulations (metatarsophalangeal) at ball of foot
- a. of a vertebra.** The arching portion of a vertebra enclosing the spinal foramen.
- a.'s, visceral.** The fetal arches.
- a., zygomatic.** The arch formed by the malar and temporal bones
- archaic type of reaction.** An inadequate immature reaction to reality, a reversion to a type once acceptable as normal (e. g., in infancy)
- archamphlaster** (ar-kam'fi-as'ter) [G. *archē*, origin, + *amphi*, around, + *aster*, star] Amphiasier formed when polar globules are extruded
- archebiosis** (ar-ke-bi-o'sis) [" + *bios*, life] Spontaneous generation.
- archegenesis** (ar-ke-jen'e-sis) [" + *genesis*, origin] Generation spontaneously. *SYN archebiosis.*
- archenteron** (ar-k-en'tei-on) [" + *enteron*, intestine] Cavity formed by invagination of the blastodermic vesicle
- archeocyte** (ar'ke-o-siti) [G. *archaios*, ancient, + *kytos*, a cell] A wandering cell.
- ar'cheokinetic** [" + *kinētikos*, concerning movement] Pert to a low and primitive type of motor nerve mechanism as found in the peripheral and ganglionic nervous systems. *SEE neokinetic, paleokinetic.*
- archepyon** (ar-ke-pi'on) [G. *archē*, a beginning, + *pyon*, pus]. Unusually thick pus
- ar'chespore, ar'chesporium** [" + *spora*, a seed]. Cells giving rise to mother cells of spores
- archetype** (ar'ke-tip) [" + *typos*, a variety]. Primitive type, from which other forms have developed by differentiation.
- archiblast** (ar'ki-blast) [" + *blastos*, a germ] The outer layer which surrounds the germinal vesicle
- archiblastic.** Derived from, or pert. to, the archiblast
- archiblastoma** [G. *archē*, origin, + *blastos*, a germ, + *oma*, a tumor]. Tumor of archiblastic tissue.
- archigaster** (ar-ki-gas'ter) [" + *gastēr*, belly]. The primitive embryonic alimentary canal
- archinephron** (ar-ki-nef'ron) [" + *nephros*, kidney]. Primordial kidney, an organ of the embryo. *SYN mesonephros, wolffian body.*
- archineuron** [" + *neuron*, sinew]. The central cell of the cerebral cortex, and all its processes.
- archipallium** [" + *L pallium*, a cloak]. Olfactory cortex, older than neopallium.
- ar'chiplasm** [" + *plasma*, a mold]. The substance of the attraction sphere.
- archistome** (ar'kis-tōm) [" + *stoma*, mouth]. Invagination of blastula making little opening into archenteron. *SYN: blastopore.*
- architis** (ar-ki'tis) [G. *archos*, anus, + *itis*, inflammation]. Inflammation of the anus, proctitis.
- archoceles** (ar'ko-sel) [" + *kēlē*, tumor]. Hernia of the rectum.
- archocystocolposyrinx** (ar-ko-sis-to-kol-po-sir'inks) [" + *kystis*, bladder, + *kolpos*, vagina, + *syrinx*, fistula] Fistula of rectum, vagina and bladder.
- archocystosyrinx** (ar-ko-sis-to-sir'inks) [" + *syrinx*, fistula]. Anoviscial fistula
- ar'chon.** Poisonous radical of all proteins
- archoptoma** (ar-kop-to'mā) [G. *archos*, anus, + *ptōma*, a fall] Prolapse of the rectum
- archoptosia** (ar-kop-to'si-ā) [" + *ptōsis*, a falling] Prolapse of rectum
- archoptosis** (ar-kop-to'sis). Prolapse of rectum
- archorrhagia** (ar-ko-ra'ji-ā) [G. *archos*, anus, + *rhēgnunai*, to break out]. Hemorrhage from the rectum, archorrhea
- archorrhoea** (ar-kor-re'ā) [" + *roia*, flow]. Rectal hemorrhage
- archos** (ar'kos) [G.]. The anus
- archostenosis** (ar-ko-sten-o'sis) [G. *archos*, anus, + *stenōsis*, a narrowing] Stricture of the rectum
- arc lamp** [L. *arcus*, a bow]. Source of light consisting of gaseous particles from the electrodes of an electric arc which are raised to a temperature of incandescence by an electric current
- arciform** (ar-sif-orm) [" + *forma*, shape]. Bow shaped
- arctation** (ar-k-ta'shun) [L. *arctatō*, draw close together] Stricture of any canal opening. [Bowed]
- arcuate** (ar'ku-āt) [L. *arcuatus*, bowed].
- arcuation** (ar-ku-a'shun) A bending
- arculus** (ar'kü-lūs) [L. *arculus*, a small arch] Support, in the form of an arch for bedclothes, to protect a part.
- ar'cus** [L. *arcus*, a bow]. An arc or arch.
- a. dentalis.** Dental arch.
- a. plantaris.** The plantar arch.
- a. senilis.** Opaque white ring about corneal periphery, seen in aged persons. Due to deposit of fat granules
- a. senilis, false.** Has no diagnostic significance. Marked by a sharply delineated ring, yellow or yellowish white. Due to deposit of fat. Keratitis, ulcer, q.v.
- ardanesthesia** [L. *ardor*, heat, + G. *an-*, priv + *aisthēsis*, feeling]. Inability to feel heat
- ardent** (ar'dent) [L. *ardens*, burning]. Burning, feverish
- a. spirits.** Distilled alcoholic liquors.

ar'dor [L. *ardor*, heat]. Burning; great heat. [urination

a. urinae. A burning sensation during

a. veneris. Sexual desire.

a. ventriculi. Heart burn; pyrosis.

area (a're-ā) [L. *area*, an open space]. A circumscribed space, one having definite boundaries. See *McBurney's point*.

a. Broca's. A. in the left hemisphere in post. portion of inferior frontal convolution. Controls speech. In left-handed persons it is in the right hemisphere. [the ovum

a. germinativa. A. of germination of

a. occipital. Portion of brain below the occipital bone. [*area germinativa*

a. pellucida. Clear central portion of

a. Rolandic. A. situated in ant. central convolution in front of fissure of Rolando in each hemisphere. Governs motor acts of the body

areatus (a-re-a'tus) Occurring in circumscribed areas or patches

arecoline. Oily antihelmintic and miotic alkaloid derived from betel nut. Dosage: 0.05-0.1 gr. (0.003-0.006 Gm.)

areflexia [G. *a-*, priv. + L. *reflectere*, bend back]. State without reflexes

arenaceous (ar-e-na'se-us) [L. *arenaceus*, sandy] Resembling sand or gravel

arenation (ar-e-na'shun) [L. *arena*, sand].

A sand bath or application of hot sand.

areoid (ar'e-noid) [“ + G. *eidos*, form].

Like sand

areola [L. *areola*, a small space] 1 A cellular, lightly fleecy connective tissue, with meshes capable of distention; a tissue occupying the interspaces of the body. 2 A form of macula showing a hyperemic area about a skin lesion such as that about a boil. 3 A ringlike discoloration as that about the nipple.

a. papillaris. The darkened ring about the female nipple

a., secondary. 1 An additional ring surrounding the a. during pregnancy. 2. Any of the large lacunae in ossifying cartilage formed by the absorption of the walls separating the primary areolae.

AREOLA

(a) Nipple; (b) Montgomery's gland;

(c) primary areola; (d) secondary a.

areolar (ar-e'o-lar) Rel. to the areola

a. tissue. Connective tissue which occupies the interspaces of the body.

areolitis [L. *areola*, a small space, + G. *itis*, inflammation] Inflammation of mammary areola

areometer (a-re-om'e-ter) [G. *araios*, thin, + *metron*, a measure] Instrument for measuring sp. gr. of fluids

areosis (ar-e-o'sis) [L. *area*, open place, + G. *osis*, increased]. Dilution, less compact

arevareva (ar-e'va-ra'va) [Tahitian, skin rash] Severe skin disease accompanied by decay of vital powers

Etiol. Excessive use of kava

argamblyopia (ar-gam-bli-o'pi-a) [G. *argos*, idle, + *amblyus*, dulled, + *ops*, eye]. Amblyopia due to not using the eye.

Ar'gand burner. Gas or oil lamp having an inner tube by which air is supplied to the flame to increase combustion.

Argas (ar'gas) [G. *argeus*, shining].

Genus of ticks usually infecting birds, but may attack man, causing severe pain, also fever

ar'gema [G. *argema*, ulcer]. White corneal ulcer.

argentaffin (ar-jent'af-fin) [L. *argentum*, silver, + *affinis*, associated with] Taking a silver stain

argentaffino'ma [“ + “ + G. *ōma*, tumor] Growth containing argentaffine elastic fibers

May be benign or malignant. Practically without symptoms unless pressing on neighboring structures

argen'tum. SYMS Ag Silver, atomic weight 107.12

argil'ia [G. *argillos*, white clay]. Clay.

argillaceous (ar-jil-a'shus) Resembling or composed of clay

ar'ginase. Enzyme of the liver that splits up arginine and forms urea

arginine (ar-j'i-nen) [L. *argentum*, silver]. Crystalline amino acid, $C_6H_{11}N_3O_2$, obtained from decomposition of vegetable tissues, protamines, proteins and also prepared synthetically

It is a guanidine derivative, yielding urea and ornithine on hydrolysis. It is a hexone base

ar'gol, **ar'gols** [G. *argos*, white]. Impure cream of tartar formed in wine casks.

ar'gon [G. *argos*, inactive] An inert gas in the atmosphere. SYMB A. Atomic weight 39.98

Argyll Robertson pupil. More properly the name of a symptom often present in paralysis and locomotor ataxia, in which the light reflex is absent but there is no change in the power of contraction during accommodation

argyria (ar-j'i'r-i-ā) [G. *argyros*, silver]. Bluish discoloration of skin and mucous membranes as a result of the administration of silver

argyri'asis. Bluish discoloration of skin due to use of silver. SYN *argyria*.

argyric (ar-j'i'r-ik) Pert. to silver

argyrisim (ar-j'i'r-izm) [G. *argyria*, silver, + *ismos*, condition of] Bluish discoloration of skin due to use of silver. SYN: *argyria*.

argyrol (ar-j'i'-rol) (silver vitellin) A dark brown, crystalline, protein substance, containing 20% silver

Uses As an antiseptic in infections of the eye, nose and throat, and for urethral injections

DOSAGE In strengths of 5% to 50% depending upon the condition.

argyrophil (ar-j'i'-ro-fil) [G. *argyria*, silver, + *philos*, fond] Staining readily or easily impregnated with silver.

argyrosis (ar-j'i'-ro'sis) [“ + *osis*, increased] Bluish discoloration of skin due to use of silver. SYN *argyria*, *q.v.*

arhyth'mia. Irregular heart action. SYN: *arrhythmia*.

a., continuous. Permanent arrhythmia.

a., inotropic. A caused by disorder of heart muscle's contraction

a., perpetual. SEE *continuous a.*

a., respiratory. Increase of heart action due to disorder of respiratory movements.

a., sinus. Disorder of the impulses arising at the sinoauricular node causing heart action to be irregular

arhythmic (ar-rith'mik) [G. *a-*, priv. + *rhythmos*, rhythm]. Pert. to arrhythmia. SYN. *arrhythmic*.

ariboflavinosis (â-ri-bô-flâ-vîn-ô'sis) [G. *a-*, priv. + riboflavin + G. *-ôsis*, disease]. Condition arising from a deficiency of riboflavin in the diet

SYM Lesions on the lips, fissures in the angles of the mouth and seborrhea around the nose

aridura (ar-id-u-râ) [L. *aridus*, parched]. Dryness, wasting, withering

aristocardia [G. *aristos*, best, + *kardia*, heart] Cardiac deviation to the right.

aristogenics [G. *aristos*, best, + *genea*, race]. Control of factors tending to improve the race **SYN** *eugenics*.

aristol (â-ris'tol) (thymol-iodide). A reddish brown powder, with faint odor of iodine.

USES As a mild antiseptic dusting powder, pure, or diluted with equal amount of boric acid.

arithmomania (ar-ith-mo-ma-nî-â) [G. *arithmos*, a number, + *mania*, madness]. Repetition of consecutive numbers, unnecessary counting, and insane interest in numbers

arkyochrome (ar'ki-o-krôm) [G. *arkus*, a net, + *chrôma*, a color] A nerve cell in which the stainable substance is arranged in a network

arkyostichochrome (ar'ki-o-stik'o-krôm) [' + *stichos*, a row, + *chrôma*, a color] A nerve cell in which the stainable material is arranged both as a network and in parallel lines.

arm [L. *armus*, a shoulder] The upper extremity from the shoulder to the elbow, also including lower extremity from elbow to the hand.

a. center. Center in rolandic area controlling arm motion

a., golf. A form of neurosis seen in golf players after excessive exercise.

a. hole. Armpit **SYN** *axilla*.

a., Saturday-night. A form of paralysis of the brachial plexus, usually seen in drunkards **Etiol.** Sleeping in a chair, with the arm hanging over the back of the chair while the head rests on the shoulder or arm

arm, words pert. to: antibrachium, antibrachium, axilla, axillary fossa, brachial, "brachio" words, brachium, cervico-brachial, dislocation, olecranon, humerus, radius, skeleton, ulna

armamentarium (ar-mâ-men-ta'ri-um) [L. *armamentum*, an implement] All that a physician or surgeon uses in his practice

armature [L. *armatura*, equipment]. A part of a dynamo consisting of a coil of insulated wire mounted around a soft iron core.

armilla [L. *armilla*, bracelet]. The annular ligament of the wrist

arm'pit [L. *armus*, shoulder, + *puteus*, a well]. Axilla **See** *hemorrhages, etc.*

arm-to-arm vaccination. Transferring vaccine virus from one patient to another.

ar'my itch. Chronic itch prevalent during U. S. Civil War.

Arneth's classification of neutrophils (ar'neth) Based on the number of nuclear lobes which polynuclear neutrophils contain. The normal are:

Lobes	1	2	3	4	5
%	5	35	41	17	2

A.'s formula. Method of procedure for elaborate differential blood count to estimate number of immature leukocytes. **See.** *formula*.

Arnold's canal. Passage in the temporal bone for small superficial petrosal nerve.

A.'s ganglion. Otic ganglion.

A.'s nerve. Auricular branch of vagus nerve.

aro'ma [G. *arôma*, spice]. An agreeable odor

aromat'ic. 1 Having an agreeable odor. 2 Belonging to that series of carbon compounds in which the carbon atoms form closed rings (as in benzene) as distinguished from the *aliphatic* series in which the atoms form straight or branched chains

a. compounds. Ring or cyclic compounds related to benzene, many having a fragrant odor

a. spirit of ammonia. Contains about 35% ammonium carbonate in aromatic dilute alcohol

ACTION AND USES Antacid and carminative with uses same as ammonium carbonate.

DOSAGE 2 cc. (30m) freely diluted with water

arrachment (â-râsh-mon') [Fr. *arrachement*, a tearing out]. Pulling out the capsule in a membranous cataract, through a corneal incision

arrec'tor muscles [L. *arrector*, an erector]. Involuntary muscle fibers inserted in the hair follicles on the side toward which the hair slopes Under the influence of cold or terror they contract, straighten the follicles, and raise the hairs, resulting in "gooseflesh," or *cutis anserina*.

arrecto'res pilo'rum [L.] Muscles whose contractions cause "gooseflesh." **See:** *arrector muscles*.

ar'hea (ar-re'â) [G. *a-*, priv + *roia*, a flow] Suppression or cessation of a discharge

arrhenoblastoma (a-re-no-blas-to'mâ) [G. *arrên*, male, + *blastos*, germ, + *-oma*, tumor] An ovarian tumor made up of masculine sex cells and producing virile sex characteristics

arrhythmia (ar-ith'mî-â) [G. *a-*, priv. + *rythmos*, rhythm] Irregular heart action causing absence of rhythm

Two or more beats may occur in quick succession, a long pause ensuing, or other irregularities. **See** *bradycardia* and *tachycardia*.

arrhyth'mic. Signifying loss of rhythm.

arrosion (ar-o'shun) [L. *arrodere*, to gnaw at] Ulcerous destruction of vessel walls.

ar'senfast. Resistant to the poisonous action of arsenic, esp. spirochetes which acquire immunity after repeated arsenic administration.

arsen'iasis [L. *arsenicum*, arsenic]. Chronic arsenical poisoning

arsenic (ar'sen-ik) [L. *arsenum*]. **SYMS:** As. Atomic weight, 74.93, atomic no., 33. A metal of grayish white color, very poisonous, used in the manufacture of dyes and in medicine.

The various compounds are used medicinally as tonics and specifics. Minute traces of arsenic are found in vegetables and animal foods of life. It is a constant element of cell life and is present in eggs, two-thirds being in the yolk, and one-third in the white, the membrane, and the shell.

CUMULATIVE EFFECT Disorders of alimentary tract, nausea, vomiting, diarrhea, dehydration, neuritis, paralysis of wrist and ankle muscles.

a. triox'ide. Used internally in form of Fowler's solution (Solution of Potassium Arsenite) 1%.

USES: Treatment of neuralgia and chorea and certain forms of skin diseases.

DOSE 1/30 m (0.002 cc.). More than a few grains may be fatal.

POISONING Used as a drug and as a vermin killer.

SYM *Acute Poisoning* May appear in a few minutes or when taken with solid food, may not appear for many hours. When the symptoms come on slowly, there are agonizing pain in pit of stomach, sinking sensations, nausea, sore throat, thirst, persistent vomiting, purging, scanty urine which may be bloody, cramps, and collapse.

Chronic Poisoning Loss of appetite, fainting, abdominal cramps, convulsions, and coma.

TREATMENT, F. A. Evacuate stomach with emetic. Wash out with stomach tube. Arsenic may be precipitated with iron salts, magnesium oxide (milk of magnesia) in teaspoonful doses.

arsenic, words pert. to: acetalarsone, arsen-fast, arseniasis, arsenicism, arsenicophagy, arsenization, "arseno-" words, arsenphenamine, bismarsen, maphaisen, neoarsphenamine, neosilver arsenphenamine, silver arsenphenamine, sulfarsphenamine, tryparsamide.

arsenical (ar-sen'ik-äl) [L *arsenica'tis*].

1 Pertaining to or containing arsenic.

2 A drug containing arsenic.

arsenic-fast. Resistant to toxic action of arsenic. **SYN** *arsen-fast*.

arsenicism (ar-sen'is-i-zm) [L *arsenicum*, arsenic, + G *ismus*, condition of].

Chronic arsenic poisoning. **SYN** *arseniasis*.

arsenicophagy (ar-sen-i-kof'ä-jī) [G *arsenikon*, arsenic, + *phagēin*, to eat].

Habitual eating of arsenic.

arsenionization. Electrolytic diffusion of arsenic ions in tissues.

arsenium [L] Arsenic.

arsenoblast [G *arsēn*, male, + *blastos*, germ]. Male element in nucleus of impregnated ovum, a masculonucleus.

arsenophagy [L *arsenum*, arsenic, + G *phagēin*, to eat]. Habitual eating of arsenic. **SYN** *arsenicophagy*.

arsenorelapse [+ *re*, back, + *lapsus*, a slipping]. Pert to syphilitic case which relapses after apparent cure by arsenic.

arsenoresistant [+ *resistere*, to withstand]. Resistant to arsenic compounds.

arsenotherapy [+ G *therapeia*, treatment]. Treatment with arsenic and its compounds.

arsenous. Of the nature of, or pert. to, arsenic or its compounds. **SYN** *arsenical*.

arsin. A very poisonous gas.

arsenalization. Application of high frequency current.

arsphenamine (ars-fen-am'in) (salvarsan). A light yellow powder containing about 30% arsenic.

ACTION AND USES Specific for treatment of syphilis in all stages, particularly in primary stage, usually given in later stages with mercurials. A 25% to 10% solution with glycerin used locally in Vincent's angina.

DOSE Intravenously, 6 gr (0.4 Gm).

artefact [L *ars*, art, + *factus*, made]. **SEE** *artifact*.

arterectomy [G. *artēria*, artery, + *ektomē*, excision]. Excising an artery or arteries.

arteria (pl. *arteriae*) [G] Artery.

a. *dentis*. The small artery supplying dental pulp.

arteriagra [+ *agra*, a seizure]. Pain in an artery.

arterial. Pert to one or more arteries.

a. *bleeding*. Blood is bright red and pumped out. Arrest by pressure on proximal side of vessel (nearest heart).

a. *circulation*. It is maintained by the pumping of the heart, elasticity and extensibility of arterial walls; peripheral resistance in the areas of small arteries, and by the quantity of blood in the body. **SEE** *circulation*.

a. *varix*. An enlarged and tortuous artery.

arterialization. Aeration of the blood, changing it from venous into arterial.

arteriarteria (ar-te-ri-ark'ti-ä) [G. *artēria*, artery, + L *artus*, bound]. Stenosis or constriction of an artery.

arteriasis (ar-te-ri-ās-is) [+ *iasis*, condition]. Degeneration of an artery.

arteriectasis, arteriectasia (ar-te-ri-ek'tas-is, -ta'zi-ä) [G *artēria*, artery, + *ektasis*, a stretching out]. Arterial dilatation. [blood]

arterin. Coloring matter of arterial **arterio-atony** [G *arteria*, artery, + *atonia*, languor]. Lack of tone in arterial walls.

arteriocapillary [+ L *capillus*, like hair]. Pert to arteries and capillaries.

a. *fibrosis*. Arteriosclerosis of capillaries and arterioles.

arteriofibrosis [+ L *fibra*, fiber, + *osis*, increased]. Arteriocapillary fibrosis.

arteriogram [+ *gramma* inscription]. Recording of arterial pulse. **SYN** *sphygmogram*.

arteriography [+ *graphein*, to write]. Description of arteries.

arteriola [L *arteriola*, small artery]. Small artery.

a. *recta*. One of the small renal arteries going to the medullary pyramids.

arterioles (ar-te'i-ole) The smallest arteries leading at their distal ends into the capillaries.

arteriolith [G *artēria*, artery, + *lithos*, stone]. An arterial calculus.

arteriology [+ *logos*, study]. Science of arteries, usually combined with study of other vessels, as in angiology.

arteriosclerosis [L *arteriola*, small artery, + G *sklerōsis*, hardening]. Thickening of the arterial walls with loss of elasticity and contractility.

arteriosclerotic. Rel to arteriosclerosis.

arteriomalacia [G *artēria*, artery, + *malakia*, softening]. Softening of the arteries.

arteriometer [+ *metron*, measure]. Instrument measuring variations in the size of a beating artery.

arteriomotor [+ L *movere*, to move]. Causing changes in size of arteries by dilatation and constriction.

arteriomyomatosis (ar-te'ri-o-mi-o-mä-to'sis) [+ *mys*, muscle, + *oma*, tumor, + *osis*, increased]. Thickening of arterial walls due to overgrowth of muscular fibers.

arterionecrosis [+ *nekros*, dead, + *osis*, condition]. Arterial necrosis.

arteriopathy [+ *pathos*, disease]. Any disease of the arteries.

arterioplania [+ *planasthai*, to wander]. The presence of an anomalous course in an artery.

arterioplasty (ar-te'ri-o-pläs-tī) [+ *plassein*, to form]. Repair of an aneurysm, restoring continuity of channel of the artery.

arteriopressor [+ L *pressura*, force]. Causing increased arterial blood pressure.

arteriorrhaphy (ar-te-ri-or'af-i) [" + *raphē*, suture]. Arterial suture.

arteriorrhexis (ar-te-ri-or-eks'is) [" + *rēxis*, rupture]. Rupture of an artery.

arteriosclerosis [" + *sklērosis*, a hardening]. A degeneration and hardening of the walls of arteries, capillaries, or veins, due to chronic inflammation and resulting in fibrous tissue formation.

Etiol. 1 A process of old age as arteries harden, lengthen, and become more tortuous after 50. 2 Due to syphilis. 3. Worry, anxiety, stress, overwork. 4 Alcoholism. 5 Overeating. 6. Lead, arsenic, and intestinal toxins. 7. Focal infections. 8 Kidney diseases. 9. Nervous disturbances. 10 Hereditary when in the young. 11 Deficiency of Vitamins A, B and C. 12. Oversecretion of certain ductless glands.

Sym. Hypertension, pallor, digestive disturbances, fatigue, polyuria, enlarged prostate in the male, myocarditis, angina pectoris, accentuation of second aortic sound, chronic bronchitis, emphysema, dizziness, cerebral anemia, thrombosis, hemorrhage of brain, vasomotor disturbances, cramps in calves and legs, cyanosis of feet. One or more of the foregoing.

NP. Avoid all conditions which induce increase of blood pressure, and excesses of all kinds. Hygienic treatment, normal action of all functions to be maintained. Hot drinks and warmth at extremities and avoidance of being chilled or taking cold. Hot water bottle in bed, flannel underwear in bed, and warm covers. Massage of limbs to avoid cramps and start circulation. Moderation in food, drink and exercise. Avoid indigestion. It is not necessary to remain in bed unless heart is affected by strain, but rest is imperative. A day in bed each week with good sleep at night sufficient. Anxiety should be eliminated. Alcohol omitted and smoking greatly diminished. Avoid all strain upon the heart. Watch for signs of cerebral hemorrhage and guard against cerebral thrombosis by prevention of sudden or continued exertion by the patient.

a. of legs. A form due to failure of circulation in the legs.

Sym. Peculiar sensation in feet and toes, burning pain about arches and ankle, cramps in calf of one or both legs when walking or standing. Worse at end of day.

TREATMENT. Heat to abdomen, rest, care, and cleanliness of feet, oils to keep skin soft, alcohol, theobromine, aminophylline, prilocaine. Also, sympathectomy.

arteriosclerotic. Pert to arteriosclerosis.*

arteriospasm [G *artēria*, artery, + *spasmos*, pain]. Arterial spasm.

arteriostenosis [" + *stenosis*, a narrowing]. Contraction of the lumen of an artery, either temporary or permanent.

arteriostosis [" + *osteon*, bone, + *osis*, increas.ed]. Calcification of an artery.

arteriostrepis [" + *strepis*, a twisting]. Twisting of divided end of an artery to arrest hemorrhage.

arteriosympathectomy [" + *sympatheia*, suffer with., + *ektomē*, excision]. Removal of arterial sheath containing fibers of sympathetic nerve.

arteriotome (ar-te-ri-o-tōm) [" + *tomē*, incision]. Knife for opening an artery.

arteriotomy (ar-te-ri-o-tō-mi). Surgical division or opening of an artery.

arteriotomy (ar-te-ri-o-tō-ni) [G. *artēria*, artery, + *tomos*, tension]. 1. Blood pressure. 2. Intraarterial blood tension.

arteriovenous [" + L. *vena*, a vein]. Rel. to both arteries and veins.

arterioversion [" + L. *versio*, a twining]. Everting wall of artery to arrest hemorrhage from open end.

arterioverter (ar-te-ri-o-ver-ter). An instrument for everting cut end of an artery for arresting hemorrhage.

arteritis [G. *artēria*, artery, + *-itis*, inflammation]. Inflammation of an artery.

a. deformans. Inflammation of inner coat of an artery. **Syn.** *chronic endarteritis*.*

a. obliterans. Inflammation of intima of artery causing closure of vessel's lumen. **Syn.** *endarteritis obliterans*.*

artery [G. *artēria*]. One of the vessels carrying blood from the heart to the tissues.

Frequently is nearly empty after death. The ancients supposed that air circulated through them, from which supposition they derived their names.

They carry the blood from the right and left ventricles of the heart to all parts of the body. There are two sets, the *pulmonary* and the *systemic*. The pulmonary artery carries the venous blood from the right ventricle to the lungs. The systemic system begins as the *aorta a.t.*, from the left ventricle.

ANAT. They have three coats. The inner, *tunica intima*, or serous; the outer, *tunica adventitia*, or white fibrous; and the middle, *tunica media*, or yellow fibrous. The blood they carry is red. **See Tables in Appendix, Fig. p. A-82.**

artery, words pert. to: a. *adventitia*, aneurysm, aneurysmectomy, aneurysmotomy, angina pectoris, arteria, arteriactia, arteriagra, arteriasis, arteriectasis, arteriomalacia, arteriorrhexis, arteriosclerosis, atheroma, atheromatous, carotid, carotidynia, catadictrosis, circle of Willis, circulation, endarteritis, hypertension, hypotonia, innominate, lumen, media, mesarteritis, sclerosis, varix, "vas-" words.

arthragra (ai-thra-grā) [G. *arthron*, joint, + *agra*, seizure]. Seizure in the joints. **Syn.** *gout*.

arthral. Pert to a joint.

arthralgia (ar-thral'ji-ā) [G. *arthron*, joint, + *algos*, pain]. Articular neuralgia. Pain in the joints.

arthrectomy (ar-threk'tō-mi) [" + *ektomē*, excision]. 1 The operation of opening into a joint cavity with the object of removing dead or diseased tissue. 2 Excision of a joint.

arthredema (ar-thred-e-mā) [" + *oidema*, a swelling]. Edema of a joint.

arthrempyesis (ar-threm-pi-e-sis) [" + *empyesis*, suppuration]. Suppuration in a joint.

arthresthesia (ar-thres-the'zi-ā) [" + *aisthēsis*, sensation]. Joint sensibility, the perception of articular motions.

arthric (ar'θrik). Pert to a joint.

arthrifuge (ar'θri-fug) [G. *arthron*, joint, + L. *fugāre*, put to flight]. A remedy for gout.

arthritic (ar-thrit'ik). 1 Gouty. 2 Pert. to arthritis.

arthritism (ar-thrit'is-in). Preparation to aid arthritis.

arthritide (ar'θrit-id). A skin eruption assumed to be of gouty origin.

arthritis (ar-thrit'is) [*G. arthron*, joint, + *-itis*, inflammation] A joint affection characterized by inflammation and other changes varying with type. Two general types: 1. Of infectious origin (rheumatoid *a.*, *a.* due to rheumatic fever, tuberculous *a.*, gonorrheal *a.*, syphilitic *a.*) 2. Of noninfectious origin (osteo- *a.*, *a.* due to metabolic disease, *a.* due to newgrowths).

TREATMENT Removal of foci of any infection. Complete rest, mental as well as physical. Build body resistance. Combat anemia and maintain normal level of hemoglobin. Stimulate circulation to overcome capillary destruction, by moderate exercise, food, and massage. No massage in presence of pain. Vaccines and baths, medication as indicated. Short-wave diathermy ACTH and cortisone, especially in rheumatoid *a.*

NP Complete rest in bed imperative during acute stage when hands and feet and joints are swollen and painful. Usually, the patient is unable to use them. In order to protect them, complete rest is necessary. Splints may be applied but avoid pressure sores from rubbing. Due to poor circulation and limitation of motion, a daily bath neces-

sary. Bony prominences rubbed with alcohol and well padded. Position should be changed frequently. A cradle may be used to avoid pressure from bedclothes. Apply heat over swollen joints by use of an electric light bulb in a cradle placed directly over the part. Daily elimination essential. May be taken care of with diet aided by a definite time each day for a stool. An enema may be necessary. The mental condition needs special consideration. Strive to keep patient's mind occupied by some form of occupational therapy and if possible, a radio placed in the room will aid in arousing interest.

SEE *acroarthritis*, *arthritis*, *rheumatism*, *synovitis*, *pannus*.

a., acute secondary. One caused by osteitis. **SYM** Severe pain, redness, and swelling.

a., a. suppurative. Purulent distention of synovial sac, a serious form.

a., atrophic. One followed by atrophy.

a. deformans. One with deformity. **SYM** Begins in fingers, develops progressively. Deformity due to ankylosis, exostosis, and atrophy of soft parts.

a. fungosa. Tuberculosis of a joint.

a., gonorrheal. One due to gonorrheal infection. **SYM** Usually attacks knee

ARTERIES OF FACE AND HEAD

1. Common carotid. 2. Internal carotid. 3. External carotid. 4. Occipital. 5. Superior thyroid. 6. Trapezius muscle. 7. Lingual. 8. Sternocleidomastoid muscle. 9. External maxillary artery. 10. Temporal artery. 11. Submental artery. 12. Transverse facial artery. 13. Inferior labial artery. 14 and 15. Inferior and superior labial arteries. 16. Lateral nasal artery. 17. Angular artery.

joint, during acute stage several joints may be affected

TREATMENT Neoprontosil combined with typhoid vaccine relieves pain and effects speedy restoration of joint function.

a., hypertrophic. Deformed enlargement of the cartilage at the edge of a joint.

a., osteo-. A form affecting the bones and joints

a., pneumococcic. One sometimes appearing as a sequel to lobar pneumonia, affecting one or more joints, and the middle ear

a., rheumatoid. A chronic joint disease, with enlarged cartilage and synovial membrane

a., syphilitic. One due to acquired or hereditary syphilis. **SYM** Enlarged, but not very painful joint.

a., tuberculous. A involving epiphyseal cartilage, synovial membrane and joint.

arthritis (ar'thri-tizm) [**+** *ismos*, condition of]. A condition or tendency to inflammation and gouty conditions of the joints and their processes. **SEE** *oxyphagia*.

arthro- [G]. Prefix Pert to joints

arthrobacterium [G. *arthron*, joint, + *bakterion*, staff] A bacterium which reproduces by segmentation or fission

arthrocace (ar-throk-ä-sei) [**+** *kakē*, badness]. Caries of a joint.

arthrocele (ar'thro-sēl) [**+** *kēlē*, tumor].

1 Hernia of a synovial membrane, punctuating the capsule of a joint 2 Any joint swelling

arthrochondritis [**+** *chondros*, cartilage, + *-itis*, inflammation] Inflammation of an articular cartilage

arthroclasia (ar-thro-kla-si-ä) [**+** *klasis*, a breaking] Breaking an ankylosed joint

arthrodesis (ar-throd'es-is) [**+** *desis* binding] The surgical fixation of a joint, artificial ankylosis

arthrodia (ar-thro-di-ä) [G *arthrōdia*, a gliding joint]. Gliding joints articulating by surfaces which glide upon each other

arthrodynia [G. *arthron*, joint, + *odynē*, pain] Pain in a joint

arthroempyema [**+** *empyēsis*, suppuration]. Suppuration in a joint. **SYN:** *arthrempyema* *

arthroendoscopy [**+** *endon*, with, + *skopein*, to examine]. Inspection of interior of a joint by endoscope

arthrography [**+** *graphein*, to write] A description of the joints

arthrogryposis (ar'thro-gri-po'sis) [**+** *grypos*, curved, + *-osis*, increased]. 1 Persistent contracture of a joint 2 Tetany

arthrokleisis (ar-thro-kl'i'sis) [**+** *kleisis*, a closure] Ankylosis,* both natural and surgical

arthrolith [**+** *lithos*, stone]. Calculous deposit in a joint

arthrology (ar-throl'o-jī) [**+** *logos*, study] The science of joints

arthrolysis [**+** *lysis*, a loosening]. The operation of restoring mobility to an ankylosed joint

arthromeningitis [**+** *mēnigx*, membrane, + *-itis*, inflammation] Inflammation of a synovial membrane **SYN** *synovitis*.

arthrometer [**+** *metron*, measure] Instrument for measuring the degree of movement of a joint.

arthron. An articulation or joint.

arthron'cus [G *arthron*, joint, + *ogkos*, tumor] 1. Tumor of a joint 2 Swelling of a joint

arthroneuralgia [**+** *neuron*, sinew, + *algos*, pain]. Pain in a joint

arthrono'sos [**+** *nosos*, disease]. Joint disease.

a. deformans. Arthritis causing deformity. **SYN** *arthritus deformans*.*

arthropathology [**+** *pathos*, disease, + *logos*, study] Joint disease pathology

arthropathy (ar-thi'op'a-thi) [**+** *pathos*, disease] Any joint disease

a., Charcot's. A trophic joint disease with effusion of fluids into a joint, seen in locomotor ataxia and in syringomyelia and sometimes in general paresis

a., inflammatory. An inflammatory joint disease, arthritis

a., osteopulmonary. Enlargement and swelling of the ends of the long bones following pulmonary disease

a., static. A disturbance in a joint of a given extremity secondary to a disturbance in some other joint of the same extremity, as one in the right knee joint secondary to one in the right hip joint

a., tabetic. Same as Chacot's arthropathy

arthrophylis (ar-thro'f'is-is) [**+** *phylis*, eruption] An eczematous eruption occurring in rheumatic subjects

arthrophyma (ar-thro-f'īm-ä) [**+** *phyma*, swelling] An articular swelling

arthrophyte [**+** *phylon*, growth]. Abnormal growth in joint cavity

arthroplasty (ar'thro-plas-ti) [**+** *plastēin*, to form] Surgical formation or reformation of a joint

arthropoysis (ar-thro-pi-o'sis) [**+** *pyōsis*, suppuration]. Suppuration of a joint

arthrorheumatism [**+** *rheumatismos*, flux] Rheumatism of the joints

arthrosclero'sis [**+** *sklēros*, a hardening] Stiffening or hardening of the joints, esp in the aged

arthro'sis [G *arthron*, joint, + *-osis*, increased] 1. Joint. 2 Joint affection due to trophic degeneration

arthroscope [**+** *skopein*, to examine]. An endoscope for examining interior of a joint

arthroscopy. Direct joint visualization by means of an arthroscope

arthrospore [**+** *sporos*, a seed] A bacterial spore formed by segmentation; has greater resistance than an endospore

arthrosteitis (ar-thro-te-i'tis) [**+** *ostēon*, bone, + *-itis*, inflammation] Inflammation of the bony structures of a joint.

arthro'stomy [**+** *stoma*, an opening]. The formation of a temporary opening into a joint for drainage purposes.

arthrosynovitis [**+** *G syn*, with, + *ōōn*, egg, + *-itis*, inflammation]. Inflammation of synovial membrane of a joint.

arthrotome (ar'thro-tōm) [G *arthron*, joint, + *temnein*, to cut]. Knife for making incisions into a joint

arthrotomy (ar-thro-tō-mi) [**+** *tomē*, incision] Cutting into a joint

arthrous (ar'thrus). Jointed or pert. to a joint.

arthroxesis (ar-throx-e'sis) [**+** *xisis*, scraping]. Scraping a joint

ar'tiad [G *artios*, even]. **CHEM:** An element of an even numbered valence. **SEE** *perissad*.

ar'tichoke [Italian *articioco*]. Perennial plant with edible flowery head.

a., French, or globe. **COMP** Lower

fleshy part nutritious and rich in extractives, manganese present in considerable quantities. Average serving 150 grams. Pro 4.4, Fat 0.6, Carbo 17.9. Contains Vitamin B. Good source Vitamin A and C.

Action. Slightly irritating to the kidneys. May cause flatulence and griping. The puree is well tolerated by a weak stomach.

a., Jerusalem. Average serving 100 grams. Pro 2.2, Fat 0.1, Carbo 17.0. Contains Vitamin C. Good source Vitamin B.

articular [L. *articularis*, joint]. Pert. to articulation.

articulate [L. *articulatus*, jointed] 1. To join together as a joint. 2. To adjust artificial teeth properly. 3. Clearly spoken. 4. To speak clearly.

articulated. State of articulation or of being jointed. [joints.]

articulation. The connection of bones. They may be *synarthroses*,* immovable ones, *amphiarthroses*,* slightly movable ones, or *diarthroses*,* freely movable ones. Cartilage, or fibrous or soft tissue lines the opposing surfaces of all joints. 2. The relative position of the tongue and palate necessary to produce a given sound. 3. Speech, clearly enunciated, enunciation.

a., confluent. Speech in which syllables are not clearly enunciated.

articulatory. Rel. to articulation (3). *q.v.*

articulo mortis [L. *articularis*, joint, + *mors*, death]. At the time of death.

articular (ar-tik'u-lus) [L.] 1. A knuckle of a joint. 2. A segment.

art'ifact [L. *ars*, craft, + *facere*, to make] 1. Anything artificially produced. 2. An apparatus structure produced in a cell or tissue by fixation, staining, or other manipulation.

artificial [L. *ars*, art, + *facere*, to make] Not natural, formed in imitation of nature. *See feeding*.

a., hyperemia. Bringing blood to the superficial tissues by means of "cups," and elastic bandage, or unions.

a., impregnation. *See insemination.*

a., pneumothorax (nu-mo-thor'aks). Artificial introduction of air into pleural cavity. Oxygen or nitrogen, or filtered atmospheric air is used.

artificial respiration. Maintenance of respiratory movements by artificial means.

Call a doctor at once. Laryngeal spasm often blocks air from lungs. Passage of catheter or tube may be necessary to convey air to lungs. Drugs may be needed to counteract spasm and promote circulation. Attempts at a r, if such a spasm exists, may be useless.

Two Uses. (1) In which respiration needs only to be started and maintained artificially for a limited period. In asphyxia from such causes as gases, drowning, and electric shock, a combination of Schafer method and inhalation of mixture of CO₂ and O₂ may be used. At present, the favored manual method is that of mouth-to-mouth breathing (rescue breathing).

(2) Cases where artificial respiration must be maintained for days, as in morphine poisoning and infantile paralysis. Apparatus such as respirator is used. More than one hundred methods have been used, including mechanical, electrical and manual types.

SUPPLEMENTARY TREATMENT. Keep warm with blankets; massage with fric-

tion, hot water bottles, etc. If possible, head should be directed downhill to aid circulation to brain, it is desirable to turn the mouth toward the wind. Circulation must be maintained by massaging extremities toward the heart. Stimulants such as aromatic spirits of ammonia applied to nostrils intermittently, and injections of drugs, such as epinephrine (adrenalin), ephedrine, ceramine and alphanolamine. Rectal instillations of hot, black coffee. Rhythmic traction of tongue (Laboide) and intermittent dilatation of the external anal sphincter (Pratt) are useful adjuncts. This method should be continued for a prolonged period of time until a physician pronounces patient dead. The use of oxygen or combination of oxygen and carbon dioxide mixtures is highly desirable if they can be obtained. Resuscitation has been necessary from several hours to many days. This method is more satisfactory than the ordinary mechanical device for inducing artificial respiration. It is possible for one operator to perform artificial respiration on two or three patients. Proficiency can be attained only by repeated practice on various types of individuals.

RS asphyxia, collapse, coma, drowning, respiration, syncope, shock, unconsciousness, back-pressure arm-lift, Byrd-Dew, Doe, Eie, Fell-O'Dwyer, hip-lift, Howard, Japanese, Laborde, Marmo, Ogata, Prochounek, Schroeder, Schultze, Schafer, Sylvester.

ar'tisan's cramp. A spasmodic affection of the muscles induced by prolonged work requiring delicate coordination and occurring only in performance of that particular work.

Occupations in which most apt to occur are writing, piano playing, sewing and telegraphing.

artus (ar'tus) [L. *artus*, joint]. A joint or joints, a limb.

aryepiglottic (ar-i-ep-i-glot'ik) [G. *arytaide*, pitcher, + *epi*, upon, + *glōttis*, glottis]. Pert. to the arytenoid cartilage and epiglottis.

ar'yl. A prefix denoting a radical of the aromatic series.

a., group. In chemistry, a radical group of the aromatic or benzene series.

arylarsonate (ar-i-lai'so-nat). Salt of arylarsonic acid.

arytenoid (ar-it-en-oid) [G. *arytaide*, ladle, + *eidos*, form] 1. Resembling a ladle or pitcher-mouth. 2. Relating to the a. cartilage, gland, ligament, or muscle.

arytenoidectomy (ar-it'e-noy-dek-to-mi) [" + *ektome*, excision]. Excision of arytenoid cartilage.

arytenoid'itis. Inflammation of arytenoid cartilage.

As. 1. Abbr. for astigmatism. 2. **SYMB:** arsenic.

a., s. [L. *auris sinistra*] Abbr. left ear.

asafetida (as-e-fet'id-a) [L. *asa*, gum, + *foetida*, fetid]. USP. A gum, resinous substance with characteristic odor and taste.

Action and Uses. A carminative and antispasmodic used in hysteria.

asaphia (as-af'i-ā) [G. *asaphia*, uncertainty]. Inability to articulate properly due to cleft palate.

asarzia (ā-sar'si-ā) [G. *a-*, priv. + *sarz*, flesh]. Leanness, emaciation.

asbes'tiform [G. *asbestos*, quicklime, + L. *forma*, appearance]. Having structure similar to asbestos.

asbes'tos. Fibrous form of magnesium and calcium silicate

asbes'to'sis [G. *asbestos*, quicklime, + *-osis*, increased]. Lung disease due to protracted inhalation of asbestos particles.

ascariasis (as-kar-i'-as-is) [G. *askaris*, pin-worm]. Symptoms produced by gastrointestinal worms (*ascarides*, round and thread worms).

ascar'ides. Pl of *Ascaris*.*

ascaridiasis (as-kar-i-di'-sis). *Ascarides* in intestine and symptoms they cause.

Ascaris (as'kar-is) [Pl *ascarides*]. A genus of nematodes belonging to the superfamily Ascaridoidea which inhabits the intestine of vertebrates

A. lumbricoides. A species of *Ascaris* which lives in the human intestine. Eggs are passed with the feces and are transmitted by contaminated water, food, or hands. After swallowing, the eggs containing embryos hatch and the larvae enter the blood stream and pass through the liver and heart, to the lungs where they enter the trachea, are coughed up and swallowed a second time

Aschheim-Zondek test (ash'him-tson'dëk). A test for pregnancy. SEE test.

Aschner's phenomenon. Slowing of the pulse caused by eyeball pressure.

Aschoff's bodies (ash'of) Rheumatic nodules in the myocardium, also in lungs in rheumatic fever complicated by pneumonia

A.'s node. Atrioventricular node.

ascia (a'si-ä, ask'i-ä) [L. *ascia*, ax]. Spinal bandage without reverse, each turn overlapping the previous one for a third of its width

ascites (ä-si'tez) [G. *askitês*, bag] Serous fluid in the peritoneal cavity

ETIOLOGY (a) Chronic cardiac disease, (b) chronic renal disease, (c) interference with the portal circulation, (d) tumors of the abdomen, (e) external enlargement of the spleen

SYM Feeling of weight in the abdomen, dyspnea,* edema of the feet, scanty urination, shifting dullness in flanks, fluctuation felt when hand is placed on one side of the abdomen, tapping the opposite side with the tips of the fingers, no aortic pulsation, enlargement more prominent about umbilicus. [cause SEE *dropsy*]

TREATMENT Directed to the original **a. chylosus**. Chyle in the ascitic fluid.

ascit'ic. Pert to ascites.

a. fluid. Sp gr 1.005-1.015, clear and pale, straw color with greenish tinge in some cases

Ascoli's reaction (ahs-kol'is). 1. Precipitation test for anthrax 2. Miotagmin reaction.*

Ascomycetes (as'ko-mi-se'tez) [G. *askos*, bag + *mykês*, fungus] A family of fungi which form ascospores. Included in this family are yeasts, molds, ergot, and truffles

ascorbic acid (äs-kor'bik) [G. *a-*, priv. + *scorbutus*] USP SYN for synthetic vitamin C

as'cospore [G. *askos*, bag, + *sporos*, seed]. Spores within an *ascus*,* or sac.

as'cus. A spore case, a sac containing spores

-ase. A suffix used in forming the name of an enzyme. It is added to the name or a part of the name of the substance upon which it acts. Ex. *lipase* which acts on fats (lipids).

as'e'mia, asema'sia [G. *a-*, priv. + *sêmasia*, sign]. Inability to comprehend any type of symbol. SEE *asymbolia*.

asepsin (ä-sep'sin) [G. *a-*, priv. + *sepsis*, decay]. An antiseptic analgesia, antipyretic drug. SYN *antiseptin*.

asep'sis. A condition free from germs; free from infection; sterile, free from any form of life. SEE *antiseptis*, *antiseptics*, *sterile*, *sterilization*

asep'tic. Rel. to asepsis, free from septic matter

asep'tic-antisept'ic [G. *a-*, priv. + *sepsis*, decay, + *anti*, against, + *sepsis*]. Both aseptic and antiseptic

asep'ticize. To make sterile, to free from pathogenic matter.

asex'ual [G. *a-*, priv. + *L. sexualis*, having sex] Without sex, nonsexual. SEE: *parthenogenesis*.

asexualization (ah-seks-u-al-iz-a'shun). Ablation of the ovaries or testes or in this manner desexing the individual.

ash (äsh) [AS *asce*, ash]. Incombustible, powdery residue of an organic substance that has been burned

Residue from food digested in the body is either alkaline or acid

The difference in the blood is slight, normally a trifle more alkaline than acid. Mineral elements in food aid in keeping the blood neutral. Some fruits and vegetables which remain acid in the gastrointestinal tract have an alkaline ash when oxidized in the body.

Acid-producing Foods All cereals, eggs, meat, fish, cranberries, peanuts, prunes, and quinces **Alkali-producing Foods** Most fruits and vegetables, cow's milk, raisins, almonds, chestnuts, currants. SEE *acid-base balance*, *acidic effects of foods*, *acidosis*.

asialia (as-i-ä'll-ä) [G. *a-*, priv. + *salon*, spittle]. Failure to secrete saliva or deficiency of it

Asia'tic cholera. An epidemic, acute infectious disease. SEE *cholera*.

asidero'sis [G. *a-*, priv + *sidêros*, iron, + *-osis*, condition] Deficiency of iron in the circulating blood

asithia (a-sish'i-ä) [G. *a-*, priv. + *sitos*, food] 1. Aversion to food. SYN: *anorexia*.* 2. The want of food.

asonia (ä-so'ni-ä) [G. *a-*, priv. + *L. sonus*, sound] Tone deafness

aspar'agus. COMP Extractive matter high. PURINS 0.021% or 150 gr. per lb. It contains asparagin

Av. SERVING (green): 75 grams. Pro. 1.7, Fat 0.2, Carbo 1.9, Ca 0.025, Mg. 0.011, K 0.196, Na 0.007, P. 0.039, Cl. 0.039. S. 0.041. Fe 0.0010. Vtrs. A, variable, B, good, C and G, excellent. Copper 14 mg. per Kg. Alkalinity 3.7 cc. per 100 grams, 6.00 per 100 cals. A base-forming food. ACTION It increases the production of uric acid. It impedes elimination as it is apt to irritate and congest the kidneys

aspa'stic (ä-spas'tik) [G. *a-*, priv. + *spas-tikos*, having spasms] Nonspastic

as'pect [L. *aspectus*, looking toward]. 1. That part of a surface looking in any designated direction. 2. Appearance, looks

aspergillosis (äs-për-jil-ô'sis). *Aspergillus* in the tissues or on any mucous surface and the condition produced thereby. This condition may develop in the bronchi, lungs, mucous membranes of the eye, nose, or urethra, the aural canal, or the skin. It may even extend through the various viscera, producing mycotic nodules in the lungs, liver, kidney, and other organs.

a., aural. Otomycosis.

a., pulmonary. Disease of the lungs caused by *Aspergillus fumigatus*.

Aspergillus (äs-për-jil'ūs) [L *aspergere*, to sprinkle] A genus of the *Ascomycetes*, including several species of the molds, some of which are pathogenic.

A. auricularis. A species in the external auditory meatus

A. barbae. A species found in mycosis of the head

A. bonfordi. A form found in black mycetoma

A. Bouffardi. Found in black mycetoma

A. bronchialis. A species in the bronchium of a diabetic patient

A. concentricus. A species once thought to be the cause of *Tinea imbricata* ringworm

A. flavus. A mold found on corn and grain

A. fumigatus. A species that has been found in the ear, nose, and lungs

A. glaucus. A bluish mold found on dried fruit, also in the human ear

A. indulans. The cause of white mycetoma, and of otomycosis

A. mucroides. A form found in the lungs

A. nidulans. A species causing one form of white mycetoma

A. niger. A pathogenic form with black spores, frequently present in the external auditory meatus

A. ocraceus. The species which produces the characteristic and desirable odor of coffee

A. pictor. A species found in the patches of pityria

A. repens. A species found in the auditory canal

aspermatic [G *a-*, priv. + *sperma*, seed]. Pert. to aspermatisin

aspermatisin (as-per-ma-tiz'm) [“ + “ + *ismos*, condition of] Lack of formation of spermatozoa due to defective secretion of semen, aspermia

aspermia. Lack of or failure to ejaculate semen

aspermous. Pert. to aspermia. **SYN** aspermatic.

asperous [L *asper*, rough]. Uneven, having minute elevations

asperion [L *aspersio*, sprinkling] Sprinkling an affected part with water, a form of hydrotherapy *

asphalgisia (as-fal-j'e'zi-ä) [G *asphlōn*, + *algos*, pain] A burning sensation and convulsions sometimes felt during hypnosis on touching certain articles.

asphyctic, asphyctous (as-fik'tik, -tus) [G *a-*, priv + *sphysis*, pulse] 1 Asphyxiated 2 Without pulse

asphyxia (äs-fik'si-ä) [“ + *sphysis*, pulse]. 1. Suspended animation in living organisms due to interference with the oxygen supply of the blood 2 Suspension of the pulse beat. 3 Cyanosis due to interference with circulation May be general or local

Etiol. Extrinsic Causes: Choking, gas (illuminating, sewer), exhaust gas (principally carbon monoxide), electric shock, drugs, anesthesia, traumatic asphyxia, crushing injuries of chest, also with compression of chest, injury of respiratory nerves or centers, diminution of oxygenation of environment, drowning, Tumors, such as goiter, pharyngeal and retropharyngeal abscesses **Intrinsic Causes:** Hemorrhage into lungs or pleural cavity, drowning, foreign bodies in throat, swelling of air passages, diseases of air passages, ruptured aneurysm or abscess, edema of the lung, cardiac de-

ficiency. **Other Causes** Paralysis of the respiratory center, profound anesthesia, pneumothorax, narcotic drugs and electricity.

SYM Vary somewhat with etiology. In general, cyanosis, cessation of respiration, pallor, lessened temperature

F A TREATMENT. Artificial respiration, *q v*

RS *acrabia, acroasphyxia, artificial respiration, drowning, gases, resuscitation, suffocation.*

a. carbonica. Suffocation from inhalation of coal or water gas

a. from chloroform, sulfuric ether, etc. Place body in horizontal position, lower head, open windows, loosen clothing, dash cold water on face, shake chest vigorously. Hold ammonia to nostrils. Introduce piece of ice into rectum. These failing, apply galvanic battery, one pole on throat, other over ensiform process, keeping up current several hours in severe cases, or induce artificial respiration

a. from cold. Place body in cold room, rub with snow or bathe in ice water till limbs become soft and flexible, then place in dry bed, rub briskly with flannel, use artificial respiration. Soon as signs of returning life give injections of clear coffee and by mouth if patient can swallow

a. from drowning. a. from hanging or choking. Maintain or reestablish respiratory movements by artificial means. **SEE** artificial respiration.

a. livida. When there is difficulty in breathing, but the superficial reflexes are present

a., local. The congested stage of Raynaud's disease

a. neonatorum. Imperfect breathing in the new born child

a. from noxious gases. Carbonic acid, carbonic oxide, fumes of burning charcoal, chlorine or sulfuretted hydrogen gas. Expose at once to fresh air, bathe face and breast with vinegar, and inhale vapor. Give strong coffee, apply cold water to head, warmth to feet. Method used in artificial respiration, or apply positive pole of battery to upper part of spine and negative pole on chest over diaphragm

F A TREATMENT If unconscious, artificial respiration, soothing substances to lining of respiratory passages, as inhalation, warm, humid air, **paraffin** spray repeatedly

a. pallida. When difficulty in breathing is accompanied by weak and thready pulse, pale skin, and absence of superficial reflexes. This is the most serious type.

a. from smoke (suffocation from smoke) **SYM** Unconsciousness, dyspnea, also irritation of nose, throat and respiratory passages

a. fraumae. Discoloration of the head and neck due to compression of the trunk **SYM** Lividity, twitching about the face and limbs, dark color of tongue and lips. **TREATMENT** (1) Expose at once to fresh air, (2) bathe face and chest with cold cloth or ice, (3) give strong coffee, (4) cold to head and warmth to feet

asphyxial. Pert. to asphyxia; asphyctic. **asphyxiant.** An agent, especially any gas that will produce asphyxia

asphyxiate. To cause asphyxiation, or asphyxia

asphyxiation [G *a-*, priv. + *sphysis*, pulse]. A state of asphyxia or suffoca-

tion. Act of producing asphyxia. SEE: *asphyxia*.

aspidium (as-pid'i-um) (Male fern) USP. The dried root of *filix-mas*, used only in form of oleo-resin.

USE Against intestinal parasites, esp tape worm. Care should be taken that it is not administered with an oil, since absorption may occur.

DOSAGE 4 Gm once daily according to condition of patient.

aspirate [L *ad*, to, + *spirare*, to breathe]. 1. Aspiration, to remove by suction. 2. A sound like that of the letter *h*.

aspiration (as-pi-a'shun). 1. To draw in or out as by suction. Foreign bodies may be aspirated into the nose, throat, or lungs on inspiration. 2. The withdrawing of a fluid from a cavity by means of suction with an instrument called an aspirator.

Cavities most commonly aspirated are (a) pericardial c., (b) pleural c., (c) theca (lumbar puncture), (d) abscess c.

OBJECT (1) To remove fluid from an affected area such as pleural effusion, ascites. (2) To obtain specimens, as blood from a vein or serum from the spinal canal.

NECESSARY ARTICLES (a) Disinfecting solution for the skin. (b) Local anesthetic. (c) Two aspirating needles with the aspirating apparatus as indicated. (d) Utensil for receiving the fluid, also a sterile receptacle for the specimen. (e) Sterile sponges, towels, basins, etc. (f) Sterile gloves. (g) Sterile forceps. (h) Surgical dressings as the case may require. (i) Stimulant ordered if indication arises.

NP (a) Place patient in a comfortable position. (b) Drape, be sure patient is warm. (c) Have all equipment in order and in readiness for the use of the physician. SEE *foreign bodies*, *lumbar puncture*.

aspirator (as-pir-a-tor). 1. Apparatus for evacuating fluid contents of a cavity.

VARIETIES Piston Pump A, Compressible Rubber Tube A, Rubber Bulb A, Siphon A, Needles and Trocars.

2. Instrument used in chemical analysis of gases.

aspirin (äs'per-in) Commercial name for acetylsalicylic acid.

DOSAGE 5 gr (0.3 Gm) In large doses it may cause an acidosis which sometimes is fatal. Severe attacks of asthma may result fatally. It is a strong gastric irritant, and can cause vomiting, nausea, and gastric bleeding. It will not affect a 4-dol* pain. One or two tablets are as effective as five or seven SEE *dol*.

POISONING Due to hypersusceptibility or to large doses.

SYM Weak and rapid pulse. Extremities cold, face and lips livid or cyanotic. Temperature subnormal. Respirations shallow and labored.

F A TREATMENT Empty stomach, keep patient quiet, stimulate with whisky or strong, hot coffee, large volumes of fluid, epinephrine and ephedrine by injections or instillation in the nose from which they are absorbed.

asporogen'ic [G *a-*, priv. + *sporos*, seed, + *genos*, origin]. Not reproducing by spores.

asporous (ä-spor'us) Having no spores. **assafoetida**, **assafoet'ida** [L *asa*, gum, + *foetida*, fetid] A resinous substance used as a carminative and antispasmodic in hysteria. SEE *assafoetida*.

assan'ation [L *ad*, to, + *sanare*, heal]. Improvement of sanitary conditions.

assault', crim'inal. Cohabitation without consent is always legal rape, but even with consent, if the victim is insane, it is legally considered rape.

assident (as'id-ent) [L *assidere*, to sit by]. Usually associated with a disease, as *assident* symptoms.

assimilable (as-sim'il-a-bl) [L *assimiläre*, to make like] Capable of assimilation.

assim'ilate. To absorb digested food.

assimila'tion. The processes whereby the products of digestion are changed to resemble the chemical substances of the body tissues, first passing through the lacteals and blood vessels, transformation of food into living tissue.

The types of chemical reactions involved are chiefly hydrolysis and condensation, also deaminization, decarboxylation, desaturation, oxidation, and reduction, *q.v.*

EX Esp some of the chemical reactions going on in the liver during and after absorption, namely, the synthesis of glycogen, the formation of serum proteins, and the alteration of fats. SEE *assimilable*, *assimilate*, *metabolism*.

asso'ciated movements. Synchronous correlation of 2 or more muscles (or muscle groups) which, though apparently not essential for the performance of some function, nevertheless, normally accompany it, as the swinging of arms accompanies normal walking.

Associated movements are lost rather characteristically in cerebellar disease.

asso'ciation ar'eas. Small islands in the brain surrounded by cerebral tissue known as motor and sense areas or association areas, as association fibers connect the motor and sense areas.

They are supposed to be plastic, registering individual experiences in the cerebrum, the organ of *associative memory*.

a. center. One controlling associated movements.

a., controlled. An idea suggested by a word uttered by the physician.

a. of ideas. The linking together in a memory chain of two or more ideas, associated by some similarity, relationship, or by both having been experienced at the same time.

a. neuron. A neuron which transmits impulses from afferent to efferent neurons.

a. fest. The patient is given a word (*stimulus word*) and he replies immediately with another word (*reaction word*) suggested to him by the first. The words chosen and the time taken in responding (*association time*) may be indicative of the patient's mental condition.

assonance (as'o-nans) [L *assonare*, to respond to] Abnormal impulse to use alliteration.

assuetude (as'wë-tüd) [L *assuetudo*, be persuaded to] 1. Becoming habituated to conditions. 2. Acquiring tolerance of a drug until it loses its effect.

as'surin. Complex substance occurring in brain tissue.

astasia (as-tä'si-ä) [G *a-*, priv. + *stasis*, stand]. Motor incoordination in standing.

a. abasia. Combined incoordination for standing or walking. PSY A mental conflict making it difficult to stand or walk without swerving or swaying.

asteatosis (as'të-ä-to'sis) [G. *a-*, priv. + *stear*, tallow, + *-osis*, condition]. Any disease condition in which there is scantiness or absence of the sebaceous secretion.

a. cutis. A dry, fissured condition of

the skin together with deficient secretion.

ETIOI. Symptomatic form due to senility, constitutional, or local affections which give rise to trophic changes in the nervous system. Local form may be caused by frequent contact with irritants.

TREATMENT. Removal of underlying cause. Locally, oils and fats.

as'ter [G *astēr*, star] The stellate rays forming round the dividing centrosome* during mitosis.

astereognosis (a-ster-o-og-no'sis) [G *a-*, priv. + *stereos*, solid, + *gnosis*, recognition] Inability to recognize objects or forms by touch.

aste'rión [G *asterion*, starlike] A cranio-metric point at junction of occipital, parietal, and temporal bones.

aster'nal [G *a-*, priv. + *sternon*, chest]. 1. Not connected with the sternum. 2. Having no sternum.

asteroid (as'tei-oid) [G *astēr*, star, + *eidos*, shape] Star shaped.

asthenia (as-the'n-i-a) [G *a-*, priv. + *sthenos*, strength] Lack or loss of strength. Inability. Any weakness, but one esp. originating in muscular or cerebellar disease.

a., neurocirculatory. A condition due to excessive stimulation of the adrenergic sympathetic system frequently seen in soldiers.

ETIOI. Hyperactivity of the adrenal glands.

SYM. Nervous excitation, palpitation, nerve fatigue, absence of mental or psychic phenomena.

TREATMENT. Adrenal denervation. **SEE:** *cerebrasthenia*, *irritable heart*.

asthenic (as-the'n-ik). Weak, pert. to asthenia.

a. body type. A thin, more or less tall person with flat chest, accompanied by inferior muscular development, who centers his interest in his inner self. Usually an introvert.* **SEE:** *pyknic type*.

asthenometer (as-the-nom'e-ter) [G *asthenia*, weakness, + *metron*, measure]. An instrument for determining loss of strength.

as'thenop [G *a-*, priv. + *sthenos*, strength, + *opsis*, power of sight] One affected with weak sight.

asthenop'ia. Weakness or tiring of eyes due to fatigue of ciliary muscle or extraocular muscles. Painful vision.

SYM. Pain in or around eyes, headache, usually aggravated by use of eyes for close work, fatigue, vertigo, reflex symptoms, as nausea, twitching of facial muscles, migraine.

a., accommodative. Refractive errors such as hyperopia and astigmatism.

a., muscular. Anomalies of external muscles.

a., nervous. Hysteria and neurasthenia.

a., photogenous. Excessive or improper illumination.

a., reflex. Disease in other organs, as nose, sinuses, teeth.

asthenop'ic. Rel. to asthenopia.

asthenox'ia [G *a-*, priv. + *sthenos*, strength, + *oxys*, deficient] Deficient oxygenation of waste products.

asthma (az'mā) [G *asthma*, panting]. Paroxysmal dyspnea accompanied by the adventitious sounds caused by a spasm of the bronchial tubes or due to swelling of their mucous membrane.

No age is exempt but occurs most frequently in childhood or early adult;

in males more frequently than in females.

TREATMENT. Adrenalin hydrochloride or epinephrine injection, removal of allergen causing attacks, hyposensitization, psychotherapy. A new method being propounded is a slow-acting mixture of gelatin and epinephrine injected into the thigh.

SEE: *anhelitus*, *asthmatic*, *Kopp's asthma*.

a., cardiac. Dyspnea due to heart disease.

TREATMENT. Upright position, morphine and venesection, if no anemia is present. When acute pulmonary edema sets in, strophanthin or digitalis.

a. convulsivum, a., bronchial, a., dyspeptic. Asthma due to a nervous reflex.

a., hay. Hay fever, q.v.

a., renal. Occurring in Bright's disease.

a., thymic. Due to enlargement of the thymus. The attacks are sudden and may prove fatal (status lymphaticus).

asthma'tic [L *asthmaticus*, panting] Pert. to or of the nature of asthma.

astigmatic (as-tig-mat'ik) [G *a-*, priv. + *stigma*, point] Pert. to or afflicted with astigmatism.

astigmatism [" + *stigma*, condition of] Form of ametropia in which refraction of several meridians of eyeball is different, usually due to change in curvature of cornea and lens.

ETIOI. Congenital or acquired. Images do not properly focus on retina.

VARIETIES. Simple, compound, mixed. **astigmatoscope** [" + *skopein*, to examine] Instrument which detects and measures astigmatism.

astigmatos'copy. Use of the astigmatoscope.

astigmometer (ah-stig-mom'e-ter) [G *a-*, priv. + *stigma*, point, + *metron*, measure] An instrument for measuring astigmatism.

asto'matous, as'tomous [G *a-*, priv. + *stoma*, opening] Without mouth or oral aperture.

astragal (as-trag'al-lai) [G *astragalos*, ankle bone] Pert. to the astragalus.

astragalectomy (as-trag-al-ek'to-mi) [" + *ektomē*, excision] Excision of astragalus.

astragalus (as-trag'al-us) BNA *Talus*. A bone of the foot which articulates with the tibia and fibula above, and with the calcaneum (os calcis) below. The ankle bone. **SEE:** *sustentaculum*.

astrophobia (as-tra-to'bi-a) [G *astrapē*, lightning, + *phobos*, fear]. Anxiety and terror of thunderstorms.

astric't [L *stringere*, to contract] 1. To contract or constrict, as the action of an astringent. 2. *Compres.*, as an artery in a hemorrhage. 3. To constipate.

astri'ction (a-strik'shun) Contraction;

compression, constriction.

astri'ngent [L *stringere*, to contract]. 1. Sympic. 2. Agent checking secretion of mucous membranes and which contracts and hardens tissues, limiting secretion of glands. Ex *Tannic or gallic acid*, *lead*, *copper*, *zinc*, *bismuth*, *barium* and *aluminum salts*. **SEE:** *styptic*, *styptic*.

a. enema. One given to contract intestinal tissue and to provoke subsequent evacuation of worms. **SEE:** *enema*.

a., mineral. They coagulate the albumins when applied to wounds or mucous surfaces, protecting them and making healing possible. They also stop bleeding. In the digestive tract they

check secretions and lessen peristalsis, creating constipation. They form albuminates by combining with the albumins. Poisonous effects may result from continued use if deposited in the tissues

astro- [G] Prefix: A star or star-shaped.

astroblast [G *astron*, star, + *blastos*, germ]. Primitive nerve cell which develops into an astrocyte.

astroblastoma [' + + *ōma*, tumor]. Tumor composed of astroblasts

astrocyte [' + + *kytos*, cell] 1 Star-shaped cell forming the neuroglia fibers. 2 Star-shaped bone corpuscle

astrocytoma [' + + *ōma*, tumor]. Tumor formed from astrocytes

astroglia [' + *glia*, glue]. Astrocytes making up neuroglia tissue

astrokinefic motions [' + *kinesis*, motion] Movements of centrosomes

astrophobia [' + *phobos*, fear] Morbid fear of stars and celestial space

astrosphere (as'tro-sfēr) [' + *sphaira*, sphere] Small body in the cytoplasm considered an independent and indispensable cell constituent

astrostatic [' + *statikos*, standing] Pert. to astrophere in its resting condition

Asturian rose. Pellagra, a disease characterized by a rosy rash on the body.

astysia (ā-stiz'ī-ā) [G *a-*, priv + *stasis*, a standing] An inability to fully (normally) erect the penis

asurrealism [G *a-*, priv + L *sur*, over, + *ren*, kidney, + G *ismos*, condition of] Deficient suparenal function

asyllabia (ā-sil-ā'bi-ā) [G *a-*, priv + *syllabas*, a collection] Recognition of letters but not syllables or words

asylum [L, from G *asylōs*, safe from violence] An institution for the care of those unable to care for themselves, as the infirm, aged insane, blind

a. ear. Bloody tumor of ear found in the insane SYN *hematoma auris*.

asymbolia [G *a-*, priv + *symbolon*, a sign] Inability to comprehend words, gestures, or any type of symbol, asemia. Sensorily aphasia

asymmetry (ā-sim'ē-tri) [' + *symmetria*, symmetry] Lack of symmetry of parts or organs on opp sides of body

asymphytous (ā-sim'fit-us) [' + *symphy-sis*, grow together] Not grown together.

asymptomatic [' + *symptomatikos*, symptom] Without symptoms

asynchronism [' + *syn*, together, + *chronos*, time, + *ismos*, condition of]. Lack of concurrence in time

asynclitism (ah-sin'klit-izm) [' + *syn-klitēin*, to lean together] GYN. An oblique presentation of the fetal head.

a., Litzmann's. Where the post parietal bone of the fetal head presents

a., Naegele's. Where the ant parietal bone of the fetal head presents

asynnergia, asynergy (ā-sin-er'jī-ā, -jī) [' + *syn*, together, + *ergon*, work] Lack of coordination between muscle groups. Movements are in serial order instead of being made together Seen in cerebellar diseases.

asynesia (ā-sin-ē'zi-ā) [G *asynesia*, lack of intelligence] Stupidness.

asynodia (ā-sin-ō'di-ā) [G *a-*, priv. + *syn*, with, + *odos*, way]. Failure of simultaneity of orgasm in man and woman in coitus.

asynovia (ā-sin-ō'vi-ā) [' + *syn*, with, + L *ovum*, egg] Lack of or insufficient secretion of synovial fluid of a joint.

astystematic [' + *systema*, arrangement]. Diffuse; not limited to one system or set of organs.

asystole, asystolia (ā-sis'to-le, -to'lī-ā) [G *a-*, priv. + *systemein*, to draw together] Faulty contraction of ventricles of the heart

asystolism (a-sis'tol-izm) [' + + *ismos*, condition of] Retention of contents of the right ventricle of the heart seen in last stages of mitral incompetence.

atabrine (at'ā-brin). Commercial preparation used in treatment of malaria. USP SYN *quinacrine hydrochloride*

Dosage 1½ gr (0.1 Gm.) three times a day for 3 days. SYN *atebrin*

atactic (at-ak'tik) [G *ataktos*, irregular]. Incoordinate, irregular, as muscular incoordination, esp in aphasia.

atactiform (ā-tak ti-form) [' + L *forma*, form] Similar to ataxia.

tactilia (ā-tak-til'ī-ā) [G *a-*, priv + L *tactilis*, pert to touch] Inability to recognize tactile impressions

ataraxia, ataraxy [' + *taraktos*, disturbed] Imperturbability.

atavico'sis [L *atavus*, ancestor, + G *-osis*, increased] Intestinal degeneration from eating highly concentrated foods.

atavism (āt'ā-vizm) [' + G *ismos*, condition of] 1 Recurrence of characteristics of a remote ancestor, after remaining latent for 1 or more generations 2. Reappearance, in a descendant, of a disease or abnormality experienced by a remote ancestor A reversion to an original type

atavis'fic. Pert to atavism *

ataxaphasia (at-aks-ā-fa'zi-ā) [G *ataxia*, lack of order, + *phasia*, speech] Inability to arrange words in sentences

ataxaphemia (at-aks-a-fē'mī-ā) [' + *phēmē*, speech] Lacking in lingual coordination

ataxia (a-taks'ī-a) Motor incoordination manifest during a purposive movement by irregularity and lack of precision.

Ser. *atactiform*, *ataxinevnic*, *ataxic*, *ataxodysamia*, *ataxodynamia*, *Brauch-Romberg's* sym.

a., alcoholic. A seen in drinkers, caused by peripheral neuritis

a., autonomic. Incoordination bet. sympathetic and parasympathetic nervous systems

a., Briquet's. Hysteria with skin and leg muscle anesthesia

a., cerebellar. Muscular incoordination due to cerebellar disease

a., choreic. Lack of muscular coordination seen in persons with chorea

a., hereditary cerebellar. Disease of late adolescence Eriol Atrophy of cerebellum SYN Ataxic gait, hesitating and explosive speech, nystagmus, and sometimes optic neuritis

a., hereditary spinal. Friedreich's disease * Sclerosis of the post. and lateral columns of spinal cord, occurs in children. SYN Ataxia in lower extremities, extending to upper, paralysis and contractures follow.

a., hysterical. Ataxia of leg muscles due to hysteria.

a., intrapsychic. A state in which emotional expressions appear to have no logical bases or relationship, other than those found in the Unconscious

a., locomotor. A sclerosis affecting the post. columns of spinal cord, most commonly due to syphilis.

SYM Characterized by incoordination, loss of deep reflexes, disturbances of nutrition, of sensation, and various ocular phenomena, with sometimes loss of sexual power, paralysis of sphincters, epileptiform seizures and dementia. In-

ability to control gait or to touch an article with the hand. **SEE** gait.

TREATMENT Best hygienic conditions, rest, nutritious diet, excess of all kinds prohibited, constitutional remedies.

a., Marie's. Hereditary cerebellar ataxia *

a., motor. Lack of ability for proper coordination of muscles.

a., spinal. Due to spinal cord disease, as in locomotor ataxia *

a., static. Loss of deep sensibility causing inability to preserve equilibrium in standing

a., thermal. Condition in which body temperature changes irregularly

a., vasomotor. Form of autonomic ataxia * **Etiol.** Lack of coordination bet. sympathetic and parasympathetic nervous systems in connection with vasomotor phenomena. **Sym.** Irregularity in peripheral circulation, alternations of pallor and suffusion, due to spasm of smaller blood vessels.

ataxiadynamia (ă-taks'î-ad-i-nam'î-ă) [G *ataxia*, lack of order, + *a-*, priv + *dynamis*, might] Muscular weakness in combination with incoordination

ataxiagram [' + *gramma*, writing] Ataxiagraph record or tracing

ataxiagraph (ă-taks'î-am-graf) [' + *graphein*, to write] Instrument measuring swaying in ataxia

ataxiometer [' + *metron*, measure] Apparatus measuring ataxia

ataxiamentia (at-aks'î-am-iē'zî-ă) [' + *amnesia*, forgetfulness] Suffering from muscular ataxia and amnesia

ataxic, ataxial. Pert to, or marked by, ataxia

ataxiodynamia (at-aks-o-ă-dî-nam'î-ă) [G *ataxia* lack of order, + *a-*, priv + *dynamis*, might] Ataxia associated with muscular weakness

ataxophemia [' + *phēmē*, speech] Incoordination of speech muscles

ataxophobia [' + *phobos*, fear] Morbid dread of ataxia

ataxy [G *ataxia*, lack of order]. Lack of muscular coordination. **SYN** ataxia.

-ate. **CHYM** Ternary acids, the names of which end in ic, take the ending *ate* to indicate salts formed from them. **Sfr** -ide, -ite.

atebrin(e) (at'ē-brin) Proprietary drug used to treat malaria

Dosage 1½ gr (0.1 Gm.) three times a day for 3 days. **SYN** atabrin

atelectasis (at-e-lek'tă-sis) [G *ateleōs*, imperfect, + *ektasis*, expansion] Lack of air in the lungs as in a fetus, or in a portion of an adult lung due to pleural effusion exerting pressure, and blocking the small bronchial tubes

atelia (at-e'lî-ă) [G *atelia*, incompleteness]. The retention of childish characteristics in the adult

atelic (at-el-ik) Without function

ateliolosis (ă-tē-lî-o'sis) [G *ateles*, incomplete, + *-osis*, condition] A form of infantilism due to pituitary causes in which growth may be arrested without deformity. The voice and face may resemble those of a child.

ateliotic. Infantile.

atelo- Prefix Imperfect development

athermic, athermous (ă-ther'mik, -mus) [G *a-*, priv. + *thermē*, heat]. Without fever.

athermosystaltic (ath-er-mo-sis-tal'tik) [' + *-systaltikos*, drawing together]. Not contracting under ordinary temperature variations, said of striated muscle.

atheroma (ath-e-o'mă) [G *athērē*, porridge, + *oma*, tumor] 1. A sebaceous cyst. 2. Fatty degeneration or thickening of the wall of the larger arteries. **SEE** arteriosclerosis.

atheromasia (ath-ei-o-mă'zî-ă). Atheromatous degeneration

atheromatosis (ath-er-o-mă-to'sis). Generalized atheromatous condition

atheromatous (ath-ei-o-mă-tus). Pert. to atheroma

atheronecrosis [G. *athere*, porridge, + *nekros*, dead, + *-osis*, condition] Necrosis or degeneration accompanying arteriosclerosis.

atherosclerosis [' + *sklerōsis*, hardness]. Senile type of arteriosclerosis characterized by atheromatous degeneration of walls of arteries

atherosis [' + *-osis*, condition] Fatty degeneration of arterial walls

athetoid (ath'e-toid) [G *athetos*, not fixed, + *eidos*, resemblance] 1. Similar to athetosis. 2. Affected with athetosis.

athetosis (ath-ē-to'sis) [' + *-osis*, condition] Slow, repeated, involuntary, purposeless, vermicular, muscular distortion involving part of a limb, toes, and fingers, or almost the entire body. **Etiol.** Brain lesion chiefly in children

athlete's foot. Infection of skin of foot by *Tinea microsporum* or *T. megalosporon*.

Sym. Cracks, redness, minute vesicles, usually bet toes, causing itching, pain, disability. **SEE** ringworm

TREATMENT Copper, which is highly fungicidal, is passed through the skin by iontophoresis * Another remedy Mix 2 parts phenol and 2 parts camphor, paint bet toes several times a day

Precaution Do not apply to wet skin. Water causes a breakdown in the preparation, resulting in caustic action

athlete's heart. Incompetence of the aortic valves

athrepsia, athrepsy (a-threps'î-ă, -î) [G *a-*, priv. + *threpsis*, nourishment] Malnutrition, marasmus *

athreptic (ath-ēp'tik) Marasmic, pert. to or afflicted with athrepsia

athrombia [G *a-*, priv + *thrombos*, a clot]. Defective blood clotting

athymia (ă-thî'mî-ă) [' + *thymos*, animation] 1. Confusional insanity, amnesia. 2. Without emotion. 3. Lack of thymus gland or its secretion

athymic (ath-i'mik) Pert to athymia

athymism [G *a-*, priv + *thymos*, animation, + *ismos*, condition of] Absence of thymus gland or its secretions. **SYN** athymia (3)

athyrea (a-thî-rē-ă) [' + *thyreos*, shield]. A condition due to the absence of the thyroid gland or insufficiency, or suppression of its function resulting in imperfect development of the tissues of the body.

athyreo'sis [' + *-osis*, increased]. Condition due to absence of thyroid gland or its secretions, causing imperfect development. **SYN** athyrea *

athyria (a-thî'rî-ă) [' + *thyreos*, shield]. Absence of thyroid gland or its secretions, causing imperfect development. **SYN** athyrea.

athyroide'mia [' + *-eidos*, form, + *aima*, blood] Morbid condition of blood due to absence of thyroid gland or its secretions

athyroidism (ă-thî'roy-dizm) [' + *-ismos*, condition of] Suppression of thyroid secretions, or absence of the thyroid gland; athyrea. [the atlas.

atlan'tad [G *atlas*, a support]. Toward

atlan'tal. Pert to the atlas.

atlas. The first cervical vertebra by which the head articulates with the occipital bone, so called because of Atlas who was supposed to support the world on his shoulders. SEE *atlantal*, *atloaxoid*.

atloaxoid (at-lo-aks'oid) [G. *atlas*, a support, + *L. axis*, a pivot, + *G. eidos*, form]. Pert to atlas and axis

atmiat'rics, atmi'atry [G. *atmos*, vapor, + *iatrios*, art of healing]. Treatment of respiratory disease by medicated vapors.

atmic (at'mik). Consisting of or pert. to vapor

atmo- [G.] Prefix Breath, vapor, steam.

atmocau'sis [G. *atmos*, steam, + *kausis*, burning]. Application of superheated steam, substitute for uterine curettage

atmocautery (at-mo-kaw'ter-i) [G. *atmos*, steam, + *kausis*, burning]. Device for cauterization with steam

atmograph (at'mo-graf) [+ *graphen*, to write]. A spiograph. Device for tracing respiratory movements

atmometer (at-mom'e-ter) [+ *metron*, measure]. Instrument for measuring exhalations

at'mos [G. *atmos*, air]. A unit of air pressure, one dyne per one sq. cc

at'mosphere [+ *sphaira*, sphere]. 1. The gases surrounding the earth to the height of 200 miles. 2. Climatic condition of a locality. 3. PHYSICS Pressure at sea level of the atmosphere—14.7 lbs to the sq in. 4. CHEM Any gaseous medium around a body

atmospher'ic. Pert to the atmosphere

atmospheriza'tion. Process of transforming venous into arterial blood

atmother'apy [G. *atmos*, air, + *therapeia*, treatment]. 1 Treatment of disease by medicated vapors SYN *atmiatrics*.* 2 Treatment by some method of condensing air

atocia (at-o'si-ä) [G. *a-*, priv. + *tokos*, birth]. Female sterility

at'om [G. *atomos*, indivisible]. The smallest particle of an element that can exist and take part in a chemical change, retaining its identity, and which cannot further be divided without change of its structure

Over 90 odd different atoms have been recognized, which in combination with one another or others like themselves make up all the various types of matter that we know. These atoms are themselves composed of still smaller particles called *electrons** and *protons*.* Dimensions of atoms are of the order of 10⁻³ centimeters. SEE *atomic theory*, *electron theory*.

atom'ic. Pert to an atom or atoms

atom'ic the'ory. Formulated by Dalton, who taught that all matter is composed ultimately of atoms.

atom'ic weight. The weight of different atoms as compared with that of *hydrogen*, which is the lightest, and is represented as 1. The heaviest known is that of *uranium*. Oxygen is 16.

atomicity (at-om-is'ti-ti) 1. Chemical valence or combining power. 2. Number of hydroxyl groups in an alcohol, or in a base [of a spray.

atomiza'tion. Converting a fluid into form a'tomize. To reduce a liquid to the form of a spray or a vapor.

atomizer (at'om-i-zer). Apparatus for changing jet of liquid to a spray

atonic (a-ton'ik) [G. *a-*, priv. + *tonos*, strength]. Without tension or tone

atonicity (at-o-nis'ti-ti). State of being atonic, or without tone. [mal tone.

atony (at'o-ni). Debility; or lack of nor-

a., gastric. Lack of muscle tone in stomach and failure to contract normally, causing slow movement of food out of stomach. Secondary to certain diseases. Dier. Small feedings at frequent intervals; soft foods; little fat. Avoid bulky foods and those requiring much mastication

at'open [G. *a-*, priv. + *topos*, place]. An allergen, exciting cause of any form of idiosyncrasy or hypersensitiveness

atophan (a-to-fan) Analgesic and antipyretic drug. SLL *cinchophen*.

Dosage 8 gr (0.5 Gm) [placed.

atop'ic. Pert to atopy* Displaced, mis-
atopognosis (at-o-pog-nō'sis) [G. *a-*, priv. + *topos*, place, + *gnōsis*, knowledge]. An inhibited sense of touch or feeling, the victim not being able to know where one has touched his skin

atopomenorrhœa (at-op-o-men-or-e-ä) [+ *mēn*, month, + *roia*, flow]. Periodic hemorrhage from any part of the female body other than the uterus, vicarious menstruation

at'opy. 1 Hereditary allergic disease. 2. The many forms of hypersensitivity or idiosyncrasies [Nonpoisonous

atox'ic [G. *a-*, priv. + *toxikon*, poison].

ATP. Abbr for *adenosine-5-Triphosphate*. Made up of sugar, adenine, nitrogen, and phosphorus, from which adenylic acid is derived. The breakdown of ATP provides the energy for muscle contraction and possibly many other physiological processes [Melancholic.

atrabi'liary [L. *atra*, black, + *bilis*, bile].

a. capsules. Suprarenal capsules.

atremia (at-re-mi-ä) [G. *a-*, priv. + *tremēn*, to tremble]. Absence of trembling or tremor

atrepsy (ä'trep-si) [+ *threpsis*, nutri-

atresia [+ *tresis*, a perforation].

Pathological closure of a normal anatomical opening or congenital absence of the same, esp that of the esophagus. Term also applied to the retrogression and disappearance of follicles in the mammalian ovary

atres'ic. Imperforate, pert to atresia

atretogastria (ä-tiet-o-gast'ri-a) [G. *atretos*, imperforate, + *gaster*, stomach]. Gastric imperforation.

atreturethria (ä-tret-u-re'thri-ä) [+ *ourēthra*, urethra]. Urethral imperforation

atrichia (ä-trik'i-ä) [G. *a-*, priv. + *thrix*, hair]. Absence of hair

atrichosis (ä-tri-ko'sis) [+ *-osis*, increased]. Having no hair, atrichia.*

atrich'ous. Being without flagella.

atrionec'tor (ä'tri-o-nek'tor) [L. *atrium*, corridor, + *nec'tor*, connector]. Sinoauricular node of Keith.*

at'riotome [+ *tomē*, cutting]. Instrument which cuts connections between the cardiac auricle and ventricle.

atrioventric'ular [+ *ventriculus*, belly]. Pert to both auricle and ventricle.

atripl'icizm (ä-trip'l'i-sizm). Poisoning due to eating one form of spinach, *At'riplex littoralis*. SEE *allantiasis*.

a'trium (Pl. *a'tria*) [L. *atrium*, corridor]. A cavity or sinus

Atrium. A cavity or sinus.

a. ear (of). Portion of the tympanic cavity lying below the malleus, the tympanic cavity proper

a. heart (of). The upper chamber of each half of the heart. The right atrium receives deoxygenated purple blood from the entire body (except lungs) through the sup and inf. vena cavae and coronary sinus; the left

atrium receives oxygenated red blood from the lungs through the pulmonary veins. Blood passes from the atria to the ventricles through the atrio-ventricular orifices. In the embryo the atrium is a single chamber which lies between the sinus venosus and the ventricle.

a. infection (of). Site of entrance of bacteria causing an infectious disease.

a. lungs (of). The space at the end of an alveolar duct which opens into the alveoli or air sacs of the lungs.

atrophia [G.] Wasting of a part from lack of nutrition. *Syn.* *atrophy*.

atrophic (a-tro'fik) [G. a-, priv. + *trophē*, nourishment]. Pert. to, or marked by, atrophy.

atrophied (ă'tro-fēd). Wasted. Afflicted.

atrophoderma (ăt-rô-fô-der'mă) [G. a-, priv. + *trophē*, nourishment, + *derma*, skin]. Cutaneous atrophy.

a. pigmentosum. Rare skin disease characterized by ulcers, disseminated pigment discolorations, etc. *Syn.* *zero-derma pigmentosum*, *g.v.*

atrophodermatosis [" + " + " + -osis, increased]. Any skin disease which has atrophied skin as a sym.

atrophy. A wasting due to lack of nutrition of any part.

Etiol. Disuse, disease, injury to trophic nerve centers in spinal cord, or interference with nerve or blood supply.

a., acute yellow. Extensive degeneration of liver cells with jaundice, mental disturbances, and cutaneous hemorrhages.

Sym. Early nervous symptoms before jaundice sets in, slow onset, some fever with nausea and vomiting, black vomit, malaise. Leucine and tyrosine in urine.

Neur. It obtains in pathologic conditions of the ant horns of the spinal cord as in destruction of or injury to the peripheral nerves or as in poliomyelitis. * Not common in disease of the cerebrum.

a., Buchwald's. Progressive wasting of the skin [causing a.

a., compression. Compression of a part

a., correlated. Wasting of a part following destruction of another part.

a., Cruveilhier's. Progressive wasting of the muscles

a. of disuse. A from failure to normally use a part.

a., Hoffman's. Progressive muscular wasting, in the legs, hands and forearms.

a., idiopathic muscular. Progressive a. affecting muscle groups and due to muscular changes, developing in early life. *Sym.* The muscles, esp those of the face, shoulders, thighs, buttocks, and calves, lose power and waste. In Erb's juvenile type the atrophy begins in shoulders; in Landouzy-Dejerine's type, in the face. *Progn.* Unfavorable. Incurable but of slow progress.

a., Landouzy-Dejerine. Muscular wasting in face and scapulohumeral area.

a., muscular. Muscular wasting.

a., progressive muscular. Chronic disease marked by progressive wasting of the muscles and paralysis, beginning with the extremities and ultimately causing death from paralysis of muscles of respiration. *Syn.* *poliomyelitis*, *chronic anterior*, *palsy*, *gang.*

a., trophoneurotic. Wasting due to disease of the nerves or nerve centers.

a., unilateral facial. Progressive a. of the facial tissues on one side only.

a., white. Wasting of nerve, leaving only white connective tissue.

atrophy, words perf. fo: antatrophic, atrophic, auantic, cataplasia, claw-foot, claw-hand, macies, trophoneurosis, wasting palsy.

atropic [G. a-, priv. + *tropē*, turn]. Displaced.

atropine sul'fate. USP. The salt of an alkaloid obtained from belladonna.

ACTION AND USES. Respiratory and circulatory stimulant, also used to overcome spasm of involuntary muscles, to check secretion, locally for its effects on the eye—externally as local anodyne.

DOSAGE $\frac{1}{120}$ gr. (0.0005 Gm.)

Atropine is used to dilate pupils before testing eyes for glasses, to relieve muscle spasm, and for many other systemic effects.

POISONING SYM. Nervousness and excitability. Patient may be delirious. Face flushed, pupils widely dilated, throat dry, great thirst, and difficulty in swallowing, skin flushed and dry, delirium.

F A TREATMENT. Empty stomach with stomach pump rather than emetics. Precipitate by introducing tannic acid by the stomach tube, or use a dilute solution of iodine. These must be washed out. Ice caps to the head. Finely divided charcoal should be given to delay its absorption. Pilocarpine is a physiologic antagonist and is sometimes helpful.

In depressant stage, caffeine and artificial respiration should be used. *See:* *atropinism*, *atropinization*, *atropinize*.

atropinism, atropism. Atropine poisoning.

atropinization. Production of physiologic effect of atropine.

atropinize. To bring under the influence of atropine.

attention [L. *attendere*, wait upon]. Power to focus on some phase of consciousness including some aspect of the world of reality.

a. reflex. Change in size of pupil when attention is suddenly fixed. *Syn:* *Pills's reflex*.

atten'uant [L. *attenuare*, to thin]. 1. Diluting, making thin or weak. 2. An agent that thins the blood.

attenuate. To render thin, or make less virulent.

atten'uated. 1. Diluted. 2. Pert. to reduced virulence of pathogenic micro-organism.

a. virus. One made less virulent.

attenuation. 1. Dilution. 2. Dynamization. 3. Lessening of violence.

attic [G. *attikos*, upper part]. Upper portion of tympanic cavity above tympanic membrane.

a. disease. Chronic suppurative inflammation of attic.

attici'tis [" + -itis, inflammation]. Inflammation of tympanic attic.

atticoantrot'omy [" + *antron*, antrum, + *tomē*, cutting]. Operation to remove contents of the attic and mastoid antrum.

attico'omy [" + *tomē*, a cutting]. Surgical opening of tympanic attic.

attitude [L. *attitudo*, posture]. Bodily posture(s), esp the stereotype seen in catatonia* and the theatric expression often seen in hysteria.

a. of combat. The rigid, defensive attitude of the corpse, due to contractions caused by fear, fire, etc.

a., crucifixion. Body rigid with arms at right angles, seen in conditions of hysteroepilepsy.

- a., defense.** Position automatically assumed to avert pain.
- a., forced.** Abnormal position due to disease or contractions.
- a., frozen.** Stiffness of gait, seen in amyotrophic lateral sclerosis.
- a., illogical.** Peculiar attitudes caused by disease, esp. hysterolepilepsy.
- a., passionate, a., passionate.** Theatrical or dramatic gestures and expressions of face and figure assumed by hysteric patients.
- a., stereotyped.** Position taken and held for a long period, seen frequently in mental diseases.
- attol'lens** [L *attolere*, to lift up]. Raising or lifting up
- attrac'tion** [L *attrahō*, to draw toward]. Tendency of particles to approach each other.
- a., capillary.** The force by which liquids rise in fine tubes, or through pores of loose material
- attrahens** (at-ra'hens) [L *attrahere*, draw toward]. Drawing forward, as a muscle.
- attrax'in.** Hypothetical substance in solutions supposed to exert chemotactic influence on certain body cells
- attrition** (at-rish'un) [L *attritō*, a rubbing against]. 1 A chafing or abrasion. 2 Any friction that breaks the skin
- atylosis** (at-lo'sis) [G. *a-*, priv. + *tylosis*, a callus]. Nontypical tuberculosis
- atyp'ical** [' + *typos*, conformed to a type]. Deviating from the normal.
- Au.** Symb for gold (*aurum*).
- A. u. or Ä.** Abbr for Angstrom's unit
- autantic** (aw-an'tik) [G *auantikos*, wasted]. Wasted away SYN *atrophic*.
- au'digram** [L *audire*, to hear, + G. *gramma*, drawing]. Chart of variations of acuteness of hearing.
- audile** (aw'dil). 1 Pert to hearing. 2. Ear-minded 3 Psy One whose mental images are auditory SEE *visile* and *motile*.
- audiogram** (aw'di-o-gram) [L *audire*, to hear, + G *gramma*, drawing]. Record of the audiometer
- audiom'eter** [' + G *metron*, measure]. A delicate instrument for testing hearing, consists of a thermoionic tube circuit in which the tube is placed into oscillation. By varying the electrical constants of the circuit, one may make the emitted tone assume various pitches
- audiom'etry.** Testing of the hearing sense.
- audiphone** (aw'di-fon) [L *audire* + G. *phōnē*, voice]. Instrument for conveying sound to auditory nerve through the teeth or a bone
- aud'ition** [L *auditiō*, hearing]. Hearing.
- a., colored.** Color sensation is perceived when certain sounds reach ear.
- a., mental.** The recollection of a sound based on previous auditory impressions
- a., m. verbal.** Mental *a.*, the sounds being words.
- auditive** (aw'di-tiv). One who is auditory minded, depending upon hearing in learning, or recall
- au'ditogno'sis** [L *auditiō*, hearing, + *gnōsis*, knowledge]. 1. Understanding and interpretation of sounds 2 Diagnosis by percussion and auscultation.
- aud'itoc"ulogy'ric reflex.** The sudden turning of the head and eyes in direction of an alarming sound.
- aud'itory.** Pert to the sense of hearing.
- a. canal** (*meatus acusticus externus*). 1. The external canal, about 2.5 cm from the concha to the tympanic membrane.
2. The internal canal from posterior surface of petrous portion of temporal bone to internal ear.
- a. nerve** (*n. acusticus*). The 8th pair of cranial nerves, it is a sensory nerve with two sets of fibers (a) cochlear n. (of hearing), and (b) vestibular n. (of equilibrium), the latter having three branches, the sup, inf, and middle br
- a. reflex.** Blinking of the eyes upon the sudden unexpected production of a sound
- a., m. verbal.** Mental *a.*, the sounds being words. [cochlea.
- a. feeth.** Toothlike projections in the
- a. tube.** Eustachian tube, *q.v.*
- aud'itus.** The power or the sense of hearing
- Auenbrugger's sign** (ow'en-broog-er's). Epigastric prominence due to marked pericardial effusion
- Auerbach's plexus.** A plexus of sympathetic nerve fibers situated bet. the longitudinal and circular fibers of the muscular coat of the stomach and intestines. Also called the *plexus myentericus*
- Auer's bodies.** Rodlike bodies in lymphocytes in leukemia
- Aufrecht's sign** (ow'f'rekht's). Diminished breathing sound heard above the jugular notch in tracheal stenosis
- augment** (aug'ment) [L *augmentum*, increase] 1 To add to or increase. 2. The increasing stage of a fever, or of an acute disease
- augmen'tor.** Increasing
- a. nerves.** Those increasing force and rapidity of the heartbeat
- aula** (aw'lā) [G *aulē*, hall]. Ant part of third ventricle
- aulatela** (aw-lā'tē-lā) [' + *tela*, web]. Membrane covering the aula
- auliplex'us** [' + L *plectere*, to twist]. Aulic part of choroid plexus
- aulix** (aw'liks) [L *aulix*, furrow] Monro's sulcus
- au'ra** [L *aura*, breeze]. The preepileptic phenomenon
- Visual sensation of fire is rather characteristic but sound sense of movement of a part, or even dream states known as intellectual auras, occur. A hysterical "attack" may present a similar phenomenon at its onset
- aural** (aw'ral) [L *auris*, the ear]. 1. Pert. to the ear 2 Pert to an aura.
- auranti'asis** [L *aurantium*, orange]. Yellowish skin color due to eating large quantities of oranges
- auran'tium** [L] Orange
- aureomycin.** A golden-color antibiotic from the *Actinomycetes*, a species of the genus *Streptomyces*, or *S. aureofaciens*. The best all-round of the mold extracts, except for tuberculosis and typhoid. An effective agent in peritonitis.
- USRS Effective on viruses Lymphogranuloma venereum, psittacosis, typhus, rickettsial pox, spotted fever, external infections of the eye
- auric** (aw'rik) [L *aurum*, gold]. Pert. to gold (*aurum*).
- auricle, auricula** (aw'rik-l, -u-la) [L *auricula*, the ear] (BNA) 1. The external ear, pinna or flap 2 (atrium, BNA).
- (1) The protruding portion of the external ear which surrounds the opening of the external acoustic meatus; the pinna (2) A small conical pouch forming a portion of the right and left atria of the heart. Each projects from the upper anterior portion of each

atrium (3) A term commonly used erroneously for the atrium

The right auricle receives the venous (purple) blood from the entire body through the vena cava and the left auricle receives the arterial (red) blood from the lungs through the pulmonary veins

auric'ular. 1 Rel to the auricle of the ear. 2 Pert to the auricles of the heart and its nerves and arteries.

See *polyotia*.

a. fibrillation. Irregular and rapid contractions of the auricles working independently of the ventricles. Instead of the contraction beginning at the sino-auricular node and being conducted along the bundle of His, to the ventricles, there is a rapid succession of beats at the auricles. Contraction of the auricular muscle causes the waves to pass round and round the auricle. There is no auricular diastole or auricular heartbeat

Etiol. Degeneration of cardiac muscle. Occurs in late stages of mitral disease of heart, after strain of the degenerated cardiac muscle, and in acute rheumatism in children

Treatment. Digitalis or quinidine

a. ventricular tract. A neuromuscular bundle of nerve fibers which pass as the bundle of His* from the right auricle into the ventricle. *Syn* pulse and heart.

auricula're (Pl *auricula'ria*) A craniometric point at center of opening of external auditory canal

auric'ulocer'vical nerve re'flex. Congestion of ear on same side resulting from stimulation of distal end of divided auriculocervical nerve

auric'ulopalpe'bral re'flex. Closure of an eye * arising from stimulation by heat or some tactile irritant on the ext. auditory meatus or deeper portions of canal up to the tympanum. *Syn* Kisch's reflex.

auriculoventric'ular [L *auricula*, the ear, + *ventriculus* belly] Pert to both auricle and ventricle. *Syn* atrioventricular

a. bundle. A fascicular bundle which forms part of the myocardium, and is made up of the bundle of His * Tawara's node,* and the Purkinje network *

auriform (aw'ri-form) [L *auris*, ear, + *forma*, shape] Ear shaped

auriginous (aw-ri-jin-us) [L *auriginosis*, golden] Pert to jaundice

aurilave (aw'ri-lav) [L *auris*, ear, + *lavare*, to wash]. An apparatus for cleansing the ear

auripuncture (aw'ri-punk-tur) [“ + *punctura*, puncture] Puncture of tympanic membrane

auris (aw'ris) [L] The ear

auriscalp, auriscal'pium [L *auris*, ear, + *scalpere*, to scrape] 1 Scraping instrument to remove foreign matter from ear 2 Earpick

auriscope (aw'ris-kop) [“ + G *skopein*, to view] Instrument for making an aural examination

aurist (aw'rist). Ear specialist. *Syn*: otologist.

auris'tics. Art of treating ear diseases.

auristil'lae [L] Ear drops.

aurococcus (aw'ro-kok-us) [L *aurum*, gold, + G *kokkos*, berry] Pyogenic microbe forming golden cultures found in boils, abscesses, carbuncles, pyemia, etc. *Syn* *Staphylococcus pyogenes aureus*.

aurometer (aw-rom'et-er) [L *auris*, ear, + G *metron*, measure] Instrument which measures hearing of each ear.

aurother'apy [L *aurum*, gold, + G. *therapeia*, treatment] Treatment of disease by adm. of gold salts.

aurum (aw'rūm) [L] Gold

auscult', auscultate [L *auscultare*, listen to] To examine by auscultation

auscultation (aws-kul-ta'shun) Process of listening for sounds produced in some of the body cavities, esp chest and abdomen, in order to detect or judge some abnormal condition

INSTRUMENTS Stethoscope or phonendoscope

PROCEDURE (Immediate a) The chest should have some soft, thin covering which will not interfere with the transmission of sound or itself produce sound from the movements of the thoracic walls to which it is applied. A soft towel answers well. When chest is covered with hair moisten latter as otherwise it will produce friction sounds, resembling rales. Auscult all over chest anteriorly and posteriorly, on full inspiration, full expiration, and after coughing. In comparing the two sides auscult symmetrical parts. Parts should be in perfect repose. Position of examiner as unrestrained as possible, lest sounds of his own blood vessels be confused with sounds from within the subject.

a., immediate. When ear is applied directly to bared or thinly covered surface

a., mediate. When sounds are conducted from the surface to ear through an instrument

auscultation, words pert. to: abdominal a. aegophony, auscult, auscultatory, bruisement, bruit, cat's purr, chest, egophony, fremitus, heart, lung, percussion, râles, souffle, uterus, vocal resonance

auscultatory. Pert to auscultation

a. percussion. Auscultation at the same time percussion is made

auscultoplec'trum [L *auscultare*, listen to, + G *plektron*, hammer] Instrument used for both auscultation and percussion

autacoid (aw'ta-koyd) [G *autos*, self, + *akos*, remedy] Any chemical substance which is produced normally by chemical reactions within a given tissue, is released into the blood, and affects the activity of some remote tissue whither it is carried

Thus during digestion the autacoid *secretin** is formed in the mucosa of the duodenum, is carried in the blood to the pancreas, where it causes secretion. An autacoid (excitatory a) which can thus excite activity is called a *hormone*,* if it depresses activity (inhibitory a) it is called a *chalone* *

autarciesiology (aw-tar-sē-si-ol'o-jī) [“ + *arkein*, to protect, + *logos*, study]. Branch of immunology pert. to autarcesis

autarcesis (aw-tar'sē-sis). Resistance to infection through natural immunity

autarcetic (aw-tar-set'ik). Pert. to autarcesis

autefechoscope (aw-teck'os-kop) [G *autos*, self, + *echos*, sound, + *skopein*, to inspect]. Instrument for auto-auscultation

autemesia (aw-tem-e'si-ā) [“ + *emesis*, vomiting]. Vomiting without apparent cause.

autism (aw'tizm) ['' + *ismos*, condition of] Psy Mental introversion in which the attention or interest is fastened upon the victim's own ego. A self-centered mental state from which reality tends to be excluded.

autistic (aw-tist'ik) 1 Self-centered 2 Daydreaming, phantasy of wish fulfillment

auto- [G] Prefix Self, as *autoinjection*.

autoactivation [G *autos*, self, + L *activus*, acting] Gland activation by its own secretion

autoagglutination ['' + L *agglutināre*, adhere to] Blood corpuscle agglutination of an individual by his own serum

autoanalysis ['' + *analyein*, break down] Patient's own analysis of mental state underlying his mental disorder

autoantibody ['' + *anti*, against, + O E *bodig*, body] Antibody acting against products of one in whom it is formed

autoantitoxin ['' + '' + *toxikon*, poison] Antitoxin produced by body itself

autoaudible ['' + L *audire*, to hear] Audible to oneself, pert to sounds produced in one's own body

autoblast ['' + *blastos* germ]. Independent cell, as a bacterium

autocatalysis (aw-to-kat-al'is-is) ['' + *kataluein*, to dissolve] Production of substances by enzymes which increase their activity

autocatheterism ['' + *katheterismos*, a letting down into] Passage of the catheter upon oneself

autochthonous (aw-tok'tho-nus) ['' + *chthon*, earth] Found where developed

a. ideas, Ideas which compel attention, which are not in harmony with one's character, and which arise spontaneously, including auditory hallucinations.

autocinesia, **autocinesis** (aw-to-sin-e-si-a, -e'sis) ['' + *kinesis*, motion] Voluntary movement

autoclasis (aw'tok'lā-sis) ['' + *klasis*, a breaking] Destruction of a part from internal causes

autoclave (aw'to-klave) ['' + L *clavis*, a key] Apparatus for sterilization by steam under 20 lb per sq in at 260° F

autocondensation ['' + L *con*, together, + *densare*, to make thick] A method of applying high frequency currents for therapeutic purposes

autoconduction ['' + L *con*, together, + *ducere*, lead] A method, formerly much in vogue in France, of administering high frequency currents

autocystoplasty ['' + *kystis*, bladder, + *plassein*, to mold] Plastic repair of bladder with grafts from patient's own body.

autocytolysis (aw-to-si-to'l'isn) ['' + *kutos*, cell, + *lysis*, dissolution] Agent destroying erythrocytes SYN *autolysin*.

autocytolysis (aw-to-si-to'l'isn) ['' + '' + *lycin*, break down] Self-digestion or self-destruction of cells

autodermic ['' + *derma*, skin] Pert to one's own skin, esp rel to dermatoplasty, * with patient's own skin

autodiagnosis ['' + *dia*, through, + *gignoskein*, to know] Diagnosis of one's own disease

autodigestion ['' + L *dis*, apart, + *gerere*, to carry] Self digestion SYN *autolysis*.

autodrainage ['' + A S *drēnigean*, strain] Drainage of a cavity by sending the fluid through a channel made in patient's own tissues

autoecholalia (aw'to-ek-o-lā'lī-ā) ['' + *ēchō*, echo, + *lalō*, babble] Repetition of words of one's own statements

autoecic (aw-te'sik) ['' + *oikos*, house]. Pert to parasite always infesting the same organism.

autoerotic ['' + *erōtikos*, relating to love]. Attracted sexually to oneself

autoeroticism ['' + '' + *ismos*, condition of] Self-love sexually, apart from masturbation. SYN *autoerotism*.

autoerotism (aw'tō-ēr-ōt'izm) ['' + '' + *ismos*, condition of]. The spontaneous generation of sexual emotion in the absence of an external stimulus, normally or abnormally, and apart from masturbation. SEE *eroticism*

autofundoscope (aw-to-fun-dō-skōp) ['' + L *fundus*, bottom, + G *skopein*, to examine] Apparatus for autoc-examination of eye vessels about macular region

autogenesis (aw-to-jen'e-sis) [+ *genesis*, production]. Abiogenesis, self-production, spontaneous generation

autogenetic (aw-to-jen-et'ik) Pert to self-production or autogenesis

autogenic (aw-to-jen'ik) Rel. to self production SYN *autogenetic*

autogenous (aw-toi en-us) 1 Self-producing 2 Originating within the body 3 Denoting a vaccine from a culture of bacteria from the patient who is to be inoculated with it

a. vaccines, Culture infected material from lesion and isolate the organism present in largest numbers. Subculture this. Wash these cultures into a physiological saline solution. Add phenol as preservative. Sterilize.

Dosage: 0.1 cc initial dose subcutaneously. Increase 0.1 to 0.2 cc each dose at three-day intervals to 1 to 2 cc per dose according to the reaction obtained.

autograft [G *autos*, self, + L *graphein*, knit] A graft taken from one part of a person's body to fill in another part

autographism ['' + *graphein*, to write] Nervous state in which tracings made upon the skin leave wheals

autohem'ic ['' + *aima*, blood]. Done with one's own blood

autohemolysin ['' + *aima*, blood, + *lysis*, dissolution] Antibody acting on corpuscles of individual in whose blood it is formed

autohemolysis, Hemolysis of a person's blood corpuscles by his own serum

autohemotherapy [G *autos*, self, + *aima*, blood, + *therapeia*, treatment] Treatment by withdrawal and injection of patient's own blood

autoimmunization ['' + L *immunis*, safe]. Immunization produced by an attack of the disease

autoinfection ['' + L *inficere*, to dye]. Infection by bacteria present within one's own body.

autoinfusion ['' + L *in*, into, + *fundere*, to pour] Forcing blood from extremities to body by applying Esmarch bandages.

autoinoculation ['' + L *inoculare* to inject] Secondary infection from disease focus already present in body

autointoxication ['' + L *in*, into, + G *toxikon*, poison] A condition produced by poisonous products, set free within the body. SEE *autophytization*.

Erroneously thought to be poisoning due to faulty digestive processes. SEE *food poisoning*, *intoxication*.

autokinesis (aw-to-kin-e'sis) ['' + *kinesis*, motion] Voluntary action

autokinet'ic, Being able to move voluntarily

autolesion (aw-to-le'shun) [G *autos*, self, + L *laedere*, to wound] Injury self-inflicted

autolysate (aw-toi'f-sāt) [+ *lysis*, solution] Specific product of autolysis

autolysin (aw-toi'f-sin) Agent in serum destroying erythrocytes

autolysis. The self-solution or self-digestion which occurs in tissues or cells by ferment in the cells themselves, even after death and in the absence of putrefactive bacteria

autolytic. Rel to autolysis SEE *enzymes*.

automatic [G *automatos*, self acting]. Spontaneous, involuntary.

autom'atin. Hypothetical heart substance which is supposed to be the natural excitant of the heartbeat.

automatinogen [G *automatos*, self acting, + *gennan*, to produce] Heart substance which is activated into automatin

automatism (aw-tom'ā-tizm) [+ *ismos*, condition of] Automatic actions or behavior without conscious purpose or knowledge

The subject, though amnesic, appears normal to an observer but the "real" personality is "latent" during a secondary state or period of automatism, usually a hysterical trance. The patient is not responsible for his acts and must not be left for a second. He may carry out complicated acts without any idea of them and any after memory.

automatograph [+ *graphem*, to write] Instrument which records automatic movements

automyso'phobia [G *autos*, self, + *mysos*, dirt, + *phobos*, fear] Morbid dread of personal uncleanness

autonephrec'tomy [+ *nephros*, kidney, + *ektomē*, excision] Ureteral stricture, completely closing it

autonomic (aw-to-nom'ik) [+ *nomos*, law] Spontaneous, self-controlling.

SEE *autonomous*, *autonomy*, *autop-*

athy.

a. **nervous system**. A part of the nervous system which is concerned with control of involuntary bodily functions. It controls function of glands, smooth muscle tissue and the heart. It is commonly defined so as to include the *sympathetic* or *thoracolumbar* division and the *parasympathetic* or *craniosacral* division

THE **SYMPATHETIC SYSTEM**, which includes. The paired ganglionated sympathetic trunk, its connections (*rami communicantes*) with the thoracic and lumbar parts of the spinal cord, the large and small splanchnic nerves, and certain ganglia in the abdomen (e. g., the mesenteric ganglia)

THE **PARASYMPATHETIC SYSTEM** (or autonomic system proper). Certain fibers of some cranial nerves such as the motor fibers of the vagus. Other fibers connected with the sacral part of the spinal cord

It is best to use the word "autonomic" only in connection with efferent fibers, sensory fibers coming from the viscera and passing through the above named ganglia and trunks to reach the cord may be called "visceral afferents."

GENERAL FUNCTIONS OF THE AUTONOMIC SYSTEM: 1 Stimulating sympathetic fibers usually produces vasoconstriction in the part supplied, general rise in blood pressure, erection of the hairs, gooseflesh, pupillary dilation, secretion of small quantities of thick saliva, depression of gastrointestinal activity, and acceleration of the heart. 2 Stimulating parasympathetic nerves generally produces vasodilation of the part supplied,

general fall in blood pressure, contraction of the pupil, copious secretion of thin saliva, increased gastrointestinal activity, and slowing of the heart. SEE. *autonomotropic*, *nervous system*.

auton'omin. A hormone supposed to correlate endocrine gland activity, inhibiting or stimulating secretions of each according to systemic need

autonomotrop'ic [G *autos*, self, + *nomos*, law, + *tropēa*, turning] Drawn to the autonomic nervous system

auton'omous. Independent of external influences

auton'omy. Functional independence

autop'athy [G *autos*, self, + *pathos*, disease] A disease originating without apparent external cause

autopep'sia [+ *pepten*, to digest] Digestion by self, as of gastric wall by its own secretion

autopha'gia, **autoph'agy** [+ *phagein*, to eat] Biting oneself

autophil (aw'to-fil) [+ *philein*, to love]. Person having sensitive autonomic nervous system.

autophilia (aw-to-fil'i-ā) Narcissism, *q. v.* Self-love

autophobia (aw-to-fō'bī-ā) [G *autos*, self, + *phobos*, fear] 1 A psychoneurotic fear of being alone 2 Abnormal fear of being egotistical

autophonia (aw-to-fō'nī-ā) [+ *phonos*, murmur] Suicide

autophony (aw-to'fōn-i) [+ *phōnē*, voice] The vibration and echolike reproduction of the patient's own voice, breath sounds, and murmurs

autoplasmo'ther'apy [+ *plasma*, a thing formed, + *therapeia*, treatment] Treatment through injecting patient's own blood plasma

autoplas'tic [+ *plassein*, to form] Psy. Rel to psychic modifications in adapting oneself to reality

autoplasty (aw-to-plas-ti) [+ *plassein*, to form] A grafting of fresh parts taken from the patient's body for the repair of wounds

autoprecipitin (aw-to-pre-sip'i-tin) [+ *L. praecipitare*, to cast down] Precipitin active against serum of animal that was injected

autopsia (aw-top'sī-ā) [+ *opsis*, view]. 1 An exploratory incision to determine cause of a disorder or nature of a disease 2 Autopsy

autopsy (aw'top-sī) Examination of the organs of a dead body to determine cause of death, or pathological conditions.

autopsychosis [G *autos*, self, + *psychē*, the soul]. Mental disease in which patient's ideas about himself are disordered

autopyoth'ery [+ *pyon*, pus, + *therapeia*, treatment] 1 Treatment of disease by adm of patient's own pathological excretions. 2 Self-treatment

autoreinfusion [+ *L. re*, back, + *infundere*, to pour]. Intravenous injection of patient's blood which has been effused in his body cavities.

autor'haphy [+ *raphe*, suture]. Wound closure by tissue taken from edges of the wound

autosepticemia [+ *sēpsis*, decay, + *aima*, blood] Septicemia from poisons existing within the organism.

autoseroanalysis [+ *L. serum*, whey, + *G. dia*, through, + *gnōsis*, knowledge]. Diagnosis through serum from patient's blood.

aut'o-ser'o-sal'var-san [' + " + salvar-san]. Blood serum from patient after salvarsan injection used on the patient himself.

autoserother'apy [' + " + G *therapeia*, treatment]. Treatment by hypodermic injection of patient's own blood serum

autose'rous. Pert to autoserum

autose'rum. Serum obtained from patient's own blood or cerebrospinal fluid

autosuggestibility [G *autos*, self, + L *suggerere*, to suggest]. Peculiar lack of resistance to any suggestion that may be offered.

autosugges'tion. Acceptance of an idea uninfluenced by others that induces mental or physical action or change

Psy 1 Hysteroid aggravation of actual injury 2 Persistence into normal consciousness of impressions occurring during secondary states SEE *hypnotism*.

autosynnoia (aw-to-sin-noy'ä) [G *autos*, self, + *syn*, with, + *nous*, mind] Psy Intense concentration to the extent of loss of interest in the outside world a state of introversion

autotem'nous [' + *temnein*, to divide]. Pert to cells propagating by spontaneous division

autother'apy [' + *therapeia*, treatment]. 1 Spontaneous cure 2 Treatment of disease by administering patient's own pathological secretions

autotomy (aw-to'ö-mi) [' + *tomê*, a cutting] A surgical operation performed by oneself

autotopnosia (aw-to-top-no'z'i-ä) [' + *topos*, place, + *gnosis*, knowledge] Inability to orient various parts of body correctly

autotoxe'mia, **autotoxoc'sis** [' + *toxikon*, poison, + *ama*, blood] Self-poisoning due to absorption of ferment or poison generated within the body

autotox'in. Poison generated within the body upon which it acts

autotransform'er [G *autos*, self, + L *trans*, across, + *forma*, form] A transformer that has part of its turns common to both primary and secondary circuits SEE *transformer*.

autotransfusion (aw-to-trans-fu'shun) [' + " + *fundere*, pour] 1 Bandaging the limbs to force the blood to the vital centers 2 A method of treating internal hemorrhage by returning the patient's own extravasated blood to the circulation

The apparatus required is a beaker, glass rod, two cups or small bowls, a funnel, and 250 cc ampules of 2% sodium citrate, the quantity being used is 10 cc for each 90 cc of blood. The apparatus for giving intravenous saline is also prepared, together with some physiological salt solution (0.9%). After opening the abdomen, the blood is allowed to run into the cup, which is then emptied into the beaker containing the sodium citrate

The mixture is continually stirred by the nurse. After discovering and arresting the cause of the hemorrhage, the rest of the blood is bailed out, and the citrated blood now filtered through several layers of gauze (15-20) over the glass funnel into the saline flask, so that it enters the blood vessel with the saline. CONTRA (1) Obviously infected blood, (2) stale blood, i.e., when the bleeding has been going on for several days.

autotransplanta'tion [' + " + *plantäre*, to plant]. Transferring a piece of tissue from one part to another in same person

autotrophic (aw-to-trof'ik) [' + *trophê*, nourishment]. Self nourishing; pert. to green plants and bacteria which form pro. and carbo from inorganic salts and carbon dioxide

autotuber'culin [' + L *tuberculum*, a swelling] Tuberculin prepared from cultures of patient's own sputum

autotyphization (aw-to-ti-fiz-a'shun) [' + *typhos*, fever]. Production of state resembling typhoid fever, due to auto-intoxication

autourother'apy [' + *ouron*, urine, + *therapeia*, therapy] Treatment of various allergic diseases by injections of the patient's own urine

autovaccina'tion [' + *vacca*, cow]. Vaccination with autovaccine *

autovac'cine. Vaccine prepared from virus developed in patient's own body

autoxida'tion [G *autos*, self, + *oxys*, acid, + *gennan*, to produce] Spontaneous combining with oxygen

auxanography (awks-an-og'rä-fi) [G *auxanên*, to increase, + *graphein*, to write] Determination of most suitable medium for bacterial cultivation

auxanology (awks-an-ö'lo-jí) [' + *logos*, study] Scientific study of growth

auxesis (awks-e'sis) [G *auxein*, to increase] Enlarged in bulk, or size

auxet'ic. Promoting proliferation in leukocytes and other cells

auxiliary (awks-i-lit'ik) [G *auxein*, to increase, + *lyein*, dissolve] Favoring lysis (2), q 1.

auximone (awks'im-on) [' + *ormanein*, to excite] Vitaminlike substance favoring growth in plants

aux'in. Plant-sprout and human urine hormone promoting growth in plant cells and tissues

auxocyte (awks'o-sit) [G *auxein*, to increase, + *kytos*, cell]. Cell taking part in growth

auxoglic (awks'ö-glük) [' + *glukus*, sweet] A group of tasteless atoms which combine with gluciphores to form sweet-tasting compounds

auxol'ogy [' + *logos*, study]. Scientific study of growth of organisms

auxotroph (awks'ö-trof) A mutant or other organism needing a specific factor for growth

a'va, **a'va-ka'va**. 1 Intoxicating beverage 2 Drug used in cystitis, gout and wasting illnesses SYN *kara*.

av'alanche theory [F *avalanche*, descent]. Theory that nervous impulses increase in intensity in passing efferent nerves

avasculariza'tion [G *a-*, priv + L *vascularis*, having vessels] Expulsion of blood, as by use of Esmarch bandage

Avell'is' syndrome. Paralysis of one-half of soft palate, the pharynx, larynx, and loss of pain and heat and cold sensation on opp side

averse' depression. Depression accompanied by defective judgment and rut-formation, esp in the premenstrual period

avertin (a-ver'tin) A tribromethanol, is a white, crystalline substance with a melting point at 79° to 80° C (174° to 176° F) and is 3½% soluble in water at a temperature of 40° C. Used as a basal narcotic SYN *tribromoethanol*

It is evanescent under steam, and should be protected from light and air. The dissolving of avertin in water must be carried out at a moderate temperature (95° to 104° F) to prevent it

breaking up, as at a higher temperature hydrobromic acid is split off and dibrom-acetaldehyde is formed, the latter causes severe injury to the bowel, and must be avoided at all costs. It is prevented by the use of a special test, viz., 5 cc of a 2½% avertin solution are placed in a clean test tube shortly before the time for the injection, and 1 to 2 drops of an aqueous (1:1000) solution of Congo-red are added. The color must be of a pure orange red. When badly made, the color tends towards blue, such solutions are dangerous to the patient.

The 2½% tested solution is passed into the rectum at body heat 30 minutes before the operation, if possible, in a quiet, dark room. Morphia, 1/6 to 1/3 gr., is given by some authorities, but is not advised as a routine.

The bowel is emptied the previous evening by means of an enema or aperient. It is most important to regulate the dosage to the body weight. This is estimated at 0.08 to 0.1 Gm. (1/14 to 1/12 gr.) avertin per Kg. body weight in 2½% aqueous solution. In this strength the solution is quickly absorbed by the mucous membrane, becomes detoxicated through chemical action with glycuronic acid, and is excreted in this form through the kidneys in from 6 to 12 hours.

Sleep ensues in from 5-20 minutes after rectal adm. without any stage of excitation, and awakening occurs as from natural sleep. Respiration is slowed, but effect on heart and blood vessels is unimportant with a normal dose. It decreases intraocular pressure with no increase in intraauricular pressure.

aviator's disease. Vasomotor disturbances, headache, and drowsiness seen in aviators.

avidin (av-id'in) [L. *avidus*, greedy]. A proteinlike substance isolated from egg-white. Said to be an inhibitor of biotin.* A B vitamin named Vit H.

avirulent (ā-vir'ū-lent) [G. *a-*, priv. + L. *virus*, poison]. Without virulence.

avitaminosis (ā-vi-tā-mī-nō'sis) ["" + L. *vita*, life, + *amin*]. Disease due to lack of vitamins in the diet, a deficiency disease. SEE *avitaminotic*, *vitamin*.

avitaminotic (ā-vi-tā-m-in-ō'tik) Pert to or affected with avitaminosis.*

avivement (ā-vēv-mōn') [Fr. *avivement*, made alive again]. Refreshing of edges of a wound by operation to hasten healing.

avocado (āv'o-kā'dō) [Portuguese *abacado*]. Pear-shaped, green fruit, alligator pear. Average serving 85 grams. Pro 1.8, Fat 17.0, Carbo 5.1, Ca 0.040, P 0.050, Fe 0.006. Contains Vit. C. Good source Vit. A and G, very good source Vit. B.

Avogadro's law. Equal volumes of gases contain equal numbers of molecules, pressure and temperature being same.

A's number. Number of molecules in one gram-molecular weight of a compound.

avoirdupois measure [Fr. *avoir*, to have, + *du*, of the, + *pois*, weight]. A system of weighing or measuring all coarse and heavy articles. 7000 grains equal one pound. Some medicines are bought and sold by avoirdupois weight.

Dry Measure

16 drams (dr) equal 1 ounce (oz)
16 ounces equal 1 pound (lb)
25 pounds equal 1 quarter (qr.)
4 quarters equal 100 weight (cwt)
20 cwt equal 1 ton (T)

Liquid Measure

2 pints equal 1 quart equals 57½ cubic inches
4 quarts equal 1 gallon equals 231 cubic inches

To find the capacity of a vessel or space in gallons, divide the contents in cubic inches by 231 for liquid gallons, or by 268.8 for dry gallons.

To reduce gallons to inches, multiply the given number of liquid gallons by 231, then change to higher denominations if required. The dry gallon (half-peck) contains 268.8 cu. in. Six dry gallons are equal to nearly seven liquid gallons.

The bushel contains 2150.42 cu. in. and is a cylindrical measure 18½ in. in diameter and 8 in. deep. Measures of capacity are all cubic measures. The number of pounds in a bushel depends upon the article contained therein. SEE *apothecaries' measure*, *household measures*, *metric system*, *Troy weight*.

avulsion (a-vul'shun) [G. *a-*, priv. + L. *avulsio*, a turning away] 1. A turning away from as in disgust. 2. A tearing away forcibly of a part or structure. If surgical repair is necessary, merely apply a sterile dressing.

axanthopsia (aks-an-thop'si-ā) [G. *a-*, priv. + *xanthos*, yellow + *opsis*, vision]. Yellow blindness. In or pert to an axis.

axial (aks'ī-āl) [L. *axis*, level]. Situated a. *skeleton*. Head and trunk.

axifugal (aks-if'u-gal) ["" + *fugere*, to flee]. Receding from the center. SYN. *centrifugal*.*

axilemma [L. *axis*, pivot, + G. *lemma*, husk]. Sheath of an axis cylinder.

axilla (Pl. *axillae*) [L. *axilla*, little pivot]. The armpit. [anatomy.]

axillar (aks'ī-lar) Pert to axilla. SYN: *axillary*.

axillary (aks'ī-lar-ī) Pert to the axilla.

axion [G. *axon*, axis]. Brain and spinal cord. The cerebrospinal axis.

axioplasm (aks'ī-o-plāzm) ["" + *plasma*, a thing formed]. Neuroplasm of an axis cylinder.

ax'ipetal [L. *axis*, pivot, + *petere*, to seek]. Directed toward the axis. SYN. *axopetal*.

ax'is. The second cervical vertebra* or backbone.

a., basicranial. A connecting bastion and gonion. [to gonion.]

a., basifacial. A from subnasal point.

a., binauricular. A bet the 2 auricular points.

a., celiac. Celiac artery from abdominal aorta.

a., cerebrospinal. Central nervous system.

a., cylinder. Nerve fiber core. SYN. *axon*, *neuraxon*.

a., frontal. Imaginary line running transversely through the center of the eyeball.

a., neural. SEE *cerebrospinal a.*

a., optic. Line of vision.

a., sagittal. Imaginary line running through the eyeball anteroposteriorly.

axis cylinder process. Axon, *q.v.*, or neuraxon. The conducting portion of a nerve fiber. SEE *axilemma*, *axioplasm*, *axite*, *axofugal*, *axopetal*, *axoplasma*, *axospongium*.

axis traction (ak'sis trak'shun). Traction made on the fetus in the direction of the birth canal.

a. f. forceps. Device used to aid in traction made on the fetus.

axite (aks'īl) Any terminal filament of an axis cylinder.

axo- (aks'o) [G.]. Prefix Axis.

axodendrite (aks-o-den'drit) [G. *axôn*, axis, + *dendron*, tree] Process given off from a nerve cell axon (not an axis cylinder)

axofugal (aks-of'u-gal) [“ + *L fugere*, to flee] Extending from an axis cylinder process

axolemma [“ + *lemma*, husk]. Axis cylinder sheath SYN *axilemma*.

axolysis (aks-ol'i-sis) [“ + *lyein*, to dissolve] Destruction of the axis cylinder of a nerve

ax'on, ax'one [G *axôn*, axis] 1 The neuraxon or axis cylinder process, the conducting part of a nerve cell 2 The cerebrospinal axis 3 The body axis. SEE *nerve*.

axosome (aks'o-nem) [G *axôn*, axis, + *nêma*, a thread] Axial thread of a chromosome

axoneuron (aks-o-nu'ron) [“ + *neuron*, snail] A nerve cell of the cerebrospinal system

axonometer (aks-o-nom'e-ter) [“ + *metron*, a measure] Device for determining the axis of astigmatism

axopetal (aks-op'et-âl) [“ + *petere*, to seek] Directed toward an axis cylinder process.

axophag (aks'o-fâj) [“ + *phagēin*, to eat] Glia cell found in myelin excavations in myelitis

axoplasm [“ + *plasma*, a thing formed] Material surrounding fibrils of axis cylinder.

axospongium (aks-o-spon'ji-um) [“ + *spoggos*, sponge] The fine fibrillar network of axis cylinder of a nerve cell

axungia (aks-un'ji-â) [L *axis*, axis, + *ungere*, to grease]. 1 Lard 2 Internal body fat

Ayerza's disease (â-yer'sâ) One characterized by dyspnea, chronic cyanosis, erythema, enlargement of spleen and liver, and hyperplasia of bone

Az. Abbr. for *azote*.

aza'lein [L *azalea*, *azalea*]. A red dye. SYN. *fuchsin*.

azo- Prefix indicating substance from a hydrocarbon by replacement by nitrogen of a part of the hydrogen

azoamylly (az-o-am'i-li) [G *a-*, priv. + *zôon*, animal, + *amylon*, starch] Diminution of amount of glycogen stored up in the liver.

azochloramid (â-zo-klor'â-mid) A stable, chlorine substance, crystalline and yellow in appearance, soluble in water or triacetin, etc

USES As an antiseptic in various infections, including fungi

DOSAGE Used in solutions of 1 500

azo-compounds. Organic substances of which an example is azobenzene, $C_6H_5N=NC_6H_5$.

They are related to aniline, and include important dyes and indicators. The color changes shown by dimethylaminoazobenzene $C_6H_5N=NC_6H_4N(CH_3)_2$ are given under "Indicators."

azoic (az-o'ik) [G *a-*, priv. + *zôē*, life]. Containing no living organisms

azoospermia (ah-zo-o-sper'mi-â) [“ + *zôon*, animal, + *sperma*, seed] Deficient vitality of the spermatozoa or their absence

azopro'fein [“ + “ + *prôtos*, first]. A horse serum protein

azoru'bin S. A dark red dye excreted in the bile after intravenous injection Test of hepatic function

azotation (az-o-ta'shun) [*azote*, nitrogen]. Nitrogen absorption from the air

az'ote [G *a-*, priv. + *zôe*, life, so named by Lavoisier because it cannot support life] Nitrogen

azotemia (az-o-tē'mi-â) [“ + *aima*, blood]. Presence of nitrogenous bodies in the blood SYN *uremia*.

azotene'sis [“ + *enesis*, injection] Disease due to excess of nitrogen in system. EX *scurrey*, *gangrene*.

azotifica'tion. Atmospheric nitrogen fixation

azotized (az'ot-izd) Containing nitrogen. **azotom'eter** [*azote*, nitrogen, + *metron*, measure] Instrument measuring amount of uric acid and urea in urine

azotorrhea (az-o-to-ri-â) [“ + *roia*, flow] Excess of nitrogenous matter in the feces or urine

azotu'ria [“ + *ouron*, urine]. Increase of urea in the urine

Az'tec type. Microcephalic idiocy *

azurop'hilic (azh-u'ro-fil) [M E *azure*, azure, + G *philein*, to love] Staining readily with azure dye

azurop'hilia. Condition in which some blood cells have azuophilic granules

azygos (az'i-gos) [G *a-*, priv. + *zygos*, yoke] Occurring singly, not in pairs.

azygous (az'ig-us) Single, not paired

a. veins. Three unpaired veins of the abdomen and thorax A major arises from *vena cava inferior* through the aortic orifice of the diaphragm and the post mediastinum, ending in the *vena cava superior*.

azymia (a-zi'mi-â) [G *a-*, priv. + *zymē*, ferment] State of being without a ferment

azymic, azymous (â-zi'mik, -mus). 1 Unfermented or unaltered 2 Denoting the absence of a ferment.

B

Ba. Symb barium

Bab'bitt metal. Antifriction alloy used occasionally in dentistry

Babcock's test. Psy The difference between a vocabulary and a nonvocabulary test indicating the degree of mental deterioration

Ba'bes-Ernst bodies. Metachromatic* bodies seen in bacterial protoplasm

Babe'sia. A genus of Protozoa belonging to the class Sporozoa which are parasitic in cattle, sheep, horses, dogs and other vertebrates They infest red blood cells bringing about their destruction with resulting hemoglobinuria They are transmitted by ticks of the genus *Boophilus*

B. bigemina. The causative organism of Texas fever or red-water fever in cattle

B. ovis. Causes hemoglobinuria and jaundice in sheep

babesi'sis. Infection caused by a species of *Babesia*.

Babinski's reflex [L *refletere*, to turn back]. Extension of the great toe (extensor plantar) on striking sole of foot, sometimes a flexion of the other toes when irritation is applied to the sole of the foot It indicates a lesion of the pyramidal tract and is found in organic hemiplegia,* diseases of nervous system, but not in hysteria

B.'s ear-reflex. Inclination of head to diseased side, in middle and internal ear diseases, when galvanic electrode is placed near the ear and when galvanic current is closed

B.'s method. Producing reflex contraction of Achilles tendon by tapping it with patient kneeling on a chair

B.'s sign. A loss or diminished reflex produced by the Achilles tendon It is found in sciatica, not in hysteric sciatica.

bacca (bak'ă) [L berry] A berry.

Baccell'i's sign (băt-chel'ēz). Good conduction of a whisper through nonpurulent effusions. Shows a serious pleuritic exudate

bacchia (bak'e-ă) Arne rosacea *

bacciform (bak'si-form) [L *bacca*, berry, + *forma*, form]. Berry-shaped, corcal

bacillac (bas'il-ăk) [L *bacillus*, rod]. Milk preparation sourced by *Lactobacillus acidophilus*

bacillae'mia [' + G. *aima*, blood]. Bactilemia *

bacillar, bacillary (bas'il-ar, bas'il-ar-i) Pert to or caused by bacilli or rodlike forms

b. layer. Rod-and-cone retinal layer
bacill'e'mia [L *bacillus*, rod, + G. *aima*, blood]. Presence of bacilli in the blood

bacil'licidal, bacillicid'ic [' + *caedere*, to kill] Destructive to bacilli

bacillicide (bas-il'is-id) An agent destructive to bacilli.

bacil'liculture [L *bacillus*, rod, + *cultura*, cultivation]. 1. Propagation of bacilli. 2 Culture containing bacilli

bacil'iform [' + *forma*, form]. Resembling a bacillus in shape

bacilliparous (ba-sil-ip'ar-us) [' + *parere*, to produce]. Producing bacilli

bacillogen'ic, bacillogenous (ba-sil-of-enus) [' + G. *gennan*, to produce]. 1.

Producing bacilli. 2. Originating in bacilli

bacillopho'bia [' + G. *phobos*, fear] Morbid fear of bacilli

bacillo'sis [' + G. -osis, infection]. Condition due to infection by bacilli

bacillum (bas-il'um). 1. Sponge holder. 2. A stick

bacilluria (bas-il-u'ri-ă) [L *bacillus*, rod, + G. *ouron*, urine]. Bacilli in the urine, though *B. coli* to *Escherichia coli* and *B. typhosus* to *Salmonella typhosus*.

Sym *B. coli* reaches urine through the blood stream Urine contains much mucus but is acid when passed, becomes alkaline on standing Rise in temperature, malaise, later cystitis and possible pyelitis

Treatment Drugs and antiseptics which make urine alternately acid and alkaline. Urine fluids, light, nonstimulating diet, avoid fatigue, rest during day, bed before night meal Antibiotics

bacillus (pl bacilli) A rod-shaped microorganism belonging to the Schizomycetes

b. acid-fast. One very resistant to decoloring effect of acids after staining

b. Bordet-Gengou. *Hemophilus pertussis* Cause of whooping cough

b. colon. *Escherichia coli* A non-pathogenic intestinal form

b. butter. *Mycobacterium butyricum*

b. comma. *Vibrio comma* The cause of cholera

b. Doderlein's. A large gram-positive bacillus usually present in the vagina Considered identical with *Lactobacillus acidophilus* Probably responsible for the acidity of the vagina

b. Ducrey's. *Hemophilus ducreyi* The cause of soft chancre or chancroid infection of the genitalia

b. Friedlander's. *Klebsiella pneumoniae* Cause of lobar pneumonia

b. gas gangrene. *Clostridium perfringens*

b. Hansen's. *Mycobacterium leprae*. Cause of leprosy

b. Kleb's Loeffler. *Corynebacterium diphtheria* Cause of diphtheria

b. Morgan's. *Proteus morganii* Isolated from patients with summer diarrhea

b. Pfeiffer's. *Hemophilus influenzae*

b. Schmitz. *Shigella ambigua* A cause of dysentery

b. Shiga. *Shigella dysenteriae* The first dysentery bacillus described

Bacillus. A genus of bacteria belonging to the family Bacillaceae All species of the genus are rod-shaped and produce endospores Some are motile, others are not Motile forms bear flagella on all sides (peritrichous) They may occur singly or in chains Some species develop capsules. All are aerobic and are usually gram-positive Most are saprophytic, some are pathogenic.

B. abortus (Bang's b) *Brucella abortus* The causative organism of contagious abortion in cattle (Bang's disease)

B. acid lactici. *Streptococcus lactis*. A non-pathogenic organism occurring naturally in sour milk.

B. acidophilus. *Lactobacillus acidophilus*. A non-pathogenic species found in the intestines of warm blooded animals. Used in the preparation of acidophilus milk which is used therapeutically in the treatment of certain digestive disorders. Considered to be identical with Doderlein's bacillus, q.v.

B. aerogenes capsulatus. *Clostridium welchii* (*C. perfringens*). An anaerobic toxin-producing bacillus, considered to be the most important cause of gaseous gangrene. It is a normal inhabitant of the human intestine and is used as an indicator of fecal pollution of water.

B. anthracis. An aerobic, spore-forming bacillus, pathogenic for man and lower animals, being the causative agent of anthrax, q.v.

B. botulinus. *Clostridium botulinum*. A saprophytic organism which grows under anaerobic conditions in decaying vegetable matter. In incompletely sterilized cans of food, it produces a potent endotoxin which, when ingested by man, causes botulism, a highly fatal form of food poisoning.

B. enteritidis. *Salmonella enteritidis*, q.v.

B. faecalis alcaligenes. *Alcaligenes faecalis*. A non-pathogenic normal inhabitant of the digestive tract.

B. mucosus capsulatus. *Klebsiella pneumoniae* (Friedlander's bacillus). The causative agent of a severe type of pneumonia (lobar pneumonia). Also found frequently in sputa of patients suffering from bronchitis.

B. paratyphosus A. *Salmonella paratyphi A*.

B. paratyphosus B. *Salmonella paratyphi B*.

B. paratyphosus C. *Salmonella paratyphi C*.

Causative agents of types of paratyphoid fever.

B. perfringens. *Clostridium welchii*.

B. pertussis. *Hemophilus pertussis*. The causative agent of whooping cough.

B. phlegmonis emphysematosae. *Clostridium welchii*.

B. subtilis. The common hay bacillus.

B. suis. *Pasteurella suispesticis*. The causative agent of swine plague.

bacitracin (bäs-i-trä'sin). An antibiotic from *Bacillus subtilis* (hay bacillus), obtained from a wound in a patient named Tracy. Active against cocci and anaerobes. It may have an irritant effect upon the kidney. Its use is now confined to local application in skin infections. It does not produce skin sensitization.

back-pressure arm-lift artificial respiration.

Place the victim prone (face down) with elbows bent, one hand on the other, head to one side, check resting on folded hands. Kneel on one knee—or both, if you achieve better balance—at the victim's head. A Place your hands on the flat of the victim's back, below the armpits, with your thumbs barely touching, fingers spread outward and downward. B Rock forward slowly, keeping your elbows straight, until your arms are nearly vertical, thus exerting a steady downward pressure. C Now rock backward, releasing pressure. Slide your hands outward to grasp the victim's arms just above the elbows. Continue to rock backward. D As you rock backward, raise and pull the victim's arms toward you until you feel tension in his

shoulders. Start over with step A. Repeat the full cycle about 12 times a minute. *Important* When the victim begins to breathe on his own, synchronize your efforts with his breathing until he breathes strongly. Then stop.

bacteremia (bäk-tēr-ēm'-ä) [*G. bakterion*, staff, + *aima*, blood] Bacteriemia; bacteria in the blood.

Bacteria. Unicellular, plant-like microorganisms, lacking chlorophyll (*Classification*. See accompanying chart).

Shape There are three principal types: (1) the *spherical* or *coccus* form. When appearing singly, they are called *micrococci*, when in pairs, *diplococci*, when in irregular clusters, *staphylococci*, when in chains, *streptococci*, when in regular groups of eight, *sarcinae*. (2) the *rod-shaped* form known as *bacillus*. When the rods are somewhat oval, they are called *coccobacilli*, when attached end to end forming a chain, *streptobacilli*. (3) the *spiral* form. When the spiral organism is rigid it is called a *spirillum*, when flexible, a *spirochete*, when forming a curved rod, a *ribrio*. (4) *involution forms*. Most bacteria are relatively constant in form in growing cultures, but in old cultures or cultures grown under adverse environmental conditions, aberrant forms such as oversized and Y-shaped individuals appear. These are considered by some to be involution or degenerating forms, by others to be stages in complex life cycles.

Characteristics

Size An average rod-shaped bacterium measures about 2 microns in length and 0.5 microns in diameter. They vary in size from 0.5 x 0.2 (the influenza bacillus) to 40-60 microns in length by 4-5 microns in width (*B. butschlii*).

Motility Some bacteria are incapable of movement (all cocci) but most bacilli and spiral forms exhibit independent movement. The power of locomotion depends on the possession of one or more flagella, slender whip-like appendages. Bacteria having no flagella are called *atrichous*, those having a single flagellum at one end, *monotrichous*, those having flagella at each end, *amphitrichous*, those having a tuft at one end, *lophotrichous*, those having flagella protruding from all surfaces of the cell, *peritrichous*.

Capsules Many bacteria possess a capsule, a layer of slimy mucoid substance which surrounds each cell. The presence of a capsule is associated with the virulence of certain pathogenic forms.

Spores Certain species of the rod-shaped bacteria have the ability to develop an encysted or resting stage known as a *spore* or *endospore*. The size, shape, and position of the spore within the cell are characteristic of particular species. Spores are *terminal*, if formed at the end of a cell; *central*, if formed in the center, *subterminal*, if formed between the center and end. Spore-formation is common among the bacilli but does not occur in the cocci or spiral forms. Bacterial spores are remarkably resistant to heat, drying, and the action of disinfectants. Few pathogenic bacteria form spores, the anthrax and tetanus organisms being exceptions. Unfavorable environmental conditions favor spore-formation.

Reproduction Binary fission is the usual mode of reproduction. Budding,

branching, filamentous growth, and the development of conidia and gonidia also occur

Colony formation A group of bacteria growing in one place is called a colony. A colony is usually composed of the descendants of a single cell. Colonies differ in shape, size, color, texture, type of margin, and in other characteristics. Each species of bacteria has a characteristic type of colony formation. Sometimes a single species may produce two types of colonies, one the *smooth* or *S-type*, the other the *rough* or *R-type*. Sometimes colonies contain clear spots and have a moth-eaten appearance. Such colonies are called *plaques* and are thought to be due to the lytic action of bacteriophage.

Food requirements Bacteria possess no chlorophyll hence cannot carry on photosynthesis. A few can obtain their energy from inorganic substances. These are termed *autotrophic* and include many of the soil bacteria. The majority derive their nourishment from organic material and are termed *heterotrophic*. If they live on living organisms, they are called *parasites*; if their food is from nonliving organic matter, they are called *saprophytes*. If bacteria produce disease in their host, they are *pathogens*.

Oxygen requirements Most bacteria require free or atmospheric oxygen. These are called *aerobes*. Bacteria living in the absence of atmospheric oxygen are called *anaerobes*. Those showing a preference for free oxygen and yet are capable of living in its absence are called *facultative anaerobes*, those which grow only in the absence of oxygen are called *obligate anaerobes*.

Temperature requirements Most bacteria grow best at moderate temperatures. These are called *mesophilic*. Cold-living bacteria which thrive in temperatures below 10° C are called *psychrophilic*, those which thrive in high temperatures even up to 85° C are called *thermophilic*. The optimum temperature for most saprophytes is around 25° C, for most pathogens, 37° C.

Activities of Bacteria

Enzyme production Bacteria produce enzymes which act on complex food molecules breaking them down into simpler materials capable of assimilation. *Carbohydrases* act on sugars breaking them down to alcohol and carbon dioxide, a process called *fermentation*. *Proteolytic enzymes* bring about the decomposition of proteins with the formation of ill-smelling products, a process called *putrefaction*. The term "decay" is applied to the decomposition of organic substances in the presence of air without the formation of unpleasant odors. *Putrefaction* is the decomposition of organic substances, especially nitrogenous substances, in the absence of air and with resulting unpleasant odors. Bacteria are the principal agents of decay and putrefaction.

Toxin production Many bacteria produce poisonous substances called *toxins*, which are of two types, (1) *exotoxins* which diffuse from the bacterial cell into the surrounding medium and (2) *endotoxins*, which are liberated only when the bacterial cell dies and disintegrates. Bacteria well known for their toxin production are the diphtheria, tetanus, and botulinus organisms.

Miscellaneous activities Some bacteria produce pigments, some produce light appearing *luminescent* at night. Many chemical substances are produced as a result of bacterial activity, among them acids, gases, alcohol, aldehydes, ammonia, indol. Pathogenic forms produce hemolysins, leucocidins, coagulases, and fibrinolysins. Soil bacteria play an important rôle in various phases of the nitrogen cycle (nitrification, nitrogen fixation, and denitrification).

Methods of Studying Bacteria The principal methods used in the study of bacteria are

(1) Examination of unstained bacteria in a hanging-drop preparation. Dark-field illumination is necessary to see extremely small forms.

(2) **Staining methods** General stains, differential stains, stains for specific bacteria, and stains for specific parts are employed. Of the differential stains, Gram's method and staining for acid-fast bacteria are the most widely used. Bacteria fall into these groups: *Gram-positive bacteria*. Those which retain the stain. *Gram-negative bacteria*. Those which are decolorized. *Acid-fast bacteria*. Those which, when stained with certain dyes, retain the stain even when treated with an acid.

(3) **Cultural methods** In which the bacteria are grown on various culture media. Media may be *synthetic* or *nonsynthetic*. In the former, the exact composition of the medium is known, in the latter, the constituents are uncertain. Media, on the basis of consistency, may be *liquid* (nutrient broth, milk, blood serum), *liquefiable solid media* which consist of liquid media made solid by addition of gelatin or agar-agar, *nonliquefiable solid media* (potato, carrot, starch paste).

(4) **Animal inoculation**

(5) **Immunological methods**

(6) **Sterilization methods**

Sterilization is the process of rendering any material free of living microorganisms. It may be accomplished by physical or chemical means. The use of chemical agents is usually designated *disinfection*. Physical agents employed are heat, light and filtration. Sterilization may be accomplished in a flame, in a hot-air oven (150°-170° C for one hour), in steaming steam (100° C for 20 min or longer) or by steam under pressure (10-15 lbs.) in an autoclave (121° C for 20 min). Ultraviolet light is destructive to bacteria. Filtration is accomplished by the use of cotton or by special filters (Berkefeld, Pasteur, Chamberlain) of unglazed porcelain.

Chemical Agents

Chemical agents which inhibit bacterial growth are called *antiseptics*, those which kill are called *germicides* or *bactericides*. Among disinfectants are strong acids and alkalis, metallic salts (bichlorid of mercury), halogens (chlorine, iodine), oxidizing agents (hydrogen peroxide), organic compounds (phenol, formaldehyde, salicylic acid), and other substances such as boric acid. Substances used in the treatment of germ diseases are called *chemotherapeutic agents*. They include the sulfonamide compounds and the antibiotics.

Bacteriaceae (bák-te-rí-a'se-e). Family of *Eubacteriales* with rod-shaped cells without endospores.

There are 21 genera, some parasitic and some saprophytic.

Classification of Bacteria

as suggested by the Committee of the Society of American Bacteriologists

Kingdom: Plants. Phylum: Thallophyta. Class: Schizomycetes.

Order	Family	Tribe	Genus
Eubacteriales nonbranching	Nitrobacteriaceae (nonparasitic)		
	Coccaceae (spherical).	Streptococcaceae (pairs or chains). Neisseriae Micrococcaceae (single, pairs or clusters).	Diplococcus Streptococcus. Neisseria Staphylococcus Gaffkya (tetrads) Micrococcus Sarcina
	Spirillaceae (elongate, curved).		Vibrio (includes V cholerae). Spirillum
	Bacteriaceae (rods, form no endospores).		Pseudomonas (incl. b pyocyaneus) Pasteurella (incl plague b) Klebsiella (incl pneumobacillus) Hemophilus (incl influenza b). Escherichia (incl. b coli). Aerobacter. Proteus Salmonella (incl. paratyphoid b). Eberthella (incl. typhoid b) Shigella (incl. dysentery b) Brucella (incl b. of undulant fever) Alcaligenes. Bacteroides
	Bacillaceae (rods producing spores)		Bacillus Clostridium (incl. b of gas gangrene)
Actinomycetales elongated, filamentous form branches related to plants.	Actinomycetaceae		Leptotricha. Actinomyces
	Mycobacteriaceae.		Mycobacterium (incl. b. tuberculosis) Corynebacterium (incl b diphtheriae). Fusiformis
Chlamydobacteriales sheathed, resemble algae (plants).			
Thiobacteriales, sulfur bacteria from water			
Myxobacteriales, slimy, found on decay.			
Spirochaetales spirals, related to animal protozoa.	Spirochaetaceae.		Spirochaeta. Saprosira. Cristispira. Borrelia (incl. Sp. of relapsing fever). Treponema (incl. Sp. of syphilis). Leptospira.

bacterial action (in digestive tract). It begins during the first day of birth. Over one hundred million bacteria supposed to be in large intestine of adult

B. acidophilus decreases intestinal putrefaction Lactose, dextrin, fruits, vegetables, and milk favor cultures of intestinal flora and hygiene Bacteria in the cow's digestive tract have been found to form Vitamins B and C
b. digestion. Thus takes place in the colon in which there are no secreting glands Fermentive bacteria here change carbohydrates into carbon dioxide, alcohol, and lactic acid Cellulose only may be acted upon by bacteria Putrefying bacteria are found in the lower part of the colon where poisonous decomposition-products are produced

b. resistance Development of resistance to a drug by an organism previously susceptible to it It is much more apt to develop when streptomycin is used

bactericide (bak-ter'i-sid) [G *baktêrion*, rod, + L *caedere*, to kill] That which destroys bacteria

bacteriemia (bak-ter-i-e'm'i-â) [“ + *aima*, blood] Living bacteria in the blood.

bacterine (bak'ter-en). A bacterial vaccine

bacterio-. Prefix. Pert to bacteria.

bacteriogenic (bak-tê-re-ô-jen'ik) [G *baktêrion*, rod, + *gennan*, to produce]. Caused by bacteria

bacteriologic, bacteriolog'ical [“ + *logos*, study] Pert to bacteriology

bacteriologist. One versed in bacteriology.

bacteriol'ogy. Science of microorganisms

bacteriolysis (bak-te-ri-ô-l'is-is) [G *baktêrion*, rod, + *lysis*, solution] A substance which is capable of bringing about the dissolution of bacteria More specifically, an antibody produced within the body of an animal which causes the dissolution or lysis of bacteria They develop as a result of bacterial infection The reaction is the result of the interaction of two factors (1) a thermolabile substance known as *complement* or *alexin* present in blood serum and (2) an *antibody* (also called immune body, immune substance, or sensitizer)

bacteriolysis (bak-tê-rê-ô-l'is-is) The disintegration of bacteria generally by a specific antibody

bacteriolytic (bak-te'ri-o-lit'ik). Pert. to bacteriolysis

bacterioopsonin [G *baktêrion*, rod, + *opsônên*, to prepare food for]. An opsonin acting on bacteria

bacteriophage (bâk-tê-ri-ô-fâi) [“ + *phagên*, to eat] Nonspecific agent destructive to bacteria, normally present in the intestinal tract, esp. of those recovering from a bacterial disease, also found in urine, pus, blood, etc

A virus, an ultramicroscopic live agent The present tendency is to consider it as an enzymelike substance.

bacterioph'agia. Destruction of bacteria by lytic agents

bacterioprecip'itin [“ + L. *praecipitâre*, to cast down] Precipitin occurring in bacteria-treated serum

bacterioprot'eln [“ + *protos*, first]. One of the proteins in bacteria bodies

bacterios'copy. Microscopic examination of bacteria

bacteriosis (bak-tê-ri-ô'sis). 1. Infection by bacteria 2. The action of bacteria in the system

bacteriosol'vent [G. *baktêrion*, rod, + L. *solvens*, dissolving] Agent causing lysis or solution of bacteria.

bacteriostasis (bak-tê-ri-ô-s'tâs-is) [“ + *stasis*, a stopping]. The arrest of bacterial growth

bacte'riostat. An agent inhibiting bacterial growth

bacteriotox'ic [G. *baktêrion*, rod, + *toxikon*, poison] 1 Toxic to bacteria. 2. Due to bacterial toxins

bacteriotox'in. Toxin specifically destructive to bacteria.

bacteriotropin (bak-te're-ot'ro-pin) [“ + *tropê*, a turning] An immune opsonin—a blood constituent that, by combining with bacterial cells, renders these cells more vulnerable to phagocytes

Bacterium. A genus of bacteria belonging to the family *Bacteriaceae* *Ans.*

Bact.

B. aerogenes. SYN *Acrobacter aerogenes* Commonly found in sour milk

B. aet'rycke. SYN *Salmonella typhimurium* Common cause of food poisoning

B. ambigua. SYN *Shigella ambigua* (Schmitz' bacillus)

B. cholerae-suis. SYN *Salmonella cholera-suis* An animal (pig) pathogen.

B. coli. SYN *Escherichia coli* Universally found in the digestive tract of man and higher animals Nonpathogenic

B. dysenteriae. SYN *Shigella dysenteriae* (Shiga bacillus) A cause of bacillary dysentery

B. enteritidis. SYN *Salmonella enteritidis*

B. friedlanderi. Friedlander's bacillus

B. parady'senteriae. SYN *Shigella flexneri* A dysentery bacillus

B. paratyphosum A. SYN *Salmonella paratyphi A*

B. paratyphosum B. SYN *Salmonella paratyphi B*

B. pneumoniae. SYN Friedlander's bacillus (*Klebsiella pneumoniae*)

B. suipe'ster. SYN *Salmonella cholerae-suis*

B. tularense. SYN *Pasteurella tularensis* Causative agent of tularemia

B. typhi-murium. SYN *Salmonella typhimurium*

B. typhosum. SYN *Eberthella typhi*. The typhoid bacillus

bacteriuria [G *baktêrion*, rod, + *ouron*, urine] Passage of bacteria in the urine.

bacteroid (bak'ter-oid) [“ + *eidós*, appearance] Like a bacterium

baculiform (bak-u'f'orm) [L. *baculum*, rod, + *forma*, shape] Rod-shaped.

bag, hydrostatic [F. *baque*, sack] Ob. Rubber or silk bag which is inserted into the uterine cavity and then distended with fluid in order to initiate labor and aid in dilatation of cervix

The types of bags most frequently used are those of Barnes, Bowman, Champetier, de Ribes, and Voorhees.

b. Pol'itzer's. Soft rubber bag for middle ear inflation

bag-of-waters. The amnion * The membrane enclosing the *liquor amni* and the fetus

It is applied sometimes to that portion of the membrane protruding into the *os uteri*. It is the inner embryonic membrane, the *chorion* * being the outer envelope.

baker [A S *baran*, cook by dry heat]. Two or more electric lamps mounted in semi-circular containers, called electric light bakers

baker leg. Knock knee; genu valgum

Baker's cyst. One containing synovial fluid

communicating with synovial fluid of a joint.

baker's dermatitis. Eczematous affection of hand caused by yeast SEE *baker's itch*.

baker's itch. Manual eczema from irritation of yeast SEE *baker's dermatitis*.

baker's stigmata. Manual callosities from kneading dough

BAL. Abbr for British Anti-Lewisite, originally developed for use against lewisite, a poisonous gas of chemical warfare BAL is administered both by ointment to offset cutaneous burns, by lewisite and by intramuscular injection in the treatment of poisoning due to arsenic, mercury, cadmium, or gold

Dosage. 3 mg per kg of body weight intramuscularly every 4 hours for 48 hours, then every 6 hours for 24 hours, then every 12 hours for 10 days or until full recovery SYN *dimercaprol*

bal'aneu'tics [G. *balaneucin*, to attend at the bath] The study of giving baths for therapeutic purposes

balanic (ba-lan'ik) [G. *balanos*, glans] Pert to the glans clitoridis* or glans penis *

balanism (bal'an-izm) [+ + *ismo*, condition of] Gynecological treatment by use of pessaries or suppositories

balanitis (bal-an-'tis) [+ + *-itis*, inflammation] Inflammation of the glans penis, infectious or gonococcal, and of mucous membrane beneath it with purulent discharge. The prepuce is often affected

balano- (bal-an-o) [G] Prefix Pert to the glans penis

bal'anoblennorrh'e'a [G *balanos*, glans, + *blennos*, mucus, + *roia* flow] Gonorrhoeal inflammation of the external glans penis

balanoplasty (bal-an-o-plas'ti) [+ + *plasty*, to form] Plastic surgery of glans penis

balanoposthitis (bal-an-o-pos-thr'itis) [+ + *posth*, prepuce, + *-itis*, inflammation] Inflammation of the glans penis and prepuce, balanitis *

balanoprep'u'tial. Pert to glans penis and

balanorrhagia (bal'an-o-ra'ji-a) [G *balanos*, glans, + *ragnumai*, flow forth] Hemorrhage from glans penis

balanorrhoea (bal-an-o-ic'a) [+ + *roia*, flow] Balanitis with purulent discharge

baldness [ME *balled*, without hair] Lack of hair on head RS *acomia alopecia*

Balkan frame. A framework (usually wood) to fit over a bed so that weights may be suspended from it to produce the desired continuous traction and yet permit freedom of motion while maintaining immobilization of the desired part being treated

ball-and-socket joint. Joint in which one rounded bone head fits into cavity of another bone. SYN *enarthrosis*.

ballism (bal'izm) [G *ballismos*, jumping about] 1. Condition characterized by jerking, twisting movements 2 Paralysis agitans *

ballistics [G *ballein*, to throw] Science of curves of projectiles

ballistopho'bia [+ + *phobos*, fear]. Morbid fear of missiles.

balloon'ing [It *ballone*, great ball]. The distention of a cavity, as vagina, by air or otherwise for examination.

ballot'able [Fr *balloter*, to toss about]. Capable of showing the ballottement* phenomenon.

ballottement (bal-ot-mon'). The rebound of a fetal extremity when displaced by

the examining finger either through abdominal wall or vagina.

BALLOTTEMENT

ball thrombus. A normal clot in the antemortem heart SEE *thrombus*

balm [G *balsamon* balsam] 1 A balsam. 2 A soothing or healing ointment

b. of Gilead. 1 Mecca balsam from *Commiphora opobalsamum*, probably Biblical mvrth 2 Balsam fir, source of Canadian balsam 3 Poplar bud resin

balneary (bal'ne-a-ri) [L *balneum*, bath]. Institution for adm. of balneotherapy

balneog'raphy [+ + G *graphein*, to write]. Treatise on mineral springs and baths

balneology (bal-ne-ol'o-j'i) [+ + G. *logos*, study] The science of treating disease by baths

balneotherapeutics (bal'ne-o-ther-a-pu'tiks) [+ + G *therapeutikē*, treatment]. Treatment of disease by baths. SYN. *balneotherapy*.

balneotherapy (bal-ne-o-ther-a-pl) [+ + G *therapeia*, treatment] The treatment of disease by baths [bath.

bal'neum (pl bal'nea) [L a bath]. A

b. are'nae. A sand bath

b. lu'feum. A mud bath

balop'ticon [G *ballein*, to throw, + *optikos*, pert to sight] Apparatus for projecting image of an opaque object on a screen

bal'sam. Oleoresin or resin containing aromatic acids or essential oils

balsam of Peru [G. *balsamon*, balsam]. USP. A dark-brown, viscid, resinous liquid. ACTION AND USFS. Locally same as benzoin. May be used full strength or in ointment.

DOSAGE 15 gr (10 Gm)

balsam'ic. 1 Pert to balsam. 2. Aromatic.

b. tincture. Compound tincture of benzoin

Bal'ser's fatty necrosis. Pancreatitis with fatty necrotic areas in interlobular tissue, and sometimes in pericardial fat and bone marrow

banana oil, poisoning [Sp *banana*]. Resulting from amyl acetate used as a vehicle for suspending metals for the purpose of painting with metals, as gilding

SYM. The effect may not be felt until in the fresh air for several minutes, when victim becomes dizzy, weak, and falls unconscious

TREATMENT. If unconscious, wrap in a blanket; fan face gently Give stimulants Administration of oxygen desirable Artificial respiration may be desirable.

banana. COMP. AV. SERVING 125 Gm. E P Pro 1 6%, Fat 0 8%, Carbo. 26 2%. FUEL VALUE 100 grams give 99 calories. ASI CONSI Ca 0 009, Mg 0 028, K 0 401, Na 0 034, P 0 031, Cl 0 125, S 0 010, Fe 0 00064 A base forming food Alkaline reserve 5 6 cc per 100 grams or 5 6 per 100 cals VITAMINS Vit A and B, fair to good, C to E fair in sprouted bananas, G fair

band'age [ME *band*, band] Piece of gauze or other material for application to a limb or other portion of the body

Bandages are made up of various types and materials and are used for the following purposes: (1) Hold dressing in place (2) to apply pressure to a part, (3) to immobilize a part, (4) to obliterate cavities, (5) to give support to an injured area, (6) to aid in checking hemorrhages

Types: (a) Roller bandages. (b) Triangular bandages. (c) The four-tailed and many-tailed (scultetus) bandages. (d) The quadrangular bandage. (e) The elastic bandage (elastic knit, rubber, or combinations). (f) The adhesive. (g) Elastic adhesive. (h) Newer cohesive proprietary bandage under various trade names, such as Sterila Strc, Sanulastic, Bandtex, etc. (i) The impregnated bandages, such as plaster of Paris, water glass (sodium silicate), starch, etc. (j) Rubber bandages. The most important bandages are the following

b., abdomen (Tri-b). A single wide cravat or several narrow ones may be used to hold dressing in place, or to exert a moderate pressure. A folded towel or handkerchief should be used to keep it from digging into the flesh

b., amputation-stump (Tri-b). This is made in a similar way to the open hand bandage, the limb being laid on the base of the bandage

b., ankle. One loop is brought around the sole of foot, and the other around the ankle and tied in front or side

b., axilla. This is a spica-type turn starting under the affected axilla, crossing over the shoulder of the affected side and making the long loop under the opposite armpit

b., back (Tri-b). Open Bandage to the Back. This is applied the same as the chest-bandage the point being placed above the scapula of the injured side

b., Barton's. For the lower jaw. A double figure of eight b

b., Borch's. An eye bandage covering both eyes

b., breasts. (Roller bandages) Suspensory bandages and compresses for the breasts

b., buttocks. Use (1) "T" or double "T" binder or (2) open triangle

b., capeline. A bandage applied to the head or shoulder, or to a stump, like a cap or hood

b., chalk. A bandage made of immovable stiffening with a mixture of chalk and gum

b., chest. (Roller bandages) Figure of eight (spica), many tailed (scultetus), and Tri-b (open chest) are used.

b., circular. A bandage applied in circular turns about a part

b., cohesive. Material under various trade names which has an intense power of sticking to itself, but not to other substances. Used to make encircling applications about fingers, extremities, etc., or to build up pads

b., cravat. Triangular b folded to form a band around the injured part

This is done by pulling the point over towards the base, folding the base over the point and then folding again. This makes a bandage wide enough to cover a large knee. When folded a 2nd time, it is wide enough to make the cravat bandage of the elbow. Folded a 3rd time it could be used in making a figure-of-eight for the foot, ankle, hand, wrist, head, etc. It is an effective bandage in arresting hemorrhages, retaining splints, dressings, and poultices. The center of the cravat should be laid against the affected part, the ends of the cravat carried around the limb and tied over the center of the base. When used to retain splints, it should be tied on the outer side of the limb and against the splint, thus preventing the knot from irritating the skin. When used to retain a dressing in the axilla, the center of the cravat should be placed under the arm and the ends carried upward and crossed over the shoulder and tied in the axillary space of the opposite side, thus forming a figure-of-eight. The cravat can also be used as a sling when only a simple support is needed

In using cravats for ties or splints, care should be taken so that the knots do not pass over and press unduly on the surface of the limb. Knots should be placed where they are easily found and not subject to pressure, the ends should be neatly tucked in. All knots should be square or reef knots

b., c., elbow. Bend the elbow about 45 degrees. Place center of bandage over point of elbow. Bring 1 end around forearm, and the other end around upper arm. Pull tight and tie

b., c., for fist, clenched (or Squire's diagonal figure-of-eight). This is a hand bandage to arrest bleeding or to make pressure. The wrist is laid on the center of the cravat, 1 end is brought around over the fist and back to the starting point, and the same procedure is then repeated with the other end. The 2 ends are pulled tight, twisted, and carried around the fist again so as to make pressure on the flexed fingers.

b., c., for fracture of clavicle. First put a soft pad (2x4 in.) in the forefront of the axilla. A sling made by placing the point of the open bandage on the affected shoulder, the hand and wrist laid on it, are directed toward the opposite shoulder, the point brought over and tucked underneath the wrist and hand. The ends are then lifted and the bandage is laid flat on the chest, the covered hand is carried up on the shoulder, the ends are brought together in the back and tied, the tightness being decided by how high the shoulder should be carried. A cravat bandage is then applied horizontally above the broad part of the elbow, and tied over a pad on the opposite side of the chest. Tightening this cravat pushes out the shoulder

b., c., sling (for hand and upper arm). This is used for the support of the hand and in fracture of the upper arm. The wrist is laid upon the center of the cravat bandage, the forearm being held at right angle, and the 2 ends are carried around the neck and tied. **SEE: binder.**

b., crucial. Same as T-bandage.

b., demigauntlet. A bandage that covers the hand, but leaves the fingers uncovered

b., Desault's (de-sôz') A special immobilizing bandage of the collarbone or shoulders, using 3 rollers (1) incorporating arm, (2) incorporating trunk and shoulders, and (3) incorporating forearm and left shoulder

b., ear. (Roller bandages) *T-bandage for the Ear* A piece is sewed across the right angle of the T-bandage large enough to suit the occasion

b., elastic. Bandages which have the property of stretching and hence making compression when correctly applied. Usually made of special weaves or of rubber to be applied over swollen extremities or joints, or on the chest in emphysema, or on fractured ribs, or for supporting varicose veins, etc.

b., von Esmarch's (es'marks) (1) Triangular bandage, *q.v.* (2) Rubber bandage wrapped about an extremity after elevation from its periphery toward the heart to force blood out of the extremity, prior to operation or to increase circulating blood. On removal for surgery, a proximal band is left in place to prevent blood returning to the extremity

b., eyes. One to retain dressings. The simple roller bandage for one eye or the monocle or crossed b. The binocular or crossed bandage for both eyes (2 inches by 6 yards)

b., figure-of-eight. A bandage in which the turns cross each other like the figure 8. To retain dressings or to exert pressure. For joints or to leave joint uncovered, to fix splints for the foot or hand, for the great toe and for sprains or hemorrhage

b., finger. (Roller bandage) Oblique fixation at wrist optional at start

b., foot. *Open bandage of the Foot* (Tri-b) The foot should be placed on the triangle with the base backward and behind the ankle the apex is carried upward over the top of the foot. The ends are brought forward, folded once or twice crossed and carried around the foot and tied on top

b., forearm. (Tri-b). *Open sling bandage* For support of the forearm

b., fourtailed. A strip of cloth with each end split into two. Tails used to cover prominences as elbow, chin, nose, knee, etc.

b., Fricke's. A special immobilizing bandage of the male genitalia

b., Galen's. A bandage with each end split in three pieces, the middle placed on the crown of the head, the two anterior strips are fastened at the back of the neck, the posterior (two) ones on the forehead, and the two middle ones are tied under the chin

b., Garretson's. A bandage for the lower jaw, running above the forehead and back again to cross under the occiput and ending under the chin

b., Genga's. Same as Theden's bandage.

b., Gibson's. A roller or cravat bandage for fracture of the lower jaw.

b., groin. (Special bandage) This bandage is most easily applied with the patient standing or lying on a pelvic rest (an inverted basin is satisfactory). A spica bandage, that is, a figure-of-eight with unequal loop, encircles the trunk and (c) the crossing is either placed anteriorly or lateral-ward. To bandage both groins the double spica is

used. Such a double bandage is used principally in applying a plaster cast

b., Hamilton's. A compound bandage for lower jaw, composed of a leather string with straps of linen webbing

b., hand. (Roller bandages 1 inch wide) *Demigauntlet Bandage for the Hand* To hold a dressing on the back of the hand. For thumb and hand, the ascending spica of the thumb, with spiral of the hand is used. A Tri-bandage for open b. of the hand. A descending spica is used for the thumb and figure-of-eight b. for amputation stump or clenched fist

b., head. Single recurrent roller capeline or skull cap. *Scalp* The double roller recurrent bandage for the scalp. *Skull (segmental skull cap)* Any of the quadrants of the skull may be bandaged. *Head (open bandages of)* Use Tri-b. or shawl b. *Tommy head b.* Place center of narrow (cravat under chin, bring ends to top of head and tie single knot. Have patient or an assistant hold ends, and separate knot which forms two loops, place one low on back of head and bring the other forward over forehead, eyes, or chin as necessary, adjust if symmetrical and tie ends on top of head

b., heel. The Tri-bandage is used

b., Heliodorus'. A T-bandage

b., hip. (Tri-b) *Open Bandage of the Hip* A cravat bandage or other band is tied around the waist, the point of another bandage is slipped under that and rolled or pinned directly above the position of the wound. The base is rolled up, the ends carried around the thigh, crossed and tied

b., Hippocrates'. Same as capeline bandage

b., Hueter's. A spica bandage for the perineum.

b., immovable. A bandage for immobilizing a part

b., impregnated. Wide meshed bandage. Material impregnated with substances as plaster of Paris, water glass (sodium silicate), starch, etc., which have the power of solidifying after application—used to make molds or immobilize parts of the body

b., "inacta." Dispersive electrode for surgical diathermy consisting of a fine copper gauze bandage

b., knee. The knee cravat, the Tri-bandage, and the figure-of-eight are all used

b., knotted. To exert pressure on a compress or pad over a bleeding wound

b., Langier's. A many-tailed paper bandage

b., Larrey's. A many-tailed bandage with edges glued together

b., leg. Fix the initial end by a circular or oblique fixation at the ankle or with a figure-of-eight of the foot and ankle

b., Maissonneuve's (ma-zon-nûv') A plaster of Paris bandage made of folded cloth held in place by other bandages

b., many-tailed. For trunk and limbs. A piece of roller to which slips are stitched in an imbricated fashion. One with ends split. *See four-tailed bandage, scultetus bandage, etc.*

b., Martin's. Roller bandage of rubber used to make pressure on an extremity as for varicose veins, etc., and for exsanguination, as Esmarch bandage, *q.v.*

b., neck. (Roller bandages) *Spica for the Neck:* Bandage, 2½ inches by 8 yards.

Bandage for Use After Operations on the Thyroid Gland. Roller bandage, 2½ inches by 9 yards. **Adhesive Plaster Bandage for Use After Thyroidectomy:** Used to hold dressing on wound in place, and so far has proved more satisfactory. Apply a small dressing to center of strip, and then apply to back of neck. **Special Bandage.** A double loop bandage of the head and neck is made by using a figure-of-eight turn.

b., oblique. A bandage applied obliquely to a limb without reverses.

b., plaster. A bandage stiffened with a paste of plaster of Paris, which sets and becomes very hard.

b., postoperative. (Dressing.) This is a simple divergent or convergent spica of figure-of-eight bandage.

b., pressure. A bandage for applying pressure, usually used to stop hemorrhage.

b., protective. A bandage for the purpose of covering a part or of keeping dressings in place.

b., quadrangular. A towel, large handkerchief, etc., folded variously and applied as a bandage, as of head, chest, breast, abdomen, etc.

b., recurrent. A bandage over the end of a stump.

b., reversed. One applied to a limb in such a way that the roller is inverted or half twisted at each turn, so as to make it fit snugly.

b., Ribble's. The spica of the instep.

b., Richet's (re-sház'). A bandage of plaster of Paris to which a little gelatin has been added.

b., roller. A long strip of soft material usually from ½ to 6 inches wide and 2 to 5 yards long rolled on its short axis. When rolled from both ends to meet at center it is called a "double headed roller."

Size. More common sizes of roller bandages are as follows:

	Width	Length
Arm	1 5 to 2 5 inches,	8 to 12 yds.
Chest	3 " 4 "	6 " 8 "
Finger	75 "	1 " 2 "
Foot	2 5 "	4 " 5 "
Hand	1 "	3 " 5 "
Head	2 to 2 5 "	5 " 7 "
Leg	2 5 "	6 " 10 "
Penis	75 "	2 " 3 "
Shoulder	2 5 "	8 " 12 "
Thigh	3 "	6 " 9 "
Toes	.75 "	1 " 2 "
Trunk	3 to 4 "	8 " 12 "

Bandage Roller. For rolling and re-rolling bandages.

See bandages of special parts.

b., rubber. A roller bandage of rubber used for pressure as in swollen parts for immobilization, etc.

b., sanilastic. *See cohesive bandage.*

b., scultetus. Many-tailed bandage. A succession of interlocking, overlapping bands originally used to enclose a rigid support against a fractured extremity, but now used without the splint or impregnated as a supporting bandage of the abdomen, or lower extremity.

b., shoulder. (Tri-b.) *Open Bandage of the Shoulder* (Useck); Spica bandage. *Shoulder and Neck Shawl* bandage of both shoulders and neck. *Special Bandage.* Figure-of-eight bandage is used.

b., silica. A bandage rendered firm by treatment with sodium silicate.

b., spica. When a number of figure-of-eight turns are applied, each a little

higher or lower, overlapping a portion of each preceding turn so as to give an imbricated appearance, it is called a spica. For breast, shoulder, limbs, thumb, and great toe. For support, to exert pressure, or to retain dressings. Also for hernia at the groin.

b., spiral reverse. Technic of folding a bandage on itself, during application, to make it fit more uniformly. These reverse folds may be necessary every turn or less depending on contour of part being bandaged.

b., sterilastic. *See cohesive bandage.*

b., suspensory. A bandage for supporting the scrotum.

b., T. One shaped like the letter T. For the perineum and, in certain cases, for the head.

b., tailed. One with ends split.

b., Theden's. A roller bandage applied from below upward over a graduated compress to control hemorrhage.

b., toe. Small bandage should be used, about 2 inches wide.

b., triangular. (von Esmarch bandage.) A 36- to 42-inch square, usually muslin cut diagonally, makes two triangular bandages. Frequently used in First Aid.

b., Velpeau (vel-pöz'). A special immobilizing roller bandage which incorporates the shoulder, arm and forearm. *See adhesive, binders, cast, cravat, slings.*

band forms [M E a band, + L. *jorma*, shape] Neutrophil granular leukocytes with bandlike or horseshoe shaped nuclei. Constitute about 4 per cent of total leukocytes.

Bandl's ring. Line of depression corresponding to site of internal os uteri, sometimes felt just above pubis during labor pains.

band'y leg. Bowleg. *SYN genu varum.*

Banti's disease. A syndrome combining anemia, splenic enlargement, hemorrhages, and ultimately cirrhosis of liver.

baptorrhæa (bap-toi-c'a) An infectious discharge from a mucous membrane.

baragnosis (bar-ag-no'sis) [G *baros*, weight, + *o-*, priv + *gnōsis*, knowledge] Inability to estimate weights.

Barba'does leg. Disease marked by hypertrophy of skin and subcutaneous tissue, due to obstruction of circulation in lymphatic or blood vessels. *SYN. elephantiasis, pachydermia.*

barber's itch. Fungous affection of the bearded portions of face and neck. *SYN: Tinea sycosis.*

Etiol. Due to *Trichophyton tonsurans*.

SYM. Tubercles on hairy parts of face which involve the hair follicles, with suppuration in center of tubercles. Hair dry, brittle, and loose.

b., rash. Barber's itch. *See sycosis.*

barbital (bar-bit-al) [diethylbarbituric acid] (Veronal) USP. Uses As sedative and hypnotic in simple insomnia, neurasthenia, and sleeplessness of hysteria.

Dosage. 5 gr. (0.3 Gm) in hot water or milk.

POISONING. *SYM:* Increasing drowsiness, followed by profound sleep and later coma. *Respiration* and *pulse* slowed.

F A. TREATMENT. Evacuate stomach, follow by gastric lavage, with strong, warm, black coffee, leave coffee in stomach; stimulants of all types. Intravenous hypertonic glucose is of very great benefit. Promote perspiration.

b. sodium. (soluble barbital, medicinal). USP. Has same properties as barbital but because of greater solubility, more rapidly absorbed. Dosage: 5 gr. (0.3 Gm.).

barbitalism. Acute or chronic poisoning from use of barbital or its derivatives. *SYN* *barbiturism, q.v*

barbitulism (bar-bit'u-lizm) Poisoning from use of barbital or its derivatives. *SYN* *barbitalism, barbiturism.*

barbiturate. Barbituric acid salt

barbiturics. Derivatives of barbituric acid such as *luminal* (phenobarbital), *barbital* (veronal), *dial*, *amytal*, *alional*, and many others. They are narcotics and hypnotics varying from mild sedation to profound sleep. They are not analgesics or anesthetics. They depress respiration rate and volume and, to lesser extent, create circulatory depression with symptoms of shock. May produce excitement and delirium. Used as preanesthetic medication. Dose is according to weight of patient. Adm by mouth, rectum, or hypodermic injection. Effect minimized by patient's excitement.

NP AFTER CARE. While unconscious, place on side unless an air-way has been inserted, when patient may lie on back. Watch for quiet breathing and gray color of face which should be reported at once to surgeon. Have oxygen ready. Never leave patient while unconscious.

barbiturism (bar-bit'u-rizm). Acute or chronic poisoning from use of veronal, luminal, or any barbituric acid derivatives. *SYN* *barbiturism.*

SYM. Headache, chills, fever, cutaneous eruption.

barbotage (bar-ho-tāzh') [Fr *barboter*, to dabble]. Spinal anesthesia by withdrawal of spinal fluid to which the drug is added before reinsertion.

baesthesia (bar-es-the'zi-ā) [G. *baros*, weight, + *aesthesia*, perception]. The pressure sense.

baesthesiometer (bar-es-the-si-om'ē-ter) [" + " + *metron*, measure]. Instrument for determining sensibility to pressure in different parts of body.

ba'ric [G. *baros*, weight]. Pert. to barium.

barium (ba'ri-um). *SYMS.* Ba. A metallic element of the alk. line group. Atomic weight 136.4. Barium sulfate is used for taking x-ray pictures of the abdominal tract.

b. compounds. *POISONING.* Largely used in the paint industries to kill pests, to color fireworks and in the form of soluble barium sulfate to visualize the hollow viscera in x-ray examinations. Poisoning occasionally comes from using the soluble salts in place of the insoluble sulfate.

SYM. Gastrointestinal irritation, pain, vomiting, convulsions, paralyses, and cardiac failures.

F A TREATMENT. Precipitate with epsom salts (magnesium sulfate), or Glauber's salts (sodium sulfate). Stimulants. Keep patient warm, increase fluid intake.

bark [Dan *bark*]. The outer cover of the woody parts of a plant. *EX* *cascara sagrada, cinchona, wild cherry.*

Barkov's ligaments (bar'kov's). Ant. and post. ligaments of elbow.

barley [AS *baerlic*, barley]. *COMP.* (pearled b.). *AV* SERVING 30 grams. *PRO* 2.6%, *FAT* 0.3%, *CAIRO* 23.2%. *FUEL VALUE:* 100 Gm give 351 calories. *ASH CONST:* Rich in minerals. Ca 0.020, Mg

0.070, K 0.241, Na 0.031, P 0.400, Cl 0.016, S 0.120, Fe 0.002. *VITAMINS:* (whole b.) A and B present, but C practically absent. *ACTION.* Easy to digest. Laxative due to cellulose content. *SEE* *cereals.*

Barlow's disease. Infantile scurvy,* a deficiency disease, occurs in bottle-fed babies who lack other foods.

SYM. Failure to gain weight, tenderness of extremities, hemorrhage of gums, susceptibility to infections, paleness, lack of appetite.

TREATMENT. Vitamin foods in forms assimilable by infants.

barm [AS *beorma*, yeast]. Yeast.

Barnes' bag or dilator. Rubber bag used to induce premature labor by dilating uterine cervix.

B.'s curve. The segment of a circle whose center is the sacral promontory.

baro- [G.] Prefix Weight, heaviness.

barognosis (bar-og-no'sis) [G. *baros*, weight, + *gnōsis*, knowledge]. The ability to estimate weights. *OPP* *baragnosis.*

barograph (bar'o-graf) [" + *graphein*, to write]. Self-registering barometer.

baromachrometer (bar-o-ma-ki-om'et-er) [" + *makros*, long, + *metron*, measure]. Instrument for measuring and weighing infants at time of birth.

bar'oscope [" + *skopein*, to examine]. Instrument noting atmospheric pressure variations, without accurately weighing them.

bar'ospirometer [" + *spirare*, to breathe]. Apparatus producing artificial respiration by means of air pressure variations in a closed chamber.

barotaxis [" + *taxis*, turning]. Protoplasmic reaction to any form of pressure.

barotropism [" + *tropē*, turning]. Protoplasmic reaction to any form of pressure. *SYN* *barotaxis.*

bar'el chest. A form of thorax resembling a cylinder.

bar'en [ME *barain*, uncultivated land]. Sterile, incapable of producing offspring.

Bartholin's abscess (bar-to-lin-z). This develops when B's glands* are affected in gonorrhea and when they become occluded in an acute inflammatory process. **B.'s cysts.** In chronic inflammation of B's glands* cysts are commonly formed. Carcinoma is rare.

B.'s ducts. Large ducts of the sublingual salivary gland. They parallel Wharton's duct* and open with it.

B.'s glands. Two small compound, racemose, mucous glands, pea to bean size, situated beneath the vestibule, one on each side of the vaginal opening and at the base of the labia majora. They lie under the constrictor muscles of the vagina. Their ducts open up on the sides of the vestibule and are 1.5 to 2 cm. in length. They secrete an odoriferous, yellowish, mucous fluid upon the inner surface of the vagina and labia majora, acting as a lubricant for copulation.

bartholinitis (bar-to-lin-i'tis) [Bartholin + G. *-itis*, inflammation]. Inflammation of a vulvovaginal gland.

bartonellosis (bar-to-nel-lo'sis). *SEX.* Oroya fever.

Baruch's law. Water has a sedative effect when its temperature is the same as that of the skin, and a stimulating effect when it is below or above the skin temperature.

B.'s sign. When rectal temperature remains high after a 15-minute bath in water at 75° F. it points to typhoid fever.

baruria (bar-u'ri-ä) [G *baros*, weight, + *ouron*, urine]. Urine having a high specific gravity.

bary- [G.]. Prefix Heavy, dull, hard

barycoëia (bar'i-e-koy-ä) [G. *barykōia*, deafness] Hardness of hearing, deafness

baryesthesia (bar-i-es-the'zi-ä) [G *barys*, heavy, + *aisthēsis*, feeling]. The pressure sense SYN *baresthesia*.

baryglossia (bar-i-glos'i-ä) [" + *glōssa*, tongue]. Having a slow, thick utterance.

barylalia (bar-i-la'li-ä) [" + *lalia*, speech]. Indistinct, husky speech

baryodmia (bar-i-od'mi-ä) [" + *odmē*, stench] Disagreeable, heavy odor

baryodynïa (bar-i-ö-din'i-ä) [" + *odynē*, pain] Severe pain

baryphonia (bar-i-fo-ni-ä) [" + *phōnē*, voice]. Difficulty in speaking words.

baryta, **barytes**. Barium oxide, BaO; caustic and poisonous

barythymia (bar-i-thi'mi-ä) [G. *barys*, heavy, + *thymos*, mind] Sullen, gloomy, or melancholy state of mind

basal [G *basis*, base]. Denoting the direction toward the base of anything.

bas'al. 1 Pert to the base of anything, the base 2 Of primary importance

b. ganglia. The optic *thalamus* and *corpus striatum* located in the floor of the lateral ventricles of the brain

basal metabolism [G *basis*, base, + *metabolē*, change] The minimal amount of energy or number of calories sufficient to support the basic metabolic processes of a resting individual in the postabsorptive state, the *basal metabolic rate*.

The metabolic processes are maintenance of respiration, body temperature, peristalsis, circulation, function of glands, etc

Zero is used as the normal standard of measurement of basal metabolic rate, above or below, but this varies according to locality, condition of patient, and laboratory technique Determination of zero point should be verified by determination of 25 normal persons

A formula given by Read is pulse rate plus 0.75 pulse pressure minus 72 equals basal metabolic rate It is measured by amount of oxygen taken from the air or by skin radiation

Excess energy above that necessary to sustain the body is called *free energy* or *marginal metabolism*

Measured according to surface radiation, the basal metabolic rate drops from 50 calories per hour per sq meter of surface at 12 years old to at least 40 calories at 17 years old, which rate is maintained until about 35 years old. It slowly decreases until 50 and goes much lower at 60 years of age

The brain seems to regulate the expenditure of energy and perhaps its generation through connection with the endocrines The required brain energy necessary to produce intellectual activity is much less than the amount of physical energy necessary to produce physical activity

Diag Increased *b. m.* Seen in fevers, pregnancy, leukemia, decompensation, and esp in hyperthyroidism; from plus 25 to plus 75. **Low b. m.** Indicates hypothyroidism, minus 25 to minus 40, pathological obesity, cachexia, myxedema. **ES anabolism, catabolism, metabolism.**

bascula'tion [Fr. *basculer*, to swing]. 1. Replacement of a retroverted uterus by swinging it into place. 2. Systolic recoil of the heart.

base [G *basis*, base] 1. The lower part of anything. 2. The principal substance in a mixture. 3 (Chem.) A compound containing a metal or the ammonium radical combined with the *hydroxyl* (OH) radical in general, any substance which will neutralize an acid. SYN *alkali* Bases react with acids to form salts, turn red litmus blue, and have a bitter taste Strong bases feel slippery and are corrosive to human tissues Ex Sodium hydroxide (NaOH) (lye or caustic soda), potassium hydroxide (KOH) (caustic potash)

This includes (a) compounds of metallic elements, as *e. g.*, sodium hydroxide, and (b) various complex nonmetallic substances such as ammonia, the amines, and the alkaloids. Such substances are detected in solution by the colors they give with *indicators, q.v.*
b. of heart. Heart surface back and upward, containing pulmonary vein and vena cava openings

baseball finger. Results from violent backward dislocation of the terminal phalanx onto the dorsum of the middle phalanx, as when a finger is struck on its tip when extended

Basedow's disease (baz'e-do). Grave's disease, exophthalmic goiter.

B.'s syndrome. Flashes of heat, sweating crisis, tachycardia

basement membrane [G *basis* + L *membrana*, membrane]. A thin layer of solid substance underlying the epithelium of mucous surfaces, a part of the corium * *See membranes*

base'plate. Plastic material for making dental trial plates

bas-fond (bah-fawn') [Fr *bas*, low, + *fond*, bottom] A lundus

bas-i-, basio- [G.] Prefixes base.

bas'ial [G *basis*, base] Pert to the basion.

basiarachnitis (ba-si-ar-ak-ni'tis) [" + *arachne*, spider, + *-itis*, inflammation] Inflammation of the arachnoid membrane at base of brain

basiarachnoiditis (ba-si-ar-ak-noy-di'tis) [" + " + *eidos*, form, + *-itis*, inflammation] Inflammation of the arachnoid membrane at base of brain SYN *basiarachnitis*

basibregmatic axis [" + *bregmatic*, pl. front of head, + *axis*, pivot] Vertical line from the basion to junction of coronal and sagittal sutures

bas'ic. 1 Possessing properties opposite to those of an acid 2 Fundamental.

b. diet. Protein 1 Gm per Kg ideal body weight Emphasize milk, all vegetables, all fruits except prunes, plums, cranberries, and possibly grapes. Limit meat, cereals, eggs

b. salt. A compound formed when only part of the hydroxide radicals of a base are replaced by the acid radical of an acid

basicity (ba-sis'i-ti). 1 Basic in character 2 The combining power of an acid; the valence It is expressed by a number indicating number of hydrogen atoms replaceable by a base

basica'rial axis [G. *basis*, foundation, + *kranion*, skull, + *axis*, pivot]. Straight line from the basion to point of angle of mandible.

basifa'cial axis [" + L *facies*, face, + G. *axis*, pivot]. Straight line from the point of angle of mandible to the subnasal point.

basihyal, basihyoid (ba-si-hi'al, -oyd) [" + *oidēs*, hyoid]. The body of the hyoid

arch or either of the two bones forming it.

basilar. Basal, pert to a base

basilal'eral [G *basis*, foundation, + *L. lateralis*, pert. to the side]. Both lateral and basilar

basilem'ma [' + *lemma*, rind]. 1 Basement membrane 2 Basis supporting framework of nervous tissue of cerebrospinal axis

basil'ic. Prominent, important

b. vein. Large vein on inner side of biceps Usually chosen for intravenous injection or for withdrawal of blood

basilysis (bas-il'i-sis) [G *basis*, base, + *lysis* loosening]. Crushing the fetal head in labor

basilyst tractor (ba'sil-ist) Instrument devised by Sir A. R. Simpson consisting of three blades for perforating the fetal head and obtaining a substantial grasp to facilitate delivery of the child

basio'ccipital bone (ba-si-ok-sip'i-tal) [G *basis*, base, + *L. occiput*, head, + *AS. bān*, bone] Basilar process of occipital bone

basioglossus (bas-i-o-glos'us) [' + *glossa*, tongue] Part of hyoglossus muscle attached to base of hyoid bone

bas'ion. Point at middle border of the foramen magnum

basio'tic [G *basis*, base, + *ous*, ear]. Pert to base of ear

basiotribe (ba'si-o-trih) [' + *tribem*, to crush] Instrument for crushing the fetal head

basiotripsy (ba-si-o-trip'si). Crushing fetal head

basiphobia (bas-i-fō'bi-ā) [' + *phobos*, fear] Fear of walking

basirrhinal fissure (bas-i-ri'nal) [G *basis*, + *ris* nose] 1 Pert to base of brain and to the nose 2 A cerebral fissure at base of olfactory lobe

basis (ba'sis) Base

b. cranii. Base of skull.

basisphenoid (bas-i-sfe'noid) [G *basis*, base, + *sphēn*, wedge, + *oidos*, form]. Lower portion of sphenoid bone

basily'vian fissure. Transverse basilar portion or stem of Sylvian fissure

basket cell. A multipolar ganglion cell in outermost gray layer of cerebellum

ba'sograph [G *basis*, a walking, + *graphein*, to write] Device for registering abnormalities of gait

basophilic (bas'o-fil or fil) [G *basis*, base, + *philein* to love] (a) In histology, applied to cells or parts of cells which are readily stained with basic dyes like methylene blue, (b) A type of white blood cell (leukocyte) characterized by possession of coarse granules which stain intensely with basic dyes. Constitute 0.5-1% of leukocytes. Their function is unknown They increase in certain pathological conditions (Hodgkin's disease, smallpox, chicken pox, myelocytic leukemia), (c) A type of cell found in the ant lobe of the hypophysis

basophilia (bas-o-fil'i-ā). 1 A pathological condition of the blood in which the erythrocytes develop basophilic granules 2 A condition in which many mast cells are present

basophilic (ba-so-fil'ik) Pert. to method of staining various cells

basophilism. Condition characterized by excessive numbers of basophils

b. pituitary. A clinical syndrome (Cushing's disease) characterized by basophilic invasion or adenoma of the pituitary gland. SEE *Cushing's disease*

basophobia (bas-ō-fō'bi-ā) [G. *basis*, base,

+ *phobos*, fear]. 1 Emotional inability to stand or walk without muscle impairment 2. Abnormal fear of walking.

bass deafness. Deafness to bass notes, the higher ones being heard.

Bassini's operation (bah-si'niz). One for inguinal hernia

bas'tard [OFr *batard*, bastard] 1. One born out of wedlock 2 Not legitimate.

Bastedo's sign (bās-tē'dō) (W A Bastedo, physician, New York, born 1873) Tenderness and pain in right iliac fossa on inflation of the colon with air in chronic appendicitis

B.'s rule. One for dosage for children from one to twelve years old For child of x years, adult dose is multiplied by x plus 3

30

bath [AS *baeth*, bath]. The medium and method of cleansing the body or any part of it, or to treat it therapeutically, as with air, light, steam, vapor, water, etc

Room Temperature Water Temperature Should Be

Below 76° F 94-96° F

Above 76° F 92-94° F

On hot summer days . . . 90° F

If Rectal Temperature Is Bath Water Should Be

103° F 90° F.

104° F 86° F.

104.5° F 82° F.

105° F 78° F.

105.5° F 70-60° F.

Baths May Be Indicated As

Cold 45- 65° F.

Cool 65- 75° F.

Tepid 75- 85° F.

Warm 85- 95° F.

Hot 95-105° F.

Very Hot 105-110° F.

The general cleansing bath for a bed patient may be from 110°-115° F. with a room temperature of 75°-80° F.

THERAPEUTIC EFFECT OF Warm and Hot Baths and Applications They soothe the cutaneous nerves, and nerves of internal organs, in reflex relation with the skin areas to which heat is applied. *Gradually Elevated Hot Tub and Vapor Baths* They relax all the muscles of the body. *Brief Hot Tub and Shower Baths* They relieve fatigue but may cause cerebral congestion and wakefulness unless cold compresses are used on the head. *Hot Baths* They relax tissues, including the capillaries of the skin, drawing blood from the deeper tissues. They also relieve pain. They stimulate the nerves. *Cold Baths and Applications* They abstract heat and stimulate reaction, especially if followed by frictions and percussion. They contract the small blood vessels when applied locally. *Cold and Hot Applications* One followed by the other causes revulsion, relieving congestion of internal organs.

b., acid. 5 oz hydrochloric acid or 1 gal vinegar to 30 gal water.

b., air. Therapeutic use of air, warmed or vaporized, on the nude body

b., alcohol. Use of alcohol on patient, as a stimulant and debridescent, in dilute form

b., alkaline. For chronic rheumatism. 1 lb sodium bicarbonate or washing soda to 30 gal water.

b., alum. Use of alum in washing solution, as an astringent.

b., animal. Therapeutic use of a recently killed animal or its pelt on a patient.

- b., antipyretic.** SEE *Brand b.*
- b., antiseptic.** For irritating, offensive, and parasitic skin diseases. SEE *carbolic, creosote, sulfur baths*
- b., aromatic.** One to which some volatile oil or perfume is added, or some herb.
- b., arsenical.** Weak solution in tepid bath
- b., arthritic.** Alum, $\frac{1}{2}$ lb., to 30 gal. water, or boric acid solution, $2\frac{1}{2}\%$, made by adding 2-3 lb boric acid to 30 gal. water. Tannic acid only as ordered. Amount of any of these baths must be specified by physician and amount checked
- b., astringent.** Bathing in liquid containing an astringent
- b., blanket.** One in which wet pack and blankets are used
- b., blood.** One using fresh animal blood.
- b., bog.** Peaty mud bath, for therapeutic purposes
- b., borax.** Glycerin and borax solution for bathing
- b., box.** One in which patient is completely enclosed in box except for his head
- b., bran.** 2-3 lb. bran to 30 gal. water, or 3-5 lb. malt or starch to 1 gal. water added to bath at 95° F. to 96° F., may be used to stop itching
- b., Brand.** Full bath of 65° F. combined with strong friction in the water, used in typhoid fever
- b., brine.** 7 lb. sea salt to 30 gal. water
- b., bubble.** Mechanical production in a bathtub of water of tiny air bubbles by (1) an air distributor which consists of a number of metal tubes through which the air passes to the water, (2) an air pump, and (3) an electric motor that drives the pump.
- b., cabinet.** Exposure of the skin of the body except the head, to heat from electric lamps, live steam, steam radiators, or electric heaters. Bath cabinets are constructed of wood, marble, or steel
- b., camphor.** Bath in air charged with camphor.
- b., carbolic.** Strength 1-100. Mix 48 oz pure carbolic in 5 pt boiling water, putting it into bath before 30 gal. water are added, to make sure of mixing.
- b., carbon dioxide.** An effervescent saline bath consisting of water, salts, and CO₂. The natural CO₂ baths are known as Nauheim baths, and approach closely CO₂ baths in their therapeutic effects.
- b., cold.** One used for stimulation, being followed by brisk rub
- b., cold plunge.** Tub bath with water at 65-79° F., duration $\frac{1}{2}$ to 3 minutes, with bather using friction while in water
- b., colloid.** One containing bran, gelatin, starch, etc., for treatment of dermatitis.
- b., continuous.** One that is administered for hours, days, weeks, or months. It is a continuous, flowing bath if the prescribed temperature is maintained by keeping a stream of water flowing through the tub
- b., contrasted.** Used for hands or feet. Two large basins or pails of sufficient depth, filled with water, one as hot as can be borne, the other as cold as can be borne. Change or add hot and cold water frequently to keep temperatures same as in beginning. Put part to be

- treated in hot water for 1 minute, then into cold for $\frac{1}{2}$ minute, then again into hot water. Repeat for prescribed length of time, ending with cold water
- b., creosote.** 1-2 drams creosote to 30 gal. water, to which 10 oz. glycerine are sometimes added
- b., douche.** Large jets of water sprayed on the body
- b., drip sheet.** Modified sheet bath.
- b., earth.** Bathing in warmed earth or sand.
- b., electric light.** Exposure of the nude body, except the head, to rays from a large number of electric lights placed on the inside walls of a cabinet
- b., electrotherapeutic.** An electric current sent through water in which the patient lies, or in which a limb is immersed. Only a faradic current is used for a faradic bath
- b., emollient.** Used for irritation and inflammation of skin, and after erysipelas. SEE *glycerin, linseed, oatmeal, powdered borax starch baths*
- b., foam.** Tub bath to which has been added an extract of a saponin containing vegetable fiber, and through this mixture, O or CO₂ is driven through porous wood or the foam is produced mechanically.
- b., foot.** Immersion of feet and legs to a depth of 4 inches above ankles in water at 98° F. The temperature of the water is increased
- b., full.** The whole body except the head is immersed in water
- b., galvanic.** Entire body or one or more limbs immersed in large tub or several smaller basins made of insulating material (porcelain or wood), with electrodes consisting of metal plates in wooden frame to prevent direct contact with patient's body. Motor generators generally preferable to wall plates, or other not ground-free sources of current.
- b., glycerin.** 10 oz to 30 gal. water
- b., half.** Tub bath with about 18 inches of water, the temperature depends on the case and the desired action
- b., Heller.** Form of hydroelectric bath
- b., herb.** One to 2 pounds of herbs, such as chamomile, wild thyme, or spearmint, are tied in bag, boiled with 1 gal. of water, and the decoction added to the full bath
- b., hip.** SEE *sitz b.*
- b., hof.** Tub bath with the water covering the body to a little above the nipples, and temperature gradually raised from 99° F. to desired degree (to 108° F.)
- b., hot air.** Exposure of entire body except head to hot air contained in a bath cabinet
- b., hydroelectric.** Application of faradic, galvanic, or sinusoidal current conducted to the patient through water.
- b., hyperthermal.** One in which the body except head is immersed in water from 105-120° F. for 1 to 2 minutes.
- b., immersion.** Free tub bath.
- b., incandescent light.** SEE *electric light b.*
- b., internal.** Introduction of large amounts of water into rectum and stomach
- b., kinetotherapeutic.** Bath given for underwater exercises of weak or partially paralyzed muscles
- b., linseed.** 1-2 lb. to 30 gal. water. Boil emollient in a tied muslin bag, and add the mucilage to the 30 gal. water.
- b., lukewarm.** Bath in which patient's

whole body except head is submerged in water, temperature, 94-96° F., duration 15-60 minutes.

b., medicated. Bath to which bran, oatmeal, starch, sodium bicarbonate, epsom salts, pine products, tar, sulfur, potassium permanganate, or salt is added.

b., milk. Bath taken in milk, as an emollient or cosmetic.

b., mud. Old form of applying moist heat which depends on availability of certain soils heated by thermal springs or artificially.

b., mustard. For irritant effect, and to draw blood from deeper parts, as in a febrile cold, infantile convulsions, infantile diarrhea, and for shock. A heaping tablespoonful of fresh mustard for each gallon of water. In adults it is used as a hot foot bath.

b., Nauheim (naw'him) A bath in which the human body is immersed in warm water and subjected to the action of carbon dioxide gas.

b., neutral. One in which no circulatory or thermic reaction occurs, temperature 92-97° F.

b., neutral sitz. Same as hot sitz bath, except temperature between 92-97° F. and foot bath, 104-110° F., duration 15-60 minutes.

b., oatmeal. 2-3 lb to 30 gal water.

b., oxygen. Given by introducing O into the bath through a special device consisting of a metal plate provided with bamboo reeds which are connected to an oxygen tank or by generating the O by chemicals.

b., paraffin. Member is immersed in warm paraffin, 140-150° F., withdrawn, immersed again, withdrawn repeatedly until it is encased. For larger joints, may be applied with paint brush. Apparatus is manufactured in which extremity may remain in bath of paraffin, temperature 130-135° F., equipped with electric heating coils, controlled by a switch and thermostat, lined with insulating material.

b., Peng. A form of foam bath, *q.v.*

b., pine needle. One-half to 1 lb extract pine needles added to a bath covering the whole body to the chin, temperature 93-98° F., duration 20 minutes.

b., powdered borax. One-half lb to 30 gal water, 5 oz glycerine may be added.

b., reducing. One given to reduce patient's temperature.

b., Russian. Warm vapor bath followed by rubbing and cold plunge.

b., saline. Given in artificial sea water made by dissolving 8 lb of sea salt, or a mixture of 7 lb of sodium chloride and ½ lb of magnesium sulfate in 30 gal. of water.

b., Sander. A form of foam bath, *q.v.*
b., Schnee. Four cell hydroelectric bath.

b., seawater or salt. Antipruritic.

b., sedative. A prolonged warm bath. Continuous flow of water may be used. Use air cushion and back rest.

b., sheet. Given by wrapping the patient in a sheet previously dipped in water 80-90° F., and rubbing the whole body with vigorous strokes on the sheet, until all parts of the sheet feel warm.

b., shower. Water sprayed down upon the body from an overhead source.

b., sitz. Immersion of thighs, buttocks, and abdomen below the umbilicus in water. In a hot sitz bath the water is first 92° F. and elevated to 106° F., duration 3 to 10 minutes.

b., sponge. One in which patient's body is moistened with washcloth or sponge.

b., starch. 1 lb mixed in cold water, pouring boiling water to make starch mucilage, which add to 30 gal. water.

b., steam. Given in a chamber into which steam under low pressure is allowed to escape. Disadvantage is that patient must breathe hot, moist air. Better form of application is that in which subject sits in cabinet or lies in box with head outside.

b., stimulating. One which increases cutaneous effect, used for tonic purposes. See *brine, cold, and mustard baths.* [water]

b., sulfur. 2 or 3 oz. sulfur to 30 gal.

b., sweat. One given to induce perspiration, as in temperature reduction.

b., tonic. One which, through its stimulation of the cutaneous nerves and the response of the autonomic nervous system, quickens the circulation of the blood throughout the body.

b., towel. Given by applying towels dipped in water 70-80° F. to arms, legs, ant and post surfaces of trunk successively, removing towel, drying part.

b., vapor. Exposure of skin of body except head to vapor. Sometimes the vapor is impregnated with substances thought to possess therapeutic value, as sulfur, mercury, or camphor.

b., whirlpool. Continuous localized douches for the arm and leg. Water 105-120° F. from a thermostatic mixer is given a swirling motion in special reservoir as it mixes with air forced through an aerator.

b., Ziemssen (tsem'sen) Tub bath at 88° F., cold water added slowly until temperature reaches 65° F., patient is rubbed vigorously, duration 20-30 minutes or until chilled.

bathesthe'sia [G *bathys*, deep, + *aisthēsis*, perception] Consciousness of joints, muscles, and organs beneath the skin. *SYN bathyesthesia*

bath'mic [G *bathmos*, a step]. Pert to the vital force controlling nutritional function.

bath'mism [“ + *ismos*, condition of] Force regulating nutrition and growth.

bathmotrop'ic [“ + *trepōn*, to turn] Promoting excitability of tissues in response to stimuli.

bathopho'bia [G *bathos*, height, + *phobos*, fear] A fear of high objects.

bath'yanesthe'sia [G *bathys*, deep, + *ana-*, priv + *aisthēsis*, perception]. Loss of deep sensibility.

bathycar'dia [“ + *kardia*, heart]. A fixed abnormally low position of the heart.

bathyesthesia (bath-i-es-the-zī-ā) [“ + *aisthēsis*, sensation]. A consciousness of muscles, joints, and organs under skin.

bathygast'ry (bath'i-gas-trī) [“ + *gaster*, stomach] Abnormally low stomach. *SYN Gastroptosis.*

bathyhyperesthesia (bath-i-hī'per-es-the-zī-ā) [“ + *yper*, above, + *aisthēsis*, sensation]. Sensitiveness of muscular tissues and deep structures.

batono'ma [G *batos*, height, + *ōma*, tumor] A tumor supposed to be caused by vegetable organisms of higher grade than bacteria.

batophobia (bat-ō-fō-bī-ā) [“ + *phobos*, fear]. 1. Acrophobia, fear of heights. 2. Dread of anything high.

batrachoplasty (bat'rak-o-plās-tī) [G *batrachos*, frog, + *plassen*, to form]. Plastic operation for ranula.

battarism (bat'ā-rizm). Stuttering.

battery [Fr *battre*, to beat]. Device for generating galvanic currents by chemical action

Battery's operation. Excision of healthy ovaries to induce menopause or for other therapeutic purposes

bauchstiel (bowch'shtel) The abdominal pedicle by which the embryo is attached to the chorionic membrane

Baudelocque's diameter (bo-dloks') Distance bet the depression just beneath the spine of the last lumbar vertebra and the ant. and upper margin of the *symphysis pubis*. The ext. conjugate diameter

B.'s method. Manipulation to convert a face presentation into one of the vertex.

Bauer qualimeter. Instrument for measuring intensity and penetrating power of roentgen rays through various metals. SEE *penetrometer*

Bauhin's valve (bo-ninz') Ileocecal valve.

baunscheidtism (bow'n'shid-izm) Acupuncture for producing counterirritation.

Bavarian splint. A splint of plaster of Paris between two flannel cloths.

Bayle's disease. A general paresis described in 1822 by Antoine Bayle

bayonet leg. Backward dislocation at knee joint of tibia and fibula

Bazin's disease (bah-zanz') 1. Buccal psoriasis. Purple or reddish nodules on legs which may ulcerate. 2. Erythema induratum

B. C. G. Abbr. *Calmette-Guérin bacillus*

B. C. G. vaccine. (a) Bovine tubercle bacilli are attenuated by long growth over many years with many transfers in a bile-containing artificial medium. (b) a single subcutaneous injection is given to infants who live in a tuberculous environment

b. d. Abbr. *L. bis die*, twice a day

bellometer (del-lom'et-er) [G. *bellula*, leech, + *metron*, measure] Artificial substitute for a leech

beaded [A.S. *bed*, prayer] Referring to disjointed colonies along the inoculation line in a streak or slab

beads, rachitic. Visible swelling where the ribs join their cartilages, seen in rickets "Rachitic rosary"

bead test. A method of testing the activity of the digestive process in different parts of the alimentary tract. Beads covered with different types of food are attached by a thread and enclosed in a capsule which the patient swallows after a meal. The time taken for elimination of the beads per rectum is noted, and the remaining food on the beads is carefully examined

beaker (be-ker) [O.F. *becke* beak] Glass vessel with wide mouth for mixing or holding liquids

beans [A.S.] Comp. There are many varieties of beans, but their composition is practically the same. They are heavy in cellulose and have a higher percentage of fats than peas and other lentils, although not so easily digested. All legumes are digested better as a part of a mixed diet

b... kidney are a good source of B and contain A, but lack in C and G

b... navy. Canned Vit. C 5 units per oz., 45 units per 100 cal. Navy b., dried or canned, contain Vit. A, and are a good source of Vit. B, but C and G are lacking

b... string. The carbohydrates of string beans are made up of both nucleic and of mosaic which do not produce glucose. They contain 92% water. A good source of Vit. A, C and G and Vit. B, excellent

bearing down. The expulsive effort of a parturient woman, in second stage of labor

beat [A.S. *beatan* to strike] A pulsation or throb resulting from contraction of the heart, or the passage of blood through a vessel

b... apex. Stole of the heart beat felt by the hand when held over the fifth intercostal space on left of chest wall

b... ectopic. One beginning at a place other than sinoauricular node

b... forced. Extrasystole brought on by artificial heart stimulation

b... premature. An extrasystole

beat knee. A subcutaneous connective tissue inflammation over the patella

Beccaria's sign (bek-ku'ri-a's). Occipital pulsation in pregnancy

Constituents of Beans

NUTRIENTS	Pro.	Fat	Carbo.	Cals. per lb.
baked (canned) ..	6.9%	2.5%	19.6%	583

bechesthesis (bek-es'thes-is) [G. *bēx*, cough, + *aisthēsis*, feeling]. A feeling in the throat causing one to cough.

bech'ic. 1 Controlling a cough 2. A cough medicine

Bechterew-Mendel reflex (bekh'te-rev). A reflex indicating a lesion of the pyramidal tract, and manifested when the cuboid bone is tapped, causing a flexion of the 4 outer toes.

Bechterew's reflex (bēk'tēr-év). 1 Contraction of facial muscles due to irritation of nasal mucosa. 2 Dilatation of pupil on exposure to light 3 Plantar flexion of foot 4. Flexion of foot in dorsal direction and flexive movement of knee and hip following passive flexion of toes and plantar extension of foot. 5 Contraction of lower abdominal muscles when skin of inner surface of thigh is stroked.

Béclard's hernia (bū-klārs'). Hernia through opening for the saphenous vein.

bed [A.S. *bedd*, bed] A piece of furniture for rest of body

How to MAKE AN OCCUPIED BED

1. Assemble all necessary articles; place clean linens on back of chair at bedside
2. Tell the patient what you are going to do, check temperature of room and adjust windows if necessary
3. Loosen all bedclothes, remove and fold spread and all but one blanket Hang on back of chair Remove top sheet from under remaining blanket Place in laundry bag or fold and place on seat of chair to form receiver for dirty linens
4. Turn patient away from you, if possible, and insure safety by placing chair or bedrail for security
5. Fold draw sheet to patient's back, straighten rubber draw sheet and fold likewise Bottom sheet is also folded in neat, flat folds to center of bed
6. Place clean bottom sheet on exposed half of mattress, folding neatly to center creases Tuck top of sheet under head of mattress, miter corner and tuck under mattress to foot of bed Sheet must cover mattress completely.
7. Pull rubber draw sheet out, straighten and place clean draw sheet with center crease to patient's back Fold top of clean draw sheet over top edge of rubber sheet and tuck both securely under mattress
8. Assist patient to roll toward you, under blanket, to clean side of bed Again insure safety Proceed to other side of bed Remove soiled draw sheet and bottom sheet and place in first piece of soiled linen on chair Pull through clean bottom sheet, rubber sheet, and draw sheet Proceed as for first side, tightening draw sheet to avoid any wrinkles Ask patient to raise buttocks, if possible
9. Remove pillows, remove pillow cases, and replace cases with clean ones Pull mattress to head of bed, replace pillows and adjust to patient's comfort
10. Place clean top sheet, wide hem to top, over blanket; draw blanket

out from under sheet and replace with top of blanket well over patient's shoulders

Put on spread and turn top hem of sheet over spread at least 8 inches

- 11 Remake foot of bed, allowing sufficient room for feet and toes of patient to move freely

Remove soiled linens Avoid shaking any bedclothes in order to prevent spreading dust which is a possible source of infection Place signal light for patient, straighten room and evaluate comfort and appearance carefully.

b., air. One inflatable with air

b. blocking. Placing bedblocks under bed to raise it at head or foot

Foot of b. raised (a) In shock; (b) bleeding from lower limbs, (c) edema of lower limbs, vulva, or scrotum, (d) some cases of hemorrhoids, (e) to retain enema or aid high colonic injection, (f) when weight is used on lower limbs, (g) in reduction of inguinal hernia

Head of b. raised (a) To drain abdomen or pelvis, (b) to aid respiration, (c) in treatment for bleeding from head, neck, or upper chest

b. case. Hysteria with refusal to leave the bed

b. fast, b. ridden. Unable or unwilling to leave the bed

b., fracture. One for patients with fracture

b., Gatch. An adjustable bed which provides elevation of the back and knees

b., hydrostatic. A water bed

b., metabolic. One arranged to catch the feces and urine

b. rest. A device for propping up patients in bed

b., water. A rubber mattress filled with water. USSR Prevention of bed sores

bedbug (*Cimex lectularius*) [“ + M.E. *bugge*, swollen] An insect which injects an irritating substance causing a purpuric* reaction, or an urticarial* wheal

TREATMENT Antipruritic lotions containing phenol, camphor, and menthol Dusting of gualacyl powder bet the sheets is a preventive measure

b. poison. Usually contains combinations of mercury, nicotine, fluorides, arsenic, or strychnine as principal ingredients, the names of which usually appear on the container

SYM Gastrointestinal irritation, abdominal cramping

F A TREATMENT Wash out stomach and give large quantities of milk and egg whites

Bednar's aph'thae. Minute yellowish patches on either side of the palate of the newly born

bedpan [A.S. *bedd*, bed, + *panna*, flat vessel] Device for receiving fecal and urinal discharges from patient confined to the bed

bedsore [“ + O.E. *sāre*, open wound]. Pressure sore. SYN. *decubitus*.*

Decubitus consists of ulceration and gangrene of a localized area, due to pressure which limits the nutrition of the affected area by

1. Inducing a passive congestion in the veins and capillaries surrounding it, thereby restricting the inflow of fresh blood to the part.

2. By squeezing the lymph from its contact with the cells. It is likely to

develop and become serious when spinal cord lesion lowers tissue resistance.

CAUSE Continued pressure. **PREDISPOSING CAUSES** (1) Any factor which interferes with the circulation (2) Prolonged fever. (3) Emaciation (4) Obesity. (5) Paralysis (6) Old age or senility. (7) Poorly made beds (8) Lack of cleanliness (9) Bruising (10) Too infrequent change of positions (11) Cardiac diseases, nephritis, diabetes, anemia, etc

LOCATION The body prominences thinly covered with flesh, as: (1) The end of the spine (2) The buttocks. (3) The heels (4) Elbows (5) Shoulder blades. (6) Back of the head and ears in children

TREATMENT (1) Best nursing care, as prevention is easier than a cure (2) Prophylactic measures in keeping the bed dry and clean (3) Relieving the pressure as soon as the first signs of redness appear (4) Report to the attending physician at once (5) Use the prescribed medication as directed (6) Keep affected part covered by soft gauze held in place by narrow adhesive straps which will facilitate changing of dressings without further irritating the skin. (7) If nurse is thrown on his own resource for treatment, apply alcohol and massage the surrounding area at least three times a day

When massaging, keep the fingers or hand still on the part you are massaging and move the tissues. Do not rub the skin as it may break. Zinc oxide may be gently massaged over the affected area. A solution of alum which has been dissolved by alcohol is also very effective. Balsam of Peru is also extensively used. An electric heater may be used to keep the skin warm.

A fresh 5% solution of tannic acid in water may be sprayed on the sore every hour, or gauze saturated in the solution may be applied, keeping the gauze wet with the solution. Discontinue when the sore is covered with a thick tannic layer, which will be in about 12 hours. It may be applied at first showing of redness of skin. The sore should be sterilized, before using tannic acid, if badly infected.

bed wetting. Name for habit of young children of wetting bed at night. *SYN* enuresis, *q. v.*

beef [*Fr* *boeuf*, flesh] **COMP** *Protein* Nitrogen is the essential characteristic of beef, it being richer in this element than any other food excepting cheese. The fatter the beef the smaller the percentage of nitrogen.

		Gr.
Purins	%	per lb.
Beef ribs	113	7.96
Steak	206	14.45
Sirloin	130	9.13

CARBO Very deficient. They are principally in the form of glycogen or animal sugar. **FATS** Second only to butter, sugar, bread, rice and pulse. Half its calory value is derived from albumin, an inferior source of energy. **MINERALS.** Very deficient in salts, although the phosphates are superabundant. Chloride of sodium (salt) is almost nil, and meat may be considered a dechlorinated food. **NUTRIENTS** Depend upon the amount of fat.

	Av. SERVING	230 Gm	Cal.
	Pro %	Fat %	per lb.
Porterhouse	21.9	20.4	1230
Sirloin	18.9	18.5	1099
Tenderloin	16.2	24.4	1290

beer [*A.S.* *ðeor*, fermented drink]. Fermented alcoholic beverage from a malt infusion of barley, malt or hops, with aid of brewer's yeast

Contains about 4% alcohol, 1% sugar, 3% dextrin with small amount of lactic acid, glycerine, and inorganic salts.

ASH CONST (in grams per 100 cal): Ca 0.008, P 0.061, Fe 0.00217, CaO 0.011, P₂O₅ 0.140. **CALORIES** 500 per qt

Beer's operation. Flap operation for cataract or artificial pupil

bee sting [*AS* *bco*, bee, + *stingan*, to pierce] The sting, which is barbed, is usually left in the wound. Pain, mottled redness, and edema result. In the aged, phlebitis, erysipelas, and other septic conditions may occur. The remedy is as stated for insect bites. *RS* *apimination*.

beestings (best'ings) [*AS* *bysing*, puffed up] Colostrum*, first milk after parturition

beetle disease. *SEE* *scarabiasis*

beets (red) [*L.* *beta*, beet] **COMP** Rich in sugar. Calory value less than carrots, turnips, or salsify and less in fat. They contain oxalic acid. **NUTRIENTS** *AV. SERVING* 100 Gm. *Prot* 1.6, *Fat* 0.1, *Carbo* 8.8. *Vit A+*, *B+*, *C*1, *G+* + **FUEL VALUE** 100 Gm.—39 cal. **ASH CONST** Ca 0.029, Mg 0.021, K 0.353, Na 0.093, P 0.039, Cl 0.058, S 0.016, Fe 0.0006. **Fresh Beets** They are base-forming, alkalinity being 10.9 cc per 100 Gm., or 23.6 per 100 cal. *Prot* 2.0, *Fat* 0.3, *Carbo* 4.2 per 100 Gm. *Vit A+*, *B++*, *G+++*. **Action** Pickled beets hard to digest. Boiled easier to digest. Slightly laxative.

begma [*G* cough] 1 A cough. 2 Expecterated matter

behaviorism. A theory of conduct which regards normal and abnormal behavior as the result of conditioned reflexes quite apart from the concept of will. It does not apply to conditions resulting from structural disease.

behavior reflex. One acquired as result of training and repetition.

Behring's law. Serum of an immunized person confers immunity on another into whom diphtheria antitoxin is injected.

belch [*AS* *baelcan*, to eructate] Escape of gas from the stomach through the mouth, to eructate

belching. Raising of gas from the stomach. *Error* Gastric fermentation, air swallowing, gas-containing foods, foods or drinks taken simultaneously and containing acid and alkaline substances. *RS* *eructation*, *rectus*.

belemnoid [*G* *belemnus* dart, + *eidos*, shape] Dart shaped, styloid

belladonna (bel-a-don'a) [*lit* fair lady] (Deadly Nightshade). *USP* The dried leaves and roots of *Atropa belladonna*, the active principle of which is atropine.

ACTION AND USES Same as atropine. **DOSAGE** (Leaf) . . . 1 m (0.06 cc) (Root) = 3/4 m (0.05 cc)

b. and atropine poisons. These include stramonium, hyoscyamus, scopolamine, belladonna, and atropine.

SYM Poisoning from them is attended by extreme dryness of mouth and throat, due to paralysis of the chorda tympani nerve which diminishes supply of saliva, huskiness of the voice, redness of tongue, great thirst, difficulty in swallowing, and marked dilatation of the pupils making the eyes prominent, brilliant, staring, and interfering with accommodation of the eye, making near

vision difficult or impossible. Distant vision is unimpaired. Hallucinations, dizziness, vertigo, excitement, and delirium are usually present. The patient may be violent or merely hilarious. Nausea is common, the pulse is at first strong, but later becomes weak and rapid or even imperceptible. Respirations become increased at first, but may be depressed later. The skin is dry and may be hot, and occasionally erythema is present. These symptoms may come on in susceptible patients when these drugs are given in ordinary dosage, but an excessive amount is usually required.

Treatment. If drug is swallowed give an emetic or use stomach pump. Morphine usually given as an antidote. Stimulants if necessary, strong, black coffee. Artificial respiration may be required.

Bellini's ducts (bel-lī'nī). The excretory tubules of the kidneys.

B.'s ligament. A fasciculus of capsular ligament of the hip reaching the great trochanter.

Bell-Magendie's law. That ant spinal nerve roots only contain motor fibers and post roots sensory fibers.

bell-metal resonance. A metal-like sound heard in pneumothorax.

Belloc's cannula or sound (bel-lok's). An instrument for drawing in a plug through nostril and mouth in epistaxis.

bell sound. Bell metal resonance.

Bell's disease. Acute delirious mania, acute periencephalitis.

B.'s law. Post spinal nerve roots are sensory and ant ones motor.

B.'s nerves. Internal and external respiratory nerves.

B.'s paralysis. Facial motor lower neuron paralysis affecting 7th cranial nerve.

Sym. Pain or tenderness behind ear and at side of neck followed by complete paralysis of facial muscles. Face expressionless, upper eyelids droop, lower lids sag, as well as corners of mouth. Fluid trickles out of mouth, and tears run down face. Lasts for few weeks to a few months and recovery usually takes place.

NP. Heat to affected side. Bathe eye and keep covered with a pad. Mouth must be kept clean. Light massage as recovery sets in. Teach patient to move facial muscles by frowning, grinning, whistling, etc.

B.'s spasm. Convulsive facial tic.

belly [AS *baēla*, bag]. Abdomen, stomach.

b. ache. Colic, gastralgia.

b. button. Umbilicus.

b. of muscle. Nontendinous thick central part of a muscle.

belonephobia [G *belonē*, needle, + *phobos*, fear]. Morbid fear of sharp-pointed objects.

belonoid (bel'o-noid) [G *belonē*, needle, + *eidos*, shape]. Needle shaped.

belonoskiacopy (bel-o-no-ski-as'ko-pl) [" + *skia*, shadow, + *skopein*, to examine]. Subjective retinoscopy by means of shadows and movements to determine refraction.

benadryl (ben'a-dri) A drug effective in common allergies, preventing ill effects of histamine released from body cells during an attack of allergy.

Bence-Jones' albumose. Protein bodies appearing in the urine of persons suffering from disease of the bone marrow.

On heating the urine, a precipitate forms at about 60° C., this disappears

on further heating to the boiling point, and reappears on cooling at 60° C.

Bendien's test. A precipitation test carried out in varying concentrations of blood serum and colloidal vanadic acid, reputed to be of diagnostic value in cancer.

bonds [raisson disease]. Pain and weakness caused by increased atmospheric pressure.

This brings about the absorption of atmospheric gases other than oxygen, particularly nitrogen. Release of pressure releases this nitrogen from solution in the blood and causes formation of gas bubbles in the tissues.

Treatment. Decompression, or increased pressure reapplied until nitrogen is redissolved in the blood, when gradual cessation of pressure is induced.

benecceptor (be-ne-sep'tor) [L *benē*, well, + *capere*, to take]. A nerve organ for the reception and transmission of beneficial stimuli.

Benedict's solution. A solution used to test for the presence of glucose. It consists of

B. test. Place 5 ml of Benedict's sol in a test tube and heat to boiling. Add 8-10 drops of urine. Mix and boil vigorously. Let cool slowly. Positive reaction indicated by turbidity of solution due to formation of a precipitate, which is greenish, yellow or brick-red depending on amount of glucose present.

Ben'edikt's syndrome. Hemiplegia with oculomotor paralysis and clonic spasm on opp side.

benign (be-lin') [L *benignus*, mild]. 1 Not recurrent 2 Not malignant. **b. stupor.** A stupor sometimes seen in the depression of manic-depressive psychosis.

benignant [L *benignus*, mild]. 1 Not malignant. 2 Not recurrent. **Syn** benign.

Benzedrine (ben-ze-drēn') Trade name for amphetamine. A colorless mobile liquid, producing local effects similar to those of ephedrine.

Uses. In head colds, by shrinking of the nasal mucosa, sinusitis, hay fever, asthma. Should be used with caution.

CONTRA. Cardiovascular disease.

Dosage. As a spray, 1% solution in liquid petrolatum, as an inhalant, one or two inhalations through each nostril at hourly intervals. Continued use should be guarded against sleeplessness and restlessness may be the result.

b. sulfate. A white, odorless powder, a cerebral stimulant, similar in its action to caffeine.

Uses. In the treatment of narcolepsy, and certain depressive psychopathic conditions. Its use should be under the strict supervision of the physician, and the same degree of caution should be exercised as with ephedrine.

Dosage. Average, 10 mg.

benzene, or **benzol** [L *benzinum*] C_6H_6 . A volatile liquid, immiscible with water, able to dissolve fats.

Important theoretically because it is the simplest member of the aromatic series of hydrocarbons, and useful practically because, prepared in the distillation of coal tar, it serves in the synthesis of innumerable dyes, drugs, etc. The phenyl radical, C_6H_5 , will be recognized in the formulae for phenol, dimethylaminoazobenzene (which see under azo-compounds), and benzoic acid.

Dosage. 2-10 m (0.12-0.6 cc.).

benzidine test. A test used to determine the presence of blood. Prepare benzidine sol as follows: to a sat solution of benzidine in glacial acetic acid, add equal volume of 3% hydrogen peroxide. Appearance of a blue color indicates presence of blood.

benzidine test diet. This consists of milk, crackers and rice.

An iron free diet, its purpose being to free the alimentary tract of any iron; often the stool is tested for iron. Since no iron was in the food, if any is present in the food masses, it must have come from only one source: the hemoglobin of the blood. Such a result is a positive test of bleeding into the intestinal tract, and an evidence of an ulcer. Patients should be watched to be sure that they eat nothing but those foods which are served at the prescribed times.

benzoate. Any salt of benzoic acid.

benzocaine (benz-o-kain'). Nontoxic local anesthetic. *Syn. anesthesin.*

DOSAGE 5 gr (0.3 Gm.)

benzoic acid, USP. May be obtained by sublimation from gum benzoin.

ACTION AND USES. Antiseptic, stimulant and diuretic.

DOSAGE 5-15 gr (0.3-1.0 Gm.)

benzoin (ben'zoin, -zo-in) [*L. benzoinum*].

USP. A balsamic resin from *styrax* b.

ACTION AND USES. A parasiticide, as a protective for ulcers, bedsores, etc.; promotes granulation when applied to wounds. *Tr.* benzoin comp., which is 10% benzoin, is used for inflamed mucous membrane of the throat and bronchi—by inhalation.

benzol [*L. benzolum*]. Same as benzene. Widely used in industry as from coal tar distillation, manufacture of motor fuels, rubber industry, manufacture of cans, lacquer and paint trades.

b. poisoning. *SYM.* Acute poisoning from exposure to high concentrations: Dizziness, weakness, followed by unconsciousness. *Chronic poisoning from prolonged contact.* Leads to aplastic anemia, various hemorrhages from any orifice or into skin, weakness, anorexia, headache.

F. A TREATMENT. Artificial respiration when indicated, repeated blood transfusions, oxygen inhalations. Otherwise symptomatic treatment.

Bérard's aneurysm (bā-rars'). An arteriovenous aneurysm in the tissues surrounding the injured vein.

Bérard's ligament (bā-rōz'). Pericardial suspensory ligament.

B.'s valve. Krause's* valve. Fold of mucous membrane at beginning of nasal duct.

Ber'levitz test. For pregnancy. Several drops of patient's citrated blood instilled into one eye, if contraction or dilatation of the pupil occurs, sometimes the two eyes alternately, pregnancy is assumed.

Bergeron's chorea (bair-zhē-rawn'). A hysterical type of chorea.

Bergmann's incision. One in flank for exposing the kidney.

Beriberi. A clinical syndrome associated with faulty nutrition, endemic in Oriental countries. May be acute or chronic.

Error. Deficiency in thiamine (vitamin B₁). There is a definite relationship between beriberi and an unbalanced diet, especially one rich in decorticated cereals.

SYM. Multiple neuritis; weakness and wasting of body tissue; palpitation;

shortness of breath, dropsy of feet and legs.

TREATMENT. Rest in bed, good hygiene, food rich in Vitamin B, fruit and vegetables. *PROG.* Good.

Bernard's canal or duct (ber-nar'). An accessory pancreatic duct. *Ductus pancreaticus accessorius, BNA.*

B.'s granular layer. Inner layer in cells lining acini of pancreas.

Bernreuter test (bern'rū-ter). A "yes" and "no" test of 125 questions, used to ascertain the attitudes and interest of a patient.

bertillonage (ber'tē-yon-āj). Physical measurement for identification of criminals.

Bertin, Bertini, columns of (ber'tan). Renal cortical columns supporting the blood vessels in the kidneys. The part that separates the medullary pyramids.

B.'s ligament. Illofemorall ligament.

besoin de respirer (ba-zwan de res-pi-ra') [*Fr.* need to breathe]. Sensation inducing act of breathing.

bestiality (bes-ti-al'ti-ti) [*L. bestia, beast*].

Cotition with an animal.

beta. Second letter of Greek alphabet. Used as a prefix to chemical words to note isomeric variety or position in compounds of substituted groups.

Beta rays. Negatively charged particles emitted by radium, more penetrating than alpha rays. Absorbed by 1 mm. lead or 0.6 mm. platinum.

beta test (bā'ta). An army group intelligence test used with those unable to read English.

betacism [*G. beta* the letter b]. Speech defect giving the b sound to other consonants.

betaine hydrochloride (bē-tain'). A colorless crystalline substance, containing 23% hydrochloric acid, and obtained from an alkaloid found in the beet, and other plants.

USES. A convenient method of administering hydrochloric acid, and for the same purpose.

DOSAGE 8 gr (0.5 Gm.) dissolved in water, which corresponds to about 18 m. dilute hydrochloric acid *USP.*

betalin S (bā'ta-lin). Synthetic vitamin B₁. 1 mg. contains 400 Sherman units.

betanaphthol (bē-tā-naf'thol). Occurs as a colorless or buff colored crystalline powder, with faint odor of phenol.

ACTION AND USES. Several times more antiseptic than phenol, irritating to mucous membrane when applied in solution, used externally in ointment 1 to 10%, internally, as intestinal antiseptic, but should be used with caution because of irritating effects on kidneys.

DOSAGE 4 gr (0.25 Gm.)

betaxin (bē-taks'in). Synthetic crystalline vitamin B₁ hydrochloride.

USES. In the various conditions due to deficiency of vitamin B₁, as beriberi, muscular weakness, etc.

DOSAGE Orally, from 1 to 5 mg. daily. Intramuscularly, from 1 to 10 mg.

Betz cell. A form of giant pyramidal cell in the cortical motor area.

bex (bēks) [*G. bēz, cough*]. A cough or condition characterized by a cough.

b. convulsiva. Whooping cough.

bezoar (bē-zō'ar) (Persian). A concretion from the stomachs and intestines of animals, and also in man as a hair-ball (*trichobezoar*), hair and vegetable fiber-ball (*trichophytobezoar*), and food-ball (*phytobezoar*).

Bezold's abscess (be'zolt's). Mastoiditis which involves the tip cell, causing abscess underneath insertion of sternocleidomastoid muscle

Bi. CHEM. Symb for bismuth

bi- [L *bis*, two] Prefix Two, double, twice, as *biopsy*

biartic'ular [l' + *articulus*, joint] Pert. to two joints, diarthric

bibasic (bi-ba'sik) [l' + G *basis*, foundation] Pert. to an acid with two hydrogen atoms replaceable by bases to form salts

bibulous (bib'u-lus) [L. *bibere*, to drink] Absorbent

bicam'eral [L *bis*, two, + *camera*, a chamber] Having two cavities or hollows, esp. an abscess divided by a septum

bicap'sular [l' + *capsula*, container] Having a double capsule

bicar'bonate [l' + *carbonate*] A salt resulting from the incomplete neutralization of carbonic acid or from the passing of an excess of carbon dioxide into a solution of a base

Sodium bicarbonate is NaHCO_3 , calcium bicarbonate is $\text{CaH}_2(\text{CO}_3)_2$. A carbonate composed of 2 equivalents of carbonic acid and 1 of a base

b. *blood*. That in the blood An alkali reserve index

bicarbonatemia (bi-kai-bō-nā-ti-mī-ā) Bicarbonate in the blood

bicar'diogram [l' + G *kardia*, heart, + *gramma*, a writing] A cardiogram curve representing the combined effects of the right and left ventricles

bicellular (bi-sel-u-lar) [l' + *cellularis*, little cell] 1 Composed of two cells 2 Having two chambers or compartments

bic'eps [l' + *caput*, head] Two-headed, in front of humerus and behind femur

b. *brachii*. Muscle of the upper arm, having two heads Flexes and supinates forearm

b. *femoris*. Muscle of the thigh

b. *reflex*. Biceps muscle contraction when tendon is percussed

BICEPS

1 Ulna 2 Humerus 3 Biceps 4 Radius

bicep'tor [l' + *capere*, to take] A receptor having two complementophilic groups

Bichat's canal (bi-shā's) The subarachnoid canal extending from third ventricle to middle of B's fissure carrying the veins of Galen

B's fat ball or pad. Mass of fat behind the buccinator muscle

B's fissure. The horseshoe fissure separating cerebrum from cerebellum.

B's foramen. Same as B's canal

B's ligament. Lower fasciculus of post. sacrotail ligament

B's membrane. *Lamina basalis*

B's tunic. The tunica intima of the blood vessels

bichloride of mercury (bi-klo'id) (corrosive mercuric chloride). A crystalline salt, Hg Cl_2 SEE *mercuric chloride*

POISONING SYM Intense burning of throat, mouth, and abdomen, difficulty or inability to swallow, mucous membrane of mouth and throat stained white, resembling boiled meat Nausea and vomiting, usually bloody Temperature below normal, collapse ensues

TREATMENT Use stomach pump or an emetic Give white of eggs or milk Follow with soothing drinks, such as barley water or flour and water Apply heat to abdomen Stimulate

bicho (bē'chō) Epidemic gangrenous proctitis

biciliate (bi-sil'i-āt) [L *bis* two, + G. *kyla*, eyelids] Having two cilia

bicip'ital [L *biceps*, two heads] 1 Pert. to a biceps muscle 2 Having two heads.

Bi.(CO.)₂. Bismuth carbonate

bicon'cave [L *bis*, two, + *concavus*, concave] Concave on each side, as a lens

bicon'vex [l' + *convexus*, rounded raised surface] Convex on two sides, as a lens.

bicor'nuate, **bicornuous** [l' + *cornutus*, horned] Having two processes or hornlike projections

b. *uterus*. Anomalous uterus resulting from incomplete union of the Mullerian ducts May be double or single organ with two horns

bicor'onial [l' + G *korōnē*, crown]. Pert. to the two coronas

bicor'porate [l' + *corpus*, body] Having two bodies

bicus'pid [l' + *cuspis*, point] Having two cusps or prongs

b. *valves*. Valves bet the left ventricle and left auricle (atrium) SEE: *heart*.

bicus'pid (bi-kus'pid). One of 2 teeth above and below on each side between the molars and canines

b. i. d. Abbr for *bis in die* twice daily

Bidder's ganglion. One of two ganglia or cardiac nerves

bidermo'ma [L *bis*, two, + G *derma*, skin, + *-oma* tumor] A teratoid growth having two germ layers *bidermoma*

bidet (bi-det') [Fr a small horse] A receptacle with attachments for giving injections, for a hip bath or sitz bath, or for washing the genitals or for douching.

biduous (bid-u-us) [L *bis* two, + *diēs*, a day] Continuing for two days

Biederman's sign (be'der-man's) Dusky redness of the lower ant. pillars of fauces in certain cases of syphilis

bier merin. Hormone in gastric juice. SYN *adysin*.

Bier's cup (beers) A clear glass cup provided with a pump and bulb named after the inventor

Its use is to induce hyperemia where there is pronounced external inflammation These cups vary in size, the smallest ones are used for carbuncles, the largest of such a diameter as will enclose an extremity of the body, as an arm or a foot

bifa'cial ([L *bis*, two, + *faciēs*, face]. Having similar opposite surfaces

bi'fid [l' + *findere*, to cleave]. Cleft or split into two parts

b. *spine*. Congenital fissure of vertebral column.

b. *tongue*. Cleft tongue

bifo'cal [l' + *focus*, hearth]. Having two foci, as b. *eyeglasses*.

bifo'rate [l' + *fora*, opening] With two openings

bifurcate (bi-fur'kate) [l' + *furca*, fork]. Having two branches or divisions; forked

bifur'cated. Having two branches, forked.

bifurcation (bi-fŭr-kā'shŭn) [L. bis, two, + *furca*, fork] A separation into 2 branches, the point of forking

Bigelow's ligament. The iliofemoral ligament, Y-ligament

B's septum. Bony tissue layer under neck of femur SYN *calcar femorale*

bigeminal [L. *bigeminum*, twin]. Double, paired

b. bodies. Either of the two anterior eminences of the corpora quadrigemina

b. pulse. Pulse in which beats are in groups of two with pause in between groups. SEE *pulse*, *b.*

bigeminum. A bigeminal body.

bigeminy (bi-jēm'in-i) [L. *bigeminum*, twin] Pulse marked by occurrence of 2 beats close together followed by a pause before next pair of beats SYN *pulse*, *bigeminal*.

bilabe (bi'lāb) [L. bis, two, + *labium*, lip] Device used for urethral extraction of vesical calculi

bilateral [' + *latus*, side] Pert to, affecting, or rel to two sides of the body.

b. symmetry. Symmetry of paired organs. SYN *bilateralism*

bilateralism (bi-lat'fr-āl-izm) [' + + + *G ismos*, condition] Arrangement on 2 sides, symmetry

bile (bil) [L. *bilis*, bile]. A secretion of the liver.

It is a thick, brightly colored, greenish, viscid fluid with a bitter taste which passes into the common bile duct and then into the duodenum as needed. The bile from the liver is straw color, while that from the gallbladder varies from yellow to brown and green. There are more solids in green bile and it is mixed with mucus.

It is also stored in the gallbladder, drawn upon as needed, and discharged into the duodenum. Contraction of the gall bladder brought about by a hormone, cholecystokinin, produced by the duodenum, its secretion being brought about by the entrance of fatty foods (esp egg yolk and cream) into the duodenum. Added to water, bile decreases surface tension, giving a foamy solution favoring the emulsification of fats and oils, this action is due to the bile salts, mainly sodium glycocholate and taurocholate.

Comp The bile pigments (principally bilirubin* and biliverdin*) are responsible for the variety of the colors observed. In addition, bile contains cholesterol, lecithin, mucin, and other organic and inorganic substances. The bile does not contain any important enzymes.

Funct Its importance as a digestive juice is due to its emulsifying action which facilitates the digestion of fats in the intestines by pancreatic steapsin, plus a further effect of the bile salts which form compounds with the fatty acids and are necessary for their absorption. Bile also stimulates peristalsis.

Normally the ejection of bile only occurs during duodenal digestion. Bile is both an antiseptic and a purgative. About 1800-2000 cc are secreted per 24 hr in the normal adult. SEE *gallbladder*.

PATH Interference with the flow of bile produces jaundice, resulting in unabsorbed fats being found in the feces. In such instances, fats should be restricted in the diet. Gallstones also may be produced in the gallbladder when the free flow of bile from the gallbladder is checked, or when pathological conditions impede bile production.

TEST FOR IN URINE There are several methods of testing for bile in the urine.

1 **Gmelin's Test**: 1 in. of concentrated nitric acid is carefully overlaid with the suspected urine. Bile is present when there is a play of colors at the junction of the fluids. This test can also be carried out by pouring some urine onto blotting or filter paper, and then placing a drop of concentrated nitric acid on the moist paper. From the spreading edge of the drop of acid will develop a ring of various colors in which green predominates and forms the outer band.

2 **Iodine Test** Take an inch of the suspected urine in a test tube and carefully overlay it with dilute tincture of iodine. A bright green ring will appear at the junction of the fluids, if bile is present.

RS *acholia*, *acholuria*, "*bilir*-" words, *cacocholia*, *calciobilia* "*chol*-" words, *hypercholia*, *oligocholia*, *stercobilin*, *urobilin*, *urobilinogen*.

b. acids. Complex acids, of which cholic, choleic, glycocholic, and taurocholic acids are examples, and which occur as salts (e. g., sodium taurocholate) in bile. They give bile its foamy character, are important in the digestion of fats in the intestine, and are reabsorbed from the intestine so as to be used again by the liver, this circulation of the bile acids is called the "enterohepatic circulation."

HAY'S TEST FOR Some urine is placed in a watchglass, and a little powdered sulfur is thrown on the surface. If bile acids are present, the sulfur sinks, due to the lowering of the surface tension by the bile salts.

b. ducts. Intercellular biliary passages conveying the bile from the liver to the hepatic duct which joins the duct from the gallbladder (cystic duct), to form the common bile duct (ductus choledochus), and which enters the duodenum about 3 inches (7.5 cm) below

BILE AND PANCREATIC DUCTS

1. Ampulla of Vater. 2. Duodenum. 3. Cystic duct. 4. Gallbladder. 5. Hepatic duct. 6. Common bile duct. 7. Duct of Wirsung. 8. Duct of Santorini.

the pylorus. SEE: *hepatic d.*, *cystic d.*, *common bile d.*, *gallbladder*.

b. pigments. Complex, highly colored substances found in bile, derived

from the red pigment (hemoglobin) of the blood, and imparting the brown color to intestinal contents and feces *Ex bilirubin, biliverdin*.

In estimating the concentration of bile pigment in the blood (*Van den Bergh test*), sulfanilic acid is added to the blood serum. If a great excess of bilirubin is present, a purple color is formed. This is called a *direct reaction*, and is said to indicate obstructive jaundice. If the amount of bilirubin is smaller, alcohol must be added to bring out the purple color. This is called an *indirect reaction*, and is said to be indicative of hemolytic jaundice. By comparing the color produced with a standard color, the amount of bilirubin in the blood serum may be estimated, the normal amount is about 2 mg per 100 cc of serum.

b. salts. Alkali salts of bile. Sodium glycocholate and sodium taurocholate.
bilharzia (bil-har'zi-ä) A parasitic fluke in blood supply of the liver. The eggs are found in great numbers in bladder or rectum.

bil- [L] Prefix Pert to bile.

biliary (bil'i-ar-i). Pert. to or conveying bile.

RS *bile, bile ducts, common bile duct, cystic duct, gallbladder, hepatic duct, liver*.

b. calculus. Cholelithiasis. Formation of stone in any of the biliary passages or in the gallbladder.

b. colic. Pain caused by the pressure or passing of gallstones.

b. ducts. Passages conveying bile from liver to hepatic duct. See *bile ducts*.

bilious (bil-i-a'shun) Excretion or secretion of bile.

bilifecia (bil-if-e'si-ä) [L. *bilis*, bile, + *faeces*, excrement] Presence of bile in the feces.

bilification [" + *facere*, to make] The formation of bile.

biliflav [" + *flavus*, yellow] A yellow pigment derived from biliverdin.

biliful [" + *fulvus*, tawny] Biliverdin mixed with other substances.

BILIARY TRACT

1. Pancreas. 2. Common bile duct. 3. Cystic duct. 4. Gallbladder. 5. Hepatic duct. 6. Liver. 7. Portal vein. 8. Hepatic artery. 9. Stomach.

bilifuscin (bil-i-fus'in) [" + *fuscus*, brown]. A dark green pigment in gallstones.

biligenesis (bil-i-jen'ë-sis) [" + *G genes*, origin] The formation of bile.

biligenetic. Forming bile.

biligenic (bil-i-jen'ik). Forming bile. SYN: *biligenetic*.

bilihum [L. *bilis*, bile, + *humus*, earth]. A dark residue after applying solvents to bile or gallstones.

bilin. Mixture of sodium glycocholate and sodium taurocholate extracted from bile.

bilineurin (bil'i-nü'r'in) [L. *bilis*, bile, + *G acuron*, nerve] $C_9H_{15}NO_2$. A toxic ptomaine from organic substances; choline.

bilious. 1 Pert to bile. 2 Afflicted with biliousness.

b. fever. Fever with vomiting of bile.

b. remittent. SEE *b. fever*.

biliousness (bil'yus-nes) 1 A symptom due to disordered condition of the liver causing constipation, headache, loss of appetite, and vomiting of bile. 2 Excess of bile, bilious fever. Fever with vomiting of bile.

TREATMENT. Rest in bed, saline cathartics, light diet, vegetable soup, fish, meat sparingly, no eggs, constitutional remedies.

biliphoen (bil-i-fe'in) [L. *bilis*, bile, + *G phaios*, tawny]. An impure bilrubin.

biliprasin [" + *G prason*, leek-green]. Green pigment similar to bilrubin.

bilipurpin, **bilipurpurin** [" + *purpur*, purple] A purple pigment derived from biliverdin.

bilirachia (bil-i-ra'ki-ä) [" + *G rachis*, spine] Bile in the spinal fluid.

bilrubin (bil-i-rü-bin) [" + *ruber*, red] ($C_{42}H_{54}N_2O_6$). The orange-colored or yellowish pigment in bile.

It is carried to the liver by the blood, the product of degenerated hemoglobin in bone marrow, in the spleen, and elsewhere. It is chemically changed in the liver and excreted in the bile through the duodenum. As it passes through the intestines it is converted into urobilinogen by the coli bacteria, most of it being excreted through the feces to which it gives then color. If urobilinogen passes into the circulation it is excreted through the urine if the kidneys remain intact. RS *bile pigments, cholepyrinum*.

bilirubinemia (bil-i-roo-bin-e'mi-ä) [" + " + *G aimia*, blood] Bilrubin in blood.

bilirubinuria [" + " + *G ouron*, urine]. Bilrubin in urine.

bilis [L] Bile

b. bovina, **b. bulbata**. Oxgall, used as laxative, cholagogue and intestinal antiseptic. SYN *fel bovis*.

bilitherapy [" + *G therapeia*, treatment].

Treatment with bile salts.

biluria (bil-i-nü'i-ä) [" + *G. ouron*, urine] Bile in the urine.

biliverdin (bil-i-ver'din) [" + *viridis*, green] A greenish pigment in bile formed in oxidation of bilrubin. RS: *bilifulvin, bilipurpin, choleverdin*.

bilocular [L. *bis*, two, + *loculus*, cell]. 1. Having two cells. 2. Divided into compartments.

bilon (bil-ron'). Iron bile salts.

Use. In oral management of biliary dysfunction.

DOSAGE. 15 to 60 gr. daily (0.97-3.9 Gm.).

bimanual [L. *bis*, two, + *manus*, hand]. With both hands, with two hands, as *b. palpation*.

bimaxillary [G *bios*, life, + L *maxillaris*, pert. to the jaw] Pert. to or afflicting both jaws

binary (bi'nar-i) [L *binarius*, of two] 1. Compounded of two elements 2 Separating into two branches

b. acid. One containing hydrogen and one other element.

binaural [L *binus*, two, + *auris*, ear]. Pert. to or having two ears

b. arc. The arc from one aural point to another across top of cranium

binauricular [+ *auricula*, little ear]. Pert. to or having two ears. SYN *binaural*.

binder [AS *bindan*, to tie up]. A broad bandage, most commonly used as an encircling support of abdomen or chest

b., abdominal. A wide band fastened snugly about the abdomen for support

b., chest. A broad band used for encircling the chest to apply heat, dressings, or pressure, and supporting the breasts. Improved by using shoulder straps to keep from slipping.

b., double T. A horizontal band about the waist to which two vertical bands are attached in back, brought around leg and again fastened to horizontal band. Holds dressings about perineum or genitalia (esp. male)

b., obstetrical. A broad bandage encircling entire abdomen from ribs to pelvis, affording support

b., T. Two strips of material fastened together, resembling a T, used as a bandage to hold a dressing on perineum of women, or vertex of head, etc.

b. towel. A towel encircling abdomen or chest with ends pinned or sewed together for support

blind web. 1 Connective tissue 2 Tissue forming framework of brain and spinal cord. SYN *neuroglia*.

Binet age (bi-na') Intellect as measured by the Binet-Simon tests as compared with the age of a normal child. The Binet age of an idiot is 1-2 yr, the imbecile, 3-9 yr, the moron, 8-12 yr

binocular [L *binus*, two, + *oculus*, eye] Pert. to both eyes

b. vision. Normal vision and use of

binotic [+ G *ous*, ear] Pert. to or having two ears. SYN *binaural* *

binovular [+ *ovum*, egg] Derived from or pert. to two ova

binuclear, binucleate [+ L *nucleus*, kernel] Having two nuclei

binucleolate (bi-nū-kle'o-lāt) [+ *nucleolus*, small nut] Having two nucleoli

bio [G] Prefix Life

bio-assay [G *bios*, life, + O Fr *essayer*, to try] Estimation of strength of a drug

bioblast [+ *blastos*, germ] A corpuscle that has not yet become a cell, micella

biocatalyst (bi-o-kat'al-ist) [+ *katalysis*, to dissolve] An enzyme, a biochemical catalyst

biochemistry [+ *chēmeia*, chemistry] The chemistry of living things, the science of the chemical changes accompanying the vital functions of plants and animals

biochemorphic (bi'o-kem-or'fik) [+ " + *morphe*, shape]. Pert. to the relation bet biologic action of drugs and foods and their chemical constitution.

biochemorphy (bi'o-kē-mor-fol'o-jī) [+ " + " + *logos*, study]. Science of chemical structure of substances as related to their action on the body.

bioclimatology (bi'o-kli-ma-tol'o-jī) [+ *klima*, climate, + *logos*, study] Relations of climate to life.

biocolloid (bi-o-kol'oid) [+ *kollōdēs*, glutinous] A colloid in animal or vegetable organism

biocytoculture [+ *kytos*, cell, + L *cultura*, cultivation] A culture made from live leukocyte bearing pus.

biocytoneurology (bi-o-si-to-nu-rol'o-jī) [+ " + *neuron*, nerve, + *logos*, study] The science of living nerve cells

biodynamies [+ *dynamis*, force]. The science of living force of energy

biodyne. A group of natural substances secreted by cells and having the function of regulating the growth and metabolism of the cells. They are secreted by cells into the intercellular fluid and act directly on neighboring cells

b. ointment. Preparation containing 3/4 proliferation-stimulating biodynes from liver, 1/4 respiratory-stimulating biodynes from yeast, and phenyl mercuric nitrate 1 20,000, in a special lanolin-petrolatum base. Uses. Externally, for the local treatment of burns and wounds.

biogen (bi'o-jen) [+ *gennan*, to generate] 1 Protoplasm 2 Assumed substance of a spiritual body

biogenesis [+ *genesis*, origin] Begetting living things from living things opp. to spontaneous generation

biogenetic. Pert. to biogenesis

biokinetics [G *bios*, life, + *kinētikos*, moving] The science of changes in developing organisms [Pert. to biology.]

biologic, biological [+ *logos*, study].

biologicals. 1 Complex substances of organic origin, depending on their action on the processes effecting immunity, used esp. in diagnosis and treatment of disease, as vaccines, serums, or antigens 2 Complex products, of organic or synthetic origin, obtained or standardized by biological methods, as insulin

biologist. A professional student of or a specialist in biology

biology (bi-ol'o-jī) [G *bios*, life, + *logos*, study] Science of life and living things RS "abio-" words, *genesis*, *orthogenesis* [living organisms]

b. dynamic. Science of activities of

b. static. Science of structures and potentialities of living organisms

biolysis (bi-ol'is-is) [G *bios*, life, + *lysis*, dissolution] Devitalization or destruction of living tissue by action of living organisms.

biolytic (bi-o-lit'ik) Capable of destroying

biometer (bi-om'et-er) [+ *metron*, measure] Instrument for measuring sounds

biometrics. Biometry

biometry [G *bios*, life, + *metron*, measure] 1 Application of statistics to biological facts 2 Computation of life expectancy [organism.]

bion (bi'on) [G *biōn*, living] Any living

bienergy (bi-on'er-jī) [G *bios*, life, + *ergon*, work] Vital energy or force.

bionomics (bi'ō-nōm'iks) [+ *nomos*, law] Branch of science dealing with the relations of organisms to their environments. SYN *ecology*.

bionomy. The science pert. to vital functions. [G *bios*, life, + *nomos*, disease]. Any disease due to pathogenic organisms.

biophagism, biophagy (bi-ol'ā-jizm, -ā-jī) [+ *phagēin*, to eat]. Absorbing nourishment from living matter [matter]

biophagous. Feeding on nonparasitic

biophilia (bi-o-phil'ā) [+ *philein*, to love]. Instinct of self-preservation.

biophore (bi'o-fōr) [+ *phoros*, bearing]. The ultimate unit having vital energy.

biophylac'tic [' + *phylax*, a guard]. Tending to preserve life

biophysics (bi-o-fiz'iks) [' + *physikos*, natural] Vital process phenomena

biophysiol'ogy [' + " + *logos*, study]. Study of morphology and physiology

bioplasm [' + *plasma*, matter]. Proto-plasm. Living substance SEE. *biogen*.

bioplas'mic. Pert to bioplasm.

bioplas'min [G *bios*, life, + *plasma*, matter] A hypothetical substance contained in every living cell, essential to its life.

bioplast (bi-o-plast) [' + *plassein*, to form] The cellular unit

bioplas'tic. Pert to a bioplast

bi'opsy [G *bios*, life, + *opsis*, vision]. Excision of a small piece of tissue for microscopic examination

bios (bi'os) [G] Life

bios'copy [G *bios*, life, + *skopein*, to examine] Examination to determine life.

biose (bi'os) A saccharide

biospectrom'etry [G *bios*, life, + L *spectrum*, image, + G *metron*, measure]. Clinical spectrometry to determine presence of foreign matter

biospectros'copy [' + " + G *skopein*, to examine] The clinical spectroscopy of living tissue [ence of metabolism]

biostat'ics [' + *statikos*, standing] Sci-

biotax'is, **biotaxy** [G *bios*, life, + *taxis*, arrangement] 1 The selecting and arranging activity of living cells. 2 Systematic classification of living organisms [laws of living organisms]

bio'tics [G *biōtikos*, living] Pert to the

biotin (bi-ot'in) [G *bios*, life, vital] A B vitamin named Vit H. The most powerful life substance known and a great stimulator. It is active in concentrations of one part to four hundred billion parts. It, with avidin,* seems to maintain an equilibrium of vital forces. Lack of this equilibrium may be the cause of disease

biotomy (bi-ot'o-mi) [G *bios*, life, + *tomē*, incision] Operation on living animals for pathological or physiological study. SYN *vivisection*.

biotox'in [' + *toxikon*, poison] A toxin from living tissues and juices

biotrip'sis [' + *tripsis*, rubbing]. A condition of the skin seen in old people in which skin wears away

May be smooth, pigmented, shiny, esp. on forehead, backs of hands, and shin.

biotropism (bi-ot'ro-pizm) [' + *tropē*, turning] Increased virulence resulting from therapeutic procedures

Biot's breathing or respiration (bi'ōs'). Rapid breathing with rhythmical pauses. Unfavorable in meningitis

bio'type [G *bios*, life, + *typos*, mark]. Fundamental constitution of an organism or those possessing it

biov'ular twins [L *bis*, two, + *ovulum*, ovum] Twins from two separate ova

bi'para [L *bis*, two, + *parēre*, to give birth]. Woman who has had two labors.

bioparas'itic [L *bis*, two, + G *para*, beside, + *sitos*, food] Pert to parasite living upon another parasite

bioparen'tal [' + *parēre*, to bring forth]. Derived from both parents.

biop'arous. Giving birth to two at a time.

biop'ar [' + *polus*, a pole]. 1. Having 2 poles or processes. 2 Pert to the use of 2 poles in electrotherapeutic treatments.

When referring to an alternating current, biternal should be used.

b. nerve cell. Cell with 2 processes.

b. version. Braxton Hicks v.; a combined one. Changing a cephalic position into a podalic one, or *vice versa*, by

placing 1 hand on fundus of uterus and 2 fingers of other hand in cervix

B. I. P. P. The letters stand for *bismuth*, *iodoform*, *paraffin paste*. A paste used during the first World War

It is used for deep septic cavities. The wound is first thoroughly irrigated to clear it of pus, and then the cavity is swabbed out quite dry (this last is an important point). The paste is spread on ribbon gauze and packed, not too tightly, into the cavity until it is filled up. Outer dressings of sterile gauze and wool are applied, and these are not removed for two or three days.

biramous (bi-ra'mus) [' + *ramus*, a branch] Possessing two branches

Birdsall punch. Modification of the caulk punch for using the cutting current for excision of the prostatic median bar.

birefrac'tive, **birefrin'gent** [L *bis*, two, + *refrangere*, to break up]. Splitting a ray of light in two

birth [ME *byrthe*, birth]. Act of being born. Passage of a child from uterus

b., **complete**. The instant of complete separation of the body of the infant from that of the mother, regardless of cord or placenta detached

b. control. Any method used to prevent conception, such as artificial devices used by the male or the female

Rhythmic control consists of abstinence from copulation excepting during a certain period following menstruation, after the descent of the ova and before the next menses. Any change in periodicity necessitates the establishment of a new period of sterility

b., **cross**. With fetus across the uterus

b., **dry**. Birth following premature rupture of the fetal membrane

b., **live**. An infant showing one of the three evidences of life (breathing, heart action, movements of a voluntary muscle) after complete birth [injury]

b., **mark**. Nevus, mark from birth

b., **palsy**. Paraplegia or hemiplegia caused by birth injury. Injury to some shoulder muscles may cause Erb's palsy

b., **premature**. One bet 7th month and term

b., **still**. An infant not exhibiting evidence of life after complete birth

bisacro'mial [L *bis*, two, + G *akron*, point, + *ōmos*, shoulder]. Pert. To both acromial processes

bisection (bi-sek'shun) [' + *sectiō*, a cutting]. Division into 2 parts

bisexual [' + *sexus*, sex]. Hermaphroditic, having imperfect genitalia of both sexes in one person

bisferious (bis-fer'i-us) [' + *ferre*, to beat]. Having two beats; dicrotic

bisiliac (bis-il'i-āk) [' + *ilium*, ilium]. Pert to the two most distant points of the two iliac crests

bis in d., bis in die [L]. Twice a day

bismarsen (bis-mar'sen). A bismuth derivative of arsphenamine containing approximately 13% arsenic and 24% bismuth

Uses: Same as arsphenamine, but said to be slower in its action

DOSAGE: Initial, 0.1 Gm intramuscularly, succeeding doses, 1½-3 gr (0.1-0.2 Gm) at weekly intervals, a few drops of a 2% solution of butyn should be added to lessen the pain on administration.

bismosol (biz'mo-sol). A solution of potassium sodium bismuthotartarate (containing 35% bismuth)

Uses: In treatment of syphilis.

DOSAGE: Intramuscularly 15 m (1.0 cc.)

every 2 to 7 days for 20 doses; after interval of 1 month a second course may be given.

bismuth (biz'muth) [L. *bismuthum*]. A drug used as a protective for inflamed surfaces, and as an opaque medium for x-ray visualization.

POISONING **SYM** Metallic taste, foul breath, fever, gastrointestinal irritation. Bismuth line at gum margin, ulcerative process of gums and mouth, headache. Albuminuria, resembles lead poisoning with an absence of the blood changes and paralyses.

F A TREATMENT Removal of source of bismuth, gastric lavage, saline cathartic, treat symptomatically.

b. sodium tartrate. Contains 72.7 to 73.9% bismuth. Uses In treatment of syphilis. Dosage: $\frac{1}{2}$ gr. (0.03 Gm.) intramuscularly.

b. subcarbonate. USP. Uses As an antacid. **SFX** bismuth subnitrate. **INCOMPATIBILITIES** Sulfides, acids, acid salts. Dosage 15 gr. (1 Gm.).

b. subgallate (Dermatol) USP. A bright yellow powder without odor or taste. Uses First introduced for treatment of skin diseases. General use—same as bismuth subnitrate. Dosage: 15 gr. (1 Gm.).

b. subnitrate. USP. Occurs as heavy white odorless powder. **INCOMPATIBILITIES** Acids, tannins, and sulfides. Uses: Astringent, protective antiseptic. Dosage: 15 gr. (1 Gm.).

bistoury (bis'to-ri) [Fr. *bistouri*, surgical knife]. Small surgical knife used in minor operations, special varieties are tenotomes, gum lancets, hernia knives, and lithotomy bistouries.

bite (bit) [A.S. *bitan*, to puncture]. 1. To cut with the teeth. 2. A bite by an insect. 3. Occlusion of the teeth.

b., close, closed. One in which lower incisors lie behind upper incisors.

b., end-to-end. One in which incisors of both jaws meet along cutting edge when jaw is closed.

b., open. One in which labial teeth cannot come together.

b., over. One in which upper incisors overlap lower ones when jaws are closed.

bitelock. Device for retaining position biters outside the mouth.

bitemporal [L. *bis*, two, + *temporalis*, pert. to a temple]. Pert. to both temples or temporal bones.

bite plate. A plate to support a biterim.

biterim. A rim of wax placed on base plate as a guide for inserting artificial teeth.

biterminal [L. *bis*, two, + *terminalis*, pert. to an end]. Using an alternating current and two poles in electrotherapeutic treatment. **SFX** bipolar.

bites. Injuries in which body surfaces are torn by insects or animals, resulting in abrasions, punctured, or lacerated wounds.

PREVENTION Aromatic oils, especially oil of citronella and smoke of all kinds.

SYM May be evidence of a wound usually surrounded by a zone of redness and swelling, often accompanied by pain, itching, or throbbing. Often become infected and may contain specific noxious materials as bacteria or venom of rabies.

F A TREATMENT If suspected of poison, apply tourniquet first. Induce bleeding to wash out foreign material. Apply antiseptic, sterile dressing.

RS: bee stings, bedbugs, bot flies, cat bites, chiggers, dog bites, fleas, freezing, frost, hornet, human bites, insects, name of, poisonous fish, scorpions, snakes, spiders, tarantulas, and wasp.

b. insect. They contain an acid substance resembling formic acid and consequently are relieved by alkalies, as ammonia water, baking soda paste or even soap paste rubbed on.

Others, such as the bee, wasp, and hornet, contain unknown organic substances for which there is no specific antidote. (Remove the "stinger" if one is present.) Poisonous spiders (especially the "black widow"), *q.v.*, scorpions, *q.v.*, tarantulas, *q.v.*, poison fish, *q.v.*, etc., should have the tourniquet applied promptly, incise with any sharp instrument, and cauterize with heat or chemically (nitric acid or silver nitrate). Successive incisions are necessary if swelling progresses. Do not remove tourniquet too soon, use caution in removal.

Bitot's spots. Triangular, shiny, gray spots on the conjunctiva seen in vitamin A deficiency.

bitter (bit'er) [A.S. *biter*, strong]. 1. Having a disagreeable taste. 2. Sensation of taste stimulated by strong disagreeable flavor.

bitterling fish (for pregnancy). A Japanese carplike fish is placed in a quart of fresh water with 2 teaspoonfuls of a woman's urine. A long tubular oviduct will grow from the fish's belly if the woman is pregnant.

bit'ters [A.S. *biter*, strong]. Herb tonic for stimulating the tone of gastrointestinal mucous membrane.

b., aromatic. Substances having aromatic properties. [digestive mucosa.]

b., simple. Those which stimulate the

b., styptic. Those with styptic and astringent properties.

bi'uret [L. *bis*, two, + *urea*]. A crystalline decomposition derivative of urea.

b. reaction. Rose to violet coloring in an aqueous solution of protein, when dilute solution of copper sulfate and sodium hydroxide are added to it.

b. test. Use of above reaction to detect presence of urea or any soluble protein. **SFX** test, b.

bivalent (bi-vă'lent) [L. *bis*, two, + *valens*, powerful]. 1. Having a valence of 2. 2. Biol. Double, as a chromosome consisting of 2 joined chromosomes. 3. A bivalent chromosome.

biven'ter [' + *venter*, belly]. A muscle with two bellies, pert. to several muscles.

biven'tral. Diaphragm, with two bellies.

Bizzoxero's corpuscles (bit-sol'se-ro-s) Nucleated red blood cells, round or elliptical.

Gjerrum screen. Tangent plane for mapping field of vision, esp. central and para-central scotomata.

B. sign. One seen in glaucoma, a sickle-shaped blind spot usually found in central zone of the visual field. **SFX** sign.

black (blăk) [A.S. *blæc*, dark]. 1. Devoid of color, reflecting no light. 2. Marked by dark pigmentation.

b. blood. Impure or venous blood.

b. body. Phrys. A body that absorbs all radiation falling upon it.

b. cancer. An abnormal deposit of black matter in various parts of the body in melanosis.

b. death. A contagious, malignant disease, as the bubonic plague.

b. eye. Subcutaneous extravasation of blood into the eye or orbit, usually the result of injury. **SYM** Pain, swelling, discoloration. **TREATMENT** Cold applications with pressure for 12 to 24 hr.—tends to prevent swelling. Later, apply heat and frequent gentle massage directed toward periphery.

b. head. Comedo *

b. measles. A severe type of measles in which the eruption is very dark due to hemorrhage under the skin

b. tongue. Presence of dark patch on back of tongue caused by microphytes. **SYN** *glossophytia*

b. vomit. The vomiting of black matter as in yellow fever

blackberries [“ + *berie*, berry] **NUTRIENTS** *

A. P. Prot 1.03, Fat 0.08, Carbo. 6.3 per serving. **FUEL VALUE** 100 Gm.—58 cal. **ASH CONTS** Ca 0.017, Mg 0.021, K 0.169, Na 0.007, P 0.034, Cl 0.010, S 0.020, Fe 0.0006. **AV. SERVING** 75 Gm

blackout. 1 Temporary loss of consciousness. 2 Temporary loss of vision in aviators due to changing course at high speed.

blackwater fever [“ + *waeter*, water] **Hemoglobinuria** * A pernicious, fatal, infectious malarial fever due to the destruction of the red blood cells by the malarial organism.

SYM There is a marked *hematuria* * also jaundice and vomiting. The urine is dark, containing blood.

TREATMENT Similar to that for typhoid. Keep mouth clean. Guard against suppression of urine. Rectal feeding may be necessary.

black widow [“ + *AS weoduwe*, widow]. *Lactrodectus mactans*. A poisonous spider *

bladder [*AS. blaedre*, bladder] 1 A membranous sac or receptacle for a secretion, as the *gallbladder*, *q.v.* 2 The vesicle which acts as a reservoir for urine. **SEE** *urinary b.*

THE MALE BLADDER (rear view)

1 External trigone. 2 Line of reflection of the peritoneum. 3 Left ureter. 4 Ejaculatory duct of right side.

b., atony of. Inability to urinate, due to lack of muscular tone

b., catarrh of. Cystitis.

b., exstrophy of. The nonclosure of the bladder.

b., irritable. Marked by a constant desire to urinate.

b., nervous. Irritable b. with incomplete urination.

b., stammering of. Interruption of urination *

b., urinary (vesica urinaria). The muscular, membranous, distensible reservoir for the urine, which it receives from the kidneys through the ureters, and which it discharges from the body through the urethra * It has no function other than that of a reservoir.

ANAT It is covered with peritoneum and lined with mucous membrane, made up of a vault, two lateral walls, a fundus (the pouch above and behind the trigone*), and a trigone (at the base); the urethral orifice is called the neck.

The bladder is supported by numerous ligaments, supplied by the sup., middle, and inf. vesical arteries, and numerous veins and lymphatics, and innervated with nerves derived from the third and fourth sacral by way of the hypogastric plexus.

It is situated in the ant. part of the pelvic cavity, in front of the ant. wall of the vagina and the uterus, and in the male it lies in front of the rectum. It is about 5x3x5 in. in size and has a storage capacity in health of ½ to 1 pt., although it may be greatly distended.

PHYS An average of 40 to 50 oz. of urine are secreted within a 24-hr. period. Inability to empty the bladder is known as “retention” and may call for catheterization. Sphincter muscles control retention within the bladder.

PALPATION Of The bladder cannot be palpated when empty. When full it appears as a tumor in the hypogastric region, which, on palpation, is smooth and oval.

FECUSSION of. When containing urine its rounded margin is easily made out by observing the tympanic sound of the intestines on one hand, and dull sound of the bladder on the other.

b.-worm. Larval type of tapeworm.

bland [*L. blandus*, soft]. Soothing, mild.

b. diet. One soothing in flavor and texture, all food which causes chemical, mechanical, or thermal irritation is avoided.

Blandin's glands (*blan-dāns'*). *Glandula lingualis* ant. or Nuhn's glands. Glands near tip of tongue.

-blast. A suffix used to designate a cell or a structure which gives rise to a definitive structure. **Ex** *epiblast*, *erythroblast*, *fibroblast*.

blast [*G. blastos*, germ]. A nucleated erythrocyte, also called an *erythroblast*. Normally these are not found in the circulating blood, since the red cells lose their nucleus on leaving the bone marrow. In certain blood diseases, such as pernicious anemia, large numbers of nucleated cells may appear in the blood over the period of a few days. This is known as a *blood crisis*.

blast. A violent movement of air such as accompanies the explosion of a shell or bomb, a violent sound as the blast of a horn.

b. injury. A clinical condition which follows severe non-penetrating chest injuries. Effects may vary slight respiratory distress to cessation of respiration.

blaste'ma [*G. blastēma*, sprout] Immature material from which cells and tissues are formed.

blas'tid, blas'tide [*G. blastos*, germ]. Marking site of the nucleus in the impregnated ovum.

blasto- [G] Prefix Germ or bud
blastocoele (blas'to-sēl) [G *blastos*, germ, + *kōilos*, hollow] The cavity of the blastula, an embryonic stage of development; the segmentation cavity
blastochyle (blas'to-kīl) [G *blastos*, germ, + *chylōs*, juice] Blastocoele fluid
blastocyst (blas'to-sist) ["" + *kystis*, bag] A stage in the development of a mammalian embryo which follows the morula. It consists of an outer layer or trophoblast to which is attached an inner cell mass. The enclosed cavity is the blastocoele. The whole is called blastodermic vesicle or blastocyst
blas'tocyte ["" + *kytos*, cell]. The morula after change into a cyst
blas'toderm ["" + *derma*, skin] A disk of cells (*germinal disk* or *blastodisk*) which develops on the surface of the yolk in an avian or reptilian egg from which the embryo develops, also applied to the embryonic disk of mammalian embryos, a disk of cells lying between the yolk sac and the amniotic cavity from which the embryo develops. From the blastoderm, the three germ layers, *ectoderm*, *mesoderm* and *endoderm* arise
blastodermic vesicle. A blastocyst
blastogen'esis [G *blastos*, germ, + *genesis*, generation] 1. Multiplication by budding. 2. Transmission of characteristics from parents to offspring by the germ cells
blastol'ysis ["" + *lysis*, dissolution] Lysis or destruction of a germ cell
blas'toma (pl. *blastomata*) ["" + *-ōma*, tumor]. A granular tumor formed by a single type of tissue, including *fibromas* and *chondromas*
blastomere (blas'to-mere) ["" + *meros*, a part] One of the cells resulting from the cleavage or segmentation of a fertilized ovum
blastomero'tomy ["" + *tomē*, incision] Destruction of blastomeres
Blastomyces (blās'to-mī-sēz) (pl. *blastomyces*) [G *blastos*, germ, + *mykes*, fungus] A genus of yeasts with a morphological similarity to the *Saccharomyces*. Blastomyces refers to those yeasts which are pathogens to man and animals
B. coccidioid'es (*Coccidioides immitis*) The pathogen of coccidioidal granuloma. Its reproduction in the tissues of infected animals is by endosporeulation
B. dermatit'idis. The pathogen causing in man blastomycotic dermatitis and in some instances generalized blastomycosis
B. farcimino'sus. The pathogen causing blastomycotic epizootic lymphangitis in horses
blastomycetes (blas-to-mī-sē'tēs) ["" + *mykes*, fungus] Saccharomycetes, budding fungi, yeast fungi
blastomyc'o'sis ["" + *mykēs*, fungus]. A disease caused by budding yeast fungi in the tissues
blastopore (blas'to-pōr) ["" + *poros*, passageway] The small opening into the archenteron made by invagination of the blastula
blas'tosphere ["" + *sphaira*, circle] Blastula or germinal vesicle
blas'tospore ["" + *sporos*, seed] A thallospore formed by budding from a hypha
blastula (blas'tu-lā). An early stage in the development of an ovum consisting of a hollow sphere of cells enclosing a cavity, the blastocoele. In large-yolked eggs, the blastocoele is reduced to a narrow slit. In mammalian development, the blastocyst or blasto-

dermic vesicle corresponds to the blastula of lower forms
blas'tular. Pert to a blastula.
blastulation (blas-tu-lā'shun). The formation of the blastula or blastosphere
Blat'ta orienta'lis [L] The common cockroach
Blaud's pills. Named after a French physician. Contents are sulfate of iron and carbonate of potash. Their use is indicated in anemia, amenorrhea, etc.
INCOMPATIBILITIES Tea (*tannin*)
bleaching powder (blēsh'ing) [A.S. *blæcan*, to pale] Chlorinated lime
blear-eye. Marginal blepharitis. Chronic inflammation of margins of eyelids
bleb. Elevation of the epidermis, irregularly shaped. A blister or a bulla
 They vary in size from a bean to a goose egg and they contain serous or seropurulent, or bloody fluid. A primary skin lesion. They occur in *dermatitis herpetiformis*, *pemphigus*, and *syphilis*.
See bulla
bleeder [A.S. *bledan*, to bleed] One who bleeds an abnormal amount. **See** hemophilia
blee'der's disease. Congenital blood condition marked by inability of blood to coagulate. **Syn** hemophilia
bleeding (blēd'ing) [A.S. *bledan*, to bleed]. 1. Emitting blood. 2. Process of emitting blood, or a hemorrhage or operation of letting blood
 The plasma of the blood, when exposed to air, changes its character to fibrin which entangles the corpuscles and forms a blood clot. For this reason wounds should not be washed with water. Calcium salts are essential to clotting of the blood and they are often given before an operation for this purpose. They contract the cardiac muscles of the heart. **See** hemorrhage, blood clotting
b., arterial. This is indicated by bleeding in spuits. Color, bright red
TREATMENT Pressure with fingers above at nearest pressure point bet it and heart. Locate drainage artery and apply digital pressure above it until bandedaged. Elevate with patient recumbent
b. time. About 3 minutes or less
b., venous. Flow continuous. Color of blood, dark red
TREATMENT Patient recumbent. Pressure below wound with wound bet heart and hand. Bandage over wound above and below
blen'a [G *blennos*, mucus] Mucus
blennadenitis (blen-ad-en-'tis) ["" + *adēn*, gland, + *-itis*, inflammation]. Inflammation of mucous glands
blennelytria (blen-el-'tī-lā) ["" + *elytron*, vagina] An abnormal white mucous discharge from vagina or cervical canal. **Syn** leukorrhoea
blennemesis (blen-em'es-is) ["" + *emesis*, vomiting] Vomiting of mucus
blennenteritis (blen-en-ter-'tis) ["" + *enteron*, intestine, + *-itis*, inflammation] Enteritis accompanied by a flow of mucus
blennisthmia (blen-isth'mī-ā) ["" + *isthmos*, neck] Catarrh of the pharynx
blenno- [G] Prefix Pert to mucus
blennocystitis (blen-o-sis-'tis) [G. *blennos*, mucus, + *kystis*, bag, + *-itis*, inflammation] Inflammation of the urinary bladder
blennogenic, or blennogenous (blen-o-jen'ik, or blen-o-jen-us) ["" + *gennan*, to produce] Secreting mucus.

blennoid (blen'oid). Like mucus; mucoid.
blennometritis (blen-o-me-tri'tis) [G *blennos*, mucus, + *mētra*, womb, + *-itis*, inflammation]. Inflammation of the uterus

blennophlogisma, **blennophlogosis** (blen-o-flo-jis'mā, blen-o-flo-jo'sis) [' + *phloz*, flame, + *gennan*, to produce]. Inflammation of a mucous membrane

blennophthalmia (blen-off-thal'mi-ā) [' + *ophthalmos*, eye]. Catarrhal conjunctivitis

blennoptysis (blen-op'tis-is) [' + *ptyein*, to spit]. Expectoration of mucus from the bronchi.

blennorrhagia (blen-or-a'ji-ā) [' + *rēgnuui*, to break forth] 1 A discharge from mucous membranes, esp gonorrheal discharges from the genital or urinary tract 2 Gonorrhea

b. of conjunctiva. ΟΡΗΤΗ Adult form: gonorrheal ophthalmia.

b. of lacrimal sac. A chronic catarrhal inflammation of the mucous membrane lining the lacrimal sac, resulting in retention of the mucous secretion and tears. **Proc** Depends upon the degree. **Treatment** Probe lacrimal apparatus and leave free passage for secretion. Indicated remedies.

Infantile form *ophthalmia neonatorum*. **Treatment**: Prophylactic

blennorrhagic (blen-o-raj'iki). Pert to blennorrhoea, blennorrhical.

blennorrhoea (blen-or-ē'ā) [G. *blennos*, mucus, + *roia*, flow]. Discharge from mucous membranes, esp gonorrheal discharge from genital or urinary tract. **Syn** *blennorrhagia*.

blennorrhoeal (blen-o-rē'āl). Blennorrhagic; pert. to blennorrhoea

blennorrhinia (blen-or-in'i-ā) [G *blennos*, mucus, + *ris*, nose] Coryza. Catarrh of the nasal passages.

blennosis (blen-o'sis). Any disease of a mucous membrane

blennostasis (blen-os'tas-is) [G. *blennos*, mucus, + *stasis*, a halt]. The checking of any mucous discharge.

blennostatic. Diminishing mucous secretion

blennostromous (blen-o-stru'mus) [G. *blennos*, mucus, + *L struma*, scrofula]. Pert to gonorrhea and scrofula.

blennothorax (blen-o-tho'raks) [' + *thōraz*, chest]. Pulmonary catarrh

blennorrhoea (blen-ot-or-ē'ā) [' + *ous*, ear, + *roia*, flow] A discharge of mucus from the ear

blennurethria (blen-u-rē'thri-ā) [' + *ourēthra*, urethra]. Gonorrhea of the urethra

blennuria (blen-nu'ri-ā) [' + *ouron*, urine] Excess of mucus in the urine

blepharadenitis (blef-ar-ad-en-i'tis) [G. *blepharon*, eyelid, + *adēn*, gland, + *-itis*, inflammation] Inflammation of the meibomian glands **Syn** *blepharoadenitis*.

BLEEDING: ARREST OF

For Wounds of the Face

Artery	Bone Against Which Pressure Is Applied	Course	Spot to Apply Pressure
Temporal	Temporal bone	Upwards of 1/2 in. in front of ear	Against bony prominence immediately in front of the ear or on temple
Facial	Low part of lower maxilla	Across the jaw diagonally upward from below	An inch in front of angle of lower jaw on the face
Carotid	Cervical vertebrae	From outer upper edge of sternum to angle of jaw	Deeply down and backwards an inch to the side of the prominence of the windpipe

For Wounds of the Upper Extremity

Subclavian	First rib behind clavicle	Across middle of first rib to armpit	Deeply down and backwards over center of clavicle against first rib—(depress the shoulder first).
Axillary	Head of humerus	Descends across outer side of armpit to inside of humerus	High up in the armpit against upper part of humerus
Brachial	Shaft of humerus	Along inner side of humerus under edge of biceps muscle	Against shaft of humerus by pulling aside and gripping biceps, pressing deep down tips of fingers against the bone

For Wounds of the Lower Extremity

(a) Femoral	Brim of pelvis	Down the thigh from the pelvis to the knee from a point midway bet iliac spine and symphysis pubis to inner side of end of femur at knee joint	Against brim of pelvis, midway bet iliac spine and symphysis pubis
(b) Femoral	Shaft of femur		High up on the inner side of the thigh, about 3 inches below brim of pelvis, over the line given in the direction of the knee
Posterior Tibial	Inner side of tibia, low down above ankle	Downwards to foot in hollow just behind the prominence of inner ankle	For wounds in the sole of the foot against the tibia in center of the hollow behind the inner ankle

blepharal (blef'ar-al). Pert. to an eyelid.
blepharodema (blef'ar-ê-de'mă) [G. *blepharon*, eyelid, + *oidēma*, swelling]. Swelling of the eyelids.

blepharolosis (blef'ar-el-o'sis) [" + *eilein*, to roll]. Ingrowing eyelashes.

blepharism [" + *ismos*, condition of]. Twitching of the eyelids.

blepharitis (blef'ar-'tis) [" + *-itis*, inflammation]. Inflammation of the edges of the eyelids involving hair follicles and glands opening on surface, ulcerative and nonulcerative.

ETIOI. Astigmatism, excessive use of the eyes, constant exposure to dust, smoke or overbright light, much weeping, etc. Found in conjunctivitis,* measles,* and in catarrhal affections of eye.

SYM. Lids red, tender, and sore, with sticky exudate, ulcers on edges, lids may become inverted, lashes falling out, and epiphoria* occurring. Styes and meibomian cysts are associated with the condition.

NP. Bathe lids with borax and warm water to remove crusts. Ointment to edges. Good food, cod liver oil.

RS. *blear-eye*, *madayosis*.

b. ciliaris, **b. marginalis**. Inflammation affecting the ciliary margins of the eyelids.

b. squamosa. B. with scaling.

b. ulcerosa. B. with ulceration.

blepharo- (blef'ar-o) [G.]. Prefix. Pert. to the eyelid.

blepharoadenitis (blef'ar-o-ad-en-'tis) [G. *blepharon*, eyelid, + *aden*, gland, + *-itis*, inflammation]. Inflammation of meibomian glands.

blepharadenoma (blef'ar-o-ad-e-no'mă) [" + *-oma*, tumor]. Adenoma or glandular tumor of eyelid.

blepharoatheroma (blef'ar-o-ath-ê-o'mă) [" + *athērē*, thick fluid, + *-oma*, tumor]. Sebaceous cyst of an eyelid.

blepharochalasis (blef'ar-o-kal'us-is) [" + *chalasis*, relaxation]. Relaxation of skin of eyelid due to loss of elasticity following edematous swellings, such as in recurrent angioneurotic edema of lids.

bleph'arochromidrosis [" + *chrōma*, color, + *idrōs*, sweat]. Discolored sweat of the eyelid.

bleph'aroclonus [" + *klonos*, tumult]. Clonic spasm of muscles of the eye.

blepharconjunctivitis (blef'ar-o-con-junc-tif'itis) [" + *L conjunctiva*, + *G. -itis*, inflammation]. Inflammation of eyelids and conjunctiva.

blepharodiastasis (blef'ar-o-di-as'tas-is) [" + *diastasis*, separation]. Excessive separation of eyelids.

blepharolithiasis (blef'ar-o-lith-'iās-is) [" + *lithos*, stone]. Concretions within the eyelid.

blepharomancus (blef'ar-on'kus) [G. *blepharon*, eyelid, + *ogkos*, tumor]. Tumor of the eyelid.

blepharon (blef'ar-on). The eyelid; palpebra.

blepharopachynsis (blef'ar-o-pă-kin'sis) [" + *pachynsis*, thickening]. Thickening of the eyelid.

blepharophimosis (blef'ar-o-fi-mo'sis) [" + *phimosis*, narrowing]. Narrowing of slit between eyelids at external angle of eye due to angle being covered by vertical fold of skin.

blepharophryplasty (blef'ă-rô-frī-plas-tī) [" + *ophrys*, eyebrow, + *plassem*, to mold]. Plastic operation for restoration of eyelid and eyebrow.

bleph'aroplast [" + *plassem*, to form]. A minute mass of chromatin in a cell forming the base of a flagellum.

blepharoplasty (blef'ar-o-plas-tī) [" + *plassem*, to form]. Plastic operation upon the eyelid.

blepharoplegia (blef'ar-o-ple'jī-ă) [G. *blepharon*, eyelid, + *plēgē*, a stroke]. Paralysis of an eyelid.

blepharoptosis (blef'ar-op-to'sis) [" + *ptōsis*, a falling]. Drooping of the upper eyelid.

blepharopyorrhea (blef'ăr-o-pī-or-ê'ă) [" + *pyon*, pus, + *roia*, flow]. Pus flowing from the eyelid.

blepharorrhaphy (blef'ă-roi'răf-I) [" + *raphē*, seam]. Reducing length of palpebral fissure by stitching margins of eyelids at outer canthus.

blepharorrhea (blef'ăr-or-ê'ă) [" + *roia*, flow]. Discharge from the eyelid.

blepharospasm (blef'ar-o-spazm) [" + *spasmus*, spasm]. A twitching or spasmodic contraction of the orbicularis palpebrarum muscle due to habit spasm, eyestrain or nervous irritability.

blepharosphincterectomy (blef'ar-o-sfink-ter-êk'to-mī) [" + *sphinktēr*, a constrictor, + *ektomē*, excision]. Excision of part of the orbicularis palpebrarum to relieve pressure of eyelid on cornea.

blepharostat (blef'ar-o-stat) [" + *istanai*, cause to stand]. Device for separating the eyelids during an operation.

blepharostenosis (blef'ar-o-sten-o'sis) [" + *stenosis*, a narrowing]. Narrowing of the palpebral slit through inability to open the eye normally.

blepharosynechia (blef'ar-o-sī-nek'jī-ă) [" + *syncheia*, a holding together]. Permanent adhesion of the eyelids.

blepharotomy (blef'ar-o'to-mī) [" + *tomē*, a cutting]. Cutting of eyelid.

blepsopathia (blep-so-path'i-a) [G. *blepsis*, sight, + *pathos*, disease]. Eyestrain.

Blessig's groove. A mark in the embryonic eye indicating the *ora serrata*, or retinal anterior edge. SEE *groove*.

blind [A.S. *blind*, unable to see]. Without sight.

blindness [A.S. *blind*, unable to see]. Amaurosis; loss of sight.

b., color. Inability to distinguish one or more primary colors.

b., day. Inability to see in daylight; hemeralopia.

b., letter. Inability to understand the meaning of letters, a form of aphasia.

b., night. Nyctalopia, inability to see at night.

b., psychic. Sight without recognition due to brain lesion.

b., snow. ETIOI. Glare of sunlight upon the snow, temporary.

b., word. Inability to understand written or printed words.

blindness, words pert. to: albelesia, acathemesia, achloropsia, "achro-" words, aglaupopsia, amanthimopsia, amaurosis, amaurotic, aphemesia, axanthopsia, acritochromacy, blind spot, blindness, chionolepsia, color, hemeralopia, hemiachromatopsia, hemianopia, meropia, mild b., night b., nyctamblyopia, nyctophobia, nyctotrophos, trianopia, typhology, word b., xanthochromia.

blind spot [A.S. *blind*, unable to see, + ME *spot*, small bit]. Physiological scotoma situated 15° to outside of fixation point, corresponds to entrance of optic nerve in eye. SYN. optic disc.

blister [ME *blester*, a swelling]. 1. A bleb or vesicle containing serum, sometimes caused by a pressure. 2. A collec-

tion of fluid below the epidermis, usually the result of a burn.

TREATMENT: Mild antiseptic, protective dressing if extremely painful due to pressure, may be aseptically punctured and then treated as a wound. *See causes, as burn, scald, etc.* An agent producing a bleb *RS vesicle, vesicular*.

b., blood. Small subcutaneous or intracutaneous extravasation of blood due to rupture of blood vessels

TREATMENT Apply antiseptic and a firm dressing with moderate pressure to aid in stopping extravasation and hasten absorption. Sometimes desirable to puncture aseptically and aspirate.

b., fly. Known as *cantharides* and Spanish fly b., the therapeutic value of which consists in the irritation which it produces, drawing a large amount of blood to an area, thereby relieving the congestion, and improving the circulation.

b., flying. One to be used in more than 1 place

b., water. One containing water

NP Swab with alcohol sponge and puncture with sterile needle, aspirate fluid at base of blister. Use sterile cotton to absorb fluid. Bandage tightly with sterile gauze and adhesive strip

bloated (blō'tēd) [AS *blōtian*, to swell up] Swollen or distended beyond normal size, as by serum, water, gas, etc.

block [OFr *bloc*, a piece of wood, an obstruction] 1 To deaden all sensory impressions in a nerve, or in the nerve trunk and roots of the spinal cord through the use of an anesthetic for operative purposes. 2 To obstruct. 3. An obstruction or stoppage

b., heart. Interferences with the heart's contraction, causing disassociation of the auricular and ventricular

rhythms. Due to failure of the contractile impulses to pass through the conductile tissue (atrio-ventricular node and bundle of His).

blocking. 1 Interruption in free association during psychoanalysis as a defense against unpleasant ideas

2 *Psy* A sudden, unaccountable stoppage of speech or thought. May be due to a conflict or painful thought, and exhibited in dementia precox

3 Process of obstructing or deadening, as a nerve

Blondlot rays (blon-lo'). Rays of shorter wave length but which resemble light, making certain bodies luminous, also called *n-rays*.

blood [AS *blōd*]. The fluid that circulates through the heart, arteries, veins, and capillaries carrying nourishment and oxygen to the tissues and taking away waste matter and carbon dioxide

FUNCT (a) Nutrition and respiration of tissues located far from the food and air supplies, (b) transportation of waste from the tissues to the excretory organs, (c) chemical and thermal coordination of the body, (d) defense against infection through the action of antibodies* and phagocytes*

COMP Human blood is composed of a fluid part (*plasma**) in which are suspended red and white corpuscles,* platelets* and fat globules. Blood consists of 22% solids and 78% water.

The amount of blood in man, measured in pints, can be computed approximately by dividing the weight in pounds by 14, using the metric system, an adult weighing 70 Kg has a blood volume of about 5.5 liters. Its specific gravity varies from 1.055 to 1.062, the corpuscles being heavier and plasma lighter than this

Blood	{	Water 78%	{	Proteins .. .	18.5%
				Glucose .. .	0.1
	{	Solids 22%		Lipids (fats) .. .	1.4
				Salts (inorganic) .. .	1.5
				Waste products, etc .. .	0.5

In passing through the lungs the blood gives up carbon dioxide; after leaving the heart it is carried to the tissues as arterial blood, and then returned to the heart. It moves in the principal arteries at the rate of a foot per second and it makes the circuit of the vascular system in about 20 seconds. It constitutes 1/14 of the body weight. SEE: *circulation*.

CHARACTERISTICS: It has a peculiar odor. Arterial blood is bright red or scarlet; the venous blood dark red or crimson.

b., chemical analysis. Specimens should be obtained in the morning before eating or drinking.

If refrigerated they may be kept for a number of days, but samples should be sent to the laboratory as soon as taken. 10 to 20 cc of venous blood are ordinarily sufficient. 0.25 to 1 cc. of finger blood for micro-Folin blood sugar test. If placed in a container, 2 drops of a 20% solution of potassium oxalate should be added for an ounce of blood. This serves as an anticoagulant. It should then be mixed by shaking. Hemoglobin is low in anemia. Creatinine, urea, and nonprotein nitrogen are high in nephritis, as is uric acid. Blood sugar is high in diabetes. Cholesterol is low in anemia and high in nephrosis.

b., clotting of. The process whereby blood changes into a jellylike, nonfluid mass. Blood plasma normally contains fibrinogen, a protein. When blood is exposed to air, foreign substances, or juices from injured tissues, a new substance, thrombin, appears in it. Thrombin converts fibrinogen into the insoluble

fibrin, a stringy, elastic substance that forms a meshwork in which the corpuscles are caught. Calcium deficiency causes tendency to slow clotting.

RS *athrombia, blood, blood clot, coagulation, c. time test, hemophilia.*

b., constituents. The preceding tables give pertinent data on this subject.

b., defibrinated. If whole blood is stirred in a dish, e.g., with a stick of wood, the stringy, elastic fibrin comes out on the stick, it can be washed until white. The remaining thick, red blood can no longer clot, and is called defibrinated blood.

If it is centrifuged, the clear liquid which now appears in the upper half of the centrifuged tube is called *serum*, this differs from plasma chiefly in that it contains no more fibrinogen (the parent substance of fibrin). The corpuscles are in the lower half of the tube.

Excess of fibrin in the blood indicates excessive intake, esp. of albuminous foods, a factor in increased coagulation. Excess of urea in the blood frequently found in renal retention such as in Bright's disease. Excess uric acid indicates increased protein metabolism or retention, or both. Uric acid in the blood and urine indicates fermentation of waste products in system and impaired condition of eliminating organs. Hemoglobin is low in anemia. Creatinine, urea and nonprotein nitrogen are high in nephritis, as is uric acid. Blood sugar is high in diabetes. Cholesterol is low in anemia and high in nephrosis.

RS *b. c casts, b. clot, b. count, b. examination, b. grouping, b. platelets, b.*

Clinically Significant Blood Constituents*

Blood Constituents Tested for Per 100 cc. of Blood	Normal Range	Beginning Pathologic Range Below is indicated by a (—) sign, and above by a (+) sign	Pathologic Range	Significance
Hemoglobin	14-17 Gm	—12	3-23	Low in anemia
Nonprotein nitrogen (N P N.)	25-35 mg.	+35	20-400	High in nephritis
Urea nitrogen	12-15 mg.	+20	5-350	High in nephritis
Creatinine	1-2 mg.	+3.5	to 34	High in nephritis
Uric acid	1-3.5 mg.	+4	to 27	High in nephritis, gout
Blood sugar	70-120 mg	+150	40-1300	High in diabetes
CO ₂ capacity	50-70% by volume	—45	5-130	Low in nephritis, acidosis
Cholesterol	140-170 mg.	—130 +170	60-1000	High in nephritis, low in anemia
Calcium as calcium	9-11 mg.	—8	3-20	Low in tetanus, stages of nephritis
Inorganic phosphorus as phosphorus				Low in rickets High in stages of nephritis
Adult	2.5-4 mg.		2-40	
Children	4-6 mg.	—4		
Chlorides as NaCl.				High in nephritis, with edema, nephritis, eclampsia, low in pneumonia
Plasma	570-620 mg.	—500	300-850	
Whole blood	450-520 mg.	—450	120-700	High in hemolytic anemia. Indicates liver disturbances
Icterus index (terms of 1 10,000 potassium dichromate)	4-6 mg	+10	10-225	

* Myers: *Jr. Am. Med. Assoc.*, July 21, 1928.

poisoning, b. pressure, erythrocytes, leukocytes.

blood, words pert. to: acapnia, acetone-mia, acetonuria, achrocythemia, acidemia, adrenalinemia, aeration, afflux, albukalin, albuminosis, albumosemia, aleucemia, -ic, aleukemia, -ic, alexin, alkalemia, aminosis, amyemia, anadrome, anemia, -ic, anhydremia, anoxemia, apocrenosis, apoplasmia, apostaxis, an-thocythemia, atmospherization, blood-attenuant, "auto-" words, avasculariza-tion, bacteriemia, basophilia, beat, bends, bilirubinemia, bleeding, buffer, buffer salts, cacemia, calcemia, "carbo-" words, carotenemia, carotenosis, cell-color ratio, chloridemia, chloruremia, "chole-" words, "cine-" words, circula-tion, clotting, coagulum, coagulation, -time test, coagulin, color index, co-sanguinity, diapedesis, differential blood count, dyscrasia, exsanguinate, ex-sanguine, fibrin, fibrinogen, glycemia, glycosemia, grouping, "hema-" words, "hemo-" words, hydremia, hyperemia, hypoglycemia, icteric index, inemia, inosemia, inosite, lithiasis, melanemia, melitemia, necemia, occult, oligemia, opsonic index, opsonins, oxalemia, oxy-genation, oxyhemoglobin, pachemia, plasma, platelet, poikilocytes, -osis, poly-morphonuclear, prothrombin, regurgita-tion, revulsion, sapremia, spanemia, "thromb-" words, transfusion, transuda-tion, revulsion, sapremia, spanemia.

blood bank. Storing place for reserve blood kept for emergency transfusions.

Person donating blood generally bet. 21 and 50 years, with negative history of syphilis, chronic alcoholism and recent illness.

Blood is mixed with sodium citrate, physiological saline solution and glu-cose, and is then stored at 4° C (39° F). Used up to 3 weeks after storage, but preferably should not be older than 5 days.

blood cell [*AS blōd*, blood, + *L cella*, small chamber] Minute body in the blood of 2 types, erythrocyte,* or red cell, and leukocyte,* or white cell.

b. c. casts. Masses of red cells molded by the renal tubules, the blood origi-nating from the glomeruli. Abnormal microscopic body in the urine composed of coagulated serum covered with red blood cells.

blood cell, words pert. to: achromatocyte, achromatolysis, aglobulia, aleukia, aleu-kocytosis, anemia, anerythrocyte, an-erythroplasia, anerythroplastic, anhemato-sis, anhemolytic, anisocytosis, Arnett's classification of neutrophils, bioblast, Bizzozzero's c., blast, blood cell, cell color

ratio, crenation, erythrocytes, erythro-penia, "hem-" words, hypercythemia, "leuc-" words, "leuk-" words, megal-o-blasts, normoblast, oligochromemia, oli-gocythemia, ozonophore, phagocyte, -osis, polycythemia, spanemia

1 Red blood cells 2 Immature (nucleated) red blood cell 3 Lym-phocyte 4 Eosinophil 5 Neutrophilic leukocyte 6 Basophil 7 Blood platelet

blood clot [*" + OE clott*, a mass] Co-agulated mass of blood. *SYN* coagulum.

It is the result of prothrombin (zyme-gen, or mother's enzyme), when it forms an enzyme or ferment called *thrombin* by combining with calcium salts in the blood, the thrombin acting on fibrino-gen. The latter coagulates on exposure to the air and changes into fibrin. Coag-ulation Time Normal, 2 to 8 minutes. *SEE* buffy coat, clotting, coagulation.

blood corpuscles. The solid or cellular elements in the blood. *SEE* erythrocytes, leukocytes.

blood count. Enumeration of the red cor-puscles and the leukocytes per cu. mm.

A blood count shows the variation of the different cells in number per cubic millimeter of blood, and in the charac-ter and type of the different cells.

Normally in each cu. mm. of blood there are an average of five million erythrocytes in the male and four and a half million in the female. Altitude increases the number. The leukocytes average 5,000 to 9,000 per cu. mm.

Tabular Summary of Blood Corpuscles

Cells	Nucleus	Cytoplasm		Average diameter (Microns)	Number per cmm.
		Color	Granules		
Erythrocytes or red blood corpuscles	Absent	Red	None	7.3	4,500,000 to 5,000,000
Platelets	?	None	None	3	200,000 to 900,000
Leukocytes or white blood corpuscles	Varies with different types	None	Varies with different types	13	5,000 to 9,000

A laboratory technician makes the count, which is done microscopically. A ruled area is used by which the different cells are counted in small squares. The percentage of different cells may be calculated from any number counted, but it is best to count not less than 200. Pathologic cells are also looked for, and platelets, and hemoglobin tests are also made.

A DIFFERENTIAL BLOOD COUNT This is an examination of the blood by stained specimens to ascertain the characteristic of the red cells and the variety of the white ones.

Some blood diseases, and inflammatory conditions may be recognized in this way. In a differential count, the varieties of the leukocytes and their percentages should be. Polymorphonuclears, 65-70%; small mononuclears, 20-30%; large mononuclears, 4-8%; transi-

tionals, 1/3%; basophils, 1/4-1/2%; eosinophils, 1/2-2/4; platelets, 300,000 per cu mm.

blood dust. Minute colorless bodies in the blood, particles of the blood corpuscle. *SYN:* *hemoconia*.

blood examinations. They may be (a) morphological,* (b) chemical, (c) physical, (d) bacteriological, and (e) serological.*

Blood is difficult to study because it so promptly clots unless anticoagulants are added to it. *SEE b constituents.*

WHAT THE EXAMINER LOOKS FOR The number and character of the red blood cells, the percentage of hemoglobin, the coagulation time,* the number and character of white blood cells, the presence of parasites, also the amount of sugar, urea, urea-nitrogen, nonprotein nitrogen, creatinin, and uric acid. Complement fixation tests are made for sus-

Method of Testing Blood Groups

Serum of Group	Agglutinin in Serum	Recipient Red Blood Cells of Group				Remarks
		O	A	B	AB	
O	Anti-A and Anti-B					Cells of Group O not agglutinated by any sera. Contains no agglutinable substances. <i>Universal Donors</i> (45% of adults).
A	Anti-B					Cells of Group A agglutinated by sera of Groups O and B (40% adults).
B	Anti-A					Cells of Group B agglutinated by sera of Groups O and A (10% adults).
AB	None					Cells of Group AB agglutinated by sera of Groups O, A, B. Serum of Group AB contains no isoagglutinins. <i>Universal recipient</i> (5% adults).

When recipient is Group O, select Donor from Group O

85-89	7	170	90	77
90-94	3	137	80	53

pected gonorrhea, and Wassermann for syphilitic infection. Culture should be made if bacteria are suspected.

CHEMICAL FINDINGS The first figures indicate the normal, the second figures indicate beginning pathology (amount in mg per 100 cc of blood) Sugar 70-100, P, 120, nonprotein nitrogen, 25-35, P, 40, urea nitrogen, 10-15, P, 20; creatinin, 1-2, P, 3, uric acid, 1-3, P, 4, CO_2 combining power, 55-75, P, 45; cholesterol, 150-190, P, 200, sodium chloride, 45-500, P, 400-550 plus

Whenever blood is to be collected from a vein the following points should be observed

1 The syringe and needle should be not only sterile, but either dry or washed out with sterile normal saline solution. In particular the syringe should contain no trace of alcohol or ether, and preferably no distilled water.

2 The blood withdrawn is put into test tubes which are sterile and either (a) plain dry or (b) oxalated (*i. e.*, containing a small quantity of sodium or potassium oxalate powder). (a) Plain tubes are required for Wassermann reaction, Widal and other agglutination reactions, v d Bergh reaction, blood calcium. (b) Oxalated tubes are required for Blood sugar, blood urea, nonprotein nitrogen (N P N), etc.

3 Immediately the blood has been expelled from the syringe, this and the needle should be washed out with normal saline or cold water. In this way "jamming" of the piston is avoided.

blood groups. Scientific findings show that all human bloods fall within four groups, the fourth one being a rare group.

On examining the serum and cells of a number of bloods, Landsteiner (1901) found that the reactions of serum and cells did not occur in a helterskoter manner, but fell into three groups, a fourth one being discovered later. It was also found that the blood group properties were inherited, and that the distribution differs among various races. Prior to these discoveries blood transfusions* were often followed by severe symptoms or death.

In selecting a donor it is essential to know that the donor and the recipient are compatible as to their blood grouping, and a retyping of their blood is made for this purpose. When a donor is used over any extensive period retyping is necessary.

Due to confusion from two classifications (Jansky & Mosz), blood groups are now represented by letters indicating their serological characteristics. (See table on B-33.)

INCOMPATIBILITY This is indicated if there is any clumping or agglutination seen with naked eye.

bloodless. Without blood

b. operation. One by which the blood is expelled by compresses from the part which is to be operated upon, or by electrocautery.

blood motes. Minute colorless particles in the blood, bits of blood corpuscles. Syn blood dust, hemoconia.

blood platelets. Small, colorless bodies in circulating blood, averaging about 3 microns in diameter which in shed blood tend to agglutinate into small clusters. They may originate from giant bone-marrow cells (megakaryocytes). They play an important rôle in clotting through release of thrombo-

kinase which in presence of calcium reacts with prothrombin to form thrombin.

The normal number in circulating b. is about 250,000 to 300,000 per cmm. Reduction below normal is called *thrombocytopenia*. In certain forms of hemophilia, they are abnormally stable and fail to release thrombokinase, thus increasing coagulation time.

blood poisoning. The entrance of noxious materials, such as bacteria and their toxic products, into the blood stream. SEE *pyemia*, *sapremia*, *septicemia*, *toxemia*.

blood pressure. As popularly used, the pressure existing in the large arteries at the height of the pulse wave, the systolic intraarterial pressure.

More generally, the pressure exerted by the blood on the wall of any vessel. This pressure reaches its highest values in the left ventricle during systole, it is lower successively in the left arteries, capillaries, and veins, and sinks to sub-atmospheric values in the large veins during diastole.

The systolic arterial blood pressure itself rises during activity or excitement and falls during sleep. In the normal, relaxed, sitting adult, it is likely to be between 110 and 145 mm of mercury.

The following findings are considered abnormal (1) Systolic pressure persistently above 150, (2) diastolic pressure persistently above 100, (3) pulse pressure constantly greater than 50. Blood pressure varies with age, sex, altitude, muscular development, and according to states of worry and fatigue. It is lower in women than in men, low in childhood and high in advancing age as a rule. SEE *Normal blood pressure*.

b. p., children's. This is much lower than in adults. Differences in rate of growth varying at different ages are factors in children's blood pressure. Dr. H. C. Richey gives the approximate normal or, perhaps, better said, the average blood pressure at different ages of childhood at the foot of this page.

b. p., diastolic. Lowest point to which it drops between beats. Average in brachial artery of adult is 60 to 90 mm.

b. p., normal. Should show a high systolic pressure of about 145 mm with 10 mm less for women. Normal diastolic pressure, 60 mm to 90 mm, 120 mm. average systolic pressure at the age of 20, and $\frac{1}{2}$ mm for each year above that age, which would give 135 mm as normal systolic pressure for a man of about 50. Arterial pressure is not uniform. Most published findings are the results of tests made before the technic of measuring blood pressure was perfected, and before the modern instruments for the purpose existed. Unfortunately, then, such findings cannot be depended upon except in a general way. Life insurance companies have compiled tabulations of blood pressure at different ages. One table presents the above figures.

b. p., systolic. The highest point caused by the contraction of the heart. 120 to 145 mm.

RS *anuria*, *anisopnea*, *arteriotomy*, *diastole*, *hyperpiesia*, *hypertension*, *hypotension*, *pulse pressure*, *systole*.

blood shot. Locally congested with blood.

blood smear. Drop of blood spread on a slide for purpose of examination.

For the easy recognition of white cells, it is essential that a good smear be made. This is easily done as follows. Cover glasses three-quarters of an inch square must be perfectly clean and lint free. This is accomplished by cleaning them with hydrochloric acid for 24 hr. They are then washed in water and placed in alcohol. A silk cloth is used to dry them. The finger should never come in contact with the flat sides of the glasses.

A small drop of blood the size of the head of a pin is taken on 1 of these cover glasses which in turn is placed upon a second similar film. If they are clean, the blood runs out, covering the entire surfaces in apposition. Just before this movement of the blood stops, the films are gently pulled apart and allowed to dry in the air.

blood sugar. Sugar in the form of about 0.08 to 0.12% dextrose in the blood or about 80-120 mg per 100 cc of blood.

It rises after a meal but not more than 160 mg per 100 cc of blood but this may vary. Above this amt sugar enters the urine. Dextrose is half as sweet as cane sugar.

b. s. test. Increased sugar content of the blood, or presence of sugar in the urine indicates faulty metabolism and diabetes. The urine may be free of sugar but the blood sugar may have increased, which necessitates a test being made.

A wound is very slow to heal if there is an excess amt of blood sugar present. An abnormal amt in the blood may bring about an occlusion of the blood vessels, thus interfering with nourishment of the tissues which produces gangrene in diabetes and increases susceptibility to infections. Arteriosclerosis also may be induced by an excessive amt of sugar in the blood.

blood test. To ascertain contents of the blood.

Blood Urea. For this test 10 cc of blood are withdrawn into a sterile test

tube containing a few crystals of calcium oxalate.

UREA CONCENTRATION TEST. The patient has a drink at midnight and nothing afterwards. At 6 A. M. the patient passes urine. The amt is recorded and a specimen put up. 15 Gm of urea dissolved in 100 cc of water are taken, and afterwards 4 specimens of urine are obtained at hourly intervals, the whole of each specimen being kept. In the second and third specimens the urine should contain 2% of urea.

UREA CLEARANCE TEST. This test gives more accurate information as to the efficiency of the kidney than the above. It shows the amt of blood cleared of urea in a given time. It is carried out bet breakfast and lunch as follows.

The bladder is completely emptied. Exactly one hr after the bladder is again emptied. The specimen of urine obtained is kept. One hr after, this is repeated. Blood for blood urea, is withdrawn at the end of the first hr. No coffee is allowed for breakfast. Tea is sometimes allowed.

BLOOD SUGAR TOLERANCE CURVE. The fasting level of blood sugar is normally 80-120 mg in 100 cc. If large amts of carbohydrate are taken the sugar in the blood rises as high as 170 mg. The sugar level falls to fasting level within 2 hr.

TEST. No food or drink after 9 P. M. the evening before. In the morning blood is withdrawn and the amt of glucose estimated. This represents the fasting level. The patient then empties the bladder completely and drinks a solution of 50 Gm of glucose in 100 cc of water flavored with lemon juice. Blood is taken every half hr. for 2 1/2 hr. The bladder is emptied one hr and 2 hr after taking the glucose. The urine is tested. In health neither specimen contains sugar. A prolonged curve indicates impaired carbohydrate metabolism.

INTERPRETATION. In a normal person, blood sugar level rises to 170-180 mg.

Normal Blood Pressure

Age	Systolic Range			Diastolic Range			
	Mini-mum	Aver-age	Maxi-mum	Mini-mum	Aver-age	Maxi-mum	Pulse Pressure
15-19	135	117	129	73	77	81	40

and then drops to fasting blood level (100 mg or less) within two to three hours. In a diabetic or a person with impaired sugar tolerance, blood sugar may exceed 180 mg and appear in urine. The curve is prolonged and drops slowly and tends to remain above fasting blood sugar level. In hyperinsulinism, the curve is lower than normal and blood sugar may fall to low levels (40-60 mg) four to six hours after administration of glucose.

b., test for, in urine. Take 1 in. of urine in a test tube and add 1 or 2 drops of tincture of guaiacum. Carefully overlay this with $\frac{1}{2}$ in. of ozonic ether. Hold the tube in the hand to warm it for a few minutes. Blood is indicated by the appearance of a blue line at the junction of the fluids.

blood transfusion. The transference of the blood of one person into the blood vessels of another. In direct or immediate transfusion, the blood is transferred without being exposed to air, in *indirect* or *mediate* transfusion, the blood is collected in a receptacle from the donor before transfusion.

blood typing. Determination of which agglutinins are present in an individual's blood. Usually, only A, B, and Rh agglutinins are determined. SEE *blood groups and typing*.

BLOOD TYPING (Direct)

The red blood cells of the donor are mixed with the serum of the recipient. **Left:** Compatibility, no agglutination. **Right:** Incompatibility with formation of clumps. This donor cannot be used.

bloody flux. Dysentery.

bloody sweat. Excretion of blood or blood pigment through the sweat glands. Syn *hematidrosis*.

bloody vomit. A result of rupture of the blood vessels of the upper alimentary tract due to injury, disease, or swallowing of blood.

TREATMENT. Do not give stimulants, nothing by mouth. Keep patient quiet and lying down. Cold applications to lower chest and upper abdomen.

bloody weeping. Hemorrhage from conjunctiva.

Blot's perforator (blōs). Instrument used to perforate the fetal skull to facilitate its delivery.

blow fly. Flesh fly that deposits its eggs in flesh, *Musca vomitoria*.

blowing respiration. Bellows murmur, bruit de soufflet.

blowpipe. A tube through which a gas is passed under pressure, the gas being directed upon a flame, it is employed to concentrate and intensify the heat of the flame.

blows (blōz). A disease of hogs occurring in northern Ireland. Characterized by

marked anemia. It is noninfectious and its etiology unknown.

blue [O.Fr. *bleu*, blue]. 1. A primary color of the spectrum, sky color, azure. 2. Cyanotic.

b. baby. A child born with a very blue color due to mixture of the venous and arterial blood through a defect in the heart.

b., brilliant cresyl. A dye used in staining blood.

b., Evans. A dye, injected intravenously, for determining blood volume.

b. mass. A compound pill of mercury.

b., methylene. A dye used for staining tissues, also used as an indicator.

b. ointment. Mercurial ointment.

b. stone. POISONING (copper sulfate). Sym. Vomiting which is bluish and which turns darker on addition of ammonia. Pain and cramps in upper part of the abdomen. Convulsions. Pulse first strong and rapid, and later feeble. Treatment: Empty stomach by means of a stomach tube or an emetic. Give large quantities of milk or the white of eggs in water. Follow with barley water or gruel or similar demulcent.

b., toluidine. A metachromatic dye used as a stain for tissues.

b. vitriol. SEE *copper sulfate*.

blueberries [" + *A S berry*, berry]. Av. Serving: 100 Gm. Pro 0.6, Fat 0.6, Carbo 15.1 per serving. Ash Concr: Ca 0.020, Mg 0.007, K 0.051, Na 0.016, P 0.008, Cl 0.008, S 0.011, Fe 0.0009.

bluecomb (blō'kōm). A disease of turkeys characterized by cyanosis. It is due to infection with *Erysipelothrix rhusiopathiae*.

bluefish [" + *A S fish*, fish] NUTRIENTS. A. P. Prot 19.4, Fat 12. FUEL VALUE: 100 Gm.—88 cal.

Blumberg's sign. The occurrence of a sharp acute pain when the examiner presses his hand over McBurney's point and then releases the hand pressure suddenly. This sign is indicative of peritoneal inflammation.

Blumenau's nucleus (blō'men-ōws). Outer part of the cuneate fasciculus.

Blumenbach's clivus. Sloping part of sphenoid bone behind post clinoid processes.

Blumenthal's disease. Leukemia in which there is an excessive amount of immature blood cells—both red and white—in the blood.

blush'ing [*A S blýscan*, to be red]. Rush of blood to the face caused by embarrassment or other emotion. SEE *rubedo*.

Blyth's test. A test for the detection of lead in drinking water. In the presence of lead a white precipitate forms on the addition of a small amount of alcoholic tincture of cochineal to the water to be tested.

B. M. A. Abbr for *British Medical Association*.

B. M. R. Abbr for *basal metabolism rate*.

B. M. S. Abbr for *Bachelor of Medical Science*.

BNA. Abbr for *Basile nomina anatomica*, an anatomical nomenclature adopted by the German Anatomical Society in 1895, at Basle, Switzerland. It includes some 4500 terms.

Boas motor meal. Test for tonicity of bowels.

If the morning after an Ewald-Boas test meal was given, lavage shows the stomach to be empty, there is normal motility.

B. point. A tender spot left of the 12th dorsal vertebra in cases of gastric ulcer. [drochloric acid in gastric juice.

B. reagent. Formula for testing hy-

B. sign. The presence of lactic acid in the gastric contents.

B. test meal. This is a nonlactic-acid-containing meal. It consists of 30 Gm. of rolled oats boiled in 500 cc. salted water, or two shredded wheat biscuits with 300 cc. of water. This is used as a test of lactic acid. If the patient is to be given the above mentioned test meal, the stomach should be lavaged* the night before.

Bochdalek's ganglion (bok'dal-ek) Ganglion of plexus of dental nerve in the maxilla above the canine tooth

Bo'do. A genus of protozoan organisms. Some are parasitic in man's intestines.

body [AS *body*, body] Soma, corpus. 1. The physical man. 2. The trunk without the head and extremities. 3. The principal part of anything. 4. A small organ or a structure within an organ.

EXAMINATION. The nude body is examined and both sides compared. Physical examination is made by *inspection*, *palpation*, *manipulation*, *mensuration*, and *auscultation*, *q r* Chemical and microscopic examination may be made of the blood, sputum, feces, urine, cerebrospinal fluids, and other fluids of the body. X-ray, or Roentgen ray, is also used, and checked with clinical findings. The radiograph is used for determining heart rhythms.

b., aortic. Two small bodies located in the arch of the aorta which contain the endings of the aortic nerve. They are chemoreceptors, responding to changes in the chemical content of the blood esp., changes in CO₂ content and H-ion concentration.

b., basal. A basal granule or blepharoplast. A small granule usually present at the base of a flagellum protozoa.

b., Call-Exner. Darkly staining bodies found in growing follicles of the ovary. Also called vacuoles of Call-Exner.

b., carotid. A flat structure at the bifurcation of the common carotid artery. Contains epitheloid cells which serve as chemo receptors, responding to changes in carbon dioxide and oxygen content of the blood and to changes in pH.

b., cavernous. One of three cylindrical bodies of erectile tissue found in the penis. SEE corpora cavernosa.

b. cavities. The thorax, abdomen, and pelvis.

b. cell. The main portion of a cell, esp. a neuron, the portion that contains the nucleus.

b. cells. Somatic cells. Any cells of the body excepting the reproductive or germinal cells.

b., chromaffin. A number of bodies composed principally of chromaffin cells, *q v* which lie serially arranged along both sides of the dorsal aorta. Also called *paraganglionic bodies*. They are ectodermal in origin, having the same origin as cells of the sympathetic ganglia.

b., chromatoid. Darkly staining bodies found in the encysted forms of parasitic amebae. Thought to serve as reserve food. They disappear as cysts grow older.

b., chromophilic. One of the granular bodies in cytoplasm of a nerve cell which stain readily with basic dyes.

b., ciliary. A structure in the eye consisting of the ciliary muscle and

ciliary processes. Functions in accommodation.

b., coccygeal. A mass of tissue consisting of one or several small nodules located at tip of coccyx. It contains an arteriovenous anastomosis. Its function is unknown.

b., Donovan's. Organism supposedly causing granuloma inguinale.

b., geniculate, lateral. Two bodies forming elevations on the lateral portion of the posterior part of the thalamus. Each is the termination of afferent fibers from the retina which they receive through the optic nerves and tracts.

b., geniculate, medial. Two bodies lying in the posterior part of the dorsal thalamus, connected by the commissure of Gudden. Each receives fibers from the acoustic center of the medulla and from the inferior colliculus through the brachium.

b., Hassalls. Hassall's corpuscle, found in the medulla of the thymus.

b., Hensen's. A modified Golgi net found in the hair cells of the organ of Corti of the ear.

b., inclusion. Cell inclusions. Non-living substances in the protoplasm of a cell.

b., ketone. One of a number of substances which increase in the blood as a result of faulty fat metabolism. Among them are D-hydroxybutyric acid, acetoacetic acid, and acetone. They increase in diabetes mellitus and are the primary cause of acidosis. They may also occur in other metabolic disturbances.

b., Leishman-Donovan. Small bodies found in the spleen and liver of victims of kala-azar or dum-dum fever. Now known to be *Leishmania donovani*, causative organism of the disease. They are found both within and outside of living cells and in circulating blood.

b., Malpighian. (1) A renal corpuscle consisting of a glomerulus enclosed in Bowman's capsule. (2) a lymph nodule found in the spleen.

b., mammillary. A rounded body of gray matter found in the diencephalon. It forms a rounded eminence projecting into the anterior portion of the interpeduncular fossa. Their nuclei constitute an important relay station for olfactory impulse.

b., medullary. The deeper white matter of the cerebellum enclosed within the cortex.

b., metachromic. Metachromic granule, *q i*

b., Negri. Inclusion bodies found in the cells of the central nervous system of animals infected with rabies. They are acidophilic masses appearing in large ganglion cells or in cells of the brain esp. those of the hippocampus and cerebellum.

b., Nissl. Also called Nissl granules or chromophil substance. Conspicuous structures in nerve cells demonstrated by selective staining. They are absent in the axon and axon-hillock. They show changes under various physiological conditions and in pathological conditions may dissolve and disappear (chromatolysis).

b., Pacchionian. Arachnoid granulation. Numerous small ovoid or villus-like projections of the subarachnoid membrane of the brain. They may project into the superior sagittal sinus as arachnoid villi or they may press against the outer dura and grow into

the inner plate of the cranium forming ovoid depressions

b., perineal. The mass of tissue which separates the anus from the vestibule and the lower part of the vagina

b., pineal. The epiphysis, a dorsal outgrowth of the diencephalon. Also called pineal gland

b., pituitary. The hypophysis; pituitary gland, *q.v.*

b., polar. A small cell produced in cogenesis resulting from the divisions of the primary and secondary oocytes. It has no functional significance

b., postbranchial. Ulumobranchial bodies. Two bodies which develop from the post. wall of the 4th pharyngeal pouch. They become incorporated into the thyroid gland

b., psammoma. Laminated calcareous bodies seen in certain types of tumors. Terms also applied to sand-like bodies (brain sand) bound in the pineal body

b., restiform. The inferior cerebellar peduncles. Two bands of fibers which connect the medulla with the cerebellum

b., tigroid. The chromophil substance of neurons, Nissl bodies

b., of vertebra. A short column of bone forming the weight-supporting portion of a vertebra. From its dorso-lateral surfaces project the roots of the arch of a vertebra

b., vitreous. A jelly-like body within the eye which fills the space between the lens and the retina. It is colorless, structureless, and transparent

b., Wolffian. The mesonephros or middle kidney of the embryo

body fluids, words pert. to: anastasis, anhydremia, anorthorhea, apocrenosis, ascites, colliquation, colloid, extravasation, flux, humor, humoral, hydrops, hypoacidia, hypochlorhydria, oligohydria, protoplasm, stagnation, succorhea.

body mechanics. Mechanical correlation of the various systems of the body.

body substances, words pert. to: activator, adenine, addisin, agglutinin, aggrassin, allergen, allergenic, alloxuremia, alloxuria, antibacterins, antithrombin, apesima, ash, aquamedin, autacoid, autotoxin, bacteriolysin, buffer salts, chalone, collagen, collemia, cephalin, ketogenesis, ketonemia, ketones, ketosis, lactacidogen, lecithin, leukomaine, lime, lipacidemia, lipaciduria, lipemia, lysine, melanosis, melanuria, opsonins, oxygenase, parenchymatous, phosphates, purins, trephones, wax, xanthine

Boeck's sarcoid (becks) A multiple benign one of a superficial nature esp on arms, face, or shoulders

boil [AS *byl*, a swelling]. A furuncle. An acute circumscribed inflammation of the subcutaneous layers of the skin, gland, or hair follicle

The deeper tissue inflammation is so severe that blood clots in the vessels and the center dies. This is the cause of the acuteness of the pain, the dead core is ultimately thrown off. Contrary to general opinion, boils do not arise from "bad blood," but are the result of local infection due to an invasion of bacteria from the outside

Treatment. As cold contracts the peripheral vessels, decreasing the amt. of blood in the region and reducing the pain, ice is the first thing to apply. Wet dressing by salt solution should be applied. Clothing should not rub the af-

fected parts. Sunshine, fresh air, exercise out of doors.

Vaccine from pus of one of the boils is sometimes used. Painting with colorless tincture of iodine followed by application of electricity, esp when abscess on face appears. Collodion with $\frac{1}{2}$ to 2 gr salicylic acid to the dram is also used over affected area. Injections every day for 6 days, of a pint of dextrose solution

Diet. A diet of green vegetables, fruit, whole wheat cereals, and milk, little meat, drink plenty of water. See *furuncle*, *furunculosis*

boiling. Vaporization of a liquid

1 Boiling water destroys organic impurities 2 Boiling toughens and hardens albumin in eggs 3 Boiling toughens fibrin and dissolves tissues in meat 4 Boiling bursts starch granules 5 Boiling softens cellulose in cereals and vegetables

b., point. The degree of heat required to bring a liquid to a boil. It depends upon the liquid. Water boils at 212° F. (100° C) under ordinary conditions. To kill microorganisms water should be boiled 3-15 minutes. Aeration (pouring from one vessel to another) will overcome the flat taste of boiled water

bolometer [G *bolē*, a throw, + *metron*, measure] 1 Device for measuring the force of the heat beat apart from blood pressure 2 An instrument for gauging minute degrees of radiant heat

bolus [G *bolos*, a mass] A pill-shaped mass [food ready to swallow]

b., alimentary. A mass of masticated

bond. A mark or short line bet atoms to indicate the number and attachments of the valencies of an atom giving a graphic representation of arrangement of the atoms of elements in the molecules of compounds, as, H-Cl

bone [AS *bān*, bone]. The hardest connective tissue that forms the framework of the body (1) Osseous tissue. A specialized form of dense connective tissue consisting of bone cells (*osteocytes*) embedded in a *matrix* consisting of calcified intercellular substance (2) An individual unit of the skeleton. Bones give shape to and support the body. They also serve as a storage place for mineral salts and play an important rôle in the formation of blood cells

It consists of about 50% water, and 50% solid matter, the solids being chiefly cartilage hardened by impregnation with inorganic salts, esp carbonate and phosphate of lime. The proportion of lime in bone gradually increases and in old age there is such a large proportion that the bones are brittle and break easily

They surround and protect some vital organs, and give points of attachment for the muscles, serving as levers and making movement possible.

The outer surface is less porous than the inner, and is called the compact tissue, the more porous portion is called cancellous tissue. The compact tissue is tunneled by a central canal containing marrow, and fine branching canals. In these canals run small blood vessels and lymphatics for the maintenance and repair of bone tissue. This is known as the Haversian system or canals. The exterior covering of the bone, or periosteum, serves to extend the blood supply to the bone. According to their shape, bones are classified as *flat*, *irregular*, *long*, and *short*.

CAVITIES: Depressions, openings, and cavities in bones consist of a *fissure*, a *foramen*, a *meatus* or *canal*, a *sinus* and *antrum*, *groove* or *sulcus*, and a *fossa*

FORAMEN. Opening for blood vessels or nerves

fossa A concavity

fissure A slitlike opening

meatus A tubelike passage

sinus (a) Air cavity within a bone.

(b) A groove lodging a blood sinus.

sulcus A groove

PROCESSES Enlargements or protrusions

crest A ridge

condyle A rounded process for articulation

head Rounded end of a bone separated from the body by a constricted region the neck

spine A pointed process

trochanter A very large process.

tubercle A small rounded one

tuberosity A large rounded p

b., ankle. The astragalus or talus

b., breast. The sternum

b., carpal. One of the wrist bones (navicular).

b., membrane. The intramembranous b.

b., perichondral. One formed beneath the perichondrium

b., periosteal. One formed by osteoblasts of the periosteum

b., ping pong. The thin shell of osseous tissue covering a giant cell sarcoma in a bone

b., replacement. Cartilage b, one which replaces cartilage

b., sesamoid. One which develops in tendon, as the patella

b., spongy. Cancellous bone

b., sutural. A Wormian b

b., thigh. The femur

b., Wormian. A small irregularly-shaped b, often found in the sutures of the cranium

Names of principal bones See Appendix, also *skeleton*

bone cell. One in osseous tissue or bone. It may be (a) an osteoblast or bone-forming cell, (b) an osteocyte which lies within a lacuna in bone matrix, or (c) an osteoclast, a giant, multinucleated cell occupying deep grooves (Howship's lacunae)

bone graft. A piece of bone taken either

General view Longitudinal section of the femur of a six months human fetus.
A Epiphysal cartilage B Epiphysal line C. Bone substance. D. Periosteum.
E Medullary canal

b., cancellous. A spongy bone in which the matrix forms connecting bars and plates, partially enclosing many intercommunicating spaces filled with bone marrow

b., cartilage. Endochondral bone which develops from cartilage

b., cavalry. Rider's b Bony formation in adductor magnus femoris

b., collar. The clavicle

b., compact. Dense, hard bone with microscopic spaces

b., cotyloid. One which during development forms a part of medial portion of the acetabulum. It fuses with the pubis

b., cranial. A b of the cranium or brain case

b., cyst. B tumor of cystic variety

b., dermal. A membrane bone

b., endochondral. Cartilaginous b

b., epiphysal. A small, scalelike b which occupies the sphenoidal fontanelle

b., inca. An incarial b

b., incarial. The interparietal b, part of the occipital b

b., incisive. Part of maxilla bearing the incisor teeth

b., intracartilaginous. Cartilage or endochondral b

b., innominate. Hip b, composed of the ilium, ischium, and pubis

from some animal (foreign) or the body of the patient in which it is to be used (autogenous) and placed so as to encourage its growth and union with the bone it is being placed in contact with

bone grafting. Transplanting a healthy bone to replace missing or defective bone

bonelet. A small bone.

bone marrow. Medulla or soft tissues in the hollow of long bones and in the extremities of long bones. See *marrow*.

bone reflex. Any res ult of bone percussion

bone reflex. A reflex action resulting from tapping or percussion; actually a tendon or muscle reflex

Bonnet's capsule (bon-nâ'). Tenon's capsule.

bo'ny. Resembling or of the nature of bone. SYN *osseous*.

boopia (bo-op'i-â) [*G* *bous*, ox, + *ôps*, eye]. Ox-eyes observed in hysteria.

booster. A device, consisting essentially of a small induction coil with adjustable core, for increasing the electromotive force of an alternating current circuit, or a device, such as a dynamo, in series to increase the voltage of a direct current circuit.

bo'rate. A basic salt of boric acid.

bo'rated. That to which borax has been added

borax [L.]. A sodium salt of a form of boric acid.

It is found in some arid regions, and is made by combining a complex boric acid with sodium borate. Its chief use is as a detergent and water softener; also a weak antiseptic.

borborygmus (bor-bor-ig'mus) (pl *borborygmi*) [G. *borborygmus*, rumbling in the bowels]. A gurgling, splashing sound heard over the large intestine, intestinal flatus.

PATH Its absence may denote such obstruction of the bowels as torsion, volvulus, or strangulated hernia. In nervous persons denotes a form of indigestion. Associated with diarrhea and may arise in constipation.

border. The outer part or edge, boundary.

b., brush. A brushlike structure found on the free surface of epithelial cells in the proximal convoluted portion of a renal tubule. It consists of nonmotile hairs.

b., cells. Those in the stomach from which the secretion of acid takes place. They are fewer in number at the cardiac and pyloric ends of the stomach.

b., striated. A modified layer of the surface protoplasm of columnar epithelial cells lining the intestine. It consists of regular, perpendicular striations consisting of minute protoplasmic processes.

Bordet's theory (bor'das). That bacteriolytic sera owe their action to (a) an *antibody* and (b) *alexin*.

boric acid (boric acid, *acidum boricum*). An odorless, white, crystalline powder obtained by condensation and evaporation from certain mineral salts.

In solution it is used as mild antiseptic wash, esp. for the eyes, mouth, and bladder. As an ointment it is valuable in dressing burns, blisters, etc. When large doses are accidentally taken by mouth, as in children, it may be poisonous.

SYM Nausea, vomiting, diarrhea.

TREATMENT Wash out stomach. Give saline cathartic and large volumes of water. Stimulants as necessary.

bo-rism. Symptoms caused by internal use of borax or boron compounds.

boroglycerol (bo-ro-glis'er-öl). A liquid made by heating boroglycerid and glycerin.

borolyptol (bo-ro-lip'töl). An antiseptic compound of formaldehyde, eucalyptus, myrrh, storax, etc.

bo-ron [L. *borum*]. **SYMS** B. At weight, 11. A nonmetallic element, with oxygen it forms boric acid.

Borrelia (bor-rel'i-ä). A genus of spirochetes including organisms responsible for relapsing fever.

B. vincenti. A species found in Vincent's angina.

Borsieri's line (bor-si-ä-r'i's). In the early stage of scarlet fever, a line drawn on the skin with the finger nail leaves a white mark which quickly turns red and becomes smaller in size. See *scarlatina*.

bess [O Fr. *böce*, a swelling]. A circumscribed roundish protuberance, as that of a humpback.

bos'selated. Marked by numerous bosses.

bossella-tion. One or more small bosses.

Bossi's dilator (bos'si). Metal instrument used to dilate the cervix by means of force.

Botal's (Botal'lo's) **duct**. The ductus arteriosus.

B.'s foramen. Orifice bet the two atria of the fetal heart.

B.'s ligament. Relic of the ductus arteriosus.

bot flies. Flies belonging to the families *Gastrophilidae*, *Cuterebridae*, and *Ces-tridae*. The adults are free-living but the larvae or maggots are parasitic, living on the flesh of their host, producing *myiasis*. The larvae are called *bots*, certain species of which live in the skin forming cystlike lumps called *warbles*. Others form boil-like swellings. Some infest the sinuses of the skull (sheep bot), others the stomach and intestine (horse bot). Human infestation is rare.

TREATMENT Manually squeezing out the mature "grubs" and application of antiseptics. Grubs can be killed by application of a lanolin ointment (78 ml), water (9 ml), benzene hexachloride (9 ml), rotenone extract (1 ml), or 5% rotenone extract in linseed oil.

bothrenchyma (both-ten'ki-mä) [G. *bothrion*, pit, + *ecchyma*, an infusion]. Tissue that is pitted.

botryoid (bot'ri-oid) [G. *botrys*, bunch of grapes, + *eidos*, appearance]. Resembling a bunch of grapes.

Botryomyces (bot'ri-o-mi'sez) [+ *mykēs*, fungus]. A genus of fission fungi or bacteria.

bot'le nose. Acne rosacea of the nose.

botuliform (bot-u'li-form) [L. *botulus*, sausage, + *forma*, shape]. Shaped like a sausage.

botulinic acid. A toxin found in putrid *botulism* (böt'u-lizm). A severe form of food poisoning from food containing the *botulinus* toxin, produced by *Clostridium botulinum*. This organism is widely found in the soil. Cases of human botulism are usually associated with development of the bacteria under anaerobic conditions in improperly canned foods, esp. meats and nonacid vegetables. The toxin is a powerful exotoxin. It is very thermolabile losing its toxic properties when exposed to temperatures of 75 C-85 C. for 30 m. or boiling for 10 m.

POISONING The toxin has a selective action on the central nervous system. In fatal cases, cardiac and respiratory failure occur through involvement of the medullary centers. Paralysis may occur, esp. that of the pharyngeal muscles, leading to difficulty in swallowing.

SYM Intense abdominal cramping, headache, general malaise, difficulty in swallowing, distorted vision, thick speech, nausea, repeated spells of vomiting, later, intense diarrhea, collapse, shock, perhaps unconsciousness. Death may result in from 3 to 7 days.

TREATMENT Permit vomiting for a while, and give large volumes of fluid bet. attacks, preferably salt water (teaspoonful to a pint), atropine, or belladonna in repeated small doses. Apply heat to abdomen. Stimulants, as hot, sweetened coffee and tea. Cathartics are generally superfluous. Botulinus antitoxin is effective in early stages. A formal toxoid (types A and B) provides active immunization.

B.'s coefficient. Proportion of fluid to solids in urine.

Bouchut's method (boo-shus'). Intubation of larynx.

B.'s respiration. Expiration longer than inspiration in children with bronchopneumonia.

B.'s tube. One used for intubation
bougie (boo-zhē) [F *bougie*, candle] Instrument for exploring and dilating canals, esp. the male urethra

b., armed. One with caustic attached.

b., filiform. One of very small size

b., obstetrical. GYN Rubber catheter inserted bet. the fetal membranes and the uterine wall for instituting labor.

bouillon (boo-yawn') [F. *bouillir*, to boil]. Clear beef broth.

b. culture. Bouillon used as a basis for a bacteriological culture

boulimia (boo-lim'i-ā) [G *bous*, ox, + *limos*, hunger] Abnormal hunger sensation a short time after a meal SYN *bulimia*, *q v.*

bouquet (boo-kā') [F *nosegay*] 1 The aroma of a wine 2 A cluster of things, esp. of blood vessels or nerves

Bourdin's paste (boor-dans'). A caustic mixture of nitric acid and sublimed sulfur

Bourdon's test (boor-don') One administered to determine the alertness of attention, time and accuracy being requisite

Certain letters on a printed page are to be crossed out by the subject

bourdonnement (boor-dōn-mon') [Fr a droning]. A humming sound

boutonnière operation (boo-tōn-yār') [F. *buttonhole*] 1 Incision through perineum behind an impervious stricture 2 A buttonhole-like opening in a membrane.

boutons terminaux. Bulblike expansions at the tip of axons which come into synaptic contact with the cell bodies of other neurons

bovine [L *bovinus*, pert to a cow] Pert. to cattle

b. lymph. Vaccine virus from a heifer.
bovinoid [' + *eidos*, resemblance] Like that of cattle

bowel [OFr *boel*, intestine, from L. *botellus*, little sausage] The intestine
 RS *colon*, *evacuate*, *feces*, *intestines*, *rectum*, *sigmoid*, *stool*.

b. movement. Evacuation of feces. SYN *stool*, *defecation*

NUMBER OF This varies in normal individuals, some having a movement after each meal, others 1 in the morning and 1 at night, and still others only 1 a day. Proper nursing will do much to aid the patient in regular elimination

bowleg. A bending outward of the lower limb *Bandy leg*, *genu* varum*

Bowman's capsule. The expanded end of a renal tubule or nephron which invests a glomerulus, the two constituting the renal or Malpighian corpuscle. It consists of a visceral layer closely applied to the glomerulus, and an outer parietal layer. It functions as a filter in the formation of urine

B.'s glands. Branched tubuloalveolar glands located in the lamina propria of the olfactory membrane which serves to keep the olfactory surface moist

B. membrane. Thin homogeneous membrane separating corneal epithelium from corneal substance SYN *membrane*.

boxnote. A hollow sound heard on percussion in emphysema

box splint. One for fractures below the knee.

Boyer's bursa (bwā-yas'). One ant. to the thyrohyoid membrane

B.'s cyst. A subhyoid cyst

Boyle's law. The volume of a given mass of gas, at any given temperature, varies inversely as the pressure it bears.

Boze'man-Fritsch catheter. Double-current uterine catheter with several openings at tip

B. P., B. Ph. Abbr. for *British Pharmacopeia*.

Br. CHEM SYMB: *bromine*. BACT: Abbr. for *Brucella*.

bra'chia. Pl of *brachium*, arm
brachial (bra'ki-al) [G. *brachiōn*, arm]. Pert to the arm

b. artery. Main a. of arm. Continuation of the axillary artery on the inside of the arm.

b. glands. Lymphatic glands of the arm

b. plexus. Network of lower cervical and upper dorsal spinal nerves supplying arm, forearm and hand SEE *nerve plexuses*

b. veins. Those accompanying the brachial artery

brachialgia (bra'ki-al'i-ā) [' + *algos*, pain]. Intense pain in the arm

brachio [G] Prefix Pert to the brachium

brachiocephalic (bra-ki-ō-sef-al'ik) [G. *brachiōn*, arm, + *kephalē*, head]. Pert. to arm and head

brachiorural (bra-ki-o-kru'ral) [' + *L. cruralis*, pert to the leg] Pert to arm and leg

brachio-cubital [' + *L. cubitus*, forearm]. Pert to the arm and forearm

brachiocyllosis (bra-ki-o-sil-o'sis) [' + *kylōsis*, a bending] Curvature of the arm

brachiofacial [' + *L. facialis*, pert. to face] Pert to arm and face

brachioncus (bra-ki-on'kus) [' + *ogkos*, a swelling] A chronic, hard swelling of the arm

brachiotomy (bra-ki-ot'o-mī) [' + *tomē*, a cutting] Surgical removal or cutting of an arm of the fetus to facilitate delivery

bra'chium [L. from G. *brachiōn*, arm] 1. The upper arm from shoulder to elbow. 2 One of the white tracts of the brain

brachy [G *brachys* short] Prefix Short.

brachybasia (brā-ki-ba'si-ā) [' + *basis*, walking] A slow, shuffling gait seen in partial paraplegia. SEE *gait*

brachycardia (brak-i-kar'di-ā) [' + *kardia*, heart] Slowness of heart action SYN *bradycardia*, *q v*

brachycephalic, brachycephalous (brak-i-sef-al'ik, -al-us) [' + *kephalē*, head]. Having a head disproportionately short.

brachycephalism, brachyceph'aly. Shortness of the head

brachydactylia (brak-i-dak-til'i-ā) [G *brachys*, short, + *dactylos*, finger]. Shortness of the fingers

brachygnathia (brak-ig-na'thi-ā) [' + *gnathos*, jaw] Abnormal shortness or recession of under jaw

brachymetropia (brak-i-me-trop'i-ā) [' + *metron*, measure, + *opsis*, sight]. Myopia, nearsightedness

brachymetropic (brak-i-me-trop'ik). Nearsighted, myopic

brachyphalang'ia. Shortness of phalanges.

brachypnea (brak-ip-ne'ā) [G *brachys*, short, + *pnoē*, breathing] Shortness of breath

brachyran'ic [' + *ouranos*, roof of mouth] Having a short palate, or a palatomaxillary index over 115

bradesthesia (brad-es-the'zi-ā) [G *bradys*, slow, + *aisthēsis*, sensation] Blunted perception SYN *bradyesthesia*, *q v*

Bradford frame. An oblong frame, about 7 x 3, made of 1 in. pipe, covered with canvas strips which run from one side

of the frame to the other and which are movable, thus permitting the patient to urinate and defecate without moving the spine or changing position.

brady- [G *bradys*, slow]. Prefix: Slow, as *bradycardia*.

bradyacusia (brad-i-ak-oo'si-ä) [" + *akouein*, to hear] Hardness of hearing.

bradyarthria (brad-i-ar'thri-ä) [" + *arthron*, articulation] Bradyphasia, unusual slowness of articulation of words.

bradycardia (brad-i-kar'di-ä) [" + *kardia*, heart]. Slow heart action. SEE: *arrhythmia*, *tachycardia*.

b. sinus. A sinus rhythm with a rate below 60 in an adult, or below 70 in a child.

bradycardic. Pert to bradycardia.

bradykinesia (brad-i-slu-e'si-ä) [G. *bradys*, slow, + *kinēsis*, movement]. Extreme slowness of movement. SEE: *bradykinesia*.

bradycrotic (brad-i-krot'ik). Pert to slowness of pulse.

bradydiastole (brad-i-di-as'to-le) [G. *bradys*, slow, + *diastole*, dilatation]. Prolongation of the diastolic pause, as in myocardial lesions.

bradycoia (brad-i-ek-oi-ä) [G. *bradykooos*, hard of hearing] Hardness of hearing.

bradyesthesia (brad-i-es-the'zi-ä) [G. *bradys*, slow, + *aisthēsis*, perception]. Blunted perception.

bradyglossia (brad-i-glos'i-ä) [" + *glōssa*, tongue] Unusual slowness of speech. SYN *bradyphasia*, *bradyarthria*, *bradylogia*, *bradyphasia*, *bradyphemia*.

bradykinesia (brad-i-kin-e'si-ä) [" + *kinēsis*, motion]. Extreme slowness of movement.

bradykinetic (brad-i-kin-et'ik). Relating to slow movements.

A slow motion picture exhibiting details very plainly is used for analysis of the patient.

bradyphasia (brad-i-la'fi-ä) [G. *bradys*, slow, + *lalein*, to talk]. Slowness of utterance. ETIOL Brain lesion. SEE: *speech*.

bradylexia (brad-i-lex'i-ä) [" + *lexis*, word]. Slowness in reading due to a brain disorder.

bradylogia (brad-i-lo'ji-ä) [" + *logos*, speech] Unusual slowness of speech. SYN *bradyphasia*, *bradyphasia*, *bradyphemia*.

bradypepsia (brad-i-pep'si-ä) [" + *pepsis*, digestion] Slow digestion.

bradyphagia (brad-i-fa'ji-ä) [" + *phagein*, to eat] Slowness in eating.

bradyphasia (brad-i-fa'zi-ä) [" + *phasis*, speech] Extreme slowness of speech. SYN *bradyphasia*, *bradylogia*, *bradyphemia*.

bradyphemia (brad-i-fe'mi-ä) [" + *phēmē*, speech] Unusual slowness of utterance of words. SYN *bradyphasia*.

bradyphrasia (brad-i-fra'zi-ä) [" + *phrasia*, utterance] Slowness of speech; seen in some types of mental disease.

bradyphrenia [" + *phrēn*, mind] Slowness of mental activity as a result of epidemic encephalitis.

bradypnea (brad-ip-ne'ä) [" + *pnoē*, breathing] Abnormally slow breathing.

bradypermatisim (brad-i-sper'mat-izm) [" + *sperma*, semen]. Abnormally slow emission of semen.

bradyphymia (brad-i-säg'mi-ä) [" + *sphythmos*, pulse]. Abnormally slow pulse.

bradystal'sis [" + *stalsis*, constriction]. Slow peristalsis.

bradytocia (brad-i-to'si-ä) [" + *tokos*, childbirth]. Slow parturition.

bradyuria (brad-i-u'i-ä) [" + *ouron*, urine] Slowness in passing urine.

bradism (bra'dizm). Hypnotism.

brain [A S *braegen*]. A large, soft mass of nerve tissue contained within the cranium, the *encephalon*.

structure: It is composed of neurons which are nerve cells and neuroglia or supporting cells. The brain consists of gray and white matter. Gray matter is composed principally of nerve-cell bodies and is concentrated in the cerebral cortex and the nuclei and basal ganglia. White matter is composed of nerve-cell processes which form tracts or commissures connecting various parts of the brain with each other.

It consists of 5 parts: the *cerebrum*, *cerebellum*, *pons*, *Vulvul*, *medulla oblongata*, *q v* and *midbrain*.

The cerebrum represents seven-eighths of the weight of the brain.

LOBES 1. Frontal 2. Parietal. 3. Occipital 4. Temporal 5. Insula. 6. Limbic, *q v*.

GLANDS Pineal, pituitary.

MEMBRANES Meninges, consisting of the dura mater (external), arachnoid (middle), and pia mater (internal).

NERVES Cranial, *q v* SEE Appendix, pages 53, 55.

The subdivisions of the brain are *dienecephalon*. This includes the epithalamus, thalamus, and hypothalamus (optic chiasma, hypophysis, tuber cinereum, and maxillary bodies).

mesencephalon. This includes the corpora quadrigemina, tegmentum, and crura cerebri.

metencephalon. This includes the cerebellum and pons.

myelencephalon. This includes the medulla oblongata.

telencephalon. This includes the rhinencephalon, corpora striata, and cerebrum (cerebral cortex).

ventricles. The cavities of the brain are (a) the lateral ventricles (1 and 2) which lie in the cerebral hemispheres; (b) the third ventricle of the diencephalon, and (c) the fourth ventricle of the medulla. The first and second communicate with the third by the interventricular foramina, the third with the fourth by the cerebral canal (aqueduct Sylvius), the fourth with the subarachnoid spaces by the two foramina of Luschka and the foramina of Magendie. The ventricles are filled with cerebrospinal fluid which is formed by the choroid plexuses in the walls and roofs of the ventricles.

functions: The brain is the primary center for regulating and coordinating body activities. Sensory impulses are received through afferent nerves, these register as sensations which are the basis for perception. It is the seat of consciousness, thought, memory, reason, judgment, and emotion. Motor impulses are discharged through efferent nerves to muscles, and glands initiating activities. Through reflex centers automatic control of body-activities is maintained. The most important reflex centers are the *cardiac*, *vasomotor*, and *respiratory* centers, which regulate circulation and respiration.

For illustrations of the brain SEE: *Central Nervous System* (C-28) *Cerebrum* (C-32); *Nerve Cell Cerebral Corte* (N-12).

The weight of brain and cord is about

1350-1400 Gm., of which total the cord represents 2%. SEE spinal cord.

For picture of brain areas, see diagram under Nervous System, Central.

b., fever. Meningitis

b. stem. All the brain except the cerebellum and cerebrum. It includes the medulla oblongata, pons, midbrain, and thalamus

b. sand. Laminated bodies consist-

PATH General symptoms due to increased intracranial pressure are distinguished from the focal symptoms which vary with the actual structures implicated by the growth. The general symptoms are headache, the change in the retina recognized by ophthalmoscopic examination as "choked disc," and by vomiting (without nausea). Mental changes (esp. dullness), epileptiform

BASE OF THE BRAIN

ing principally of phosphates, and carbonates of calcium, and magnesium found in the pineal body called *corpora arenacea*.

b. tumor. Usually used inexactly to describe any intracranial mass, neoplastic, cystic, inflammatory (abscess), or gummatous. Except the latter, treatment depends on surgery and this on accurate diagnosis, the earlier the better. Here great difficulties may arise due to the inadequate signs of tumor or the simulation of these signs by diffuse diseases such as multiple sclerosis, paresis, internal hydrocephalus, kidney disease, and plumbism.

convulsions, giddiness, are often general but may be localized signs, these latter are very variable. In addition, history and cranial x-ray are of great value. The injection of air into the ventricles prior to x-ray is known as pneumo-ventriculography.

brains (beef). Av. SERVING: 230 Gm. Pro. 22.1, Fat 21.4, Carbo 2.5 per serving. Vit C+ They contain Vit. A. They contain lecithin but are poor in nuclein.

brain storm [A.S. *brægen*, + *storm*, violent weather]. Temporary outburst of mental excitement, often maniacal, esp. in paranoia.

Brain's reflex. Extension of flexed arm on assuming quadrupedal posture

branchial (brang'ki-al) [G. *brachia*, gills]. Pert. to gills

b. arches. Five pairs of arched structures which form the lateral and ventral walls of the pharynx of the embryo. They are partially separated from each other externally by the branchial clefts, internally by the pharyngeal pouches. The fifth arch is rudimentary. They play an important rôle in the formation of structures of the face and neck. The first is the *mandibular arch*, the second the *hyoid arch*. They are also called the visceral arches

b. clefts. A series of openings between the branchial arches. They become functional gill slits in fishes

b. grooves. A series of furrows separating the branchial arches. They are homologous to the branchial clefts of fishes and amphibians

b. muscles. Those which develop in the branchial arches

branchiogenous (brang-ki-oj'en-us) [" + *gennan*, to generate]. Having origin in a branchial cleft

branchiomer (brang-ki-ô-mêr'ik) Of or pertaining to the branchial arches

branchiomerism (brang-ki-om'er-izm) [" + *meros*, part]. Segmental division of the endoderm

brandy. Spirituous liquor distilled from wine and containing about 50% alcohol by volume

branks (brangk) [F. *branques*, pl. branches] Mumps

Brasador's operation (brah-dôrs') Ligation of an artery below an aneurysm

brash [F. *breche*, attack]. 1 A cutaneous eruption. 2 Pyrosis

b., water. Acidity of the mouth.

brass founders' a'gue. Tremors due to zinc poison from inhalation

brass poisoning. Due to the inhalation of fumes of zinc and zinc oxide with destruction of tissue in respiratory passage

SYM. Dryness and burning in respiratory tract, cough, headache, chills, rarely fatal

TREATMENT Entirely symptomatic, inhalations of humidified air make patient more comfortable

Brauch-Romberg symptom (browkh-rom'berg). A sign of ataxia, swaying of body when eyes are closed and feet held together.

Braun's hook (browns). Instrument for fracturing clavicle or to assist in decapitation of the fetal head

Braune's canal (brow'nehs). The parturient canal formed by the uterus, dilated cervix and vulva

B.'s ring. A point, supposedly 10 cm above the margins of the dilated external os. The portion above this ring possesses thin walls, while the remainder forms a thin walled tube

braw'ny induration. Pathological hardening and thickening of tissues

Braxton Hicks sign. Intermittent painless uterine contractions observed every 5-15 minutes throughout pregnancy, after uterine body becomes palpable

Brazil nuts. Av. SERVING 30 Gm. Prot. 5.0, Fat 20.0 Carbo. 2.0 per serving. FUEL VALUE 100 Gm — 714 cal

bread [AS] A food made from flour or meal, yeast, baking powder, etc., by moistening, kneading, and baking.

COMP. Starch, 40% to 60%, according to method of making. It undergoes car-

bonic fermentation. Baking the starch in the crumb forms a starchy paste and unites with the gluten, while in the crust, dextrin is produced by heat, with partial caramelization. The gluten forms nitrogen and it is accompanied by cereal, which peptonizes the nitrogenous matter. Phosphorated lecithin makes up the fats. Potassium and magnesium are well represented. The ash is acid.

b. paste. Bacterial culture medium.

breakbone fever. Acute epidemic febrile disease. SEE *dengue*.

breast [AS *brest*]. 1. The upper ant. aspect of the chest. 2. One of the mammary glands. A gland consists of 15-20 lobules divided into smaller ones with cavities or alveoli, the cells of which abstract from the blood the milk-forming substances

PATH. Tumors may be benign or malignant. Simplest one is *fibroadenoma*; others are *lipoma* and *cystic adenoma*. Malignant ones are usually *carcinoma*. Early surgery is necessary. A painful breast is usually due to mastitis.*

CHANGES IN PREGNANCY 6-12½ weeks, fullness and tenderness, erectile tissues in nipples, nodules felt, pigment deposited around nipple (primary areola), and few drops of fluid may be squeezed out. 16-20½ weeks (secondary areola), small, whitish spots in pigmentation

NP PREVENTIVE CARE Most complications of the breast during the puerperal period will not occur if proper care is given

POINTS TO OBSERVE 1. Prevent infection of the infant's mouth from improper cleansing and unclean nursing articles. This infection can be carried to the nipples and breasts when the infant nurses.

BREAST, SECTION

1 Lactiferous ducts 2 Papilla or nipple of breast 3 Lobules of secreting alveoli 4 Lactiferous sinuses 5. Pectoral fascia

2. Care for the breasts aseptically: by proper cleansing of the nipples, the application of sterile dressings, and proper cleansing of the nurse's hands.

3. Early treatment of soreness, cracks and fissures (a) By the use of sterile nipple shield while the baby nurses, which in most cases is inadequate treatment, (b) by taking the baby off the breast and pumping them at the time the baby would be due to nurse. Pumping should be done under very low pressure, and should be repeated until the nipple is well healed. This does away with the danger of infection from the infant's mouth and prevents him from making matters worse by his terrific nursing suction. Antiseptic oil, ointments, etc., may be used to favor the healing process.

4. Limit the nursing period during the first 3 days when no breast milk is available and during the engorgement period when the breasts are extremely sensitive from congestion and distention with milk. The use of the electric pump is stressed during this time.

5. Avoid bruising of the breasts. The use of the electric breast pump in place of brutal manual massage during the extreme sensitive period will prevent this.

6. Keep the nipples soft to avoid cracking. Applications which harden them predispose to cracking.

7. Avoid "caking" of the breasts by the use of the breast pump to remove any excess milk which may plug the ducts. In the home it will be necessary to resort to the hand breast pump or proper manual expression of the milk.

8. Proper support of the breast with a binder which pulls upward and inward. Do not bind tightly enough to restrict circulation.

9. Use ice bags during the engorgement period and when there is any tenderness. The ice bags are particularly soothing to cracked nipples as they relieve congestion.

CARE WHEN ABSCESS OCCURS 1. Avoid carrying infection. When abscesses occur and drainage has been established, there is danger of carrying infection on your hands to other parts of the mother's body. The nurse must protect the mother, herself, and other patients in the department by the use of proper technique. Gloves should be worn during the dressings and they should be boiled immediately after their removal. Dressings should be disposed of at once and before removing the gloves.

2. Remember the infant's milk supply is endangered. The infant is taken off the affected breast, but sometimes is permitted to nurse the normal breast. At other times pumping of the good breast is ordered during the height of the infection. Nursing orders will, of course, vary with the physician, but the infant's food intake must be kept up if necessary by artificial means.

3. Remember that an abscess may not only impair the function of the breast at this time but may also affect it in subsequent pregnancies.

RS *Clark's bodies, mamma, mammary glands, mamilla, mammillation, "mast-" words, nipple scirrhus, sternum.*

b., chicken; b., pigeon. Deformity in which chest is protruding, caused by rickets or obstructed respiration in infancy.

b. milk. Mother's milk. **SEE** *colostrum.*

b. pump. One to draw milk from the female breast.

breath (brēth) [A.S. *braeth*, odor]. The air inhaled and exhaled in act of respiration.

Diag. Foul odor indicates neglect of mouth or teeth, improper diet, constipation, neglect of exercise, use of drugs, alcohol or tobacco. It also depends upon the food ingested, and may indicate stomatitis, necrosis of jaw, caries of teeth, tonsillitis, diphtheria, gangrene and abscess of the lungs, fetid bronchitis, bronchiectasis, pyothorax, catarrh, diabetes, kidney disease, and other disorders.

Urinous odor Indicates uremia.
Sweetish odor (that of ripe apples): Found in diabetes mellitus, esp. during coma.

Odor of carnivorous animals: Noted in critical illness, in acidosis and alkalosis.

RS *air, brachypnea, breathing, bronopnea, bronchi, lungs, oxygen, respiration, ventilation.*

b., rattling and shortness of. Edema; presence of fluids in the air passages.

b., sighing. Air hunger. Occurs in internal hemorrhage.

NP Watch for after abdominal operations and in typhoid fever.

breath (brēth) [A.S. *braeth*]. 1. To inhale and exhale air, to respire. 2. To inject by breathing.

breathing (brōth'ing) [A.S. *braeth*, odor]. **Act of inhaling and exhaling air. SYN:** *respiration.*

This act includes the process of inspiration, or drawing the air into the lungs, and expiration, the forcing out of the air which is caused by the alternate expansion and contraction of the walls of the chest and the lungs.

The normal rate of breathing is **Men**, 16-18 per m., **women**, 18-20 per m.; **children**, 20-26 per m., **infants**, 30-35 per m. The ratio to pulse in breathing is usually about 1 to 4. In women and children, breathing is largely thoracic or costal, in men and in old of both sexes, it is largely abdominal, or diaphragmatic. Restricted abdominal breathing is observed in pregnancy, in abdominal tumors and effusions; in peritonitis, in diaphragmatic pleurisy; in paralysis of the phrenic nerve from pressure or bulbar disease and occasionally in hysterical abdomen.

SEE *apnea, asphyxia, Cheyne-Stokes respiration, drowning, dyspnea, orthopnea, stridor, unconsciousness.*

ADVENTITIOUS SOUNDS: Friction sounds produced by the rubbing together of roughened pleural surfaces, may be heard both in inspiration and expiration and often resemble subcrepitant râles, but are more superficial and localized than the latter, and are not modified by cough or deep inspiration.

Metallic tinkling: Silvery bell-like sounds heard at intervals over a pneumohydrothorax or large cavity. Speaking, coughing and deep breathing usually induce them. Must not be confounded with similar sound produced by liquids in the stomach.

Râles: Abnormal bubbling sounds heard in air cells or bronchial tubes, *q.v.*

Succussion-splash or hippocratic succussion: A splashing sound produced by

the presence of air and liquid in the chest, may be elicited by gently shaking the patient while auscultating. Nearly always indicates either a hydro- or a pyopneumothorax, although it has been detected over very large cavities. Air and liquid in stomach produce similar sounds. *See respiration, also heart, for auscultation.*

AUSCULTATION OF RESPIRATORY ORGANS. Normal respiration. Vesicular breathing is heard over the body of the lungs and is characterized by a soft, breezy inspiration, and a short, low pitched expiration. Normally, expiration is not more than $\frac{1}{2}$ as long as inspiration. Auscultation over trachea or main bronchi in the interscapula space yields bronchial breathing.

MODIFICATION OF THE RESPIRATORY MURMUR. Amphoric and cavernous breathing. These two are almost identical. Sounds loud, expiration prolonged and hollow. Pitch of amphoric breathing a little higher than cavernous. May be imitated by blowing over the mouth of an empty jar. Heard in (a) Phthisical or bronchiectatic cavities, (b) pneumothorax, when the opening to the lung is patulous, (c) area of consolidation near a large bronchus, (d) sometimes over lung compressed by a moderate effusion.

b., asthmatic. Harsh breathing with a prolonged wheezing expiration. Is heard all over the chest.

b., bronchial or tubular. Harsh breathing with a prolonged high pitched expiration which has sometimes a tubular quality. Heard over (1) Phthisical consolidation, (2) pneumonic consolidation, (3) lung which is compressed, (4) rarely over a lung infiltrated with a tumor growth.

b., clogged wheel or jerky. Respiratory murmur not continuous, but broken into waves, not indicative of any special disease, but frequently observed in bronchitis and in incipient phthisis.

b., of emphysema. Weak with prolonged, low pitched or inaudible expiration.

b., exaggerated. Almost same peculiarity as puerile. B. Heard over lung that is doing extra work necessitated by some impairment of its fellow.

b., odorous. Due to drugs, alcohol, tobacco, diabetes, kidney disease.

b., puerile. Type heard normally over lungs of children, loud expiration, higher pitched than in vesicular breathing and almost as long as inspiration.

b., rapid. In pneumonia, high fevers, or interference with oxygenation.

b., slow. Found in narcotic poisoning, sleep, or rest, and in cases of brain compression.

b., stertorous. Due to a relaxation of the palate and is characterized by a deep snoring sound on inspiration. It is most always present in apoplexy, the cheeks puff out with each breath on expiration. It is not regarded as a serious symptom, although it may indicate brain or nerve pressure. It is found in deep sleep and in coma.

b., weak or shallow. Noted (a) When chest walls are thick; (b) in the old and feeble, (c) in emphysema; (d) in pleural effusion; (e) in incipient phthisis; (f) in painful affections of the chest, like pleurodynia and beginning pleurisy; (g) in pulmonary edema.

breath and breathing, words pert. to: anapnea, anapneic, anhelation, anhelitus, anhelose, anima, apnea, asthma,

asthmatic, Aufrecht's sign, besoin de respirer, brachypnea, bradypnea, bromopnea, carbonometry, dyspnea, eupnea, exhalation, expiration, halitosis, halitus, hyperpnea, inhalation, inspiration, insufflate, orthopnea, ozostomia, respiration, respiratory center, stertorous.

breidouillement (bra-dwé-mon') [Fr.]. Pronunciation of only part of a word due to rapid utterance.

breech [A.S. *brēc*, buttocks]. The nates, or buttocks.

b. presentation. The presentation of the buttocks instead of the head in childbirth. Occurs in 1/60 of all full-time labors.

breeze [Fr. *brise*, wind]. A movement of air.

b., static. If a dry stick is brought near a patient on an insulated platform receiving a charge from a static machine, the charge will pass gradually to the conductor from the patient in the form of a bluish brush.

bregma (breg'mā) [G front of head]. That point on the skull where the coronal and sagittal sutures join. The ant. fontanelle in the fetus and young infant.

bregmatic. Pert. to the bregma.

bregmocardiac reflex. Reduced heart rate following pressure on post. fontanel.

Breisky's disease (br'iskis). Atrophy of the vulva. Kraurosis vulvae.

Brenner tumor. A benign fibroepithelioma of the ovary.

breuzkatechinuria (brents'kat'ek-in-u'ri-ā) [Ger. *brenz*, burnt, + *catechin*, + G. *ouron*, urine]. Alkaptonuria. Condition in which alkapton is present in urine, causing it to darken on standing.

brick dust. A red deposit of urates in the urine.

bricklayers' cramp. A neurosis with inco-ordination of muscles of the hand when using the trowel.

b. itch. Eczema from lime mortar.

brickmakers' disease. Hookworm disease. Ankylostomiasis, uncinariasis.

bridge [A.S. *brycg*]. 1. Narrow band of tissue. 2. Dental plate fastened to a tooth at each end.

b. of nose. The ridge formed by the nasal bones.

bridgework (brij-werk). A partial plate held in place by permanent attachments to other teeth.

b., fixed. Partial plates held by crowns or inlays fastened to the natural teeth.

b., removable. Partial plates held by clasps which permit their removal.

Bright's disease. A generic term for acute and chronic disease of the kidneys. It is usually associated with dropsy and albuminuria. Known also as *nephritis*.

brim [A.S. *seashore*]. 1. An edge or margin. 2. Brim of pelvis. Superior aperture of the lesser or true pelvis, the inlet. Formed by the iliopectineal line of the innominate bone and the sacral promontory. Oval-shape in the female; heart-shaped in the male.

brisement forcé (bréz-mon') [Fr. crushing]. Breaking, by forcible means, of adhesions.

Brissaud's reflex (brís-sos'). Contraction of fascial femoris muscle following tickling of sole of foot.

British thermal unit. Amount of heat necessary to raise the temperature of one pound of water 1 degree F. *See: calorie.*

broach [A.S. *broche*]. A dental instrument for enlarging a tooth canal or for removing the pulp.

broad ligament. A transverse fold of peritoneum arising from floor of the

pelvic cavity between the bladder and rectum, dividing the minor pelvis into ant. and post. compartments. In its median portion lies the uterus to which it is attached on both sides. Its free superior border contains the uterine tube. A lateral portion of the upper border forms the suspensory ligament of the ovary.

Broadbent's sign. A visible retraction of the left side and back in region of 11th and 12th ribs synchronous with the cardiac systole, in adheient pericardium.

Bro'ca's area. On left side of brain, controlling movements of tongue, lips, vocal cords, or motor speech area. Loss of speech due to hemorrhage from this area. Area parolfactoria.

B's convolution. Third left frontal convolution.

B's fissure. One surrounding B's convolution.

broccoli. Av. SERVING: 120 Gm Pro 4.0, Fat 0.2, Carbo 5.0 per serving Ca 0.122, P 0.059, Fe 0.0001. Vit. A+++ , B++ , C+ , G++.

Brodie's abscess. An abscess of the head of the tibia, or it may be an abscess of any bone.

Enol. It is usually of tubercular origin or from subacute infection.

Sym. May be aching pains in area, followed by slight swelling and tenderness on movement. Symptoms less acute but similar to osteomyelitis.

brokaw ring. Rubber tubing ring threaded with catgut for intestinal anastomosis.

brom-, bromo- [G. *brōmos*, stench] Prefixes. Presence of bromine.

bro'melin [L. *bromelia*, pineapple] Ferment allied to trypsin; found in pineapple juice.

It digests 1500 times its weight of proteins.

bromides (bro'mīds) [G. *brōmos*, stench] Salts of biomine.

They are nerve depressants. Adm by mouth or rectum.

Poisoning Sym: Fetid breath, mental dullness, depression, weakness, skin eruptions, tremors, headache, vertigo. In large doses exhaustion and cardiac failure.

T. A TREATMENT Evacuate stomach, administer protective mucilaginous drinks, as flour, starch, rice, oatmeal or barley water.

bromidrophobia (bro-mīd-ros-i-fō-bī-ā) [" + *idrōs*, sweat, + *phobos*, fear] Abnormal fear of personal odors, accompanied by hallucinations.

bromidrosis (brom-i-dro'sis) [" + *idrōs*, sweat]. Fetid or offensive sweat. It occurs mostly on feet, groins, and axillae.

Etiol: Symptomatic or idiopathic.

Sym: Presence of asafetida, musk, copaliba, urea in sweat. In localized forms, decomposition of sweat after excretion, or as a result of contamination by *B. foetidus*.

NP Cleanliness, use of an antiseptic, daily change of clothing, deodorant antiseptic powders.

RS: anhidrosis, chromidrosis, hyperidrosis, ozoehrotia, uridrosis.

bromism, brominism (bro'mīzm, bro'mīn-izm) [" + *ismos*, state of] The results of prolonged use of bromides.

Sym. Apathy, somnolence, coldness, headache, feeble heart action, pallor, anorexia, acne, and loss of sexual power.

bro'moder'ma [" + G. *derma*, skin]. Acne-like eruption due to chronic bromide poisoning.

bromo"hyperhidro'sis [" + *yper*, over, + *idrōs*, perspiration]. Fetid and excessive sweat. SEE. *bromidrosis*.

bromo"iodism [" + iodine, + G. *ismos*, state of]. Poisoning from bromoiodides.

bromomania (bro-mo-man'i-ā) [" + G. *mania*, insanity]. Insanity caused by use of bromides.

bromomenorrhea (bro-mo-men-or-e'ā) [" + *mēnes*, menses, + *roia*, flow]. Offensive and disordered menstruation.

bromopnea (brom-op-ne'ā) [" + *pnoē*, breath] Offensive breath.

bromo seltzer (bro'mo selt'zer). A proprietary headache powder.

POISONING. TREATMENT Same as for acetanilid, q.v.

bromural (bro'mur'al). A white, crystalline substance, α-nombromisovalerylurea derived from bromine.

USFS As a nerve sedative, in mild cases of insomnia, producing sleep of short duration; its action usually ceases after 3 to 5 hours.

DOSAGE As nerve sedative, 5 gr. (0.3 Gm.) 3 times a day. As hypnotic, 10 gr. (0.6 Gm.)

bronchadenitis (brōnk'ad-en-i'tis) [G. *brōchia*, bronchia, + *adēn*, gland, + *-itis*, inflammation]. Inflammation of bronchial glands.

bronchi (brōn'ki) (sing. *bronchus*). The primary divisions of the trachea, divides opp 3rd dorsal vertebra. The right bronchus is shorter and more vertical than the left one.

They penetrate the lungs, one for the right and the other for the left lung, and terminate in the bronchioles or bronchial tubes.

B., foreign bodies in. May cause various diseases of bronchi, large objects leading to collapse of the lung. Metal bodies, if small, may produce no symptoms. Beans, nuts, seeds, etc., may cause pneumonia, bronchitis or lung abscess.

Sym: Choking and gagging, immediately. Later, symptoms of bronchitis, atelectasis, pneumonia or lung abscess.

Prog Good, if removed before complications. Better in case of metallic objects than in vegetable bodies.

TREATMENT. Removal through bronchoscope.

BRONCHI AND TRACHEA

1. Bronchioles. 2. Right bronchus. 3. Trachea. 4. Larynx. 5. Left bronchus.

bronchi, words pert. to: alveobronchitis, bronchadenitis, bronchial tubes, bronchiectasis, bronchioles, bronchitis, bronchocele, bronchopneumonia, bronchorrhea, bronchoscopy, bronchostenosis, bronchotomy, bronchus, "bronch-" words, Charcot-Robin crystals, mesobronchitis, râles.

bronchia (bron'kī-ā) [G. *bronchos*] The divisions of the bronchi.

bronchial (bron'ke-al) Pert. to the bronchi or bronchioles.

b. crises. Paroxysm of coughing in locomotor ataxia

b. glands. Mucous or mixed glands in the bronchi or bronchioles.

b. tree. Bronchi and bronchial tubes.

b. tubes. The smaller divisions of the bronchi

RS: *bronchi, bronchioli, bronchitis, bronchus.*

bronchiectasia (bron-kī-ark'shī-ā) [G. *bronchos, bronchial tubes, + L. arcāre, to compress*] Bronchial tube stenosis

bronchiectasis (bron-kī-ek'tas-ī-s) ["" + *ektasis, dilatation*] Dilatation of a bronchus or bronchi, usually secreting large amounts of offensive pus

ETIOI. Acquired or congenital, on one or both sides of chest. Chronic bronchitis, tuberculosis, whooping cough. Blocking or narrowing of a bronchus, due to pressure or foreign body. A complication of empyema and chronic pulmonary tuberculosis

SYM Cough, dyspnea, expectoration of large amounts of foul smelling secretion, esp. in the morning Sputum is dark; a pint may be expectorated with first morning attack. When expectorated it settles in 3 layers. (a) Bottom one that is thick and which contains pus cells, (b) a middle layer of brownish fluid, (c) an upper layer of froth

NP Maintain resistance. Position to assist drainage

bronchiectatic (bron-kī-ek-tāt'ik) ["" + *ektasis, dilatation*] Pert. to bronchiectasis.

bronchiloquy (bron-kī-lō-kwī) ["" + *L. loqui, to speak*] Unusual vocal resonance over a bronchus covered with consolidated lung tissue

bronchiocele (bron'kī-o-sēl) ["" + *kēlē, tumor*] Circumscribed dilatation of a bronchus

bronchiocrisis (bron-kī-o-kri'sis) ["" + *crisis, separation*] Bronchial crisis.

bronchiogenic (bron-kī-o-jen'ik) ["" + *gen-um, to originate*] Having origin in the bronchi

bronchiolectasis (bron'kī-o-lek'ta-sis) [L. *bronchiolus, air passage, + G. ktasis, dilatation*] Dilatation of the bronchioles; capillary bronchiectasis.

bronchioles, bronchioli (bron'kī-ols, -o'li) [L. *bronchiolus, air passage*] The smaller divisions of the bronchi. They lack cartilage

Each one terminates in the atrium, an elongated sacculi, each of which is covered with alveoli or air cells.

b., respiratory. The last division of the bronchial tree They are branches of terminal bronchioles and lead to alveolar ducts leading to the alveoli

b., terminal. Next to the last subdivision of a bronchial, leading to the respiratory bronchioles

bronchiolitis (bron-kī-o-li'tis) ["" + G. *-itis, inflammation*] Inflammation of the bronchioles

b., exudative. A form with fibrinous

b., vesicular. Bronchopneumonia.

bronchiospasm [G. *bronchos, + spasmos, fit*] Spasmodic narrowing of the lumen of the bronchial tubes.

bronchostenosis ["" + *stenōsis, a narrowing*] Narrowing of the bronchial tubes. SYN: *bronchiectasis*

bronchismus ["" + *ismos, state of*] Spasmodic narrowing of the lumen of the bronchial tubes. SYN: *bronchiospasm.*

bronchitic. Pert. to bronchitis.

bronchitis (bron-kītis) [G. *bronchos, bronchos, + itis, inflammation*] Inflammation of bronchial mucous membrane

ETIOI. Usually results from exposure to cold, the inhalation of irritating substances from acute germ diseases

SYM Cough, expectorations, moist and dry rales, fever of 100° F, pain over sternum.

b., acute catarrhal. Chilliness, malaise Soreness and constriction behind sternum, increased by coughing; slight fever, 100°-102° F Cough at first dry and painful, later mucopurulent expectoration which becomes free as inflammation subsides

PROG Favorable In old, young, and feeble there is danger of its leading to capillary bronchitis or catarrhal pneumonia

TREATMENT Abortive: Use hot foot baths, hot drinks, steam inhalations, good nourishment Internal remedies

b., capillary. An inflammation of the smaller bronchi, generally secondary to simple b

SYM Severe spells of coughing, rapid respiration—30 to 80 per minute, dyspnea, high fever—104°-105° F., weak, rapid pulse Later lips become blue, extremities cold, mind dull

PROG In young children very grave. May develop into bronchopneumonia.

TREATMENT Absolute rest. Temp. of room kept uniformly at 70° or 75° F., atmosphere kept moist by steam Internal medication.

b., chronic. Persistent cough, mucopurulent expectoration Soreness behind sternum Fever absent unless disease is severe, dyspnea on exertion

NP Whenever possible it is advisable for an elderly person with chronic bronchitis to move to a dry, warm climate, especially during the winter. The ward or room in the hospital should be kept warm Bowels should be kept open and constipation avoided Diet should be nourishing and the doctor may order codliver oil as well as expectorants and respiratory antiseptics

b., fetid. Bronchitis with foul-smelling expectoration

b., fibrinous. A primary inflammatory disease of the bronchi associated with formation of false membrane.

SYM Acute and chronic forms are recognized Acute is rare, manifests symptoms of acute b., but sputum contains fibrinous casts and there is marked dyspnea. Chronic form characterized by severe cough, dyspnea, and the expectoration of fibrinous plugs. Often lasts a few weeks, then disappears, to return again at definite periods.

PROG Guarded, in acute may cause death from suffocation.

TREATMENT Moist atmosphere of room during acute attack, and uniformly warm. Internal remedies

b., putrid. Chronic form with foul-smelling sputum.

b., rheumatic. Severe cough in paroxysms, expectoration of scanty, tenacious mucus; aching pains in chest, does not yield to ordinary treatment for bronchitis.

bronchium (brong'kī-um) (pl. *bronchia*) [L. *bronchus*]. A bronchial tube.

broncho- [G. *bronchos, windpipe*]. Prefix: Rel. to the bronchi.

bronchoadenitis [' + *adēn*, gland, + *-itis*, inflammation]. Inflammation of bronchial glands. *SYN* *bronchadenitis*.

broncho'blennorrh'e'a [' + *blennos*, mucus, + *rota*, flow]. Copious, thick sputum accompanying chronic bronchitis.

bronchocele (bron'ko-sēl) [' + *kēlē*, tumor]. Goller, esp cystic goller.

bronchoclysis (bron-kok'li-sis) [' + *klysis*, washing]. Introduction of a medicated solution into the bronchi.

bron'choconstric'tion [' + *L* *constringere*, to draw together]. Constriction of the lumen of the bronchi.

bron'chodilata'tion [' + *L* *dilatāre*, to open]. Dilatation of a bronchus.

bronchoegophony (bron-ko-ē-gof'o-ni) [' + *ag-*, goat, + *phōnē*, voice]. Egobronchophony, a goatlike sound.

bronchogenic (bron-ko-jen'ik) [' + *gen-*, to originate]. Having origin in the bronchi.

bron'chogram [' + *gramma*, a writing]. A roentgenogram of the lungs and bronchi.

bronchog'raphy [' + *graphein*, to write]. Radiography of the bronchi, making a bronchogram.

broncholith (bron'ko-lith) [' + *lithos*, stone]. Calculus in the bronchus or bronchial tube.

broncholithiasis (bron-ko-lith-i'ā-sis) [' + *lithos*, stone]. Calculi in the bronchi.

bronchomoniliasis (bron-ko-mon-il-i'ā-sis) [' + *L* *monile*, necklace of chains]. Infection of the bronchial membrane with a species of *Monilia*.

bronchomo'tor [' + *L* *motus*, moving]. 1 Causing change of caliber of the bronchi. 2 An agent causing such a change.

bronchomycosis (bron-ko-mi-ko'sis) [' + *mykes*, fungus]. Any bronchial disease due to microbes or fungus.

bronchopathy (bron-kop'ath-l) [' + *pathos*, disease]. Any disease of the air passages.

bronchophony (bron-kof'o-ni) [' + *phōnē*, voice]. The voice as heard over a normal bronchus.

b., whispered. Bronchophony when patient whispers.

bronchoplasty (bron'ko-plas-ti) [' + *plasma*, to form]. Operation of closing tracheal fistula.

bronchoplegia (bron-ko-ple'ji-ā) [' + *plēgē*, stroke]. Paralysis of the bronchial tubes.

bronchopneumonia (bron-ko-nu-mo'ne-a) [' + *pneumōnia*, lung inflammation]. Inflammation of the terminal bronchioles and alveoli.

ETIO. Usually a sequel of bronchitis, or resulting from influenza, eruptive fevers of childhood, and other diseases. The pneumococcus is present and, to a lesser degree, the staphylococcus and influenza bacillus. Pneumonic patches around a bronchus which contains gray mucus, and an exudate somewhat like that found in lobar pneumonia fill the air vesicles.

SYM. Cough and expectoration, respiration short and shallow—from 50 to 75 per minute. Cyanosis may ensue. Nostrils dilate with each inspiration, and in children the temperature reaches 103° or 105° F; before death, 108° F. Pulse, 140. Vomiting and diarrhea; gradually falling temperature. Duration, 2 to 3 weeks. Improvement may be followed by increased severity as new patches form. In the aged many of these symptoms are

absent; slight cough and little sputum; temperature, 100° to 101° F. may or may not be in evidence. Gradually falling strength and increase of dyspnea. The bedridden are susceptible.

PROC. Depends upon age. Mortality greater in the very young and the very old. Childhood mortality, 30 to 50%.

NP. Hygienic. Room, 65° to 70° F, moistened with steam. Flannel next to skin. Cold sponge bath, wet pack, and compresses over chest. Stimulation in cyanosis and mustard plaster over chest or back to draw circulation to the surface. Oxygen inhalations. Liquid or semiliquid food. Beware of relapse.

bron'chopul'monary [' + *L* *pulmonarius*, pert to lung]. Pert to bronchi and lungs.

bronchorrhagia (bron-kor-a'ji-ā) [' + *rēgnunai*, to break forth]. Bronchial hemorrhage.

bron'chor'raphy [' + *raphē*, suture]. Suture of a wound of the bronchus.

bronchorrhea (bron-ko-rē-ā) [' + *rota*, flow]. Abnormal secretion from the bronchial mucous membrane, sometimes very offensive (fetid bronchitis*).

bronchorrhoeus (bron-kor-on'kus) [' + *rogchos*, snore]. A bronchial rale.

bronchoscope (bron'ko-skop) [' + *skopein*, to examine]. An instrument for examining the interior of a bronchus.

bronchoscopy (bron-kos'kō-pli) [Examination of the bronchi through a bronchoscope].

bronchosis [G. *bronchos*, windpipe, + *L* *sinus*, a hollow, + *G.* *-itis*, inflammation]. Infection of bronchi and sinuses at the same time.

bron'chospasm [' + *spasmos*, a spasm]. Spasm of the bronchus.

bronchospirochetosis (bron-ko-spi-rō-kē-to'sis) [' + *spira*, coil, + *chaîtē*, wavy hair]. Hemorrhagic bronchitis, bronchopulmonary spirochetosis resulting from spirochetes.

bronchostenosis (bron-ko-sten-o'sis) [' + *stenōsis*, a narrowing]. Narrowing of a bronchus.

bronchos'tomy [' + *stoma*, mouth]. Formation from without of an opening into a bronchus.

bron'chofet'any [' + *tetanos*, tetanus]. Extreme dyspnea due to spasm in the bronchi preventing access of air.

bronchotome (bron'ko-tom) [' + *tomē*, incision]. Instrument for making an incision of the trachea.

bronchotomy (bron'ko-to-mi) [Incision of a bronchus, the larynx, or trachea].

NP. Dressing borosalicilic acid powder. Temperature of room 80° F. and atmosphere saturated with steam.

bron'chotra'cheal [G. *bronchos*, windpipe, + *trachea*, trachea]. Pert. to both bronchi and trachea.

bron'choty'phoid [' + *typhos*, fever, + *eidos*, resemblance]. Typhoid fever marked by severe bronchitis in initial stage.

bron'choty'phus [' + *typhos*, fever]. Typhus fever accompanied by bronchial catarrh.

bron'chovesic'ular [' + *L* *vesicula*, small bladder]. Pert. to bronchial tubes and air passages of the lungs.

bronchus (bron'kus) (pl *bronchi*) [G. *bronchos*]. One of the 2 large branches of the trachea.

The trachea proper terminates at the level of the 2nd ribs, or 4th dorsal vertebra. The right b. differs considerably from the left b. *See* *bronchi*.

bronzed skin. A characteristic symptom of Addison's disease which is due to inflammation of the suprarenal capsules.

brood capsule. Cystlike bodies which develop within a hydatid cyst of *Echinococcus granulosus*. Each contains from 3 to 30 scolices.

brossage (brös-sazh') [Fr. brushing]. Brushing the averted eyelids with stiff brush, to remove granulations, as in trachoma.

Brouha's test (broo'äs). A test for pregnancy.

Daily injection of immature mice of male sex with urine of patient. If, after 10 days, mice have sexual gland secretion, pregnancy of patient is assumed.

brow'ache (A.S. brū, brow, + aken, to hurt). Supraorbital neuralgia, migraine.

Brownian movement. Bact. Oscillatory movement distinguished from self motility of living microorganisms.

Brown-Séquard's paralysis (sa-kars'). Reflex flaccid paraplegia occurring during some urinary tract affections.

B.-S.'s syndrome. Anesthesia of one side of the body and paralysis and hyperesthesia of the other side, found in unilateral compression of the spinal cord.

brow presentation. When the brow or face of the infant comes first on presentation in labor, makes birth almost impossible. Cesarean section indicated.

Brucella (bru-sel'ä). A genus of bacteria, nonmotile, nonsporing, aerobic, gram negative, and pathogenic to man causing undulant fever and contagions and abortion in cattle, hogs, and goats.

brucell'ar. Pert to Brucella.

brucell'in. A vaccine made from several species of Brucella.

brucellosis (bru-sel-o'sis) {brucella + -osis} Infection with Brucella. Undulant fever.

Bruch's septicemia. Malta fever.

Bruch's membrane. A glassy membrane of the uvea of the eye lying between the choroid membrane and the pigmented epithelium of the retina.

brucine (bru'sin). A poisonous alkaloid from *Strychnos nux vomica* and other *Strychnos* species. Similar to but less powerful than strychnine, *q.v.*

Bruenning electric head-cabinet (bru'ning). Apparatus to apply infrared radiation over face and sinus areas.

bruise [Fr. bruiser, to break]. An injury with diffuse effusion into subcutaneous tissue, and in which skin is discolored but not broken.

b. of head, chest, and abdomen. May be associated with internal injuries.

Sym: Pain, swelling, tenderness, discoloration. **NP:** Mild antiseptic if skin is scratched. Cold applications with pressure. Later, heat and massage.

b. of or confusion of breast. **Sym:** Pain, swelling, discoloration. **NP:** Apply cold applications and snug bandage with pressure and elevation. Later, heat and gently massage. **See:** contusion.

bruissement (bru-ës-mon') [Fr. droning noise]. A purring sound heard in auscultation.

bruit (broo'ë) [Fr. noise]. An adventitious sound of venous or arterial origin heard on auscultation.

b. de craquement. Crackling.

b. de diable. 1. The venous hum of anemia. 2. Subjective tinnitus of chlorotic patients and a humming hallucination of hearing in the insane.

b. de frottement. Frictionlike sound.

b., placental. A purring or blowing noise heard in the pregnant uterus due to fetal circulation of blood, and synchronous with the maternal pulse.

b. de pot fêlé. Cracked pot sound.

b. de râpe. Rasping.

b. de soufflet. Bellows sound.

Brunner's glands. Compound glands of the duodenum and upper jejunum. Also known as duodenal glands.

They are imbedded in the submucous tissue and lined with columnar epithelium. They are similar to the pyloric glands of stomach. They secrete intestinal juice.

brush discharge. In electrotherapeutics, the discharge from a static machine (less commonly from a high frequency apparatus), having a disruptoconvective character and peculiarities that can be produced by the passage of an electrical current through a resistance such as a tube containing glycerine or a damp (or "green") wooden wand. **See:** static breeze.

Brussels sprouts. **AV. SERVING.** 100 Gm. **Pro** 4.4, **Fat** 0.5, **Carbo.** 7.6 per serving. **Ca** 0.027, **Mg** 0.040, **K** 0.375, **Na** 0.004, **P** 0.120, **Cl** 0.040, **S** 0.194, **Fe** 0.0011. **Vit.** A++, B++, C++.

bruxism (brüks'izm). Grinding of the teeth, esp. during sleep, sometimes a manifestation of a neurosis.

Bryce's test. A second vaccination after 5th or 6th day from appearance of vesicles of previous vaccination as a test of latter.

bubo (bu'bo) [G. boubōn, groin]. Suppuration of a lymphatic gland, particularly in the axilla or groin, of chancroidal, tuberculous, gonorrheal or syphilitic origin.

It is also seen in diseases due to a typhoid poison, or to the absorption of pus by lymphatics which drain into the glands, as in the bubonic plague.

TREATMENT *Chancroidal* Puncture of suppuration points, pus squeezed out and iodoform emulsion injected. *Tuberculous:* Multiple small incisions followed by curettage, ensuing ulceration treated by Bier's cups. Enucleation of infected nodes is contraindicated. Hygienic regimen *Gonorrheal* Incision and drainage.

bubonadenitis (bu-bon-ad-en-i'tis) [" + aden, gland, + -itis, inflammation]. Inflammation of an inguinal gland.

bubon'algia [" + algos, pain]. Pain in the groin.

bubon d'emblée (bu-boh' dähm-biä') [Fr.]. Venereal bubo appearing without previous lesion.

bubonic plague [" + L. plāgā, epidemic]. A very fatal, acute, infectious disease, common in the Orient, esp. India. The Black Death of the Middle Ages.

Etiol. Caused by *Pasteurella pestis*, usually carried by rats and fleas, which is imparted to human beings by bite of the rat-flea. It is characterized by enlargement of lymphatic glands, severe toxic symptoms, accompanied by intense adenitis or pneumonia.

bubonocoele (bu-bon-o-sēl) [" + kēlē, tumor]. Inguinal hernia.

bubonocnus (bu-bon-on'kus) [" + ocnos, tumor]. A swelling in the inguinal region.

bubonopanus (bu-bon-o-pa'nus) [" + L. panus, swelling]. An inguinal bubo.

bucar'dia [G. bou, ox, + kardia, heart]. Severe hypertrophy of the heart.

bucca (buk's) [L. mouth, cheek]. 1. The mouth. 2. Hollow part of the cheek.

buc'cal. Pert. to the cheek or mouth.

b. cavity. The mouth.

b. glands. Small glands situated in the mucous membranes of the mouth which secrete saliva.

buccella'tion [L. *buccella*, morsell]. Hemostasis by use of a lint pad or compress.

buccinatorlabialis (buk-sin-at-o-lä-bi-a'lis) [L. *buccinator*, trumpeter, + *labialis*, pert. to the lips]. The buccinator and orbicularis oris as one.

buccinator (buk-sin-a'tor) [L. *buccinator*, trumpeter]. The muscle of the cheek. SEE: *muscles*.

buccoversion (buk-o-ver'shun) [L. *bucca*, mouth, + *versio*, a turning]. Position of part buccal to line of occlusion, said of a tooth.

buccula (buk-ü-lä) [L. a little cheek]. A double chin.

Buck's extension. An apparatus consisting of a weight and pulley for applying extension to a limb.

buckwheat flour. AV. SERVING (cooked): 115 Gm Pro. 9.4, Fat 1.4, Carbo. 84.4 per serving. Ca 0.039, Mg 0.048, K 0.130, Na 0.027, P 0.226, Cl 0.012, S 0.071, Fe 0.0021.

bucnemia (buk-ne'mi-ä) [G. *bous*, ox, + *knēmē*, leg] Inflammation of the leg; elephantiasis

budding [M.E. *budde*, to swell] A form of fission in which the mother cell puts out budlike processes containing their proportion of chromatin, which then separate and become individual cells. SEE: *gemmation*.

Burger's disease (bur'gers). A disorder affecting the muscles and blood vessels of the legs

ETIOI. Thickening and chronic inflammation of blood vessel walls in the leg. Some formation of clots may obtain. Spasm of muscles of blood vessel walls. Allergy as a cause is suspected. Over 80% of cases are tobacco addicts. Many afflicted are susceptible to hay fever and asthma.

SYM. Cramps in legs but not to be confused with those occurring in the aged. Legs give out, esp. when walking. Gangrene may set in and amputation may be necessary.

TREATMENT. Hydrotherapy, hot and cold water alternately applied. Heat of various kinds. Discontinue use of tobacco. Make allergy tests, surgery. SEE: *thromboangitis obliterans*.

buffer (bü'ër) [Fr. *bufte*, blow] 1. A substance, esp. a salt of the blood, tending to preserve original hydrogen-ion concentration of its solution, upon adding an acid or base. 2. A substance tending to offset reaction of an agent administered in conjunction with it.

It is determined by the carbon dioxide which the blood will take. This regulates the balance bet. a condition of normal alkalinity and any tendency toward acidosis.

b. action. A buffer reaction with the excess acid or alkali bringing about the production of substances less acid or alkaline. As a result there is little or no change in the pH of the solution.

b. blood. One present in the blood. The principal buffers are: carbonic acid, carbonates and bicarbonates, monobasic and dibasic phosphates, proteins, and alkali protinates. Hemoglobin is an important protein buffer.

b. food values. The ability of foods to combine with base or acid without changing their reaction.

Suitable in high gastric acidity, malnutrition, infectious and deficiency diseases, and in low acid content of the stomach. Milk, eggs, and meat have a high buffer value, and cereals, fruits, and vegetables a low buffer value. **Excess acid foods**: Meat, fish, cereals. **Excess alkaline foods**: Most fruits and vegetables, milk and some nuts. **Neutral foods**: Butter, cream, cornstarch, sugar, tapioca, most oils and fats.

b. salts. Substances in the blood which act as a buffer.

buffy coat [Fr. *bufe*, buffalo]. Light stratum of a blood clot when coagulation is delayed.

bug (M.E. *bugge*, swollen). A term applied loosely to any small insect or Arthropod, more specifically a member of the Order, *Heteroptera* which includes the squash bug, chinch bug, and bed bug. They have sucking mouth parts, incomplete metamorphosis, and two pairs of wings, the fore part being half membranous. The following bugs are of medical importance.

b. assassin. One belonging to the Family, *Triatomidae*. Many are predaceous, others are blood-sucking. *Pan-tastromgulus*, *Triatoma*, and *Rhodnius* are vectors of trypanosome diseases (Chaga's disease) in man.

b. bed. A member of the Family *Cimicidae*, esp. those of the Genus *Cimex*.

b. kissing. Several species of the Family, *Reduviidae*, *Melanolestes picipes* is the common kissing bug, or black corsair.

b. red. The larvae of mites of the Family *Trombiculidae*, commonly called "chiggers".

buggery (bug'er-i) [Fr. *bugrerie*, heresy]. Unnatural sexual relations through the anus. SYN: *sodomy*.

Buhl's disease (bools). Epidemic hemoglobinuria if associated with acute fatty degeneration. SEE: *Winckel's disease*.

bulb [G. *bolbos*, a bulbous root]. An expansion of a canal, vessel or organ, esp. the medulla oblongata.

b. aortic. Dilated portion of the truncus arteriosus in the embryo which gives rise to the roots of the aorta and pulmonary arteries.

b., duodenal. Upper duodenal area just beyond pylorus.

b. of the eye. The eyeball.

b., hair. The expanded portion at the lower end of the hair root.

b., olfactory. The ant. enlargement of the olfactory tract.

b., terminal of Krause. An encapsulated sensory nerve ending similar in structure to the corpuscles of Pacini. Also called corpuscle of Golgi-Manzoni.

b. of the urethra. The post. portion of the spongy body.

bul'bar. 1. Pert. to a bulb. 2. Shaped like a bulb. 3. Pert. to the medulla oblongata.

b. paralysis. Paralysis due to changes in motor centers of the oblongata. SEE: *paralysis*.

bul'biform [G. *bolbos*, bulbous root, + L. *forma*, shape]. Shaped like a bulb.

bulbitis (bul-bi'tis) [" + *-itis*, inflammation]. Inflammation of the urethra in its bulbous portion.

bul'bi vestib'uli (pl.). The glands of Bartholin.

Two glands an inch long, one on each side of the urogenital space, composed of erectile tissue and veins which, when engorged, narrow the vaginal orifice.

bulbocavernosus [G. *bolbos*, + L. *cavernosus*, hollow]. Ejaculator seminis; accelerator urinae, sphincter vaginae muscle. **bulbocavernosus reflex**. Contraction of bulbocavernosus muscle on percussing dorsum of penis.

bulbomimic reflex. Contraction of facial muscles following pressure on eyeball.

bulbonu'clear [' + L. *nucleus*, kernel]. Pert. to the nuclei in the medulla oblongata.

bulbourethral glands (bul'bo-u-re'thral) [' + *ourēthra*, urethra]. Cowper's glands.

Two small glands about the size of a pea, one on each side of the prostate gland, each with a duct about 1 inch (2.5 cm.) long, terminating in the wall of the urethra. They secrete a viscid fluid forming part of the seminal fluid.

RS: prostate gland, semen, testicle, urethra.

bul'bus [G. *balbos*, bulbous root]. SEE: bulb

b. corpus cavernosum. Bulb of the urethra. A bulbous swelling of the corpus cavernosum at base of the penis.

b. vestibuli. Two oval masses of erectile tissue lying beneath the vestibule and resting on the urogenital diaphragm. They are homologous to the bulbous cavernosum urethra of the male.

bul'esis (bu-le'sis) [G. *boulēsis*, a willing].

An act of the will, the will.

bulimia (bu-lim'i-ā) [G. *bous*, ox, + *limos*, hunger]. Hunger experienced a short time after a meal; morbid hunger.

Observe if the appetite arises only when presented with food, or if it exists but disappears at sight of food, or after a few mouthfuls have been taken. SEE: appetite, taste.

bulim'ic. Pert to bulimia.

bulla (bul'la) (pl. *bullae*) [L. a bubble]. A large blister or skin vesicle filled with fluid, a bleb, q.v.

b. ethmoidal'is. A rounded projection into the middle meatus of the nose underneath the middle turbinate bone, formed by an ant. ethmoid cell.

b. ossea. The dilated portion of the bony external meatus of the ear. SEE: pompholyx.

bullate (bul'āt). Said of a surface growth which appears blistered because of convex prominences.

bullation (bul-a'shun) [L. *bulla*, a bubble]. 1. Division into small compartments. 2. Inflation.

Buller's shield. Watch glass securely held in place by adhesive plaster, or junction of skin and plaster sealed with collodion.

Used over nonaffected eye as protection from affected eye.

bullet wound. Puncture wound from a bullet. SEE wounds.

bullous (bul'us) [L. *bulla*, bubble]. Having the nature of a bulla.

bun'dle. A group of fibers; a fasciculus.

b. Arnold's. The frontopontile tract. It passes from the cerebral cortex of frontal lobe through the internal capsule and cerebral peduncle to the pons.

b. atrioventricular, auriculoventricular. Bundle of His.

b. Brechterew's. The spino-olivary fasciculus or Helweg's bundle.

b. of His. Small bundle of fibers passing from auricle to ventricular musculature and septum.

b. Schultze's. Comma-shaped path of fibers in middle of spinal cord's fasciculus cuneatus.

b. of Turck. The temporopontile tract. Fibers pass from the cerebral

cortex of temporal lobe and perminate in the pons.

bundle-branch block. A form of heart block in which the two ventricles contract independently of each other.

bun'oid (bun'i-oid) [G. *bouion*, turnip, + *eidos*, resemblance] Round, as a tumor.

bunion (bun'yun) [*Hallux valgus*] [G. *bouion*, turnip]. Inflammation and thickening of the bursa of the joint of the big toe.

bunogaster (bu-no-gas'ter) [G. *bounos*, mound, + *gaster*, belly]. Protrusion of the abdomen.

Bunsen burner. A burner named after its inventor.

It has an adjustment by which the air holes at the bottom of the tube can be closed or open and the flame made either luminous or nonluminous. If the holes are closed, the flame burns luminously, i. e., it will give light but a relatively small amount of heat. Its action may be reversed by the opening of the holes.

buphthalmia, buphthalmos (bup-thal'mi-ā, -mos) [G. *bous*, ox, + *ophthalmos*, eye]. Condition of infantile glaucoma resulting in uniform enlargement of eye.

Disease may stop spontaneously or continue until it produces blindness.

TREATMENT. Iridectomy, sclerotomy, miotics. SEE: *hydrophthalmos*.

Burdach's tracts. Continuation of dorso-lateral column of spinal cord into medulla oblongata SYN *cuneate fasciculus*.

buret, burette [Fr. small holder for fluid]. A graduated tube for measuring a reagent.

burn (būrn) [A.S. *brinnan*, to burn]. The effect of undue exposure to heat, chemicals or electricity. Burns are classified into three degrees or more according to the extent and depth covered.

b. first degree. This may be more or less superficial, involving only the superficial layers of the skin. It is marked by redness or hyperemia. Shock may occur.

b. second degree: The deeper layers of the skin may be involved. Vesciation, the vesicles varying in size. If the corium is not involved and if infection remains absent, scarring will not result.

b. third degree: Destruction of the epidermis and part of corium occurs; the most painful type of burn. Healing requires two to four weeks.

b. fourth degree: This involves the destruction of the entire integument.

b. fifth degree. The muscles are encroached upon, and the scar is deeper, firmer, and immobile. It may break down and ulcerate.

b. sixth degree: The tissues are carbonized; most frequently the fingers and toes.

First degree burns may be fatal if two-thirds of the body surface is involved; **second degree** burns involving one-seventh of the body surface in adults; in a child one-tenth of the body surface may be serious.

The three critical stages are (a) the period of irritation (the first twenty-four to forty-eight hours); (b) the period of reaction and inflammation (from second day to second week); (c) the period of exhaustion and suppuration (from second week to convalescence).

TREATMENT. Old family remedies for burns are now considered useless if not harmful. There are many different treatments for burns, but recent research discards most or all of them. For instance, burns treated with tannic acid

may become infected seriously, and liver damage also may occur. Wet or moist dressings hidden from the air may become infected, or healing may be delayed.

In severe burns shock is always present and may cause death. Morphine is administered immediately, followed by intravenous injections of whole blood and of salt solutions to prevent shock. When pain has eased, charred clothing is removed and burned area is gently washed with a detergent. The body or part is then wrapped with thick layers of gauze applied under pressure. More morphine and more salt solution may be necessary and as much as 300,000 units of penicillin. The patient is placed on a clean sheet after bandages are removed, and exposed to the air.

On the second day another injection of penicillin is given, and again on the third day. No applications of any kind are given. Whole blood is better than plasma,* although a plasma extender may be used if whole blood is not available. Deep burns will not heal themselves without skin-grafting. Third degree burns should have grafts within a month; otherwise, infections, chronic anemia, and permanent deformities may result.

For deep third degree burns, a modified form of absorptive pressure dressing, thinner than the original form, and without medication, should be used, under only mild pressure. These now may be had 22 by 18 inches, and 22 by 36 inches.

The open-air exposure causes healing to take place much quicker than with pressure dressings. The fever period is decreased and infection is greatly lessened. **Precautions.** 1. Never allow a person whose clothing is burning to run. Make him lie down and roll. Wrap him in a rug, blanket, or anything within reach and smother the flames. Be careful not to allow him to inhale the smoke. Cut away the clothing, taking care not to pull any portion of the skin away. 2. Do not open any blisters, as this increases the chance for infections.

Complications (in burns and scalds): Sloughing, gangrene, erysipelas, nephritis, pneumonia, or intestinal disturbances; sudden attacks of rigor, vomiting, rise of temperature or convulsions are all suspicious symptoms. A superficial burn covering a large part of the body is more serious than a small, deep one, unless important nerves and blood vessels are involved. If two-thirds of the skin are destroyed, death may be expected, even in a burn of the first degree. Shock must always be anticipated regardless of degree of burn.

Forms

b., acid. Due to exposure to corrosive acids, as sulfuric, hydrochloric, nitric, etc. **P. A. TREATMENT:** Wash with large volumes of water; apply dilute alkalies, as baking soda (sodium bicarbonate) paste, soap solution dressing, chalk paste, etc. Follow with a bland oil or ointment.

b., alkali. Due to caustic alkalies, as lye, caustic potash (potassium hydroxide), caustic soda (sodium hydroxide), etc. **Sym.** Painful lesion of skin often associated with gelatinization of tissue. **P. A. TREATMENT:** Wash with large volumes of water. Follow by wet dressings of dilute acid, as citron fruit juices, weak vinegar, dilute acetic acid, etc. Later dress with bland ointments or oils,

or irrigate with boric acid solution. Follow by instillation of liquid paraffin or other bland oil.

b., brush. A combined burn and abrasion resulting from friction. **TREATMENT:** Like abrasion, *q.v.*

b., chemical. Injuries due to the action of corrosive or irritating chemicals, as acid burns, *q.v.*, alkali burns, *q.v.*

Burns from chemical acids or alkalies should be treated by flushing the surface with water, thereby removing all traces of the drug. Remember that usually an acid counteracts an alkali, so that weak vinegar, weak ammonia, or a solution of sodium bicarbonate is always safe. A carbolic acid burn is almost always counteracted by alcohol. Never use oil as it helps in the absorption of acid. If lime gets into the eye, flush the eye with water and follow with a solution of weak vinegar.

b., electric. A result of exposure to electricity. The extent of destruction is much greater than that evidenced by initial inspection. **TREATMENT.** SEE: *electric injuries.*

b. of eye. **F. A. TREATMENT** Wash well with warm water and instill bland oil, as sweet oil or paraffin oil. **See.** *lye.*

b., fireworks, from. Such injuries are usually burns, *q.v.*, often with imbedded foreign bodies and a high incidence of infection and tetanus which should be prevented by meticulous care of injury and use of antitetanic serum.

b., flash. Lesion from electric arc.

b., gunpowder, from. Often followed by tetanus which should be prevented by administration of antitetanic serum and meticulous care of injury.

b., heat. From exposure to heat, steam, electric arc, or spark. **See:** *actinic, electric injuries, eschar, heat cramps, heat exhaustion, heat stroke, sunburn.*

Burns' amaurosis [*G. amaurocin*, to darken]. Dimness of sight or blindness following sexual excesses.

bur'rowing. The formation of (1) A subcutaneous tunnel made by a parasite, or (2) a fistula or sinus containing pus.

bur'sa [*G.* a leather sac]. A sac or pouch in connective tissue chiefly about joints.

Usually lined with synovial membrane to reduce friction, esp. found bet. tendons and bony prominences, and other places where there is excessive friction.

RS. *Boyer's b. bursal, bursitis, bursology, bursectomy, bursolitis, bursopathy, Calori's b.*

bur'sal. Pert. to a bursa.

bursa'lis [*L. bursalis*, pert. to a bursa]. Obturator internus muscle.

bursalogy (ber-sal'o-ji) [*G. bursa*, leather sac, + *logos*, study]. Anatomy, pathology, and physiology of bursae.

bursectomy (ber-sek'to-mi) [*" + ektomē*, excision]. Excision of a bursa.

bursi'tis [*" + -itis*, inflammation]. Inflammation of a bursa.

Inflammation bet. patella and structures over it (prepatellar bursa) is known as "housemaid's knee."

VARIETIES. Simple, suppurative, acute, chronic, and specific due to some known organism.

TREATMENT. Painting skin with iodine. Adenylc acid injections. Application of figure-of-eight bandage. Post. leg splint; otherwise surgery.

bur'solith [*" + lithos*, stone]. A calculus formed in a bursa.

bursop'athy [' + *pathos*, disease]. Any pathological condition of a bursa
bursula (bur'sū-lā) [L. *bursula*, little sac]. A small bursa.

b. testium. The scrotum.

Burton's line. A blue line along the margin of the gums visible in chronic lead poisoning.

butacaine sulfate (bū'tā-kān). USP syn. for *butyn*

butane (bu'tan). C_4H_{10} . An anesthetic from petroleum.

butesin (bu'tes-in). A white, crystalline powder, derived from aminobenzoic acid, and having an action similar to anesthesin. **SYN** USP, *butyl aminobenzoate*.

Use As a local anesthetic

DOSAGE As a dusting powder, pure or diluted, may also be used in form of troches, ointment, or suppository; internally, from 1½ to 3 gr (0.1-0.2 Gm.).

b. picrate (pik'rāt) A yellow powder combining anesthetic action of butesin and antiseptic effect of picric acid

Uses As 1% ointment in treatment of burns and ulcers

butter [G. *bouturon*]. **COMP**. It consists largely of butter fat which is made up of stearin. Butyric, palmitic, and oleic acid are the acids found in butter fat. **AV. SERVING** 10 Gm. **PRO** 0.1, **FAT** 8.5 per serving, **Ca** 0.015, **Mg** 0.001, **K** 0.014, **Na** 0.788, **P** 0.017, **Cl** 1.212, **S** 0.010, **Fe** 0.0002 **Vit** A+++, **D**+, **E**+

buttermilk. **AV. SERVING** 240 Gm. **PRO** 7.9, **FAT** 9.1, **Carbo** 10.8 per serving **Ca** 0.105, **Mg** 0.016, **K** 0.151, **Na** 0.064, **P** 0.097, **Cl** 0.089, **S** 0.026, **Fe** 0.00025. **Vit** A+, **B**++, **C**+ variable, **G**+++.

butternuts. **AV. SERVING** 20 Gm. **PRO** 5.6, **FAT** 12.2, **Carbo** 0.7 per serving. **Vit** A+, **B**++.

buttocks (but'uks) [ME *butte*, thick end]. The gluteal prominence, commonly called the "seat" or "rump"

RS *breech*, *clunes*, *gluteal*, *nates*, *rump*.

button anastomosis. One made to unite severed portions of the hollow viscera without suture. Devised by Murphy.

button forceps. Those for holding parts of an anastomosis button while it is being adjusted and placed

buttonhole. A straight cut through the wall of a cavity

b. fracture. Perforation of a bone by a missile.

b., mitral. Contraction of any orifice to a slit, as that of the heart

b. operation. Boutonnière's operation. An artificial slit in a membrane.

button suture. One for preventing a suture from cutting through or into underlying tissue. **VARIETIES** *Getchell's*, *lead*, *Powell's* and *silver wire*. Also perforated shot.

butyl aminobenzoate. USP syn. for *butesin*, *q.v.*

butylchloral hydrate (bu'til-klo'ral hi'drāt). A preparation similar in action to chloral, but said to be less depressant and more analgesic

Uses Recommended for relief of facial neuralgia

DOSAGE 5 to 20 gr. (0.3 to 1.3 Gm.).

butyn (bu'tin). A colorless, odorless, solid substance derived from coal tar.

ACTION AND USES A local anesthetic "proposed" as a substitute for cocaine and novocaine in surface anesthesia, being more promptly absorbed. May be sterilized by boiling.

DOSAGE For its anesthetic action in eye, nose, or throat, 1 to 2%.

butyraceous (bu-tir-a'shus) [G. *bouturon*, butter]. Containing or resembling butter.

butyrate (bu'tir-āt). A salt of butyric acid.

butyric acid. A rancid, viscid acid found in butter and animal excretions.

butyrin (bū'tir-in). A soft, yellowish, semiliquid fat which gives butter its flavor. It represents 5% of butter fat.

butyroid (bu'tir-oid) [G. *bouturon*, butter, + *eidos*, appearance]. Having the appearance or consistency of butter.

butyrometer (bu-tir-om'e-ter) [' + *metron*, measure]. Device for estimating amt of butter fat of milk.

butyrous (bu'tir-us). Of butterlike consistency

bwamba fever A So. Amer disease probably due to a filtrable virus. Onset is sudden, headache, backache, and fever persist for 5-7 days. Nonfatal.

Byrd-Dew method. One for resuscitating newborn child suffering from asphyxia. Operator supports supine child on palms of his hands, allowing head to fall backward. By supination of forearms, operator flexes child's body and effects expiration. By pronation of arms, body is again extended, causing inspiration.

bys'ma [G. plug]. A plug or tampon.

byssa'ceous. Resembling flaxlike threads.

byssino'sis [G. *byssos*, cotton, + *-osis*]. Pulmonary condition from inhalation of cotton dust

byssocausis (bis-o-kaw'sis) [' + *kausts*, burning]. Cauterization by moxa; moxidustion.

bys'soid [' + *eidos*, form]. Consisting of a filamentous fringe, the filaments being of unequal length

byssophthisis (bis-o-this'is) [' + *phthisis*, a wasting away]. Pulmonary condition caused by inhalation of cotton dust. **SYN** *byssmosis*.

byssus (bis'us) [G. *byssos*, cotton]. The growth of hair on the pubic region.

byth'us [G. *bythus*, depth]. The lower abdominal region.

C. SYMB: Carbon Abbr. for conglus (gal-lon), compound, centigrade, Celsius, cloud, closure, etc.

C. Abbr. *L. centum*, one hundred Also, *L. cum*, without.

C₃ population. Those who are the products of imperfect development, mentally or physically

Ca. SYMB: Calcium, abbr for cathode.

cabagin. Vitamin U

cabbage [Fr. *cabocho*, to make a swelling] A leafy vegetable, growing in a head Raw cabbage Av. SERVING 85 Gm Pro 12, Fat 0.2, Carbo 36 per serving. Ca 0.045, Mg 0.015, K 0.247, Na 0.027, P 0.029, Cl 0.024, S 0.066, Fe 0.0011. A base-forming food ACTION Heavy and hard to digest May cause flatulence Raw, it serves as an appetizer

Cabot's ring bodies. Ring shaped bodies sometimes seen in red blood cells in pernicious anemia, lymphatic leukemia, and lead poisoning

CaC₂. Calcium carbide

cacaerometer (kak-ä-er-om'ë-ter) [G. *kakos*, bad, + *acr.* air, + *metron*, measure] Instrument for testing impurity of air [Malignant anthrax] **cacan'thrax** [" + *anthrax*, carbuncle]. **cacao** (kä-kä'o) [Mexican from Spanish *cacahuatl*, seed] Theobroma Seed used to prepare cacao butter, chocolate, and cocoa SEE *cocoa*.

cacation (kak-a'shun) [L. *cadere*, to go to stool] Defecation, going to stool.

cacatory (kak'at-or-i) Accompanied by diarrhea or excessive bowel movements

caemia (kas-e'mi-a) [G. *kakos*, bad, + *aima*, blood]. A poor condition of the blood

cacergasia (kas-er-gä'si-ä) [" + *ergasia*, work]. Defective functioning, mentally or physically

caesthesia (kak-es-the'zi-ä) [" + *aisthēsis*, sensation] 1. Disorder of sensibility, morbid or otherwise 2. Malaise

caché (kash-a') [Fr. covered]. A lead cone covered with paper layers, with mica bottom, used for applying radiotherapy, radium or any radioactive substance.

cachectic (kä-kek'tik) [G. *kakos*, ill, + *eris*, habit] Pert to cachexia.

cachet (kä-sha') [Fr. a seal]. Two concave pieces of wafer (rice paper) bet. which is placed medicine to be administered, the margins being pressed together so they will adhere

cachexia (kä-keks'i-ä) [G. *kakos*, ill, + *eris*, habit] A state of ill health, malnutrition, and wasting

It occurs in malignancies, advanced pulmonary tuberculosis, when excessive suppuration is present, in chronic cases of certain poisoning, toxemia, and in severe hyperthyroidism.

c., cancerous. C. caused by cancerous condition

c., lymphatic. C. caused by Hodgkin's disease of the lymph nodes.

c., malarial. C. due to chronic malaria.

c., pachydermic. C. due to myxedemic condition

c., pituitary. Group of symptoms caused by atrophy of pituitary gland, including emaciation, premature aging, atrophy of genitals with loss of sec-

ondary sex characteristics and lowering of basal metabolic rate. SYN: *Simmond's disease*.

c., splenic. C. caused by disease of the spleen SYN *pseudoleukocytthemia*.

c., strumipriva or **c., thyreopriva.** Adult type of thyroid activity due to surgical removal of the thyroid gland.

c., thyroid. Goiter

cachinnation (kak-in-a'shun) [L. *cachinnare*, to laugh aloud] Hysterical laughter.

CaCl₂. Calcium chloride; a bleaching powder

Ca(ClO)₂. Calcium chlorate.

CaCO₃. Calcium carbonate, chalk.

CaC₂O₄. Calcium oxalate

cacocholia (kak-o-ko'lli-ä) [G. *kakos*, bad, + *cholē*, bile] Abnormal condition of bile

cacochylia (kak-o-ki'lli-ä) [" + *chylōs*, chyle] Impaired digestion

cacochymia [" + *chymos*, chyme]. 1. Disordered metabolism 2. Cacochylia.

cacocopia (kak-o-ko'pi-ä) [" + *kolpos*, vagina] 1. Diseased condition of the vagina 2. Gangrene of the vulva

cadodontia (kak-o-don'ti-ä) [" + *odous*, odont-, tooth] Bad teeth

cacothēs (kak-o-e'thes) [" + *ēthos*, character] 1. Any bad habit, propensity, or disorder 2. A malignant ulcer.

cacothic (kak-o-eth'ik). Malignant.

cacogenesis (kak-o-jen'ē-sis) [G. *kakos*, bad, + *genesis*, development] Any abnormal development or growth

cacogenic. Pert to race degeneration

cacogenics [G. *kakos*, bad, + *gennan*, to produce] Race degeneration.

cacogeusia (kak-o-gū'si-ä) [" + *geusis*, taste] A bad taste

cacoglossia (kak-o-glos'ti-ä) [" + *glōssa*, tongue] Gangrene of tongue

cacomorphia (kak-o-mor'fi-ä) [" + *morphē*, form] Malformation, deformity.

caconychia (kak-o-nik'i-ä) [" + *onyx*, nail] Disease of the nails

cacop'athy [" + *pathos*, disease]. Malignant disease, a severe disorder

cacophonia (kak-o-fo'ni-ä) [" + *phōnē*, voice]. An altered, or abnormal voice

cacoplasia (kak-o-pla'zi-ä) [" + *plassein*, to form]. The formation of diseased structures

cacoplas'tic [" + *plastikos*, formed]. 1. Pert. to or causing morbid growth. 2. Incapable of normal development or formation

cacorrhythmic (kak-o-rith'mik) [" + *rythmos*, rhythm]. Showing irregularity of rhythm

cacorrhinia (kak-or-in'ti-ä) [" + *ris*, nose]. Any disease of the nose

cacosmia (kä-kos'mi-ä) [" + *osmē*, smell]. A form of parosmia * Imaginary foul odors which do not exist

cacosphyxia (kak-os-fiks'i-ä) [" + *sphyxis*, pulse] A disordered pulse

cacothēnics (kä-ko-then'iks) [" + *thēnia*, state of being]. Racial degeneration from bad environment.

cacothymia (kak-o-thi'mi-ä) [" + *thymos*, spirit]. A disorder of the mind, moral depravity, insane morbidity of temper.

cacotrichia (kak-o-trik'i-ä) [" + *trichz*, hair]. A diseased state of the hair.

cacot'rophy [' + *trophē*, nourishment]. Malnutrition.

cacozyme (kak'o-zīm) [' + *zymē*, leaven].

A ferment capable of inducing a disease. **cacumen** (kak-ū-men) [L. *cacumina*, summit]. Part of cerebellum below the declivis.

cadaver (kā-dav'er) (pl. *cadav'era*) [L. *corps*, from *cadere*, to fall]. A dead body, a corpse. **SEE: cleavage lines.**

cadaveric (kā-dav'er-ik). Pert. to a dead body.

cadaverous (kā-dav'er-us). Resembling a corpse.

caduca (kad-dū'kā) [L. *caducus*, falling off]. Thickened membrane of the uterus.

cadu'ceus [L. a herald's wand]. The wand of Hermes or Mercury; used as a symbol of the medical profession.

caducity (kad-ū'sl-tī) [L. *caducus*, falling off]. Feebleness or senility of old age.

cadu'cous membrane. Mucous membrane which develops at conception and envelops the impregnated ovum. **SYN: decidua.**

caffeine, caffaina (ka'fē-in, -ā) [L.]. **USP.** $C_8H_{10}N_4O_2$. An alkaloid of coffee and tea that is a stimulant and a diuretic.

About 1½ gr. are found in a strong cup of coffee. It is chemically identical with theine found in tea.

ACTION AND USES Diuretic, cardiac, and respiratory stimulant.

DOSEAGE. 1-5 gr. (0.065-0.32 Gm.).

INCOMPATIBILITIES Alkalies, tannic acid, quinine sulfate.

c. citrated. **USP.** A mixture of caffeine and citric acid, containing about 52% caffeine. Possesses same properties as caffeine, but more likely to disagree with the digestive functions.

DOSEAGE From 3-8 gr. (0.2-0.5 Gm.).

INCOMPATIBILITIES Sodium salicylate.

c. with sodium benzoate. **USP.** A mixture of equal parts of caffeine and sodium benzoate.

ACTION AND USES. Same as caffeine.

DOSEAGE 5 gr (0.3 Gm.) *Hypoderm.*, 3-7½ gr (0.2-0.5 cc.) [sodium salicylate].

INCOMPATIBILITIES Potassium citrate, **c. s. salicylate.** **NF.** A mixture of caffeine with sodium salicylate, containing about 52% caffeine.

DOSEAGE. 3 gr (0.2 Gm.)

USES. Same as caffeine sodium benzoate.

caffeinism (ka'fē-in-izm) [L. *caffaina*]. Chronic effects of excessive use of coffee.

SYM: Sudden flushing of the face, palpitation of the heart, trembling, general depression, anxiety, insomnia, and nervousness.

CaH₂O₂. Calcium hydroxide; slaked lime.

calinophobia (kl-no-to-fo'bi-ā) [G. *kaimotēs*, novelty, + *phobos*, fear]. Inability to adapt oneself to a new environment or to anything new. **SEE: nostomania.**

calisson disease (ka'son) [Fr. *caisse*, a box, from L. *capsa*, box]. A condition induced in divers subject to too rapid reduction of air pressure after coming to the surface and after breathing compressed air in calissons.

SYM: Condition may manifest itself on reaching the surface or several hours after. Pains in joints followed by motor and sensory paralysis in lower extremities; bladder and rectum sometimes involved; sometimes hemiplegia instead of paraplegia; gastralgia and vomiting common. In severe cases coma develops and death ensues in a few hours. Ordinarily

restored in few days or weeks. **SEE: bends, diver's paralysis, tunnel disease.**

caked breast. A stagnation of milk in the secreting ducts.

Cal. Abbr. of large calory.

cal. Abbr. of small calory.

calage (kal-azh') [Fr. wedding]. Fixation of body in a berth by means of pillows to prevent movement and so to relieve seasickness.

calamine, prepared (kal'a-mīn). A pink powder, containing zinc oxide with small amt. of ferric oxide.

USES: Externally in various skin conditions, as a protective and astringent, as an ointment, or in combination with zinc oxide and lime water, as a lotion.

calca'neal, calca'nean [L. *calcaneus*, heel bone]. Pert. to the calcaneum.

calcaneodynia (kal-ka-ne-o-din'ī-ā) [' + G. *odynē*, pain]. Pain in the heel.

calcaneum, calcaneus (kal-ka-ne-um, -us) [L. *calcaneus*, heel bone]. 1. The heel bone, or *os calcis*. It articulates anteriorly with the cuboid bone, and with the astragalus above. 2. Talipes calcaneus, q.v.

calcanodynia (kal-kan-o-din'ī-ā) [' + *odynē*, pain]. Pain in the heel when standing or walking.

cal'car [L. a spur]. A spurlike process.

c. avis. Hippocampus minor, lower of two elevations on inner wall of post. horn of lateral ventricle of brain.

c. femorale. A bony spur that strengthens the femoral neck.

calca'rea [L. *calx*, lime]. Lime.

calcareous (kal-ka're-us) [L. *calcartus*, pert. to lime]. Of the nature of lime; chalky.

calcarine (kal'kar-in) [L. *calcar*, spur]. Spurshaped.

calcaruria (kal-ka-rī-ū'ri-ā) [L. *calcartus*, pert. to lime, + G. *ouron*, urine]. Calcium salts in the urine.

calcaroid (kal'kar-oid) [' + G. *eidōs*, appearance]. Calciumlike deposit in brain tissue.

calcemia (kal-se'mī-ā) [' + G. *aima*, blood]. Excess of calcium in the blood.

calcibilia (kal-si-bil'ī-ā) [' + *bilis*, bile]. Calcium in the bile.

calcie (kal'sik). Pert. to calcium or lime.

calcosis (kal-si-ko'sis) [L. *calx*, lime, + G. *-ōsis*, infection]. Pneumoconiosis caused by inhaling dust from limestone, esp by marblecutters.

calcidin (kal'si-dīn). A combination of calcium and iodine, containing 15% of the latter.

USES: Has been recommended as an alternative and expectorant in colds and minor irritations of the respiratory tract.

DOSEAGE. From 1-3 gr. (0.065-0.2 Gm.) in hot water every 15 to 30 minutes to be effective, larger doses for iodine effect.

calciferous (kal-sif'er-us) [' + *ferre*, to carry]. Containing calcium, chalk, or lime.

calcific (kal-sif'ik) [' + *facere*, to make]. Forming lime.

calcification [' + *facere*, to make]. Deposit of lime salts in the tissues; normally in bone.

calcigerous (kal-sij'er-us) [' + *gerere*, to bear]. Containing lime or lime salts.

c. tubes. Dentinal tubules of dentin. **calcigrade** (kal'sig-rād) [L. *calcis*, heel, + *gradus*, walking]. Walking on the heels.

calclm'eter [L. *calz*, lime, + G. *metron*, measure]. Device for measuring the calcium in the blood.

calcina'tion [L. *calcinare*, to char]. Expulsion of water and animal matter by heat.

calcine (kal'sin). To cause calcination.

calcinorrhachia (kal-sin-or-ra'ki-ä) [L. *calz*, lime, + *rachis*, spine]. Calcium in the spinal fluid.

calcino'sis [' + G. *-osis*, infection]. Deposit of lime salts in tissues.

calcipectic (kal-si-pek'tik) [' + G. *pēgnunai*, to fix]. Pert. to calcipectus.

calciopenia (kal-si-pe'ni-ä) [' + G. *penia*, poverty]. Calcium deficiency in body tissues and fluids.

calcipectis, calcipecty (kal-si-pēk'sis, -pek'si) [' + *pēgnunai*, to fix]. The fixation of calcium in body tissues.

calciophilia (kal-si-fil'i-ä) [' + *philein*, to love]. Tendency to calcification.

calcioprivia (kal-si-priv'i-ä) [' + *privus*, without]. Deficiency or absence of calcium.

calcioprivic (kal-si-priv'ik). Pert to deficiency or absence of calcium in the body.

calcis, os [L.]. Heel bone

calcium [L. *calz*, lime] SYMB Ca Atomic weight, 40.09 Silver-white metallic element, the basis of limestone

Lime is its oxide Calcium phosphate constitutes 75% of the body ash, and about 85% of mineral matter in bones

FUNCTION Calcium must be carried by the blood in solution before being available for bone growth. Unless certain activating substances, such as vitamin D, are present, increased calcium intake does not affect the tissues or blood calcium. The secretions of the parathyroid glands are a factor in the utilization of calcium, making it possible for the blood to carry dissolved calcium. Cholesterol seems to stimulate these glands. Ultraviolet rays upon a sow's diet have raised the amt. of calcium in its milk 25%. Calcium stabilizes tissue cells and seems to affect, if not control, allergy or sensitization

Quantities of bread, rice, oatmeal, and maize in the diet decrease absorption of calcium and phosphorus, and the alkalinity of the small intestines promotes the formation of insoluble salts.

Calcium is necessary for (a) coagulation of the blood, (b) to give firmness and rigidity to bones and teeth, (c) as a preventive of rickets, (d) as an ion balance, (e) as essential to lactation, (f) for activating enzymes, (g) for the functions of the muscles, nerves, and heart

Calcium is taken into the body as a constituent of various foods. While much of it may prove insoluble and escape absorption, some of it passes through the intestine into the blood, where it can be found by chemical tests. Its level here is likely to be 9 to 11 mg. per 100 cc. If the calcium in the blood rises above this level, the patient feels depressed and his heart is slow; if the calcium sinks below these figures and approaches, say, 4 mg. per 100 cc. the patient suffers from twitching, spasms and convulsions. Blood deprived of its calcium will not clot, and milk without calcium will not curdle.

Calcium is deposited in the bones, but can be mobilized again to keep the blood level constant when there is a period of insufficient intake. At any given time the body of an adult contains about 700 Gm. of calcium phosphate; of this, 120

Gm. are the element calcium. Ordinarily, an adult takes in more than 0.5 Gm. of calcium per day. In the long run, therefore, one should find a total of 0.5 Gm. of Ca in a combined 24-hour sample of urine and feces.

SOURCES *Excellent* Cheese, cream, milks, chard, cauliflower, egg yolk, kale, molasses, beans, rhubarb. *Good* Almonds, beets, bran, cabbage, celery, carrots, chocolate, dates, figs, kohlrabi, lettuce, lemons, oatmeal, oranges, pineapples, parsnips, raspberries, spinach, shell fish, turnips, rutabagas, oysters, water cress, walnuts

SEE *acalcerosis*, "calci-" words.

c. carbonate. CaCO_3 (precipitated chalk). USP. A fine, white, tasteless and odorless powder

ACTION AND USES An antacid, also antidote to corrosive acid poisoning.

DOSEAGE 15 gr. (1 Gm.)

c. chloride (CaCl_2) USP. A very deliquescent salt occurring as translucent crystals having a sharp saline taste.

ACTION AND USES To raise the calcium content of the blood temporarily and increase coagulation time.

DOSEAGE 15 gr. (1 Gm.)

INCOMPATIBILITIES Ephedrine

c. deficiency. SYM Brittle bones and their poor development, including the teeth, dental caries, rickets, tetany, heart atony, hyperirritability, excessive bleeding

DIAG Normal content in blood is 9-10 5 mg. per 100 cc. of blood. It is low in convulsions and in allergic disorders.

c. gluconate. A granular or white powder without odor or taste, containing an equivalent of 8-9% calcium.

ACTION AND USES Same as calcium chloride, more pleasant to taste, and nonirritating when given hypodermically or intravenously

DOSEAGE Orally, 75 gr. (5 Gm.); intramuscularly or intravenously, 15 gr. (1 Gm.)

c., high diet. A normal adequate diet including 1½ qt milk and all other foods high in calcium. Cheese is used frequently instead of meat

c. lactate. USP. A white, odorless and nearly tasteless powder, less irritating than the chloride

USES Same as the chloride.

DOSEAGE 15 gr. (1 Gm.)

c., low diet. Milk, cheese, and other foods high in calcium are avoided.

c. oxide [*calz*, lime] USP. Occurs as white or grayish-white hard mass.

ACTION AND USES Germicide and disinfectant; used only in preparation of lime water.

calcium phosphate precipitated. A white, amorphous powder

USES As an antacid in treatment of gastric hyperacidity

DOSEAGE 15 gr. (1 Gm.)

cal'cid [' + G. *eidos*, resemblance]. Neoplasm of the tooth pulp.

calciopherous (kal-ko'fer-us) [' + G. *phoros*, bearing]. Containing or producing lime or any salts of calcium.

calciopherite (kal-kos-fer'it) [' + G. *sphaira*, a sphere] One of many small calcareous bodies found in tumors, nervous tissue, the thyroid, and prostate.

calcreose (kal'kre-ozē). A chemical combination of creosote and lime containing approximately 50% creosote

ACTION AND USES: Same as creosote.

DOSEAGE: 15-32 gr. (1.0-2.00 Gm.)

calculary (kal'ku-lä-ri) [L. *calculus*, pebble]. Pert. to calculus.

cal'culi. Pl. of calculus, *q.v.*

calculif'ragous [L. *calculus*, pebble, + *frangere*, to break] Breaking or reducing a stone in the bladder.

calculo'sis [' + G. *-osis*, infection] Having a calculus.

calculus (kal'ku-lus). Like a calculus.

calculus (kal'ku-lus) [L. pebble]. (Pl. *calculi*). Commonly called "stone": any abnormal concretion within the animal body, and usually composed of mineral salts.

Present in kidneys, ureter, bladder, urethra, usually formed of crystalline, urinary salts held together by viscid organic matter, and forming a laminated structure, composed of a nucleus about which are concentric layers of material.

Types *Primary* Developing in acid urine without antecedent inflammation. *Secondary* Developing in alkaline urine as a result of inflammation. Commonly composed of urates, oxalate of lime, and uric acid.

Etiol. *Primary* Obscure. Hereditary tendency with uric acid diathesis, predisposing cause being crystals in urine. *Secondary* Infection with cocci that split urea into ammonia and carbon dioxide.

c., biliary. Cholelithiasis*, gallstones. SEE gall bladder.

c., hemic. One formed of coagulated blood.

c., pancreatic. Stone in the pancreas, *q.v.*

c., renal. Stone in the kidney

Sym Urinary retention, sudden and paroxysmal renal colic, ulceration with possible perforation, ureteral stricture, inflammation of various degrees. If formed *in situ*, symptoms are gradual in character with gleet becoming worse, perirethritis, suppuration, fistulization.

Prog Serious in uremic stage.

Treatment *Prophylactic* Relief of retention, low nitrogenous diet, exercise, elimination, dilution of urine by water ingestion. *Palliative* Pylotomy* when feasible to drain kidney. *Radical* Operation.

c., salivary. Stone in salivary duct. Usually affects duct of submaxillary gland.

Sym Obstructs flow of saliva, causing severe pain and swelling of gland, esp when eating.

Treatment Removal of stone by surgery.

c., urinary. Stone in the urethra.

Sym Sudden stoppage of flow of urine with sharp pain if stone comes from bladder, and, if firmly impacted, complete retention or dysuria*.

Treatment Extraction or urethrotomy*.

c., vesical. Stone in the bladder.

Sym Frequency of urination, pain, diurnal hematuria increased by exercise are suggestive.

Prog Unless stone is small enough to pass by urethra it will remain with cystitis the result.

Treatment Operation.

calculus, words pert. to: antilithic, aortolith, "calcu-" words, cardiolith, "chol-" words, concretion, gravel, "lith-" words. **calefacient** (kal-ē-fa'shent) [L. *calere*, to be warm, + *facere*, to make] Conveying or that which conveys a sense of warmth when applied to a part of the body.

calf [A.S. *cealf*] The swelling on back part of the leg below the knee formed by the gastrocnemius and soleus muscles.

calf's foot jelly. AV. SERVING: 45 Gm.

Pro. 1.9, Carbo 7.8 per serving.

cal'iber [Fr. *calibre*, diameter of bore of gun] The diameter of any orifice or opening.

calibra'tion [Fr. *calibre*, diameter of bore of gun] Estimation of the caliber of an opening.

calibrator (kal'ib-ra-tor). Instrument for measuring openings.

c., anastomosis. One for determining size of opening to be united by anastomosis.

c., vaginal. One for determining degree of vaginal relaxation.

calic'ulus [L. *calyculus*, small cup]. A cup-shaped structure.

c. gustato'rius. A taste bud.

c. opthal'micus. (BNA.) The optic cup.

caliectasis (kal-i-ek'tas-is) [G. *kalix*, cup, + *ektasis*, dilatation] Dilatation of the renal calyx.

caliga'tion [L. *caligo*, darkness]. Dimness of vision, caligo.

cali'go [L. darkness]. Dimness of vision. **Syn** *caligation*.*

caliper(s) (kal'ip-er) [corruption from *caliber*] 1 Instrument for measuring diameters, as those of chest or pelvis. 2 A mechanical apparatus to aid patients who are suffering from fractures of the legs to walk.

Calliphora vomitoria. Common blowfly sometimes causing myiasis disorders.

callicec'tion [L. *callus*, insensitive, + *sectio*, a cutting]. Vivisection under anesthesia.

Cal'lisen's operation. Lumbar colotomy for an artificial anus.

callomania (kal-lo-ma'ni-ā) [G. *kalos*, beautiful, + *mania*, madness] Belief in one's own beauty, a delusion of the insane.

callo'sal [L. *callus*, tough substance]. Pert to the corpus *callosum*.

callosity, callositas (kal-os'it-i-, -as) [L. *callōsus*, thick-skinned] Circumscribed thickening and hypertrophy of the horny layer of the skin.

Etiol. Friction, pressure, or other irritation, oval or elongated, on flexor surfaces of hands and feet, grayish or brownish and slightly elevated, with smooth, burnished surfaces.

Treatment Temporary removal by salicylic acid, caustic potash, or careful shaving. Permanent removal only by removal of cause. SEE *porosis*.

callosomarg'inal [L. *callus*, tough, + *margo*, margin]. Pert to the corpus callosum and marginal gyrus, marking sulcus bet them.

callosum (kal-o'sum) [L. *callōsus*, hard]. The great commissure of the brain bet. the cerebral hemispheres. **Syn:** *corpus callosum*.

callous (kal'us) [L. *callus*, hard]. Hard; like a callus.

cal'lus. Hypertrophied thickening of circumscribed area of horny layer of skin; *callosity*.* 2 The osseous material thrown out bet ends of a fractured bone.

c., definitive. Cartilage found bet. 2 ends of a fractured bone.

c., provisional. Temporary deposit bet. ends of a fractured bone.

cal'mant [ME *calme*, from G. *kaumē*, noon heat, referring to the hour of siesta]. 1. A soothing or calming medicine; sedative. 2. Of a soothing nature.

calm'ative. 1. Sedative; soothing. 2. An agent that acts as a sedative.

Calmette's reaction (kal-mets'). Slight injection of conjunctiva in one with an

infective disease upon introduction of toxins of same disease. *SYN: ophthalmic reaction, q.v.*

calomel (kal'o-mel) [G. *kalos*, beautiful, + *melas*, black] Mercurous chloride, *q.v.*
Dosage: Laxative (fractional), 2½ gr. (0.15 Gm.).

calor (ka'lor) [L. *heat*]. 1. Heat. 2. Moderate heat of fever; with *rubor*, *tumor*, *dolor*, it represents the 4 classical signs of inflammation.

c. anima'lis. Normal heat of the body.
calor'diance [L. *calor*, heat, + *radiāre*, to shine] Giving out heat rays

calorescence (kal-or-es'ens). Producing by means of a lens incandescence of a body.

Calori's bursa (kal-o'rēz). One bet. arch of aorta and trachea.

caloric (kal-or'ik) [L. *calor*, heat]. 1. Heat. 2. Relating to heat,* or to a calory* [of the body].

caloricity (kal-or-is'it-l). Heating power

calorie (kāl'or-ē) [L. *calor*, heat]. A unit of heat. *SYN: calory, q.v.*

calorific (kal-or-i-fa'shent) [L. *calor*, heat, + *facere*, to make]. Producing heat

calorific (kal-or-if'ik). Producing heat; calorific

calorigenetic [L. *calor*, heat, + G. *gen-nan*, to produce]. Pert. to heat production or its increase. *SYN: calorigenic.*

calorigen'ic. Pert. to heat production or its increase

calorimeter (kal-or-im'e-ter) [L. *calor*, heat, + G. *metron*, measure] Instrument for determining heat of bodies.

calorimetry (kal-or-im'e-tri). A calory measure of heat thrown off by the body under different conditions

caloripuncture (kal-o'ri-punk'tur) [L. *calor*, heat, + *punctura*, a piercing]. Use of heated needles in cauterization by puncture. *SYN: ignipuncture.*

CALORY EQUIVALENTS

	Ergs	Gm.-cm.	Ft.-lb.	Cal.	Kw.-hr.
1 erg	= 1,000	= 1.02x10 ⁻⁷	= 7.37x10 ⁻⁸	= 2.39x10 ⁻¹¹	= 2.77x10 ⁻¹⁴
1 Gm.-cm.	= 9.81x10 ²	= 1,000	= 7.23x10 ⁻⁵	= 2.34x10 ⁻⁸	= 2.73x10 ⁻¹¹
1 ft.-lb.	= 1.36x10 ⁷	= 1.38x10 ⁴	= 1,000	= 3.23x10 ⁻⁴	= 3.76x10 ⁻⁷
1 calory	= 4.18x10 ¹⁰	= 4.26x10 ⁷	= 3.08x10 ³	= 1,000	= 1.17x10 ⁻³
1 kw.-hr.	= 3.61x10 ¹³	= 3.66x10 ¹⁰	= 2.66x10 ⁶	= 8.58x10 ²	= 1,000

ACTIVITY

Calory Needs

Sleeping	0.93	} Calories per kilogram per hour
Sitting at rest	1.43	
Standing relaxed	1.5	
Walking	2.0	
Light exercise	2.43	
Moderate exercise	4.14	

If a day's schedule of activities is recorded the energy expenditure can be estimated. For example, a student nurse might figure her caloric needs as follows
 Student's weight—120 pounds—22—55 kilograms.

Caloric Requirements of Infants and Young Children

They have been estimated as follows

1st month	20 calories, one at 6, 9, 12, 3, 6, 10, and 2 o'clock
2nd month	35 calories, the same as above
3rd month and after	45 calories, one at 6, 10, 2, 6, and 10 o'clock
3rd year	35 calories for each pound of weight

Calories Required per 24 Hours—Langworthy

Man at very hard muscular work	5,500
Man at moderate muscular work	3,400
Man at moderate to light muscular work	3,050
Man at light muscular work (sedentary)	2,700
Man without muscular work	2,450

Calories Expended

Activity	Kg.	Hours	Per Kg.	Per Hr.	Total
Sleeping	55	x 8	x	0.93	= 410
Sitting in class		2 hr.			
at meals		2 hr.			
studying	55	x 8	x	1.43	= 630
writing		1 hr.			
reading		1 hr.			
Standing	55	x 3	x	1.5	= 250
Walking	55	x 1	x	2.0	= 110
Light exercise	55	x 4	x	2.43	= 535
Total					1935

The Heat Value of Foods per Gram or 15.43 Troy Grains

One Gm.	Large Cal.	Small Cal.	Physiological Value
Protein	5.7	5,711	4.1
Fat	9.3	9,365	9.3
Carbohydrates	4.1	4,182	4.1

cal'ory, or gram-cal'ory [L. *calor*, heat]. The amount of heat necessary to raise the temperature of one gram of water one degree Centigrade.

In dietetics and metabolism a unit 1000 times as large is used; it is called the kilogram-calory, large calory, or simply Calory (capitalized). By the law of conservation of energy, a calory can be converted, under certain conditions, into other forms of energy in definite proportions; the conversion factors for

various energy units are given in the above table. See *therm, thermal*.

Calot's solution. Solution of creosote, iodoform, ether, olive oil and gualacol, used externally on painless granulations of fistulas and in chronic otorrhea. See: *solution*.

calva'ria [L. human skull]. Skull cap; cranium, skull.

calvities (kal-vish't-ēz) [L. *calvus*, bald]. Baldness, alopecia.*

Food Units in Calories Required Daily per Normal Height, Weight and Surface—Boys and Girls

NOTE—First figures for boys; second for girls

Age	Height In.	Weight Lb.	Surface Sq. Ft.	Calories

calx (kalks) [L. lime]. 1. Lime. 2. The heel.

c. chlorinata. Chlorinated lime. Used as a deodorant and disinfectant.

c. sulfurata. Sulfurated lime. Used as a depilatory.

c. usta, c. viva. Burnt lime, quicklime.

calyciform (ka-lis't-form) [G. *kalix*, cup, + L. *forma*, shape]. Cup-shaped.

calyculus (kal-ik'u-lus) (pl. *calyculi*) [L. little cup]. In anat. a cup- or bud-shaped structure

c. gustatorii. Taste bud.

calyx (ka'lix) [G. *kalix*, cup]. Any cup-like division of the kidney pelvis. The minor calyces enclose the tips of the renal pyramids, receiving the urine from the papillary ducts which open at their tips

c. major. One of the major subdivisions of the renal pelvis, two or three in number

c. minor. A subdivision of a major calyx, each terminating in relation to one to three papillae

Camerer's law. Two children of same weight but different ages require same amt. of food

camisole (kam'i-sōl) [Fr. little shirt, from Italian, *camisa*, shirt]. A straitjacket used for restraining violent mental patients.

Cambridge reaction (kam'ij). Urinal reaction in pancreatic disease

The result is a light yellow flocculent precipitation in a few hours following test.

camphor [G. *kamphora*]. USP. A gum obtained from an evergreen tree native to China and Japan.

ACTION AND USES Locally, a mild irritant, internally, a circulatory and respiratory stimulant

DOSAGE 3 m (0.2 cc.) hypodermically; subcutaneously, 3 m (0.2 cc.)

c. ice. Cosmetic preparation used for mild eruptions and for toilet

camphorated. Combined with or containing camphor.

c. oil. Liniment containing camphor.

camphoromania (kam-for-o-ma'ni-ā) [G. *kamphora*, camphor, + *mania*, madness] Abnormal craving for camphor.

campimeter (kamp-im'e-ter) [L. *campus*, field, + G. *metron*, measure] Device for measuring field of vision

campimetry (kamp-pim'et-ri). Measurement of field of vision **SYN** 'perimetry.

campospasm [G. *kampē*, a bending, + *spasmos*, spasm]. 1. Abnormal flexing of the body. 2. Static deformity produced in war.

campocor'mia [G. *kamptos*, bent, + *kormos*, body]. Abnormal flexing of body. **SYN** *campospasm*.

campodactylia (kamp-to-dak-til't-ā) [" + *dactylos*, finger]. Permanent flexion of fingers or toes

camp'tospasm [" + *spasmos*, spasm]. Campocormia; forward trunk flexion seen in soldiers.

canal. A narrow tube, channel, or passageway. **SEE ALSO** *duct*, *groove*, *space*, *foramen*.

c. adductor. Hunter's canal, a triangular space lying beneath the sartorius muscle and between the adductor longus and the vastus medialis muscles. It extends from the apex of the femoral triangle to the popliteal space and transmits the femoral vessels and the saphenous nerve.

c. Alcock's. A canal on the pelvic surface of the obturator internus muscle formed by the obturator fascia. It transmits the pudendal vessels and nerve.

c. alimentary. The digestive tract from mouth to anus.

c. alveolar, inferior. A canal located in the mandible for transmitting blood vessels and nerves to the lower teeth.

c. alveolar, superior. A canal in the maxilla for transmitting blood vessels and nerves to the upper teeth

c. anal. The terminal portion of the rectum opening at the anus.

c. auditory, external. The external auditory meatus, transmits sound waves

c. auditory, internal. A canal in the petrous portion of the temporal bone which transmits the acoustic and facial nerves and the acoustic artery

c. birth. Parturient canal, passageway through which the fetus passes in parturition, specifically the uterus and vagina

c. carotid. A canal in the petrous portion of the temporal bone which transmits int. carotid artery and the int. carotid plexus of sympathetic nerves

c. central. A small canal lying in the center of the spinal cord extending from the fourth ventricle to the conus medullaris. Contains cerebrospinal fluid

c. cervical. Canal in cervix of uterus extending from internal to external os

c. cochlear, spiral. A part of the bony labyrinth of the ear. A spiral tube about 30 mm long making two and three-quarters turns about a central bony axis, the modiolus. Contains the scala tympani, scala vestibuli, and cochlear duct

c. condylar (condyl'oid) A canal in the occipital bone which transmits emissary vein from the transverse sinus. Opens anterior to the occipital condyle

c. craniopharyngeal. A canal in the sphenoid bone of a fetus which contains the stalk of Rathke's pouch

c. ethmoid. Two grooves running transversely across the lateral mass of the ethmoid bone to the cribriform plate. Lie between ethmoid and frontal bones. The *anterior ethmoidal canal* transmits the anterior ethmoidal vessels and nerve, the *posterior ethmoidal canal* transmits the posterior ethmoidal vessels and nerve

c. facial. A canal in the internal acoustic meatus of the temporal bone which transmits the facial nerve

c. femoral. The medial division of the femoral sheath. It is a short compartment about 1.5 cm long lying behind the inguinal ligament. Contains some lymphatic vessels and a lymph node

c. gastric. A longitudinal groove on the inner surface of the stomach following the lesser curvature. Extends from esophagus to pylorus.

c. Haversian. Minute canals found in compact bone which contain blood and lymph vessels, nerves, and sometimes marrow. Each is surrounded by lamellae of bone comprising a Haversian system. **SEE ALSO** *bone*

c. hyaloid. A canal in the vitreous body of the eye extending from the optic papilla to the posterior surface of lens. It serves as a lymph channel. In the fetus it transmits the hyaline artery to the lens.

c. hypoglossal. A canal in the occipital bone which transmits the hypoglossal nerve and a branch of the post. meningeal artery.

c. incisive. A short canal in the maxillary bone leading from incisive fossa in roof of mouth to the floor of nasal cavity. Transmits nasopalatine nerve and branches of the greater palatine arteries to the nasal fossa.

c. infraorbital. A canal in the maxilla lying in the floor of the orbit which transmits the infraorbital nerve and vessels. It terminates anteriorly at the infraorbital foramen.

c. inguinal. A slit in the lower lateral portion of the abdominal wall, extending from the abdominal inguinal ring to the subcutaneous inguinal ring. It is an oblique passageway about 1½ inches long and serves in the male to transmit the spermatic cord and the ilioinguinal nerve and in the female the ilioinguinal nerve. It forms a channel through which an inguinal hernia descends.

c. intestinal. The alimentary canal from stomach to anus.

c. lacrimal. The lacrimal duct, q.v.

c. mandibular. The inferior alveolar canal, q.v.

c. maxillary. The superior alveolar canal, q.v.

c. medullary. The marrow cavity of a long bone. Contains yellow marrow.

c. membranous semicircular canals. See semicircular ducts.

c. nasolacrimal. A canal lying between the lacrimal bone and the inferior nasal conchae. Contains the nasolacrimal duct.

c. Nuck's. In the female, a persistent peritoneal pouch corresponding to the vaginal process of the male.

c. nutritive. An opening on the surface of compact bone through which blood vessels gain access to the medullary cavity of long bones. Also transmits veins.

c. obturator. An opening in the obturator foramen of the hip bone which transmits the obturator vessels and nerve.

c. pharyngeal. A canal between sphenoid and palatine bones for transmission of branches of sphenopalatine vessels.

c. portal. The connective tissue (continuation of Glissons capsule) and its contained vessels (interlobular branches of hepatic artery, portal vein, and bile duct and lymphatic vessel) located between adjoining liver lobules.

c. pterygoid. A canal of the sphenoid bone transmitting pterygoid vessels and nerve. Also called canal of Vidian.

c. pterygopalatine. A canal lying between maxillary and palatine bones which transmits descending palatine nerves and artery.

c. pulp. The central cavity of a tooth filled with pulp. Contains blood vessels and sensory nerve endings.

c. sacral. Cavity within the sacrum, a continuation of the vertebral canal.

c. Schlemm's. A space or series of spaces at the junction of the sclera and the cornea of the eye into which aqueous humor is drained from the anterior chamber through the pectinate villi.

c. semicircular. The portion of the bony labyrinth of the ear which encloses the three semicircular ducts. There are three, the superior, posterior, and lateral which open into the vestibule. They are enclosed within the petrous portion of the temporal bone.

c. spinal. The vertebral canal.

c. spiral cochlear. See: cochlear canal.

c. spiral (of the modiolus). A series of irregular spaces which follows the course of the attached margin of the osseous spiral lamina to the modiolus. They serve for the transmission of nerves and blood vessels. The spiral ganglion lies in the spiral canal.

c., uterine. The cavity of the uterus.

c. uterocervical. The cavity of the cervix of the uterus.

c. uterovaginal. The combined cavity of the uterus and vagina.

c. vaginal. The cavity of the vagina.

c. vertebral. The cavity formed by the foramina of the vertebral column. Also called spinal canal, neural canal. It contains the spinal cord and its meninges.

c. Volkmann's. Small canals found in bone through which blood vessels pass from the periosteum. They connect with the blood vessels of Haversian canals or the marrow cavity.

c. zygomatico-orbital. A canal in the zygomatic or malar bone that transmits branches of the zygomatic nerve and the lacrimal artery.

canalicular (kan-al-ik'u-lar) [L. *canaliculus*, pert. to a small canal]. Pert. to a canaliculus.

canaliculi (kan-al-ik'u-li) [L. pl. small channel] (sing. *canaliculus*). Small canals, esp. those opening into the lacunae of bones.

canaliculus (kã-nal-ik'u-lus). A small channel or canal.

c. lacrimalis. Lacrimal canal carrying tears from eyes to nose. Extends from puncta to lacrimal sac.

canalis [L.]. A canal or channel.

c. arteriosus. Blood vessel connecting pulmonary artery and the aorta in the fetus.

c. venosus. Duct connecting the umbilical vein in hepatic region to the ascending vena cava.

canalization (ka-nal-i-za'shun). Formation of channels in tissue.

can'cellated [L. *canellus*, lattice]. Reticulated, latticelike.

cancelli (kan-sel'i) [L. *cancellus*, lattice]. Reticulations forming spongy tissue of bones.

can'cellous [L. *cancellus*, a grating]. Having a reticular or latticework structure, as the spongy tissue of bone.

cancellus (kan-sel'us) [L. a lattice]. An osseous plate of which cancellous bone is composed.

cancer (kan'ser) [L. a crab, ulcer]. 1 A malignant tumor of epithelial origin. 2 Specifically, hyperplasia of epithelial or gland cell with infiltration and destruction of tissue.

Etiol. Origin unknown. May be caused by various forms of chronic irritation. **Sym:** Persistent discharge from a sore that doesn't heal, discharge or bleeding from the nipples, blood in the stools or urine or blood-tinged vaginal discharge, persistent, unexplained indigestion or lack of appetite, persistent pain in the part; a lump esp. in the breast, change in a wart or mole; loss of weight, persistent cough or hoarseness.

Treatment: Surgery, radium and x-rays are the only recognized effective methods of treatment for cancer.

Method still in experimental stage is refrigeration in cases of advanced malignant metastases, which has thus far

caused alleviation of pain, temporary improvement of the general state of the patients and histological changes in the primary and secondary carcinomatous growths. Also cobra venom injected for pain. A refrigerating blanket is sometimes used in place of cracked ice.

Early diagnosis and application of proper method or combination of methods are necessary for complete cure.

NP. Small pillows and sandbags to relieve strained muscles. Cradles to hold bedclothes away from painful parts. Light bedclothes, 1 wool blanket instead of several cotton ones. Olive oil added to rubbing alcohol prevents chafing and rawness. Eland, neutral soap should be used for bathing.

Destroy odors by using chloride of lime in 1 000 suspension in bedpans, for dressings, but not for the skin. Apply mixture containing 0.5 Gm pepsin, 0.2 cc diluted hydrochloric acid in 100 cc of distilled water to cancerous wounds to remove dead tissue and destroy odor.

Cater to individual idiosyncrasies. Do not deny particular foods unless there is a good reason for it. Serve 4 to 6 small meals. Attractively decorated trays stimulate appetite in patient. Diet with minimum of 2000 calories per day.

Keep patient cheerful. Talk and soothe patient out of complaint when possible. Censor talk of visitors so that cheerful attitude will be maintained, and literature as well.

Heat and cold and properly applied splints, to reduce motion and relax muscles, will often relieve pain.

See that bowels function at least every 2 days.

c., adenoid. Malignant variety with tubular cylinders with a lining of epithelium.

c., black. Cancer with dark pigmentation.

c., breast. Scirrhus, hard, and medullary soft.

c., cell. Cell composing cancerous epithelium.

c., hard. C composed of fibrous tissue.

c., lips. Epithelioma, usually in men, smokers and on lower lip.

c., scirrhus. *See* **hard c.**

c., stomach. Colloid, epithelial, hard or soft. Usually at pyloric end and lesser curvature. *Sym* Pain, dyspepsia; emaciation. Constipation and vomiting.

cancer, words pert. to: adenocarcinoma, apinoid, Benda's test, "canc-" words, "carcin-" words, carcinoma, cauliflower excrescence, chimney-sweeps' c., colloma, epithelioma, sarcoma, scirrhus.

cancerate (kan'ser-ät). Cancerous, developing into cancer.

cancerigenic (kan'ser-i-jen'ik) [L. *cancer*, ulcer, + *G. gennan*, to produce]. Causing or capable of producing cancer.

cancerine (kan'ser-ën). A ptomaine obtained from urine in uterine carcinoma.

cancerism (kan'ser-izm) [L. *cancer*, ulcer, + *G. ismos*, condition]. Tendency to cancerous formation; cancerous diathesis.

cancerocidal (kan'ser-o-si'dal) [" + *caedere*, to kill]. Destructive to cancer cells.

canceroderm (kan'ser-o-derm) [" + *G. derma*, skin]. Telangiectasis of skin on chest and abdomen sometimes seen in cancer.

cancerogenic (kan'ser-o-jen'ik) [" + *G. gennan*, to produce]. Cancerigenic.* Causing or producing cancer.

cancerology (kan'ser-o'lo-jî) [" + *G.*

logos, study]. The science of cancer. *Syn:* *cancerology*.

canceromyces (kan-ser-o-mi'sëz) [" + *G. mykës*, fungus]. An organism bet a mycete and a mould considered by Niesen as a cause of cancer.

cancerophobîa [" + *G. phobos*, fear]. Morbid fear of cancer.

can'cerous. Pert to malignant growth.

canceriform (kang'kri-form) [L. *cancer*, ulcer, + *forma*, appearance]. Having the appearance of cancer.

cancroid (kan'kroid) [" + *G. eidos*, appearance]. 1. Like a cancer. 2. A type of keloid * 3. Epithelioma.*

cancerology (kang-kro'lo-jî) [" + *G. logos*, study]. The study of cancer. *Syn.* *cancerology*.

cancrum (kang'krum) [L. *cancer*, ulcer]. A rapidly spreading ulcer.

c. na'si. Gangrenous inflammation of nasal membranes.

c. o'ris. Gangrenous stomatitis, noma. *NP.* Cleanse mouth not less than every 2 hours, the oftener the better. Fluids by mouth, nasal feeding.

c. puden'di. Ulceration of vulva.

Candida. A genus of yeast-like fungi which develop a pseudomycellium and reproduce by budding. They are the primary etiologic agents for many mycotic infections in man.

C. albicans. *Syn* *Oidium albicans*, *Monilia albicans* A small oval, budding fungus which is the primary etiologic organism of moniliasis (candidiasis).

candidiasis. Infection with any species of *Candida*. *Sre* *"Moniliasis"*.

candle, international. A unit of luminosity.

c. power. Amt of light thrown out by a lighted candle, measured in international candles. *Sre* *unit, light unit*.

canescent (kan-es'ent) [L. *canus*, gray]. Grayish in color.

cane sugar. Sucrose. Table sugar obtained from sugar cane. *Sre* *saccharose*.

canine [L. *caninus*, pert to a dog]. 1. Pert to a dog. 2. Pert to the canine teeth or the 4 teeth known as the eye-teeth (upper and lower) bet the incisors and molars. 3. A canine tooth.

c. appetite. Abnormal hunger a short time after eating. *Syn.* *bulimia*.*

c. eminence. Ridge on ant. surface of sup maxilla.

c. fossa. Depression on sup. maxilla external to the c. eminence.

c. tooth. Tooth situated bet. incisors and 1st premolar. *Sre* *dentition, tooth*.

canities (kan-ish'i-ëz) [L. gray hair]. Congenital (rare) or acquired whiteness of the hair.

Acquired form may develop rapidly or slowly, in elderly (*canities senilis*) or in early adult life (*canities praematura*), partial or complete.

Error: Hereditary tendency, prolonged fevers, wasting diseases, worry, overwork, grief, anxiety, nervous shock. In localized type, nerve injury.

canker (kang'ker) [L. *cancer*, ulcer]. Thrush; white spots on mucous membrane of the mouth, aphthae, noma, gangrenous stomatitis.

cannula (kan'u-lä) [L. a small reed]. A tube or sheath enclosing a trocar, the tube allowing the escape of fluid after withdrawal of the trocar.

cantaloupe [I. *cantalupo*]. *Comp:* Contains considerable cellulose. *Av.* *Ser* *inc.* 100 Gm. *Pro.* 0.6, *Fat* 0.2, *Carbo.* 5.7 per serving. *Ca* 0.017, *Mg* 0.012, *K*

0.235, Na 0.061, P 0.015, Cl 0.041, S 0.014, Fe 0.0003. ACTION: May cause flatulence.

Cantani's diet (kân-tâ'nêz). Exclusive meat diet in diabetes mellitus.

can'thal [G. *kanthos*, angle]. Pert. to a canthus.

cantharidal [G. *kantharos*, beetle, + *eidōs*, form]. Pert. to or containing cantharides.

cantharides (kan-thar'id-êz) [' + *eidōs*, form]. USP Dried insects of the species *Cantharis vesicatoria* obtained from Spain or Russia. SYN *Spanish fly*.

ACTION AND USES. Locally, an irritant, as a vesicant in the form of a plaster. Its use has been almost entirely discontinued.

canthectomy (kan-thek'to-mī) [G. *kanthos*, canthus, + *ektomē*, excision]. Excision of a canthus.

canthitis (kan-thi'tis) [' + *-itis*, inflammation]. Inflammation of a canthus.

cantholysis (kan-thol'is-is) [' + *lysis*, a loosening]. Incision of a canthus to widen palpebral slit.

canthoplasty (kan'tho-plas-tī) [' + *plastēin*, to form]. Plastic surgery of canthus of the eye. Enlargement of palpebral fissure by division of the external canthus.

canthorraphy (kan-thor'ā-flī) [' + *raphē*, suture]. Suture of canthus.

canthotomy (kan-thot'o-mī) [' + *tomē*, a cutting]. Division of canthus.

canthus [G. *kanthos*, angle]. The angle at either end of the slit bet the eyelids, external, internal. BNA *Commissura palpebrarum*.

can'tus gal'li [L. cock-crowing]. Children's disease marked by spasm of the larynx followed by noisy inspiration. SYN *laryngismus stridulus*.

CaO. Calcium oxide, quicklime, calx.

CaOC. Abbr for cathodal or negative opening contracture.

cap (kăp) [A.S. *caeppe*, hood] 1 A covering. SYN *tegumentum* 2 First part of the duodenum. SYN *pyloric cap*.

c., knee-. Bone in front of the knee. SYN *patella*, *q.v.*

capac'itance [L. *capacitās*, the taking]. That property of a system of conductors and dielectrics which permits the storage of electric charges. For units of capacitance. SEE *farad*.

capac'itor. A device used primarily because it possesses the property of capacitance.

It consists of two conducting surfaces separated by a nonconductor or dielectric.

capac'ity. 1. Capability. 2. Cubic content. 3. Holding power. SEE *capacitance*.

c., unit of. Unit of electrical capacity. Capacity of a condenser which, charged with 1 coulomb, gives a potential of 1 volt. SYN *farad*.

capeline (kap'e-līn) [Fr. a hat]. A bandage used for the head, or the stump of an amputated limb.

capiat (ka'pī-at) [L. 'let it take']. An instrument for removing placental remnants, etc., from the uterus.

capillarectasia (kap'il-lar-ek-ta'si-ā) [L. *capillaris*, hairlike, + *G. ekstasis*, dilatation]. Dilatation of capillary vessels.

capillaries (kap'il-lā-rēs) 1 Minute blood vessels. 2 Small lymphatic ducts. SEE: *capillary*.

cap'illariomo'tor [L. *capillaris*, hairlike, + *motus*, moving]. Vasomotor, esp pert. to the capillaries.

capillari'tis [' + *G. -itis*, inflammation]. Inflammation of the capillaries; telangiectis.

capillar'ity. Process by which a liquid's surface, at the point of contact with a solid, is elevated or lowered. SYN: *capillary attraction*.

capillaro'p'athy [L. *capillaris*, hairlike, + *G. pathos*, disease]. Capillary disorders or disease.

capillaro'scopy [' + *G. skopein*, to examine]. Examination of capillaries for diagnostic purposes.

cap'illary [L. *capillaris*, hairlike] 1. Minute blood vessel, 0.008 mm. in diameter, finer than a hair, carrying blood and forming the capillary system. Capillaries connect the smallest arteries (arterioles) with the smallest veins (venules). 2. One of the small lymphatic ducts which allow passage of nutrient matter and oxygen from the blood to the tissues, and of waste matter from the tissues into the blood. 3. Pert. to a hair; hairlike.

c., arterial. The very small vessels which are the terminal branches of the arterioles or metarterioles.

c. attraction. The relative results attending the mutual attraction (cohesion) bet the molecules of a liquid, and their attraction by a touching solid (adhesion), according to which the fluids rise above or sink away from their level about the sides of the containing vessel, or of capillary tubes or rods or plates immersed in them. When the fluid rises, the phenomenon is known as *attraction*, and cohesion dominates, when it sinks, the phenomenon is styled *repulsion*, and adhesion dominates. (*The Practical Standard Dictionary*.)

c., bile. Intercellular biliary passageways which convey bile from liver cells to the interlobular bile ducts.

c., blood. Minute blood vessels which convey blood from the arterioles to the venules. They form an anastomosing network which brings the blood into intimate relationship to the tissue cells. Their wall consists of a single layer of squamous cells called *endothelium* through which blood and oxygen diffuse to the tissue and products of metabolic activity enter the blood stream. They average about 8 microns in diameter.

c., lymphatic. The smallest lymphatic vessels. They are thin-walled tubes forming a dense network in most tissues of the body. They differ from blood capillaries in that they are generally slightly larger in diameter and end blindly. They collect tissue fluid from the tissues. Lymph capillaries unite to form larger lymphatic vessels.

c. permeability. The ability of substances to diffuse through capillary walls into the tissue spaces. It is influenced by anoxia, adrenal cortical hormone and the concentration of calons in the blood.

c. venous. The minute vessels which convey blood from a capillary network into the small veins or venules.

capilliculture (kap-il'i-kul-chur) [L. *capillus*, hair, + *cultura*, cultivation]. Systematic treatment for improvement of the hair.

capillose (kap'il-os). Hairy.

capillus (kap-il'us) [L.]. 1. A hair, esp. of the head. 2. A filament. 3. A hair's breadth; 1/10-1/12 of a line.

capitration (kap-is-tra'shun) [L. *capistrare*, to halter]. 1. Narrowing of opening of prepuce, so that it cannot be retracted behind the glans penis. SYN: *phimosis*. 2. Lockjaw. SYN: *trismus*.

cap'ital [L. *capitalis*, pert. to the head].

1. Pert. to the head. 2. Of great importance to life.

cap'itate [L. *caput*, head]. Headshaped; having a rounded extremity.

c. bone. Third bone in distal row of carpus. SYN *os capitatum*.

capit'atum (kap'-it-ä'tum). Third bone in distal row of carpus. SYN *os magnum*.

capitel'um [L. dim. of *caput*, head]. BNA. *Capitulum humeri*. The round eminence at lower end of the humerus articulating with radius, its radial head.

capitones (kap'-it-ön-éz) [L]. Fetuses with heads too large for normal delivery.

capitular (kä-pit'u-lar) [L. dim. of *caput*, head] Pert. to a capitulum

capit'ulum. A small, rounded articular end of a bone

c. fibulae. The proximal extremity or head of the fibula, articulates with tibia

c. humeri. Rounded prominence at distal end of humerus. Articulates with the radius

c. mallei. The head or large rounded extremity of the malleus, bears facet for the incus

c. stapedis. The head of the stapes, articulated with lenticular process of incus

capotement (kä-pöt-mon') [Fr.] A sound like splashing in the stomach.

cap'reolate, **cap'reolar** [L. *capreolus*, a tendril]. Spiral or tendril shaped

c. vessels. Spermatic vessels

capric (kap'rik) [L. *caper*, a goat] 1. Pert. to a goat 2. Having the odor of a goat

caprizant (kap'ri-zant) [L. *caprizans*, leaping, from *caper*, goat]. Leaping or irregular pulse.

caprokol (kap'ro-kol). A resorcin compound relatively nontoxic, and having a phenol coefficient of over 70

c. solution (S. T. 37). A 1 1000 solution of caprokol

Uses In treatment of ear, nose, and throat, or topically as wet dressing for cuts, burns, or open wounds. Used in either full strength or diluted with 1 or 2 parts warm water

Dosage: 2½-10 m (0.15-0.6 Gm)

capsicum (kap'si-kum) USP. Cayenne pepper, dried, ripe fruit of capsicum.

Action and Uses Carminative, stimulant and rubefacient

Dosage 1 m (0.06 cc)

cap'sitis (kap-si'tis) [L. *capsa*, small box] Capsulitis of crystalline lens

capsot'omy [' + G. *tomē*, a cutting] Incision through Tenon's capsule

cap'sula [L. dim. *capsa*, box] Any capsule, esp. the internal capsule of the brain

c. articul'aris. Capsule of a joint.

c. bul'bi. Tenon's capsule

c. fibro'sa hep'atis. Glisson's capsule

c. glomer'uli. Bowman's capsule; malpighian capsule

c. len'tis. Crystalline lens.

cap'sular. Pert. to a capsule

c. ligament. A ligament which surrounds a movable joint

capsula'tion. Enclosure in a capsule.

cap'sule [L. *capsula*, small box]. 1. A membranous bag or a covering enveloping a part 2. A gelatinous shell for administering medicine

c., auditory. Embryonic cartilaginous capsule which becomes ext. ear

c. of Bowman. The glomerular capsule of the kidneys.

c., brain (external of). A thin layer of white matter which separates the claustrum from the putamen

c., brain (internal of). A broad band of fibers white matter which separates the lentiform nucleus on lateral side from the caudate nucleus and thalamus on the medial side

c. cartilage. The layer of matrix forms the innermost portion of the wall of a lacuna enclosing a single cell or a group of cartilage cells. It is basophilic

c., Glisson's. An outer capsule of fibrous tissue in which is invested the liver, its ducts and vessels

c., joint. The fibrous tissues enclosing a joint

c., lane. A transparent, structureless membrane which surrounds and encloses the lens of the eye

c., nasal; **c., optic**. Embryonic cartilage developing into nose and eyes.

c. spinal ganglion cells (of). A thin nucleated sheath investing the cell bodies of sensory neurons in the spinal ganglia. It is continuous with the neurilemma of the associated nerve fiber

c. suprarenal or adrenal. "A tough connective tissue capsule which encloses the adrenal gland"

Function To supply the vasoconstrictor hormone, called epinephrine

Nerve Supply From the solar and renal plexuses

Blood Supply From branches coming from the renal artery and aorta

c. of Tenon. The *fascia bulbi*, a serous sac enveloping the eyeball, forming a socket in which it rotates

capsulec'tomy [' + G. *ectomē*, excision]. Excision of a capsule

capsul'i'tis [' + G. *-itis*, inflammation]. Inflammation of a capsule

capsulocil'iary [' + *ciliāris*, pert. to the eyelashes] Pert. to capsule of lens and ciliary structures

cap'suloplas'ty [' + G. *plassein*, to mold]. Plastic surgery of a capsule, esp. one of a joint

capsulorrhaphy (kap-su-lor'ä-fl) [' + G. *rhaphe*, suture] Suture of a joint capsule or of a tear in a capsule.

capsulotomy (kap'su-lo-tōm) [' + G. *temnein*, to cut] Instrument for incising into capsule of crystalline lens

capsulotomy (kap-su-lot'o-mi) [' + G. *temnein*, to cut]. Cutting of capsule of crystalline lens

cap'tation (kap-tä'shun) [L. *captatio*, seizure] The first stage of hypnosis.

caput (ka'put) (pl. *cap'ita*) [L.]. 1. The head 2. The upper part of an organ.

c. coli. Cecum, colonic head

c. cornus. Enlarged portion of post. horn of spinal cord's gray matter

c. cornus [*caput columnae posterioris*]. "Lies between the apex and cervix"

c. gallinaginis. Round protuberance on urethral floor. SYN *verumontanum*.

c. Medusae. Plexus of veins about the umbilicus in 1 form of cirrhosis of the liver indicating obstruction.

c. ob'stipum. Wryneck

c. succedaneum. Swelling produced on the presenting part of the fetal head during labor. It may be mistaken for the bag-of-waters

Etiol. Effusion of serum into cellular tissue of exposed scalp through venous interference from pressure.

carbamide (kar'bä-mid) Urea or one of its derivatives. USP. SYN: *urea*.

carbarsone (kar'bar-sôn). A white, crystalline, odorless solid, derived from arsenic acid; contains about 28% arsenic, having a chemical structure resembling trypanamide

Uses: In the treatment of amebic dysentery. While it is claimed to be less toxic than acetarsone, reactions common to arsenic compounds may occur. While visual disturbances appear to be rare, the possibility of this occurrence should be kept in mind during the therapeutic use of the drug

Dosage. *Orally* for adults, 3½ gr. (0.25 Gm.) twice a day for 10 days

As a retention enema for adults, 30 gr. (2 Gm.) dissolved in 200 cc. of warm 2% sodium bicarbonate solution, every other night, for a maximum of 5 doses, if necessary. Oral administration should be interrupted during this interval

carbohemla (kar-bo-he'ml-ä) [L. *carbo*, carbon, + *G. anima*, blood]. Incomplete carbon dioxide elimination from blood

carbohydrates (' + *G. ydôr*, water). The monosaccharoses, disaccharoses, and polysaccharoses. A class of organic compounds so called because in them the hydrogen and oxygen are in the same ratio as they are in water, so that the group can be represented by the formula $C_xH_yO_y$.

Glucose, $C_6H_{12}O_6$, and sucrose, $C_{12}H_{22}O_{11}$, are typical carbohydrates, but the group also includes the noncrystalline dextrins and starches

c. foods. These contain only carbon combined with hydrogen and oxygen, such as sugars, starch, and cellulose. 98% of animal carbohydrates is digested 97% of vegetable carbohydrates is digested.

CLASSIFICATION (1) Starches—Starch does not remain in the body as starch, but is transformed or converted into sugar. They form fat in the body and

produce heat and energy in the body.

See: *classification of starches.* (2) **Sugars**—These consist of various kinds, forming: (a) Fat; (b) heat and energy. (3) **Glycogen**—This may be called animal starch. It is stored as reserve material by the liver and muscles and is readily converted into sugar as needed for the production of heat and energy.

(4) **Gums**—Little is known of the animal gums and they are apparently unimportant. (5) **Cellulose**—This is the fiber of plants and vegetable cells and not a constituent of the body, but it is usually classified among vegetable food values as a carbohydrate.

CHEMICAL PROPERTIES (1) Reducing properties, (2) hydrolysis, (3) fermentation, (4) oxidation.

FUNCTION: With the exception of cellulose, to provide energy and heat. Excess is stored in the body as fat, and a small amount as *glycogen* is stored in the liver for future use. They are quickly absorbed. Insulin, a secretion of the pancreas, is necessary for the utilization of carbohydrates by the body.

See: *carbohydraturia, cellulose, starches.*

c. high diet. Large amounts of carbohydrate 0.65 Gm. pro per Kg ideal body weight. Bet. meal nourishments.

carbohydraturia (' + ' + *ouron*, urine)

Sugar in the urine *Syn. glycosuria.*

carbolic acid [L. *carbo*, coal, + *oleum*, oil] (Phenol C_6H_5OH) Colorless crystalline coal tar derivative which is a poisonous antiseptic and disinfectant

Used very freely as an antiseptic and as a dressing for wounds, but it must be considered as a dangerous antiseptic, although not as powerful a one as generally supposed.

DOSAGE 1 gr. (0.06 Gm.)

It is not (chemically) an acid, but an alcohol. It should not be used on the skin for any length of time, esp. when

Classification of Important Carbohydrates

Classification	Examples	Some Properties
Monosaccharides (monoses) ($C_6H_{10}O_5$), H_2O or $C_6H_{12}O_6$	Glucose Fructose	Crystalline, sweet, very soluble. Readily absorbed.
Disaccharides (doses) ($C_6H_{10}O_5$) ₂ H_2O or $C_{12}H_{22}O_{11}$ hydrolyzed to simple sugars.	Sucrose Lactose Maltose	Crystalline, sweet, soluble, digestible.
Polysaccharides (polyoses) ($C_6H_{10}O_5$) _n composed of many molecules of simple sugars (Since the molecular weight is unknown, <i>n</i> refers to an unknown number of these groups, the exact molecular weight being undetermined.)	Starch Dextrin Cellulose Glycogen	Amorphous, with little or no flavor, less soluble. Vary in solubility and digestibility. Form colloidal solutions which cannot be dialyzed.

Digestion of Carbohydrates

Enzyme	Found in	Carbohydrates	End-product
Sucrase (invertase) Maltase Lactase	Intestine Intestine Intestine	Sucrose Maltose Lactose	Glucose and fructose Glucose Glucose and galactose
Salivary amylase (ptyalin)	Saliva (mouth)	Starch	Dextrin to maltose
Pancreatic amylase (amyllopsin)	Pancreas	Starch	Dextrin to maltose

other antiseptics are available. Its use on skin surfaces may cause capillary destruction, cutting off circulation, and perhaps inducing gangrene. One should be very careful, then, in handling this dangerous antiseptic.

Carbolized petrolatum may produce unfortunate results if continued as an application. Any mixture of carbolic acid with other substances, such as camphor, should be avoided.

Tissue changes may take place as a result of its use without one's immediate knowledge, as carbolic acid produces a local anesthesia. The first indications of its destructive qualities are a whitening or grayish-white and wrinkled appearance of the skin. This becomes darker and the skin may turn black if application is not removed. If the hands or the skin are moistened with the acid it must not be allowed to dry, but it should be washed off immediately. Some are more susceptible to capillary destruction than are others.

Lister employed it as a spray to kill bacteria on the patient's skin and on the doctor's hands, and on surgical instruments. The burning produced by carbolic acid may be neutralized by an application of grain alcohol. *See phenol*.
NP Carbolic Acid Solutions, Usual Strengths of

Stock Solution Equal parts of pure carbolic acid and glycerine

1 IN 20 SOLUTION 1 ounce of pure carbolic or 2 ounces of stock solution in 1 pint of water

1 IN 40 SOLUTION 1 ounce of pure carbolic or 2 ounces of stock solution in 1 quart of water

To make a 1 in 20 solution into a 1 in 40 solution add an equal quantity of water

To make a 1 in 20 solution into a 1 in 60 solution, add 2 parts of water to 1 part of the 1 in 20 solution

To make a 1 in 20 solution into a 1 in 80 solution, add 3 parts of water to 1 part of the 1 in 20 solution

carbolicism (kar'bo-lizm) [*"* + *"* + *G ismos*, condition]. Poisoning by carbolic acid

car'bolize [*"* + *oleum*, oil]. To add or mix with carbolic acid

carbolu'ria [*"* + *"* + *G. ouron*, urine]. Phenol in the urine

car'bon [L. *carbo*, carbon or coal] **SYMS** C. This nonmetallic element is the characteristic constituent of organic compounds

A common form is coal. It is found in all living things in its various forms and combinations. It is the basis of all organic matter and makes life possible through a number of combinations with hydrogen, nitrogen, and oxygen. In foods it is a fuel creating animal heat, as fats. The diamond is crystallized carbon. Atomic weight 12. *See arc lamp*.

car'bonate [L. *carbo*, carbon]. A salt of carbonic acid.

c. of soda. Sodium carbonate commercially in crude form, as washing soda. The free alkali present is irritating and in larger concentrations has the effect of sodium hydroxide, *q v*

car'bon diox'ide. A colorless, pungent, and acid-tasting gas (CO₂), heavier than air, generally produced in the combustion, decomposition, or fermentation of carbon or its compounds, and found in the air and exhaled by all animals.

The final product of combustion of carbon in food, which the body exhales through the lungs, or eliminates through the kidneys in urine, or in perspiration through the skin

It is also given off by decomposition of vegetable or animal matter, or formed by alcoholic fermentation, as in rising bread. It is necessary to all plant life and it is absorbed directly from the air

Although a waste product, in small quantities (up to about 5%) in inspired air, it stimulates respiration; in greater quantities, it produces an uncomfortable degree of hyperpnea with mental confusion.

Although not supposed to be poisonous, it will cause death by suffocation. Over 500,000,000 tons are passed into the air per year, but as it is used by green plants, the air content is kept down to about 0.03%. One sq yd of leaf surface can absorb the carbon dioxide from 2500 liters of air in 1 hour. An acre of trees uses 4½ tons a year.

c. d. combining power test. This test, done on blood serum, is a determination of the amount of carbon dioxide which the blood serum can hold in chemical combination

The blood serum is saturated with carbon dioxide by blowing one's breath into it, removing the carbon dioxide by producing a vacuum, and measuring its volume directly. It is used to detect acidosis or alkalosis and to determine their degree. Carbon dioxide in solution forms a weak acid (H₂CO₃), and the amount of this acid which the blood serum can take up is a measure of its reserve power to prevent the occurrence of acidosis. The normal amount is from 50 to 75 cc for each 100 cc of blood (usually expressed as 50-75 volumes %). Values below 50 indicate acidosis, above 75 alkalosis

c. d. inhalation. Carbon dioxide mixed with oxygen for inhalation stimulates breathing the same way as increased carbon dioxide production from exercise. Inhalation of oxygen and carbon dioxide is used as an accessory during artificial respiration and as a continuation of resuscitation after spontaneous breathing has returned

c. d. poisoning. This gas is most commonly used in carbonated drinks and commercially used in dry ice, of itself, it is rarely fatal, unless the patient is in a closed space. It is a profound respiratory stimulant

SYM Violent increased breathing; sensation of pressure in the head, ringing in ears, acid taste in mouth, slight burning in nose. Within a short time, respiration almost ceases and patient becomes unconscious

TREATMENT Remove to fresh air, administer artificial respiration, inhalation of oxygen.

c. d. test. The alkalinity reserve in the plasma is indicated by the volume percentage of carbon dioxide in the blood. Acidosis shows a percentage below 50, while in coma it is as low as 20. Acidosis indicates faulty metabolism. Diacetic acid is produced as the result of accumulated fatty acids, the product of incomplete oxidation of fats. A test is often made before an operation and the patient treated if acidosis is present, as a mild acidosis might develop into a

very acute one from the effect of the ether.

c. d. [solid] therapy. Solid carbon dioxide (CO₂ snow) is used for therapeutic refrigeration. Solid CO₂ has a temperature of -80° C. Application to skin 1-2 seconds causes superficial frostbite, 4-5 seconds a blister, 10-15 seconds superficial necrosis, 15-45 seconds ulceration. Now used mostly for certain nevi and warts, occasionally for telangiectasia* and lupus erythematosus.

carbonemia (kar-bo-ne'mi-ä) [L. *carbo*, carbon, + G. *aima*, blood] Excess accumulation of carbonic acid in the blood

carbonic. Pert. to carbon

c. acid. Acid resulting from mixture of carbon dioxide and water

c. a. gas. A colorless, pungent, acid-tasting gas, heavier than air, produced in the combustion of carbon or its compounds, and found in the air exhaled by all animals. SEE: *carbon dioxide*.

carbonize. To char

carbon monoxide. An insidious poisonous gas. It is a colorless, tasteless, odorless gas, gives no warning of its presence, and it is widely distributed as the result of imperfect combustion and oxidation. (CO)

It is found in the exhaust gas from all combustion engines, such as automobiles, airplanes, and gasoline motors which are used extensively on farms. It is likewise present in illuminating gas and it results from the inefficient and incomplete combustion of coal. It is found in sewers, cellars, and mines.

Poisoning may take place even from small amounts inhaled over a long period of time, or from large amounts inhaled over a short time. For example, driving a closed automobile, or parking in an automobile with motor running may result fatally from the inhalation of these noxious fumes, from leaking exhausts and exhaust heaters, or from operating a gasoline motor in an enclosed area, such as a closed garage or basement.

Poisoning from carbon monoxide is produced as a result of a chemical combination of this gas with the hemoglobin of the blood, thus preventing the blood from carrying oxygen to the tissues, and since this combination is a relatively stable one, such a patient may need oxygen administration for prolonged periods in addition to artificial respiration.

SYM. The symptoms of carbon monoxide poisoning are somewhat variable. Respiration is deep and difficult. There may be reddish patches of color about the face and chest. The mucous membrane may have a brighter red hue than normal. The pulse initially may be slowed but it soon becomes increased. There may be pounding of the heart, dizziness is frequent, although the muscular system is often affected so that the extremities may fail. There may be ringing in the ear, throbbing in the temples, and faintness and nausea. If the patient is still breathing when found, he usually recovers when brought into the fresh air and given stimulants.

TREATMENT. The administration of 4 to 10% of carbon dioxide gas seems to stimulate respiration effectively in these patients. If breathing has stopped, artificial respiration must be instituted immediately and maintained for a long time. Oxygen should be obtained promptly and used in conjunction with artificial respiration. The intravenous

administration of methylene blue is now being used very successfully as an antidote. Moderate doses of x-rays are helpful.

COMPLICATIONS: When such patients recover, they often have some nervous system involvement, including various types of paralysis, blindness, or interference with sensation, or muscular spasms, or twitches, for an indefinite period of time. Most of these complications disappear in time, but occasionally they remain permanently.

carbonometry [L. *carbo*, carbon, + G. *metron*, measure]. Determination of presence and amt. of carbon dioxide exhaled

carbon tetrachloride (tet-ra-chlo'rīd). USP. A clear, colorless liquid, with ethereal odor resembling chloroform; not inflammable (CCl₄).

Uses. Although having narcotic and anesthetic properties resembling chloroform, it is too toxic to be suitable as an anesthetic. Recently came into use as a vermifuge in the treatment of hookworm disease, and other intestinal parasites. Also as a stain remover, type cleaner, etc.

DOSAGE. Adult, single dose 40 m (2.5 cc.), best given in capsule on empty stomach, and followed by a saline purge within 3 hours, or may be given in magnesium sulfate solution. Precaution should be taken in not administering to alcoholics nor to patients low in calcium reserve.

POISONING. Toxic effects due to prolonged inhalation.

SYM. Irritation of eyes, nose, and throat, headache, nausea, anorexia, weakness.

F A TREATMENT. Oxygen inhalation, coffee, keep patient warm. Treat symptomatically.

carbonuria [L. *carbo*, carbon, + G. *ouron*, urine]. The presence or excretion of carbon dioxide or its compounds in the urine.

carbonyl (kar'bon-il) [' + G. *ylē*, matter]. A characteristic group of aldehydes and ketones R-C=O.

R

carboxyl (kar-box'il). The characteristic group of an organic acid R-C $\begin{smallmatrix} \diagup \\ \text{O} \end{smallmatrix}$ $\begin{smallmatrix} \diagdown \\ \text{OH} \end{smallmatrix}$

carboxyhemoglobin (kar-bok'si-hem-o-glo'bin) [L. *carbo*, carbon, + G. *oxy*, acid, + *aima*, blood, + L. *globus*, sphere]. Compound formed by carbon monoxide and hemoglobin in poisoning by carbon monoxide.

carboxylase (kar-boks'il-ās). An enzyme which brings about the removal of the carboxyl group (COOH) from amino acids, an enzyme found in brewer's yeast which catalyzes the decarboxylation of pyruvic acid with the production of acetaldehyde and carbon dioxide. In the body this requires the presence of vitamin B₆ (thiamine) which acts as a coenzyme.

carbuncle, carbunculus (kar'bung-kī, -ku-lus) [L. *carbunculus*, little coal]. A circumscribed inflammation of the skin and deeper tissues which terminates in a slough and suppuration and is accompanied by marked constitutional symptoms.

Error: *Staphylococcus pyogenes aureus* most common exciting agent. Predisposing factors the same as in furuncle.* Occurs more frequently in men, and in adults than children. Diabetics are particularly susceptible.

SYM: It is characterized by a painful node at first covered by a tight, reddened skin which later becomes thin and perforates, discharging pus through several openings. Most commonly found on nape of neck, on back, or on buttocks.

Proc: Depends upon age and general condition of patient, the young and vigorous recovering promptly. When on the scalp, death usually follows from thrombosis and embolism, and in elderly and debilitated from exhaustion and sepsis.

TREATMENT: General health cared for, elimination free. Autogenous vaccines. Hot, moist dressings (antiseptic) followed by radical cross shaped incision under gas anesthesia when tumor is fluctuant. Pockets to be cleaned out and packed with moist iodoform gauze. X-ray therapy and electrocautery have been employed. Blood sugar should be checked.

NP: Area cleaned and dressed frequently. Strict isolation of utensils, towels, and dishes. If localized areas are not well drained, pyemia may ensue. Infection of deeper veins may occur, or mastoiditis in regions of head and neck.

See *anthracia, anthracoma, anthracosis, 2, charbon.*

carbuncular. Pert. to a carbuncle.

carbunculosis (kar-bun-ku-lo'sis). Appearance of several carbuncles in succession.

Carcassonne's ligament (kar-kā-sun's) The deep perineal fascia. Colles's fascia.

carcinectomy (kar-sin-ek'to-mī) [G. *karkinos*, crab cancer, + *ektomē*, excision] The excision of a cancerous growth.

carcinelcosis (kar-sin-el-ko'sis) [" + *elkōsis*, ulceration] An ulcer of a cancerous nature.

carcinogenesis (kar'sin-o-jen'e-sis) [" + *genesis*, production] The production or origin of cancer.

carcinogenic (kar'sin-o-jen'ik). Causing cancer.

carcinoid [G. *karkinos*, cancer, + *eidos*, resemblance] An epithelial growth resembling a cancer, but having a benign course.

carcinolysis (kar-sin-ol'is-is) [" + *lysis*, destruction] Destruction of carcinoma cells.

carcinolytic (kar-sin-o-lit'ik). Destructive to cancer cells.

carcinoma (kar-sin-o-mā) [" + *-ōma*, tumor]. An epithelial cell new growth or malignant tumor, enclosed in connective tissue, and tending to infiltrate and give rise to metastases. **SYN** Cancer.

It may affect almost any organ or part of the body and spread through the blood stream.

Etiol: Unknown. Irritated surfaces, and extremes of temperature may be held responsible. **Sym.** absent in early stage.

Sym Stomach Skin muddy, pale, or slightly jaundiced. Emaciation and loss of weight progressive. Increased resistance over stomach. Inguinal and supraclavicular glands may be palpated. Leukocytosis or relative increase in polynuclear cells. Deficiency of free HCl and presence of lactic acid. Secondary anemic characteristics, blood count not below 1,000,000.

Proc. Favorable if found early.

c., epithelial. Epithelial cell cancer.

c., glandular. C. with cells of the secreting variety. **See:** *adenocarcinoma.*

c., lipomatous. C. with fatty tissue.

c., melanotic. C. containing melanin.

c. ossificans, c. osteoid. C. with bony deposit.

c. sarcomatodes. C. showing transition to sarcomatous type.

c., scirrhous. C. with firm structural form.

c., squamous. C. arising from the squamous epithelium.

carcinomatophobia (kar-sin-o'mā-to-fō-bl-ā) [G. *karkinos*, cancer, + *-ōma*, tumor, + *phobos*, fear]. Morbid fear of carcinoma.

carcinomatosia (kar-si-no-ma-to'sis) [" + *-ōsis*, infection]. The condition giving rise to carcinomata.

carcinomatus (kar-sin-o'mā-tus). Pert. to or affected with cancer.

carcinomec'tomy [G. *karkinos*, cancer, + *-ōma*, tumor, + *ektomē*, excision] Excision of a cancer.

carcinomelcosis (kar'sin-o-mel-ko'sis) [" + *elkōsis*, ulceration] An ulcerating cancer.

carcinophobia [" + *phobos*, fear] Morbid fear of cancer.

carcinosarcoma [" + *sarx*, flesh, + *-ōma*, tumor] A mixed tumor of carcinoma and sarcoma.

carcinosectomy (kar-sin-o-sek'to-mī) [" + *ektomē*, excision]. Excision of a cancer.

carcinosis (kar-sin-o'sis) [" + *-ōsis*, infection]. 1. Tendency to the development of malignant disease. 2. A form of carcinoma, beginning generally in the uterus, or the stomach, and spreading to the peritoneum.

carcinous (kar'sin-us). Pert. to or of the nature of carcinoma. **SYN** *cancerous*.

cardamom, cardamon [G. *kardamōmōn*]. Dried ripe fruit of *Elettaria repens*, used as an aromatic and carminative.

Cardarelli's sign (kar-dā-rel'lis) Tracheal tugging significant of aneurysm of aorta.

cardia (kar'di-a) [G.]. 1. The heart. 2. Upper orifice (esophageal) of stomach connecting with the esophagus. **See** *heart*.

cardiac [G. *kardia*, heart] 1 Pert to the heart or esophageal orifice of the stomach. 2 One afflicted with heart disease. 3. A heart tonic.

c. arrhythmia. **See** *arrhythmia*.

c. atrophy. Fatty degeneration of the heart.

c. compensation. The ability of the heart through its reserve power to compensate for impaired functioning of its valves.

c. cycle. The period from the beginning of one beat of the heart to the beginning of the next succeeding beat, including the *systole*, or contraction of the auricles and ventricles propelling the blood onward, and the *diastole*, the period during which the cavities are being refilled with blood.

The auricles contract immediately before the ventricles. The ordinary cycle lasts 8/10 of a second with the heart beating at 72 times per minute. The *auricular systole* lasts 0.1 second; the *ventricular systole*, 0.3 second, and the *diastole*, 0.4 second, thus allowing the heart to rest about 50% of the time. Heart action is also inhibited by the action of the vagus nerve.

RS: *circulation, diastole, heart, systole.*

c. diet. Variable. Maintenance without labor upon heart.

Avoid gas-producing foods, such as cabbage, onions, turnips, beans, and bulky foods causing distention and pres-

sure upon heart. Fluid intake restricted to 1500 cc. or less. Eliminate salt if edema is present. Small quantities of food at a time Karrell diet, *q.v.*

c. diet, Smith. A variation of the Karrell diet. Maintenance protein (2/3 to 1 Gm. per Kg.) mostly milk or eggs. The calories made adequate by addition of some cream by the liberal use of carbohydrates. Fluids limited, salt restricted in cases complicated with edema. For the first few days diet is liquid, milk and cream, orange juice and added sugars. After that soft foods are added, pureed vegetables, fruits, toast, cereal, carbohydrate pushed by use of sugars, jelly, honey or sugar candy.

Advantages. An adequate diet, foods may be varied so diet is not so monotonous. The emphasis on carbohydrates is beneficial.

c. hypertrophy. Enlargement of the heart. SEE *heart, hypertrophy of*

c. insufficiency. Inadequate cardiac output due to failure of the heart to function properly, as in valvular deficiency

c. movements. Those caused by the movement of the air in the lungs from the pulsation of the heart.

c. output. The amount of blood discharged from the left (or right) ventricle per minute. Also called *minute volume*. For an average adult with pulse rate of 70, cardiac output is approximately 4 liters

c. plexus. *Plexus cardiacus*. SEE *plexuses* in Appendix.

c. reflex. A reflex in which the response is a change in cardiac rate. Stimulation of sensory nerve endings in the wall of the carotid sinus by increased arterial blood pressure reflexly slows the heart (Marey's law), stimulation of vagus fibers in the right side of the heart by increased venous return reflexly increases heart rate (Bainbridge's reflex)

c. reserve. The capacity of the heart to increase cardiac output and raise blood pressure above basal pressure to meet body requirements

cardiactia (kar-dī-ak'tī-ā) [G. *kardia*, heart, + *aktio*, function]. Cardiac stenosis

cardiagra (kar-dī-a-grā) [“ + *agra*, seizure] Serious pains in the chest of a constricting nature. SEE: *angina pectoris*.

cardialgia (kar-dī-al'jī-ā) [“ + *algos*, pain]. Pain at the pit of the stomach or region of the heart, usually occurring in paroxysms.

cardiameter [“ + *metron*, measure]. Device for marking position of the cardia.

cardiomorpha [“ + *morphe*, form]. Malformation of the heart.

cardianastrophe (kar-dī-an-as'tro-fī) [“ + *anastrophe*, reversal of position]. Congenital transposition of the heart to the right side. SYN *dextrocardia*.

cardianesthesia [“ + *anesthesia*, lack of sensation]. Lack of sensation in the heart

cardianeuria (kar-dī-ā-nu'ī-ā) [“ + *aneuros*, without nerves]. Lack of nerve stimulus to the heart

cardianeuryisma (kar-dī-an-u-riz'mā) [“ + *aneuryisma*, a widening]. Aneurysm of the heart

cardiant (kar'dī-ant). 1. Affecting, or that which affects the heart. 2. A cardiac stimulant.

cardiaortic (kar-dī-a-or'tīk) [G. *kardia*, heart, + *aortē*, aorta]. Pert. to the heart and the aorta.

cardiasthenia (kar-dī-as-the'nī-ā) [“ + *astheneia*, weakness]. Type of neurasthenia with predominance of cardiac symptoms.

cardiasthma (kar-dī-az'mā) [“ + *asthma*, panting]. Dyspnea due to heart disease.

cardiataxia (kar-dī-ā-taks'ī-ā) [“ + *ataxia*, lack of order]. Incoordination of the heart contractions, very irregular heart action.

cardiatrophia (kar-dī-at-ro'fī-ā) [“ + *atrophia*, lack of nourishment]. Atrophy of the heart

cardiechema (kar-dī-ek-e'mā) [“ + *ēchō*, echo]. A heart sound.

cardiectasis, cardiectasis (kar-dī-ek-ta-sī-ā, -sis) [“ + *ekstasis*, dilatation]. Dilatation of the heart.

cardiectomy (kar-dī-ek'tō-mī) [“ + *ektomē*, excision]. Excision of the cardiac end of the stomach.

cardielcosis (kar-dī-el-ko'sis) [“ + *elkōsis*, ulceration]. Ulceration of the heart.

cardiempyria (kar-dī-em-fraks'ī-ā) [“ + *empyria*, a stoppage]. Obstruction of the blood flow in the heart

cardiethmoliposis (kar-dī-eth-mo-lip-o'sis) [“ + *ethmos*, sieve, + *lipos*, fat]. Fat in connective tissue of the heart

cardiuryisma (kar-dī-u-riz'mā) [“ + *euryis*, wide]. Dilatation of the heart.

cardinal [L. *cardinalis*, important]. Principal, as the cardinal symptoms, temperature, pulse, respiration.

cardio- [G. *kardia*, heart]. Prefix Pert. to the cardia or heart

cardioaccelerator [“ + L. *accelerāre*, to hasten]. That which increases the rate of the heart beat

cardioangiolog (kar'dī-o-an-jī-ol-o-jī) [“ + *aggeion*, vessel, + *logos*, study]. The science of the heart and blood vessels.

cardiaortic (kar'dī-o-ā-or'tīk) [“ + *aortē*, aorta] Pert. to the heart and the aortic artery

cardiocele (kar'dī-o-sēl) [“ + *kēlē*, tumor]. Hernia of the heart

cardiocentesis (kar-dī-o-sen-te'sis) [“ + *kentēsis*, puncture]. Surgical puncture of the heart to relieve engorgement of one of its chambers

cardiocinetic (kar'dī-o-sin-et'īk) [“ + *kinesis*, motion]. Influencing heart action

cardioclasis (kar-dī-o-kla-zī-ā) [“ + *klasis*, break]. Rupture of the heart.

cardiodemia (kar-dī-o-dē'mī-ā) [“ + *dēmos*, fat]. Fatty degeneration of the heart

cardiodilator [“ + L. *dilatāre*, to enlarge]. Device for dilating the cardia.

cardiodiosis [“ + *dia*, through, + *-osis*, infection]. Dilating the cardiac end of the stomach

cardiodynia (kar-dī-o-dīn'ī-ā) [“ + *odynē*, pain]. Pain in the region of the heart.

cardiogenic [“ + *gennan*, to produce]. Having origin in the heart itself.

car'diogram [“ + *gramma*, mark]. A tracing of movements of the heart.

A simple tracing which can be made by placing a thistle tube over the apex of the heart in thin people and connecting it to a tambour, of which the lever writes on moving paper.

cardiograph (kar'dī-o-grāf) [“ + *graphen*, to write]. A device for registering heart pulsations in graphic form.

cardiographic. Pert to cardiography.

cardiography. Recording the heart movements.

cardiohepatic [G. *kardia*, heart, + *epar*, liver]. Pert. to heart and liver.

car'dioinhib'itory [' + L. *inhibere*, to check]. Slowing action of the heart.
cardiokinet'ic [' + *kinēsis*, motion]. Influencing action of the heart.
car'diolith [' + *lithos*, stone]. A concretion or calculus in the heart.
cardiol'ogist [' + *logos*, study]. A specialist in treatment of heart disease.
cardiol'ogy. The science of the heart.
cardiol'ysin [G. *kardia*, heart, + *lysis*, loosening]. A lysin acting on heart muscle.
cardiolysis (kar-di-ol'is-is) [' + *lysis*, loosening]. Freeing pericardial adhesions to surrounding tissues, involving resection of the ribs and sternum.
cardiomalacia (kar-di-o-mal-a'si-ā) [' + *malakia*, softening]. Softening of the heart walls.
cardiomegaly (kar-di-o-meg'a-ly) [' + *megas*, large]. Hypertrophy of the heart.
cardiometer (kar-di-om'ē-ter) [' + *metron*, measure]. Device for locating impulse or apex of the heart's beat.
cardiomotil'ity [' + L. *motilis*, moving]. The ability of the heart to function.
cardiomyoliposis (kar'di-o-mi'ō-l'i-po'sis) [' + *mys*, muscle, + *lipos*, fat]. Fatty degeneration of the heart.
cardiomyot'omy [' + *tomē*, a cutting]. Severing the constricting muscle of the heart to relieve cardiospasm.
cardioncus (kar-di-on'kus) [' + *ogkos*, tumor]. Heart aneurysm or a. of the aorta near the heart.
cardionecro'sis [' + *nekros*, dead]. Necrosis of the heart.
cardionephric (kar-di-o-nef'rik) [' + *nephros*, kidney]. Pert. to heart and kidney.
cardioneu'ral [' + *neuron*, nerve]. Pert. to nervous control of the heart.
cardioneuro'sis [' + *neuron*, nerve]. Functional neurosis with cardiac symptoms.
cardiopalmus (kar-di-o-pāl'mus) [' + *palmos*, palpitation]. Palpitation of the heart.
cardiop'aludism [' + L. *palus*, marsh, + G. *ismos*]. Irregularity of heart action resulting from malaria.
car'diopath [' + *pathos*, disease]. One with heart disease.
cardiopathy (kar-di-op'ath-l). Any disease of the heart.
cardiopericard'i'tis [' + *peri*, around, + *kardia*, heart, + *-itis*, inflammation]. Inflammation of myocardium and pericardium.
cardiophobia (kar'di-o-fo'bi-ā) [' + *phobos*, fear]. Morbid fear of heart disease.
cardiophone (kar'di-o-fōn) [' + *phōnē*, voice]. Device for listening to sound of the heart.
cardiophtharsis (kar-di-of-thar'sis) [' + *phthsis*, wasting]. Destruction of the heart's substance.
cardioplasty (kar-di-o-plas'ti) [' + *plassein*, to form]. Operation of the stomach to relieve cardiospasm.
cardoplegia (kar-di-o-ple'gi-ā) [' + *plēgē*, stroke]. Paralysis of the heart.
cardiopneumat'ic [' + *pneuma*, breath]. Pert. to the heart and the lungs.
cardiopneumograph (kar-di-o-nu'mo-graf) [' + *graphēin*, to write]. Device for recording motion of heart and lungs.
cardiopsis (kar-di-op-to'sis) [' + *ptōsis*, falling]. Prolapsus of the heart.
cardiopul'monary [' + L. *pulmō*, lung]. Pert. to both heart and lungs.
car'diopuncture [' + L. *punctura*, piercing]. Surgical puncture of the heart.
Syn: *cardiocentesis*.

cardiopylor'ic [' + *pyloros*, gatekeeper]. Pert. to the cardiac and pyloric ends of the stomach.
cardiore'nal [' + L. *renalis*, pert. to kidney]. Pert. to both heart and kidneys.
cardiorrhaphy (kar-di-or'af-l) [' + *raphē*, a suture]. Suturing of the heart muscle.
cardiorrhexis (kar-di-or-reks'is) [' + *rēxis*, rupture]. Heart rupture.
cardiosclerosis (kar-di-o-sklē-ro'sis) [' + *sklērosis*, hardening]. Hardening of the cardiac tissues and arteries.
car'dioscope [' + *skopein*, to examine]. Instrument for listening to heart sounds.
Syn: *cardiophone*.
cardiospasm (kar'di-ō-spazm) [' + *spasmos*, spasm]. 1 Heart spasm. 2 Spasm of the cardiac sphincter of the stomach. The esophagus fails to open properly. Tube dilates from retention of large quantities of food.
Etiol. Pressure or ulceration with scar formation.
Sym: Regurgitation, esp. at night.
Treatment: Dilatation. Also relieved by injection of thiamin chloride.
cardiosphygmograph [' + *sphygmōs*, throbbing, + *graphēin*, to write]. Instrument for graphically recording movements of the heart and pulse.
cardiostenosis (kar-di-o-sten-o'sis) [' + *stenōsis*, narrowing]. Heart constriction and its development.
cardiosym'physis [' + *symphysis*, growing together]. Destruction of pericardial sac by adhesions.
cardiotachometer (kar'di-o-tak-om'et-er) [' + *takos*, speed, + *metron*, measure]. An instrument for determining rapidity of heart beat.
cardiother'apy [' + *therapeia*, treatment]. The treatment of cardiac diseases.
cardiotomy (kar-di-o-tō-mi) [' + *temnein*, to cut]. Incision of the heart.
cardioton'ic [' + *tonos*, tone]. Increasing tonicity of the heart.
cardiotoxic (kar-di-ō-toks'ik) [' + *toxikon*, poisoning]. Exercising a poisonous effect upon or through the heart.
cardiotromus (kar-di-o-tō-ro-mūs) [' + *tromos*, trembling]. Heart flutterings.
cardiotrophother'apy [' + *trophē*, nourishment, + *therapeia*, treatment]. Nutritional treatment of heart disorders.
cardiovalvul'i'tis [' + L. *valvula*, valve, + G. *-itis*, inflammation]. Inflammation of valves of the heart. Valvular endocarditis.
cardiovalvulotome (kar-di-o-val'vū-lo-tōm) [' + *tomē*, cut]. An instrument for excising part of a valve, esp. the mitral valve.
cardiovas'cular [' + L. *vasculum*, small vessel]. Pert. to the heart and blood vessels.
C. reflex. Sympathetic increase in heart rate when increased pressure in or distention of great veins occurs.
cardiovasology (kar'di-o-vas-o'lō-jī) [' + L. *vas*, vessel, + G. *logos*, study]. Science of the heart and blood vessels.
Syn: *cardioangiology*.
card'i'tis [' + *-itis*, inflammation]. Inflammation of the heart muscles.
Etiol: Gonococcal, pneumococcal, streptococcal, or due to rheumatism, or to the influenza virus.
Car'gile membrane (kar'gil). One made from the ox's peritoneum to prevent surgical adhesions.
caribi (kar-i'bi). Epidemic gangrenous proctitis.
carlicous (kar'ik-us) [L. *carica*, fig]. Fig-shaped.

caries (ka'rez) [L. rottenness]. Decay and death of a bone or tooth associated with inflammation and the formation of abscesses in the periosteum and surrounding tissues. A progressive decalcification of the enamel and dentine of a tooth, as a result of fermentation of carbohydrates. The etiology is not fully known. Early detection and dental fillings offer the best form of control. Fluorine is assumed to promote resistance to dental caries during the stage of tooth formation.

Chronic abscess, tuberculosis, and bacterial invasion of teeth are examples. In caries the bone melts away, while in necrosis large pieces of bone are discharged. Deficiency of vitamins A and G has a direct influence upon caries of the teeth.

c. fungo'sa. A tuberculosis of bone.

c., necrotic. Caries with pieces of bone in a suppurative cavity.

c. sic'ca. Dry tuberculosis of ends of bones and joints unaccompanied by fluid or swelling

carina (kar-i'ná) [L. keel of a boat]. A keel-like structure, esp the vertebral column of the fetus and the sternum.

carinate (kar'in-át). Keelshaped, resembling the bottom of a boat

carious (ka'ri-us) [L. *caries*, rottenness]. 1. Affected with or relating to caries. 2. Having pits or perforations. See *caries*.

carmin'ative [L. *carminäre*, to cleanse]. An agent that will remove gases from the gastrointestinal tract. Ex. *asafoetida*, *peppermint*, *cardamon*.

c. enema. Given to relieve distention caused by flatulence and also to stimulate peristalsis

car'nal (kar'nal) [L. *carō*, *carnis*, flesh]. Relating to the flesh. [sexual practices]

c. knowledge. Having awareness of

car'neous (kar'ne-us) [L. *carneus*, fleshy]. Fleshy

c. columns. *Columnae carnae*. Muscular projections from inner coat of the heart ventricles.

carnification (kar-nif-ik-a'shun) [L. *carō*, *carnis*, flesh, + *facere*, to make]. Denoting alteration of tissues, esp. pulmonary tissue.

carniformis (kar-ni-form'is) [' + *forma*, appearance]. Fleshlike in appearance.

carnitine. Vitamin B₁

carnivorous (kar-niv'or-us) [' + *voräre*, to devour] Flesh eating.

carnopho'bia [' + G. *phobos*, fear]. Abnormal aversion to meat.

carnose (kar'nos). Having the consistency of or resembling flesh

carnosity (kar-nos'it-i) [L. *carnositās*, fleshiness] An excrescence resembling flesh, a fleshy growth.

caro (ka'ro) [L.] Flesh. [lations.

c. luxurians. Excessive spongy granu-

carot'enase [G. *karōton*, carot]. An enzyme that converts carotene into vitamin A.

carotene (car'o-tēn) (pro-vitamin.) A yellow crystalline pigment present in various plant and animal tissues. It is abundant in yellow vegetables (carrots, squash, corn). It exists in three isomeric forms, alpha, beta, and gamma-carotene which along with cryptoxanthine, are the precursors of vitamin A. Carotene is stored in the liver and kidney and converted to vitamin A in the liver.

carotene'mia [G. *karōton*, carot, + *aima*, blood]. Carotene in the blood.

caroteno'sis [' + -ōsis, infection]. Pigmentation of tissues caused by carotene in the blood.

carot'ic (kar-ot'ik) [G. *karoun*, to stupefy]. 1. Carotid. 2. Resembling stupor; stupefying. 3. A sleep-producing drug.

carot'id [G. *karōtides*, from *karos*, heavy with sleep, because ancient Greeks believed the carotid arteries caused sleep]. The principal artery of the neck. It divides into the right and left branches.

c. body. See *body*, *carotid*.

c. sinus. A dilated area at the bifurcation of the common carotid artery which is richly supplied with sensory nerve endings of the sinus branch of the vagus nerve. These when stimulated by distention of the vessel wall brought about by a rise in blood pressure, bring about reflex vasodilation and a slowing of the heart rate.

carotid'ynia (kar-ot-i-din'i-ā) [' + *odynē*, pain]. Pain elicited by pressure on the common carotid artery.

caro'tin [G. *karōton*, carot]. A coloring matter in carrots, a lipochrome.

Vitamin A is manufactured from this substance by body. It is probably responsible for vitamin in highly colored vegetables, butter, egg yolk. Not found in animal livers. Its chemical structure is unknown. See *carotene*

car'otinase. A ferment converting carotin into vitamin A. SYN. *carotenase*.

carot'inemia (ka-ro-tin-e-mi-ā) [G. *karōton*, carot, + *aima*, blood]. Carotin in excess, causing yellowish skin

caro'tinoid [' + *eidos*, form]. Having the qualities of carotin

car'pagra (kar-pag'rā) [G. *karpos*, wrist, + *agra*, seizure]. Sudden wrist pain.

car'pal [G. *karpos*, wrist]. Pertaining to the carpus or wrist

c. articulation. Wrist joint.

car'pale (kar-pa'lē) Any wrist bone.

car'pec'tomy [G. *karpos*, wrist, + *ektomē*, excision]. Excision of the carpus or portion of it.

carphologia, **carphology** (kar-fol'o-lī-ā, -fol'ō-gi) [G. *karphos*, chaff, + *legein*, to pluck]. Involuntary picking at bed clothes, seen esp. in febrile or exhaustive delirium, of the low muttering type. SYN *tilmus*

A grave symptom in cases of extreme exhaustion or approaching death

carpi'tis [G. *karpos*, wrist, + *-itis*, inflammation]. Inflammation of a carpal joint or joints.

carpo- [G.] Prefix. Pert. to the carpus.

car'pometa'car'pal [G. *karpos*, wrist, + *meta*, beyond, + *karpos*]. Pert. to both carpus and metacarpus

car'pope'dal [' + L. *pēs*, *ped*, foot]. Pert. to wrist, foot, feet, or hands.

c. spasm. Spasm of the hands and feet, sometimes seen in laryngismus stridulus, q.v.

car'popo'isis (kar-pop-to'sis) [' + *ptōsis*, a falling]. Wrist drop.

carpus (kar'pus) [G. *karpos*]. The 8 bones of the wrist.

See "carpus" words, *pisiform*, *scaphoid*, *skeleton*, *wrist*, *wrist clonus*, *wrist drop*.

car'reau (kar-ō') [Fr.]. Tuberculosis and scrofulosis of organs of digestion

Carrel-Dakin treatment. Method of wound irrigation first utilized by Dr. Alexis Carrel and Dr. Henry Dakin in 1915.

Most suitable for deep septic wounds. A special apparatus is necessary: A glass receptacle for the solution constructed on the principle of a thermos flask for maintaining a constant tem-

perature. From this leads a rubber tube, attached to a glass connection piece, from which are suspended several perforated fine gauge rubber tubes. Each is tied at the lower end, and perforated for about half its length. Any number of tubes can be used, depending on size of wound. The flow is regulated so that a slow dropping occurs continually, thus keeping the wound constantly bathed. A Dakin's special solution of sodium hypochlorite (0.45-0.50%) is used. It decomposes under light. Must be kept in dark bottle and not be older than 36-72 hours.

carrier [Fr. *carrier*, to bear] 1. One who, or that which carries disease germs 2 That which carries anything

One may be immune to a certain germ, such as diphtheria bacilli, and yet be a "carrier" of it to others. In diphtheria, may number 1 to every 75 persons. Carriers spread infantile paralysis, cerebrospinal meningitis, septic sore throat and typhoid, cholera, amebiasis and diphtheria. From 0.5% to 11.6% of typhoid patients become "carriers" (The tsetse fly is a vector of African sleeping sickness, the anopheles mosquitoes are vectors of malaria, and the stegomyia mosquito is a carrier of yellow fever.) Typhoid bacillus can be harbored for years in gall bladder and discharged at intervals through the feces

See: vector, vector

CLASSIFICATION *Animal Carriers* Some microorganisms may be carried from an animal to man by direct contact, indirect transfer, or by intermediary hosts.

Air-borne Infection Pathogenic organisms in the respiratory tract, discharged from the mouth or nose, may be borne on the air and settle on food, clothing, walls and floors, and if they are of the type which resists drying for a long period they may remain virulent until transmitted to another person. Coughing, sneezing, and expectorating may be responsible for "droplet infection," as may expectorations.

Contact Infection This is the result of transmission from person to person, as in kissing, coming in contact with those afflicted with communicable diseases, or with utensils handled by one with an infection.

Food-borne Infection Bacteria may be communicated through food. Root and salad vegetables may carry bacteria from the soil or from manure. Cooking safeguards by destroying microorganisms on food.

Human Carriers Some parasites may live in or upon the body of those who themselves do not suffer from them, but may be carried by them to others. Carriers may be (a) *Contact carriers*, or those who never show symptoms; (b) *incubationary carriers*, or those in whom the infection is starting but has not completed the incubation period, and (c) *convalescent carriers*, or those who have recovered but who still harbor the organism causing their disease.

Insect Vectors An insect may act as a physical carrier, as the housefly, which may transmit the typhoid bacillus, or one that acts as an active intermediate host, such as the Anopheles mosquito, which transmits malaria.

Prenatal Infection: This is the result of the fetus being infected from the mother's blood stream, or from continuity with the maternal membranes.

Soil-borne Infection: Soil-borne, spore-forming organisms commonly enter the body through wounds, as in tetanus and gas gangrene.

Water - borne Infection. Organisms producing typhoid, dysentery, cholera, and amebic infections may be carried through a water supply, or water in public pools used for bathing. These organisms may pass into the water from the feces of an infected person and be communicated to others.

c., acute. Patient who is a carrier only during and just subsequent to the convalescent period.

c., chain saw. Instrument for carrying one end of a thread around a bone to be cut.

c., chronic. Individual carrying the disease-producing organism for a long period of time or permanently.

c., drainage tube. Instrument for placing drainage tubes in narrow or deep seated tracts.

c., ligament. Flat needlelike instrument for drawing ligament through perforations made in the tascia.

c., ligature. 1. for carrying ligatures. **c., renal.** 1 for introduction into kidneys. Flexible ones, about 20 in. long.

c., suppository bladder. 1 for depositing suppositories, etc., in the bladder.

c., temporary. Healthy individual who has not had the disease, but nevertheless carries the organism in his body.

c., urethral. 1 for introductions into ureters. Flexible ones, about 12 in. long.

Carron oil (kar'on) [From Carron Iron Works, England] A mixture of linseed oil and lime water used as a dressing in treatment of burns.

car'rots [G. *karōton*, carrot] **COMP** Carbohydrates are high. They are principally represented by cane sugar. Carrots are valuable for their salts, 20.7% of their mineral substances escape assimilation. They contain 10% of sugar, 50% of which is lost in cooking, 39% of protein lost in digestion. They are richer in sugar but poorer in starch than potatoes and turnips. **AV. SERVING** 120 Gm. **PRO.** 1.3, **FAT** 0.5, **CARBO** 9.8 in av. serving. **VIT.** A 1 + 1, B 1 + 1, C 1 + 1, D 1 + 1, G 1 + 1, Ca 0.056, Mg 0.021, K 0.287, Na 0.101, P 0.046, Cl 0.036, S 0.022, Fe 0.00064.

ACTION The nutritive power is small. In large quantities they form a pasty, soft salt. Intestinal absorption is more defective than is the case with potatoes. They should be served with butter or cream to make up some of their deficiencies.

car sickness. Sickness induced by riding in cars. **SYM** Similar to seasickness.

cartilage (kar'til-aj) [L. *cartilago*, gristle]. A type of dense connective tissue consisting of cells embedded in a ground substance or matrix. The matrix is firm and compact rendering it capable of withstanding considerable pressure or tension. Cartilage has a white or gray color, is semiopaque, and is nonvascular. The cells lie in cavities called lacunae. They may be single or in groups of two, three, or four.

Cartilage constitutes a part of the skeleton occurring in the costal cartilages of the ribs, the nasal septum, in the external ear and lining the Eustachian tube, in the wall of the larynx, in the trachea and bronchi, between bodies of the vertebrae, and covering the articular surfaces of bones. It forms the major portion of the embryonic skeleton.

CARTILAGE

HYALINE CARTILAGE

Section of articular cartilage of the frog A, Shrunken cartilage cells B, Lacuna

c. articular. Hyaline cartilage covering the articular surfaces of bones

c. hyaline. A bluish-white glassy translucent cartilage. The matrix appears homogeneous although it contains collagenous fibers forming a fine-like network. The walls of the lacunae stain intensely with basic dyes. Hyaline cartilage is flexible and slightly elastic. Its surface is covered by the *perichondrium* except on articular surfaces. Found in articular cartilage, in costal cartilages, in septum of nose, in larynx and trachea

c., white fibro. Bundles of white fibers pervading the intercellular substance and containing bet. them the cartilage cells. This cartilage joins bones together.

c., yellow or elastic. A network of yellow elastic fibers, holding cartilage cells, and pervading intercellular substance. Found in the epiglottis, the external ear, the auditory tube, strengthening them and maintaining their shape.

FIBROUS CARTILAGE

Section of intervertebral cartilage, calf's tail. A, Perichondrium.

cartilage, words pert. to: achondroplasia, arthrochondritis, arytenoiditis, "cartilag-" words, "chondr-" words, crico-arytenoid, cricoid, enchondroma, gristle, semilunar, y-cartilage.

cartilagin (kar-til'aj-in) [L. *cartilagō*, gristle]. A characteristic principle of hyaline cartilage.

cartilagification (kar-til-aj-in-if-ik-a'-shun) ["" + *facere*, to make] Cartilage formation or chondrification, the development of cartilage from undifferentiated tissue

cartilagoid (kar-til-aj'in-oid) ["" + G. *eidos*, form]. Resembling cartilage.

cartilaginous (kar-til-aj'in-us). Pert. to or consisting of cartilage.

cartilago [L.]. Cartilage

cartuncle [L. *caruncula*, dim. *carō*, flesh].

A small fleshy growth

c., lacrimal. *Caruncula lacrymalis*. One found on the conjunctiva near the inner canthus. A small, reddish elevation of modified skin.

ELASTIC CARTILAGE

External ear, calf. A, Perichondrium

c., urethral. *Carunculae myrtiformes*. A small, red, papillary growth, highly vascular, sometimes found at the urinary meatus in females. It is characterized by pain on urination and is very sensitive to friction

caruncula (kar-ung'ku-lā) (pl *carunculae*) [L.]. A tiny, fleshy protuberance. **SYN:** *caruncle*.

c. myrtiformes. Shreds of the ruptured hymen. **SEE** *caruncle*.

carus (ka'rus) [G. *karos*, torpor]. A lethargic, deep sleep

c. cataleptica. Catalepsy.

c. ecstasis. A trance, or catalepsy.

c. lethargus. Lethargy.

caryenchyma (kar-I-en'ki-mā) [G. *karyon*, nucleus, + *en*, in, + *chymos*, juice]. The fluid portion of the protoplasm of a nucleus

caryocinesis, caryokinesis (kar'I-o-sin-e'-sis) ["" + *kinēsis*, movement]. Nuclear changes in cell division. **SYN:** *karyokinesis*.

caryogenesis (kar-I-o-jen'es-is) ["" + *genesis*, production]. The development of a cell nucleus.

caryogenic (kar-I-o-jen'ik) ["" + *gennan*, to produce]. Pert. to the cell nucleus.

caryolebic (kar-i-o-lo'biik) ["" + *L. lobus*, lobe]. Having a lobeshaped nucleus.

caryolymph (kar'i-o-limf) ["" + *L. lymph*, lymph]. The nuclear fluidlike substance.

caryolysis (kar-i-o-lis-is) ["" + *lysis*, loosening]. The disappearance of the nucleus of a cell, liquification of the nucleus as occurs in degenerating of irradiated tumor cells.

caryomito'sis. Nuclear changes in cell division. SYN *caryocinesis*.

cascara sagrada (kas-kar'k sag-rā'dā). USP. The dried bark of *Rhamnus purshiana*, a small tree grown on western U. S. coast, and in parts of South America. The bark is seldom used, either extract or fluid extract being preferable.

Dosage. From 15 gr. (1.0 Gm.).

c. s., aromatic fluid extract. USP. Dosage. From 10 to 60 m (12-4.0 cc.). INCOMPATIBILITIES Ferric chloride, alkalies, hydrochloric acid, quinine

c. s., extract. USP. Dosage: From 2 to 8 gr. (0.13-0.5 Gm.).

c. s., fluid extract. USP. Uses Mild laxative, less pleasant, but more efficient than the aromatic fluid extract. Dosage From 10 to 30 m (0.6-2 cc.)

case [*L. casus*, happening]. A particular example of a disease, incorrectly a patient.

c. brain. The calvaria; cranium, skull cap.

c. fatality rate. Number per thousand of fatal terminations from a disease or operation

c. taking. A record of symptoms and history pert to a patient SEE *casuistics*

caseate (ka'se-at) [*L. caseus*, cheese] 1. To undergo cheesy degeneration. 2 A lactate.

caseation (ka-se-a'shun) [*L. caseus*, cheese]. 1. Process of converting necrotic tissue into a granular amorphous mass resembling cheese 2. Precipitation of casein during coagulation of milk

casein (ka'se-in) [*L. caseus*, cheese]. The principal protein in milk, seen in milk curds

It supplies all of the amino acids necessary for body tissue. It is a derived

albumin. When coagulated by rennin or acid it becomes one of the principal ingredients of cheese. SEE *caseinogen*.

c., vegetable. A protein in beans, peas, and other legumes SYN *legumin*. **caseinogen** (ka-se-in'o-jen) ["" + *G. genan*, to produce] The principal protein in milk from which casein is derived.

It is the substance in solution and casein* is the result of its precipitation Its conversion into casein is the essential process in the curdling of milk.

caseose (ka'se-os). The product of gastric digestion of casein

caseous (ka'se-us). Resembling cheese; pert to transformation of tissues into a cheesy mass.

CaSO₄. Calcium sulfate

casoid (ka'soyd) [*L. caseus*, cheese, + *G. eidos*, form]. Bread made of a meal prepared from casein for diabetics.

Casoni's reaction (kā-so'nīz). Appearance of a white papule on skin at site of an injection of fluid from a hydatid cyst; if it remains and increases after operation, another cyst remains

cassava (kas-ah'vā) [*Sp. cazabe*, starch].

1 Tapioca 2 The manioc plant

casserian ganglion. Ganglion of sensory root of 5th cranial nerve Term used erroneously for gasserian ganglion. SEE *gasserian ganglion*.

cast [M.E. *casten*, to carry]. 1. A solid mold of a part, usually applied *in situ* for immobilization, as in fractures, dislocations and other severe injuries.

Most often made of plaster of Paris, sodium silicate, starch, or dextrine which is rubbed into crinoline, then soaked in water, carefully applied to the part and allowed to harden

2 Plastic or fibrous material thrown off in various pathological conditions, the product of effusion It is molded to the shape of the part in which it has been accumulated According to source, casts are classified as bronchial, intestinal, nasal, esophageal, renal, tracheal, urethral and vaginal, as to constituents, classified as bloody, fatty, fibrinous, granular, hyaline, mucous and waxy.

How to RECOGNIZE They have a limiting membrane enclosing a matrix or substance in which are epithelial cells, pus cells, red blood cells, granules, and fat globules From these latter characters they take their name as epithelial casts, red blood casts, etc Casts usually have square ends, their diameter is the same throughout, and usually they do not bend or twist. Their ends are not pointed.

c., bacterial. Formed from a hyaline matrix filled with these elements. Their presence indicates their origin, the kidneys.

c., bloody. Same as bacterial casts, *q.v.*

c., broad. Same as "renal failure" casts, *q.v.*

c., bronchial. Seen in sputum of cases with asthma and some cases of bronchitis.

c., epithelial. Contain cells from inner lining of uriniferous tubules. Seen in acute nephritis.

c., fatty. Those containing epithellum that has undergone degenerative changes, found in very advanced cases of renal degeneration

c., fibrinous. Yellowish-brown, sometimes with ragged fractures, and highly refractile.

CASEATION

Diagram illustrating A, Single tubercle, B, Three tubercles running together to produce a large central area of caseation 1 Fibrous tissue. 2. Inflammatory cells (lymphocytes). 3. Tubercle bacilli. 4 Caseous material.

c., granular. Of varying sizes and made up of albumin and white blood cells, and of serious import in nephritis in its acute and chronic forms.

c., hyaline. Pale cylinders with rounded edges and variable size. Found in irritating conditions of the kidneys, nephritis, and its varying forms.

c., pseudo- These are epithelial cells swollen and held in groups, resembling casts. Alkaline urine has a tendency to dissolve casts.

c., pus. Found in urine in suppuration of kidney.

c., "renal failure." Those occurring only in last stages of severe renal disease.

c., urinary. Those found in the urine. They may be *hyaline casts*.

c., uterine. Those from the uterus passed in exfoliative endometritis or membranous dysmenorrhea.

c., waxy. Light yellowish, well defined, with tendency to split transversely, found in some cases of amyloid degeneration, and advanced nephritis.

cas'tor oil [Oleum ricini] A fixed oil expressed from the seed of the plant.

Uses Most valuable and extensively used active purgative in medicine. Esp desirable in treatment of diarrhea, dysentery, and acute digestive disturbances, often used as a cathartic after parturition and major operations. A somewhat neglected use of this drug is to arrest vomiting due to gastric irritation. The first dose may be vomited, but, if repeated immediately, the second or third dose is almost certain to be retained and have a beneficial effect. Externally, it is used in the treatment of burns, ulcers, and chronic indurative skin diseases, and in such eye conditions as burns and diphtheritic conjunctivitis.

ACTION: Efficient purgative, followed by a tendency to check intestinal activity.

DOSE 4 drams (15 cc.), for adults; 1 dram (4 cc.), for children.

ADM Give cold with fruit juices, brandy, whiskey, or sodium carbonate.

NP For adults, a little black coffee just before and after the oil. For children, cover dessert spoon with sugar, pour in oil and powder with sugar. Give drink of milk just before and after.

cas'trate [L. *castrare*, to prune] 1. To remove the testicles or ovaries. 2. One who has been castrated. **SEE** *spay*.

cas'trated. Sexed, emasculated.

castration (kas-tra'shun) [L. *castrare*, to prune]. Emasculation, excision of the testicles or ovaries, the analogy of *spay*.* **SEE** *oophorectomy*, *orchotomy*, *testectomy*.

c., complex. Morbid fear of castration **casualty** (kaz'u-al-ti) [L. *casualis*, accidental]. 1. Accident causing injury or death. 2. One so disabled, as a soldier.

casuistics (kaz-u-is'tiks) [L. *casus*, a case]. Study of pathological cases.

cata- [G.]. Prefix. Down or downward, against, or according to, as *catabolism*, *catabasis* (kat-ab'as-is) [G. *kata*, down, + *basis*, going]. The decline of a disease. **catabat'ic.** Pert. to catabasis.*

catabiotic (kat-a-bi-ot'ik) [G. *kata*, down, + *bios*, life] Used up in the performance of the vital processes.

catabol ergy [G. *katabolē*, a casting down, + *ergon*, work]. The energy expended by catabolic processes. [olism.

catabolic (kat-a-bol'ik). Pert. to catab- **catabol'in.** Any product of catabolism.

catabolism (ca-tab'o-lizm) [G. *katabolē*, a casting down]. One of the two metabolic changes, the other being *anabolism*.

Catabolism is the disintegration of living cells into simpler substances, most of which are excreted. Complex molecules are split into smaller ones, others by hydrolysis, with the absorption of water, into simpler ones, and by oxidation. It is the opposite of anabolism, *q.v.* Together they represent metabolism, *q.v.* **SEE** *catatate*, *disintegration*.

catabolite (kat-ab'o-lit). Any catabolism product. **SVN** *catabolite*.

catadclasis (kat-ā-clas'is) [G. *kata*, down, + *klasis*, a break] A fracture.

catadclisis (kat-ak-il'sis) [+ *kleisis*, closure]. Closure of eyelids by spasm or adhesion.

catacrot'ic [+ *krotos*, beat]. Manifesting the downstroke of a pulse tracing interrupted by an upstroke.

catacrotism (kat-ak-ro-tizm) [+ + *ismos*]. A pulse with one or more secondary expansions of artery following main beat.

catadicrotic (kat-a-di-krot'ik) [+ *dis*, twice, + *krotos*, beat]. Manifesting 1 or more secondary expansions of a pulse.

catadi'crotism [+ + *ismos*]. Two minor expansions following the main beat of an artery.

catadioptric (kat'ā-di-op'trik) [+ *diop-sesthai*, to see through]. Pert. to refraction and reflection of light.

catadrome (kat-ad-rōm) [+ *dromos*, running]. The onset or the decline of a disease.

catagenesis (kat-a-jen'es-is) [+ *genesis*, production]. Retrogression or involution.

catagma (kat-ag'mā) [G. *kata*, down, + *agmos*, fracture] A fracture, a broken bone.

catalase (kat'a-lās) An enzyme present in cells esp anaerobic bacteria which catalyses the decomposition of hydrogen peroxide to water and oxygen.

catalepsy (kat'al-ep-si) [G. *kata*, down, + *lēpsis*, seizure]. 1. A neurosis characterized by a loss of sensibility and voluntary movements without any perceptible alteration in circulation. 2. Abnormal condition of muscular rigidity and loss of will, accompanied by hysterical coma. 3. Muscular rigidity occurring under hypnosis.*

Any form of sustained immobility and stupor, esp. the waxy flexibility (*flexibilitas cerea*) seen typically in schizophrenia.*

catalep'tic. Pert. to catalepsy.

cataleptiform (kat-al-ep'ti-form) [G. *kata*, down, + *lēpsis*, seizure, + L. *forma*, shape]. Having the form of catalepsy.

catalep'toid [+ + *eidōs*, resemblance]. Resembling or simulating catalepsy.

catalysis (kat-al'is-is) [G. *katalysis*, dissolution] Decomposition produced chemically by a substance not affected by the reaction.

catalyst (kat'al-ist) [G. *katalysis*, dissolution]. 1. An agent producing catalysis. 2. An agent employed to speed or maintain a reaction in which it does not participate. **SEE** *catalytic agent*.

catalytic (kat-al-it'ik) [G. *katalysis*, dissolution]. Pert. to catalysis.*

c., agent. A material or substance that, without itself reacting or undergoing change, induces a reaction that cannot take place without its presence.

catalyzer (kat'al-i-zer) [G. *kata*, down, + *lysis*, loosening]. An agent which speeds or maintains a reaction in which it does not take part, a catalyst.*

catamenia (kat-a-me'nî-â) [“ + *mên*, month]. The menses. Periodic menstrual discharge of blood from the uterus.

catamenial. Pert. to the menses or catamenia.

catamnesia (kat-am-ne'sis) [G. *kata*, down, + *mnēmē*, memory]. A patient's history, after first being seen by physician, including all subsequent examinations. See *anamnesis*.

cataphasia (kat-a-fa'zî-â) [“ + *phasis*, speech]. A speech disorder causing an involuntary repetition of the same word.

cataphora (kat-a'fô-râ) [G. *kataphora*, lethargy]. Lethargy with short remissions.

cataphoresis (kat-a-for-e'sis) [G. *kata*, down, + *phoresis*, being carried]. The transmission of electronegative ions or drugs into the body tissues or through a membrane by use of an electric current.

cataphoria (kat-a-fô'rî-â) [“ + *pherein*, to bear]. Tendency of visual axes to incline below the horizontal plane.

cataphoric. Pert. to cataphora or cataphoresis.

cataphrenia [G. *kata*, down, + *phrên*, mind]. A dementia type tending to recovery but which shows mental debility.

cataphylaxis (kat-â-flî-laks'is) [“ + *phylaxis*, guard]. The process of carrying antibodies, leukocytes, etc., to the site of an infection.

cataplasia (kat-â-pla'zî-â) [“ + *plassem*, to form]. Degenerative change in tissues or cells.

cataplasia (kat-ap'las-is) [“ + *plassem*, to form]. 1. The period of decline in life. 2. Application of a coating or a plaster.

cataplasm [G. *kataplassem*, to spread over]. A poultice, *q.v.*

The most commonly used are flaxseed, onion, bread and milk, and bran. They are used as counterirritants, drawing the blood to the surface of the body, thereby removing deep seated inflammation.

cataplectic (kat-â-plek'tik) [G. *kata*, down, + *plêxis*, stroke]. Pert. to cataplexy.

cataplexy, cataplexia (kat'a-pleks-i, -pleks'î-a) [“ + *plêxis*, stroke]. A form of sudden shock, accompanied by loss of muscular tone, without loss of consciousness, the patient falling to the floor.

Error. May be the result of intense emotion or the sudden onset of a disease or rarely a part of a narcoleptic* attack.

catapsois (kat-ap-to'sis) [“ + *plôsis*, a falling]. Ptoxis, apoplexy, epilepsy, paralysis.

cataract [G. *kataraktês*, a rushing down]. Opacity of lens of eye or its capsule or both.

Varieties: Capsular, polar, lamellar, nuclear, cortical, morgagnian (fluid cataract with hard nucleus). Also, congenital, infantile, traumatic, diabetic, and senile, occurring bet 50-60 years.

Stages (a) Incipient stage (spoke-shaped opacities, cloudlike opacities, opacity of cortex or nucleus) (b) Stage of swelling, or immature stage (swollen lens, shallow ant. chamber). (c) Mature stage (lens shrinks due to loss of fluid and becomes opaque, ant. chamber regains its normal depth, no shadow

thrown by iris or lens with focal illumination). (d) Hypermature stage (lens becomes either solid and shrunken or soft and liquid).

Error: General diseases (diabetes); occupation (glass blowers); traumatic (concussion, foreign bodies, electric shock); ocular diseases cause complicated or secondary cataracts (iridocyclitis, choroiditis, high myopia, glaucoma).

TREATMENT A. Extraction, intracapsular, extracapsular. 1. Combined (with iridectomy). 2. Simple (without iridectomy). B. Discussion.

c., operation for. NP Preoperative Shampoo hair if possible, braid in two braids at side of head. Postoperative Avoid turning, jarring, or startling patient. Sand bags at sides of head to prevent turning until permitted. Knee roll and small pillow under small of back to relieve strain. The hands loosely with soft bandage at night to prevent patient touching eyes in sleep, explain reason to patient to prevent fright. Dressing A mydriatic, antiseptic lint, petrolatum, antiseptic cotton, narrow flannel roller bandage to keep dressings in place or strip of knitted black yarn 2 inches wide and long enough to cover both eyes.

cataractous (kat-ar-ak'tus) Affected with or of the nature of a cataract.

catarrh (ka-tar') [G. *katarrein*, to flow down]. Inflammation of mucous membrane.

See *blennorrhina*, *coryza*, *rheum*, *rinitis*.

c., dry. Severe spells of coughing with little or no expectoration. Generally seen in the old in association with emphysema or asthma.

SEQUELAE Emphysema, bronchiectases, and dilation of right ventricle.

Prog Perfect recovery rarely attainable, but not incompatible with long life.

TREATMENT Careful regulation of the hygiene. Constitutional.

c., epidemic. Influenza.

c., gastric. Gastritis.

c., intestinal. Enteritis.

c., nasal. Coryza.

c., pulmonary. Bronchitis.

c., uterine. Endometritis.

c., vernal. A chronic form of conjunctivitis occurring usually in spring and summer. Must be differentiated from trachoma and follicular conjunctivitis.

c., vesical. Cystitis.

catarrhal (kat-â'ral). Of the nature of or pert. to catarrh.

catatastasis (kat-as-tal'sis) [G. *kata*, down, + *stasis*, contraction]. Downward contraction of stomach during digestion; not preceded by a wave of inhibition.

catataltic (kat-as-tal'tik) 1. A nerve impulse passing from above downward. 2. An astringent. 3. A sedative or inhibitory agent. 4. Inhibiting, restraining.

catatastasis (kat-as'tas-is) [G. *kata*, down, + *stasis*, halt]. Decline or quieting of symptoms. Restitution of a part.

catataste (kat-as-tât) [G. *katastatos*, settled down]. One of a succession of catabolic conditions or substances, each being less complex, more stable, and exhibiting less functional activity than its predecessor.

catatastic. Pert. to catatastasis or a catataste.

catatonia [G. *kata*, down, + *tonos*, tension]. 1. A phase of schizophrenia in which the patient is unresponsive. The tendency to assume and remain in a

fixed posture, refusal to move or talk are characteristic of this phase. 2. Stupor

cataton'ic. Stuporous; pert. to catatonia.

catatrotic (kat-ā-tri-krot'ik) [G. *kata*, down, + *treis*, three, + *krotos*, beat]. Manifesting a third impulse in the descending stroke of the sphygmogram.

catatrotism (kat-a-tri'kro-tizm) [' + + *krotos*, beat]. State in which the pulse is catatrotic

catatropia (kat-ā-tro-pi-ā) [' + *trepem*, to turn]. Having both eyes turned downward.

cat bite. Usually a punctured or lacerated wound, potentially infected with bacteria

Frequently infected wounds follow even under careful management. If animals are rabid, may lead to hydrophobia

TREATMENT Generously applied antiseptic to all parts of bite. Consider cautery and debridement. Antirabies treatment when indicated. Sterile dressings.

RS. bites, dog bites, galeophobia, galeophobia, human bites, insect bites, insect stings, snake bites.

cat'electrotonus [G. *kata*, down, + *ēlektron*, amber, + *tonos*, tension]. The state of increased excitability produced in a nerve or muscle in the region near the cathode during the passage of an electric current

catenating (kat'en-āt'ing) [L. *catena*, chain]. Linking or connecting, as one disease associated with another.

catenoid (kat'en-oid) [' + G. *eidōs*, resemblance]. Chainlike, pert. to protozoan colonies whose individuals are joined end-to-end.

cat'gut [A.S. *catta*, to whelp, + *guttas*, to pour]. Sheep's intestine twisted for use as an absorbable ligature

catharma (kath-ar'mā) [G. *katharein*, to purge]. Product or result of purging

cathar'sis [G. *katharsis*, purification]. 1. Purgative action of the bowels. 2. The Freudian method of freeing the mind by recalling the patient's memory of an event or experience that was the exciting cause of a psychoneurosis, abbreviation, q.v.

cathar'tic [G. *kathartikos*, purging]. An active purgative, usually producing several evacuations which may or may not be accompanied by pain or tenesmus.

Ex. Castor oil, calomel, cascara sagrada. See purgative

cathedral glass. Window glass substitute for transmitting antirachitic rays of sunlight

catheresis (kath-er'e-sis) [G. *kathairesis*, destruction]. 1. Weakness resulting from medication. 2. Caustic or feebly caustic action

cathartic (kath-e-re'tik) [G. *katharsis*, destruction]. 1. Weakening. 2. Slightly caustic

catherization (kath'e-ri-za'shun) [G. *katharein*, to destroy]. Act of weakening by medication

catheter (kath'et-er) [G. *katheter*, a tube placed down into]. A tube for evacuating or injecting fluids. Made of elastic, elastic web, rubber, glass, and metal

c., double channel. One providing for inflow and outflow.

c., elbowed. One which has an acute bend near the beak. USES: Cases of enlarged prostate.

c., eustachian. One for injection into eustachian tube through nasal passages.

c., female. One about 5 inches long.

c., indwelling. One which keeps its position in the ureter.

c., male. One for bladder evacuation. 12-13 inches long.

c., prostatic. One designed to pass prostatic obstruction. 15-16 inches long.

c., self-retaining. One which can be retained at will, effecting bladder drainage.

c., vertebrated. One in sections to be fitted together, so that it is flexible.

c., winged. One with little flaps at each side of beak to aid in retaining it in the bladder

catheter fever. Reactionary rise in temperature from passing of a catheter or urethral bougie.

catheterization (kath'et-er-i-za'shun) [G. *katheterismos*, an inserting of a catheter]. Use or passage of a catheter

c., cardiac. The passage of a catheter into the heart through an arm vein and blood vessels leading into the heart for the purpose of obtaining cardiac blood samples, detection of abnormalities, and determination of intracardiac pressure

c., urinary bladder. Introduction of a catheter through the urethra into the bladder for withdrawal of urine

NP Treatment should be explained to patient who lies on back with knees drawn up, slightly separated, pillows under head and shoulders to relax abdominal muscles, feet flat on bed. Place screen around bed, tray at right side within reach. Arrange top covers so they may be separated with elbow. This is an aseptic procedure. scrub hands and place sterile towels, one above and one below vulva of female patient. Separate labia with first and second finger of left hand and pick up sterile cotton balls dipped in soap solution with right hand. Use downward stroke on one side of vulva, discard cotton ball and proceed to cleanse area, swabbing orifice of meatus last.

Sterile receiver is placed bet patient's legs. Nurse holds catheter about inch from open end, drains water from it, inspects for flaws, and inserts it into meatus of urethra, being careful not to touch any other part of vulval surface. Insert gently until urine begins to flow, holding it steadily until flow ceases. By withdrawing it slowly more urine may flow. Repeat until catheter is withdrawn.

Place finger over open end, invert over receiver and empty. Dry patient and cover. Report findings and condition of patient, also time. SEE: *auto-catherism*.

catheterize (kath'e-ter-iz). To draw the urine through a catheter.

cathetometer [G. *kathetos*, vertical height, + *metron*, meter]. Device to aid in the reading of thermometers

cathexis (kath-eks'is) [G. *kathexis*, retention]. The emotional or mental energy imparted to an idea.

cath'odal [G. *kathodos*, downward path]. Pert. to the cathode

cath'ode [G. *kathodos*, from *kata*, down, + *odos*, way]. The negative pole, as opposed to the anode, or positive pole.

c., dark space. The nonluminescent region which envelops and follows the outline of the cathode in a discharge tube at moderately low pressures.

c. stream. Negatively charged electrons, sent out as particles from the cathode in discharges through the vacuum. *See* **cathode rays**.
cathod'ic. Pert. to a cathode.
cathod'ograph [G. *kathodos*, downward path, + *graphein*, to write]. An x-ray picture; skiagram.
catholicon (ka-thol'i-kōn) [G. *katholikos*, universal]. A remedy for all diseases; a panacea.
cation (kat'i-on) [G. *katiōn*, descending]. The name given by Faraday to the element or elements of an electrolyte in electrochemical decomposition appearing at the negative pole, or cathode.
cattin (kat'in). Surgical knife with double edges.
catochus (kat'o-kus). 1. Coma vigil, cataplexy 2 A trance; deathlike.
cathotric (kat-op'trik) [G. *katoptikos*, reflecting]. Pert. to reflected light or mirrors.
cathotrophobia (kat-op-trō-fō'bī-ā) [G. *katopteron*, mirror, + *phobos*, fear]. Morbid fear of mirrors or of breaking them. [purgative.
cathoteric (kat-o-ter'ik). A cathartic or **cat scratch disease**. Nonbacterial regional lymphadenitis. Unknown etiology but often follows cat scratches.
cat's-eye pupil. A slitlike pupil.
cat's purr. Purring bruit due to mitral disease.
catulotic (kat-ul-ot'ik) [G. *kata*, down, + *oulē*, scar]. Tending to cause cicatrization.
cat unit. Amount of a drug, per Kg of animal's weight, required to kill it, when injected intravenously.
cau'da [L. tail]. 1 Tail. The lower part of an anatomical structure 2 Corcyx 3 The penis 4 Insertion of a muscle 5 The clitoris. [less The Vermis
c. cerebelli. Cerebellar taillike process.
c. coccygea. The coccyx. [cord
c. equina. Termination of spinal
c. striati. Taillike post extremity of corpus striatum
caudad (kaw'dad) [+ *ad*, toward] Toward the tail, in a post direction
caudal (kaw'dal) [L. *caudalis*, pert. to a tail] 1 Pert. to any tail-like structure 2 Inferior in position
caudate (kaw'dāt) [L. *caudātus*, having a tail]. Possessing a tail
caudation (kaw-da'shun) [L. *cauda*, tail]. 1 A lengthened or elongated clitoris. 2 Having a tail or tails.
caudle (kaw'dl) [Fr. *caudel*, warm] A nutritious food made of egg, gruel, sherry, and flavoring.
caul (kawl) [Fr. *cale*, a small cap]. 1. The great omentum 2 Membranes or portions of the amnion covering head of fetus at birth.
cauliflower [L. *caulis*, cabbage, + *flos*, florist, flower]. Av. SERVING 125 Gm Pro 2.3, Fat 0.6, Carbo. 3.9 per serving. Ca 0.123, Mg 0.014, K 0.222, Na 0.068, P 0.061, Cl 0.050, S 0.086, Fe 0.0006 per serving Vit A+, B+, C+, G+++
A base forming food. Alkaline reserve 53 cc. per 100 Gm., 17.5 per 100 cal. ACTION Laxative
cauliflower ear. Malformation of auricle due to injury, as seen in boxers
c. excrescence. Condyloma of the cervix uteri.
cauloplegia (kaw-lo-plē'jī-ā) [G. *kaulos*, stalk, + *plēgē*, stroke]. Paralysis of the penis
cauma (kaw'mā) [G. *kauma*, burn]. An inflammatory fever; pyrexia, heat, fever.

c. enteritis. An acute intestinal catarrh.
caumesthesia (kaw-mes-the'zī-ā) [+ *aisthēsis*, sensation]. A sense of heat without cause of same.
causalgia (kaw-sal'jī-ā) [G. *kausis*, heat, + *algos*, pain]. Intense burning pain with a glossy skin.
cause. That which induces or brings about a particular condition, result, or effect.
c. constitutional. One that is inherent within the body
c. predisposing. One which favors but does not directly induce an effect.
c. primary. The immediate or precipitating cause
causoma (kaw-so'mā) [+ *-ōma*, swelling] A burning, an inflammation of a burning nature
caustic (kaw'stik) [G. *kaustikos*, capable of burning 1 Corrosive and burning. 2 An agent that will destroy living tissue Ex silver nitrate, potassium hydroxide, nitric acid.
c. potash. Potassium hydroxide, q.v.
c. soda. Sodium hydroxide, q.v.
cauterant (kaw'ter-ant) [G. *kautēr*, a burner] 1 Escharotic, caustic 2 A caustic agent
cauterization (kaw-ter-i-za'shun) [G. *kautēriazein*, to burn]. Burning a part, cautery
RS *byssocautus*, *chemicocautery*, *electrocautery*, *galvanocautery*, *moxibustion*, *ustion*, *zestocautus*.
c., actual. By hot iron. *Atmocautus*. By steam
c., chemical. Cautery by electrolysis. By chemical means
c., electrical. By platinum wires heated to incandescence by an electric current, *galvanocautery*
c., potential. By applying a corrosive substance
cauterize (kaw'ter-iz) [G. *kautēriazein*, to burn]. To burn with a cautery, or to apply one.
caut'erodyne [+ *dynamis*, power]. A radio knife for bloodless surgery
It is a small pencillike tube with a wire coil in place of a blade. It seals minor blood vessels. Used for cancer and gopher operations
cautery (kaw'ter-i) [G. *kautēr*, a burner]. A means of destroying tissue by electricity, heat, or corrosive chemicals.
Used in potentially infected wounds; to destroy exuberant granulations (proud flesh) or some neoplasms. Thermocautery consists of red hot or white hot object, usually piece of wire or pointed metallic instrument, heated in a flame or with electricity (electrocautery, galvanocautery)
cava (ka'vah) [L. hollow] 1 Vena cava 2 The vulva 3 Any cavity
ca'val. Pert. to the vena cava
cav'alry bone. Rider's bone, bony deposit in the adductor muscles of the thigh.
cavascop (kav'ā-skōp) [L. *cavum*, hollow, + *G. skopein*, to examine]. Instrument for examining cavities.
cavern'loquy [L. *caverna*, a hollow, + *loqui*, to speak]. Low pitched sound over pulmonary structures.
cavern'itis [+ *G. -itis*, inflammation]. Inflammation of the corpus cavernosum penis.
cavern'oma [+ *G. -ōma*, tumor]. A cavernous angioma.
cavernos'itis [L. *cavernosus*, having hollows, + *G. -itis*, inflammation]. Inflammation of the corpora cavernosa.

cavernosum (kāv-ēr-nō'sūm). One of 2 erectile columns of the dorsum of the penis or clitoris. SYN *corpus cavernosum*.

cavernous (kāv-ēr-nūs) [L. *caverna*, a hollow] Containing hollow spaces.

c. angioloma. A vascular tumor with many large spaces

c. body. Corpus cavernosum

c. rôle. Bubbling hollow sound.

c. resonance. Amphoric resonance

c. respiration. Hollow sound heard when there is a lung cavity.

c. rhoncus. A cavernous râle

c. sinus. Blood sinus on body of sphenoid bone

c. tumor. An angioloma.

caviar (Turkish *kāvyār*, salted roe). Av. SERVING 15 Gm. Pro. 4.5, Fat 3.0, Carbo 1.1 per serving. Ca 0.137, Mg 0.022, K 0.422, Na 0.874, P 0.176, Cl 1.819.

cav'itary [L. *cavitas*, hollow]. 1. Hollow, having or forming cavities. 2. Any nematode worm

cavita'tion [L. *cavitas*, a cavity]. Formation of a cavity EX Formation of lung cavity in tuberculosis

cavitis (ka-vi'tis) [L. *cavum*, hollow, + G. -itis, inflammation]. Inflammation of a vena cava.

cavity (kav'i-ti) [L. *cavitas*, hollow]. A hollow space, such as a body organ or the hole in a carious tooth

c., abdominal. The cavity of the peritoneum bet the diaphragm and pelvis

c., amniotic. That within the amnion

c., buccal. The mouth.

c., cotyloid. The acetabulum.

c., glenoid. Cavity in head of scapula, which holds the humerus

c., pelvic. One containing the bladder and rectum and the uterus in the female

c., pulp. One in a tooth containing the dental pulp and nerve termination

c., Rosenmuller's. One on either side of openings of eustachian tube

c., splanchic. One of three, the cranial, thoracic, and abdominal, including the pelvic cavity.

c., visceral. The splanchic cavity.

cavity, words pert. to: abdominal, achore-sis, acrocele, arachnoid, atresia, body, camera, "cav-" words, celom, celoma, celozoic, ctenosis, cisterna, falling drop, fenestra, introitus, locular, -us, sinus, splanchic, thoracic, venter.

ca'vum [L. a hollow] A cavity or a hole

c. septi pellucidi. BNA Cavity of the 5th ventricle of the brain

c. tympani. Middle ear cavity.

ca'vus [L. hollow] Condition of exaggerated height of arch of foot. SYN. *talipes cavus*.

cavus. A hollow or cavity.

c. talipes. SEE *talipes cavus*

Cayenne pepper (ki-ên', kâ-ên'). Capsicum, q.v.

Cazenave's lupus (kahn-nāv'). 1. Lupus erythematosus 2. Pemphigus foliaceus

cc. Abbr. Cubic centimeter, about 16 minims.

CCl₄, CHO. Chloral.

c.cm. Abbr. for cubic centimeter.

Cd. Symb. of cadmium.

Ce. Symb. of cerium.

ceasmic (se-as'mik) [G. *keasma*, chip]. Pert. to an abnormal cleavage of parts or to a fissure.

ceblone (se'bl-on). SEE: *cevitamic acid*.

cecal (se'kal) [L. *caecalis*, pert. to blindness]. 1. Pert. to cecum. 2. Blind, terminating in a closed extremity.

cecectomy (se-sek'to-mi) [L. *caecum*, blindness, caecum, + G. *ektomē*, excision]. Removing part of or incision into the cecum

NP Preparation for appendectomy slightly modified.

cectis (se-si'tis) [" + G. -itis, inflammation] Inflammation of the cecum.

cecoileostomy (se-ko-il-e-os'to-mi) [" + ileum, ileum, + G. *stoma*, opening]. Making an opening through the abdominal wall into the ileum at the ileocecal valve.

cecopexy (se'ko-peks-i) [" + G. *pēxis*, fixation]. Surgical fixation of the cecum to the abdominal wall

cecoplica'tion [" + *plica*, fold] Reduction of a dilated cecum by making a fold in its wall

cecop'tosis (se-kop-to'sis) [" + G. *ptōsis*, a drooping]. Falling displacement of the cecum.

cecosigmoidostomy (se-ko-sig-moid-os'to-mi) [" + G. *sigmoidē*, shaped like letter S, + *stoma*, opening]. Formation of a communication bet the cecum and sigmoid

cecos'tomy [" + G. *stoma*, opening]. Surgical formation of a cecal fistula or artificial anus.

ceco'tomy [" + G. *tomē*, a cutting]. Cutting into the cecum.

cecum (se'kum) [L. *caecum*]. A blind pouch at the junction of the small intestines with the ascending colon, and to which the ileum is attached.

It is slightly below the ileocecal valve and is about 2½ inches (6.3 cm.) deep. The ileocecal valve bet prevents the backward flow of feces into the intestines. The vermiform appendix is attached to the lower part of the cecum. SEE "cec-" words.

celarium (se-la'ri-um) [G. *kōilos*, a hollow] The epithelium of the celom.

-cele [G. *hernia*, tumor]. Suffix A swelling.

celectome (se-lek'tōm) [G. *kēlē*, tumor, + *tomē*, a cutting]. Instrument for obtaining a piece of tissue from a tumor for examination

celery [Fr. *celeri*, from G. *selinon*, parsley] Av. SERVING (raw) 40 Gm. Pro. 0.4, Fat trace, Carbo 1.3. FUEL VALUE: 100 Gm.—18 cal. Very heavy in cellulose. VITAMINS A— to +, B++ , C++ . Ca 0.078, Mg 0.014, K 0.316, Na 0.084, P 0.037, Cl 0.156, S 0.022, Fe 0.0005. Copper, 0.1 mg. per Kg. of fresh celery. A base forming food. Alkalinity, 7.8 cc units per 100 Gm 42 cc per 100 cal. ACTION. It is a stomach and heart stimulant, and is considered to be a nervine, a carminative and a diuretic

celiac (se'li-ak) [G. *kōilia*, belly]. Rel. to the abdominal regions

c. artery. The first branch of the abdominal aorta Branches supply the stomach, liver, spleen, duodenum, and pancreas.

c. axis. Same as *celiac artery*.

c. disease. Dilatation of the small and large intestines causing intestinal indigestion, and occurring in children and infants, usually bet. the 9th and 18th months; sometimes bet. the 3rd and 6th years

SYM First Type Porridgelike stools, large in volume Second Type Diarrhea; foul, large, frothy and acid stools.

DIER: No carbohydrates, esp. sugar, starches, potatoes, flour, grains, pastries, or puddings. No milk, fats, or cod-liver oil during first days of treatment. Ripe bananas, protein milk. Later frequent

feedings, meat juice. *Meal for Older Children:* Cottage cheese, egg white, fruits, orange juice, one vegetable at a time but no potatoes. Vitamin D, as viosterol. Maximum diet after 4 to 8 weeks 80-100 calories per lb. of food Diet period. One year.

Bread and cereals may be tried in small amounts 3 times a day, one at a time, 3 months apart, but they must be dropped at first signs of relapse.

c. plexus. Sympathetic plexus lying near the origin of celiac artery. See *plexuses*.

cellagra (se-ll-ag'rā) [+ *agra*, seizure]. Gouty affection of any abdominal organ

celial'gia [+ *algos*, pain] Abdominal pain

celiectasia (se-ll-ek-tā'si-ā) [+ *ektasis*, extension] Distention of the abdomen

celiectomy (se-ll-ek'to-mī) [+ *ektomē*, excision]. Removal of an abdominal organ

celiocentesis (se-ll-i-o-sen-te'sis) [+ *kentēsis*, puncture]. Puncture of the abdomen SYN *paracentesis*

celiolapotomy (se'll-i-o-kol-pot'o-mī) [+ *kolpos*, vagina, + *tomē*, incision] Vaginal opening into the abdomen for removing the products of ectopic pregnancy or of a tumor

celioelytrotomy (se-ll-i-o-el-i-trot'o-mī) [+ *elytron*, sheath, vagina, + *tomē*, incision]. Opening through the vagina into the abdomen

celioenterotomy (se-ll-i-o-en-ter-ot'o-mī) [+ *enteron*, intestine, + *tomē*, incision] Incision in the abdominal wall to gain access to the abdomen

celiogastrostomy (se-ll-i-o-gas-tros'to-mī) [+ *gaster*, stomach, + *stoma*, opening] Incision in the abdominal wall for making a gastric fistula

celiogastrofomy (se-l-i-o-gas-trot'o-mī) [+ *tomē*, incision] Incision of stomach with abdominal section

celiohysterectomy (se'll-i-o-his-ter-ek'to-mī) [+ *ysterā*, uterus, + *ektomē*, excision]. Removal of uterus through an abdominal incision

celiohystero-ootheectomy (se-ll-i-o-his-ter-o-o-the-sek'to-mī) [+ *oon*, ovum, + *thēkē*, box, + *ektomē*, excision] Removal of the uterus and the ovaries through an abdominal incision

celiohystero-salpingo-ootheectomy (se-ll-i-o-his-ter-o-sal-pin-go-o-the-sek'to-mī) [+ *salpīgx*, tube, + *oon*, ovum, + *thēkē*, box, + *ektomē*, excision] Removal of the uterus, fallopian tubes, and ovaries through an abdominal incision

celiohysterotomy [+ *tomē*, incision] Opening into the uterus through an abdominal incision

celioma (se-ll-i-o'nā) [+ *-ōma*, tumor] An abdominal tumor

celiomyal'gia [+ *mys*, muscle, + *algos*, pain] Rheumatic pain in muscles of the abdomen

celiomyomectomy (se-ll-i-o-mī-o-mek'to-mī) [+ *-ōma*, tumor, + *ektomē*, excision] Removal of fibroid tumors through an abdominal incision

celiomyotomy (se-ll-i-o-mī-o-mot'o-mī) [+ *tomē*, incision]. Incision of muscles of abdomen

celiomyositis (se-ll-i-o-mī-o-si'tis) [+ *-itis*, inflammation]. Inflammation of muscles of the abdomen.

celioncus (se-ll-i-on'kus) [+ *ogkos*, tumor] An abdominal tumor.

celioparacentesis (se-ll-i-o-par-ā-sen-te'sis) [+ *para*, beside, + *kentēsis*, puncture]. Puncture of the abdomen.

celiopathy (se-ll-op'ath-i) [+ *pathos*, disease]. Any disease of the abdomen.

cellopyosis (se-ll-i-o-pi-o'sis) [+ *pyōsis*, suppuration]. Purulent peritonitis

celiorrhaphy (se-ll-i-or'af-i) [+ *raphē*, suture]. Suture of wound in the abdominal wall

celiosalpingectomy (se-ll-i-o-sal-pin-jek'to-mī) [+ *salpīgx*, tube, + *ektomē*, excision] Removal of the fallopian tubes through an abdominal incision

celiosalpingotomy (se-ll-i-o-sal-pin-got'o-mī) [+ *tomē*, incision] Opening of the fallopian tube through an abdominal incision

celioscope (se'll-i-o-skōp) [+ *skopein*, to examine] Device for illumination of abdominal cavity

celioscopy (se-ll-i-os'kō-pi) [+ *skopein*, to examine] Use of the celioscope

celiotomy (se-ll-i-ot'o-mī) [+ *tomē*, incision] Surgical incision into the abdominal cavity

c., vaginal. Entering the abdomen through the vagina

celitis (se-li'tis) [+ *-itis*, inflammation] Peritonitis, abdominal inflammation

cell [L *cella*, a small chamber]. 1 A small, enclosed or partly enclosed cavity, such as an air cell 2 A mass of protoplasm containing a nucleus or nuclear material It is the unit of structure of all animals and plants and is the physical basis of all life processes

Cells and the products of cells comprise all the tissues of the body All functional activities of the body are carried on by cells The structure and form of a cell is closely correlated with its functioning Cells arise only from preexisting cells, new cells arising by cell division (mitosis or amitosis) Growth and development result from the increase in numbers of cells and the differentiation of cells into different types of tissues Reproduction is accomplished by specialized germ cells, the spermatozoa and ova, which contain in their nuclei the genes or determiners for hereditary characteristics

Cell inclusions or paraplasmic bodies include (1) *food substances* fat droplets, glycogen and protein granules (2) *chromophil substance* (Nissl bodies) (3) *pigment granules* (melanin) (4) *crystals* of various substances (5) *secretory granules*

Also present in the cytoplasm are submicroscopic bodies called *microsomes* demonstrated by differential centrifugation Their exact nature is unknown

Structure A typical cell, when killed, fixed and stained, exhibits a centrally located *nucleus* surrounded by *cytoplasm* (a) *Nucleus* The nucleus possesses a *nuclear membrane* which encloses a clear *nuclear sap* or *karyoplasm* within which are twisted filaments, *chromonemata*, which contain *chromatin*, a material which stains densely

CELL

From testicle of salamander showing: A, Nucleus with chromatin network. B, Centrosome. C, Centriole.

with basic stains. A network of fine filaments, the *linin net*, supports the chromonemata. Usually present are one or more densely staining bodies, the nucleoli. (b) *Cytoplasm*. This includes the cell protoplasm lying outside the nucleus. Its outermost layer constitutes the *cell membrane* which forms the limiting membrane of the cell. Within the ground substance of the cytoplasm are found cell *organooids*, living components of the cell, and *inclusions* or *paraplastic substances* which are nonliving. Organooids present in most cells include (1) *chondriosomes* or *mitochondria*, (2) Golgi apparatus, (3) *cell center* or *attraction sphere*, (4) *fibrils* (5) *plastids*, common in plant cells but usually lacking in animal cells.

A cell may produce other cells, and it has the power of exercising the vital processes of life. Cells of one tissue differ from those of other tissues, depending upon the function they perform. Those of one tissue in man are very similar to those of corresponding tissues in all mammals and in fish. The protoplasm of the cell without its nucleus is known as *cytoplasm*.

RS *amitosis*, *karyokinesis*, *mitosis*.

c., *adipose*. A fat cell

c., *blood*. Erythrocyte or leukocyte.

c., *body*. Part of the nerve cell or neuron which contains the cell nucleus and cytoplasm. See *nerve*

c., *daughter*. One from a parent cell

c., *endothelial*. A flat c. making up the lining membranes of vessels

c., *epithelial*. One forming epithelial surfaces of membranes and skin

c., *giant*. Large multinucleated cells found in bone marrow, a *megakaryocyte*. They are thought to give rise to blood platelets

c., *glia*. Spider or mossy cell in neuroglia tissue. SYN *neuroglia c*

c., *goblet*. Epithelial c. distended with mucus

c., *interstitial*, c., *Leydig's*. One of many found in connective tissue of the seminiferous tubules of the testes, and such tissues of the ovary which account for their internal secretion

c., *Kupffer's*. The reticuloendothelial cells which line the sinusoids of the liver

c., *mother*. One which gives rise to 2 or more daughter cells

c., *mucous*. (1) A cell which secretes mucus found in mucus secreting glands. (2) A goblet cell

c., *neuroglia*. Non-nervous cells found in the central nervous system and the retina of the eye. Includes astrocytes, oligodendrocytes, and microglia

c., *plasma*. A cell thought to be derived from large lymphocytes. They are found in serous membranes, lymphatic tissues and loose connective tissue

c., *prickle*. A cell possessing spine-like protoplasmic processes which connect with similar processes of adjoining cells. Found in the stratum germinativum of the epidermis

c., *pus*. Pyocyte, pus corpuscle.

c., *pyramidal*. A nerve cell of the cerebral cortex

c., *sickle*. An abnormal erythrocyte in anemia.

c., *spider*. An astrocyte.

c., *squamous*. Flat, scalelike, epithelial cell

Cellano factor (sél'an-ô fâkt'ôr). One rarely found lacking in the blood, 89 8

per cent have it. Named for woman by that name who did not have it

cellase (sél'as). An enzyme acting upon cellulose.

cell-color ratio. The product of dividing the percentage of hemoglobin into the number of red blood cells in a cc.

cellophane (sél'ô-fân). Thin, transparent, waterproof sheet of viscose.

Used as a wound dressing because it does not crack, is singularly free of infection, and wound can be seen without its removal.

cell-organ. A part of certain cells which may perform digestive functions. Ex: *cytosome*, *plastid*.

cel'lula (pl. *cellulae*) [L little cell]. 1. A minute cell 2. A small compartment.

cel'lular. 1 Pert to, composed of, or derived from cells. 2 Areolar; having interstices

cellulicidal (sél-u-lî-sî'dal) [' + *caedere*, to kill] Destructive to cells

cellulif'ugal [' + *fugere*, to flee]. Extending or moving away from a cell.

cellulin (sél'u-lîn) A carbohydrate forming the basis of vegetable fiber. SYN: *cellulose*.

cellulipetal (sél-u-lîp'et-al) [L. *cellula*, little cell, + *petere*, to seek]. Extending or moving toward a cell

cellulitis (sél-u-lî'tis) [' + G -itis, inflammation] Inflammation of cellular or connective tissue, spreading as in erysipelas

A deep abscess, in pushing its way to the surface, may result in the formation of a *sinus* leading to an exit on the surface. If the inflammatory fluids are forced into the tissues, rather than being discharged on the surface, and inflammation of tissues results, the condition is known as *cellulitis* [pus]

c., *diffuse*. That accompanied with c., *pelvic*. Parametritis, inflammation of the parametrium * Occurs in puerperal fever, or septic conditions of the uterus and appendages

cellulofib'rous [' + *fibra*, fiber]. Both cellular and fibrous

celluloneuritis (sél'u-lo-nû-rî'tis) [' + G. *neuron*, nerve, + -itis, inflammation]. Inflammation of nerve cells

c., *acute anterior*. Polynneuritis and Landry's paralysis

cellulose (sél'u-los) [L. *cellula*, little cell]. A fibrous form of carbohydrate constituting the supporting framework of plants, plant fiber

It stimulates peristalsis and aids in intestinal elimination. It is not ordinarily chemically changed or absorbed in digestion, remaining a polysaccharide.

IND Atonic constipation due to lax muscular tone

CONTRA Cellulose foods should not be eaten in acute intestinal troubles without the advice of a physician.

SEE *cellulin*.

c. or *fiber containing foods*. Apples, apricots, asparagus, beans, beets, bran flakes, broccoli, cabbage, celery, mushrooms, oatmeal, onions, oranges, parsnips, prunes, spinach, turnips, wheat flakes whole grains, whole wheat bread.

c., *high diet*. High residue diet, q.v.

cellulotox'ic [' + G. *toxikon*, poison]. 1. Poisonous to cells 2. Caused by cell toxins.

cel'oglass. Window glass substitute for transmitting antirachitic rays of sunlight.

celol'ogy [G. *kêlê*, hernia, + *logos*, study]. The surgical study of hernias.

celom, celoma (se-'lom, se-lo'mä) [G. *kōlōma*, a hollow]. The body cavity, esp. of the embryo The celom, *q. v.*

celonychia (se-lo-nik'i-ä) [G. *kōlos*, hollow, + *onyx*, *onych-*, nail]. Fingernails with concave outer surface.

celoschisis (se-los'ki-sis) [G. *kōlia*, belly, + *schisis*, fissure]. Congenital fissure of the abdominal wall.

celoscope (se-'los-kōp) [G. *kōilos*, hollow, + *skopein*, to examine]. Device for throwing light into a cavity

celosomia (se-lo-so'mi-ä) [G. *kēlē*, hernia, + *sōma*, body]. Congenital protrusion of viscera.

celotomy (se-'lot-o-mi) [' + *tomē*, incision]. A cutting operation for strangulated hernia

celozo'ic [G. *kōlia*, belly, + *zōon*, animal]. Inhabiting any cavity of the body, such as parasitic protozoa

Celsius scale. The reverse of the centigrade scale, a degree Celsius being 1.8 degree Fahrenheit, the boiling point, F. 212°, being zero C, the freezing point, F. 32°, being 100° C

cementi'tis [L. *caementum*, cement, + G. *-itis*, inflammation]. Inflammation of the dental cementum.

cementoblast (se-men'to-blast) [' + G. *blastos*, germ]. A cell of the inner layer of the dental sac of a developing tooth They deposit cementum *q. v.* upon the dentine of the root

cementocla'sia [' + G. *klasis*, breaking]. Decay of the cementum of a tooth root.

cemento'ma [' + G. *-ōma*, tumor]. A tumor having its origin in the substantia ossea.

cementum. Thin layer of modified bone formed by cementoblasts and deposited upon the dentine of the root of a tooth, the substantia ossea. To it is attached the alveolar periosteum or periodental membrane which binds the tooth to its socket

cenesthesia, cenesthesia (sen-es-the'z-l-ä, -sis) [G. *koinos*, common, + *aisthesis*, feeling] 1 A hysterical condition resulting in loss of the consciousness of identity 2 The sense of pleasurable or painful existence in states of exaltation or depression. 3. The sensing of the normal functioning of the body organs.

cenestho'sic, cenesthet'ic [' + *aisthesis*, feeling] Pert to cenesthesia

cenesthopathia (sen-es-tho-path'i-ä) [' + + *pathos*, disease] (1) Malaise or a general feeling of lack of well-being in illness

cenopho'bia [G. *kenos*, empty, + *phobos*, fear]. Morbid fear of open spaces and of crowds Syn *agoraphobia*.

cenopsyche (sen-o-si'kik) [G. *kainos*, new, + *psychē*, mind] Only recently appearing in mental development

cenosis (se-no'sis) [G. *kenos*, empty, + *-ōsis*, infection] 1. Evacuation 2. Inanition

cenosite (se-'no-sit) [G. *koinos*, common, + *sitos*, food]. A microorganism not depending for life upon its host, but parasitic in character

cenotic (se-not'ik) [G. *kenos*, empty]. 1. Purgative; drastic 2 Pert to cenosis.

cenotophobia (se-no-to-'fo'bi-ä) [G. *kainos*, new, + *phobos*, fear] Morbid aversion to new things and new ideas

cenotype (sen'o-tip) [G. *koinos*, common, + *typos*, a type]. An original type

cen'sor [L. *censere*, to judge] Psy. A psychic inhibition that prevents abhorrent unconscious thoughts or impulses from seeking objective expression unless in a form unrecognized by consciousness.

center (sen'ter) [G. *kentron*, middle]. 1. Middle point of a body. 2. Nerve cells governing a function

c., accelerating. One in the medulla accelerating to the heart.

c., arm. One in cerebral cortex controlling arm movements

c., association. Center controlling associated movements

c., auditory. One for hearing, in the gyri in sylvian fissure

c., cardioinhibitory. Medullary center which slows heart action.

c., ciliospinal. One which dilates the pupils

c., deglutition. One which controls swallowing

c., diabetic. One in ant. half of floor of fourth ventricle, post part; glycosuria excited by its puncture.

c., epiloic. Ossification center of mastoid process

c., erection. Found in lumbar region of spinal cord, controlled from oblongata

c., gustatory. One in cerebrum which controls taste

c., leg. One controlling leg movements, located in ascending frontal convolution

c., motor cortical. Nerve center controlling voluntary movement.

c., nerve. One of many in cerebrospinal or ganglionic nervous systems originating or controlling vital function.

c., ossification. Spot where ossification begins in bones

c., reflex. Cerebral center transforming sensory impressions into efferent motor ones

c., respiratory. Medullary center in fourth ventricle controlling breathing

c., spasm. At junction of medulla and pons, injury causes convulsions

c., speech. One for articulate speech memories, located in post. part of third left frontal convolution

c., sweat. Medullary center, subsidiary centers in spinal cord. Controls sweating

c., temperature. One controlling body temperature.

c., trophic. One of many located in cerebrospinal and sympathetic systems presiding over nutrition

c., visual. In occipital lobe. Controls sight

c., word. Cerebral center controlling perception of word meanings.

centesimal (sen-te'sim-al) [L. *centesimus*, hundredth] Divided into or rel to hundredths

centesis (sen-te'sis) [G. *kentēsis*, puncture] Puncture of a cavity

centigrade (sen-ti-grād) [L. *centum*, a hundred, + *gradus*, a step] A thermometer divided into 100° bet. the boiling and freezing point, which is 0 degree. See *thermometer*.

cent'igram [' + G. *gramma*, a small weight] A measure of weight; the hundredth part of a gram; 0.15432 gr. See *metric measures*.

centiliter (sen-ti-le-ter) [' + G. *litra*, measure of wt.]. One-hundredth part of a liter; 10 cc

centimeter (sen-ti-me-ter) [' + G. *metron*, measure] One-hundredth part of a meter; 2/5 of a linear inch (0.3937).

centinormal (sen-ti-nor'māl) [' + *norma*, rule]. One-hundredth part of the normal, as the strength of a solution.

centrad (sen'trad) [G. *kentron*, center, + L. *ad*, toward]. Toward the center.

central (sen'tral). Situated at, or rel. to, a center.

c. bodies. Attraction center of a cell. *SYN. centrosome.*

c. nervous system. Brain and spinal cord, including their nerves and end organs, controlling voluntary acts. Also called cerebrospinal system, and voluntary nervous system.

Composed of nerve tissue which forms the brain, spinal cord and the nerves from both. Tissue is made up of gray and white matter. Gray matter is com-

posed of cells of nervous tissue, while the white matter is composed of nerve fibers from the cells. White matter in the brain and cord carries messages or impulses from the body, or outside world, to the cells or gray matter.

GENERAL FUNCTION OF CENTRAL NERVOUS SYSTEM. Includes (1) Parts of the brain governing consciousness and mental activities; (2) parts of brain, spinal cord and their sensory and motor nerve fibers controlling skeletal muscles, and (3) end-organs of the body-wall. *SEE: autonomic, parasympathetic, and sympathetic nervous systems.*

centrophose (sen'tra-fōz) [*G. kentron, center, + a-, priv. + phōs, light*]. A subjective sensation of a dark spot originating in the optic brain centers. *SEE: centrophose, chromophose.*

cen'tre. Center.

centric (sen'trik). Pert. to a center.

centriciput (sen'tris'i-put) [*G. kentron, center, + L. caput, head*]. The central part of upper surface of skull, bet. the occiput and sinciput.

centrifugal (sen-trif'u-gal) [*" + L. fugere, to flee*]. Receding from the center.

SEE: arifugal, centrifuge.

c. force. The force which impels a thing, or parts of it, outward from the center of rotation.

centrifuge (sen'tri-fūj). A machine for the separation of heavier materials from lighter ones, through the employment of centrifugal force.* Used in testing for solids in urine, corpuscles in blood, etc.

THE SYMPATHETIC NERVOUS SYSTEM

EFFECT OF CENTRIFUGING

Rapidly whirling a tube of blood in a centrifuge hastens sedimentation, and separates corpuscles from plasma. Generally 12 cc. of blood yield 6 cc. of packed corpuscles and 6 cc. of supernatant plasma. (Highly schematic.)

centriole (sen'tri-ōl). A minute body found in the cell center or attraction sphere of a cell. Preceding mitosis it divides, forming two daughter centrioles (diplosomes). During mitosis the centrioles migrate to opposite poles of the cell and each form the center of the aster to which the spindle fibers are attached. *SEE: mitosis.*

centripetal (sen'trip'e-tal) [*G. kentron, center, + L. petere, to seek*]. Toward the center.

centrocinesia (sen'tro-sin-e'zi-ä) [*" + kinesis, movement*]. Movement excited from central stimulation.

centrocinectic (sen'tro-sin-et'ik). Exciting motor action; pert. to centrocinesia.

centrocyte (sen'tro-sīt) [G. *kentron*, center, + *kytos*, cell]. A cell having single and double, hematoxylin stainable, granules of varying size in its protoplasm.

centrodesmus (sen'tro-dez'mus) [" + *desmos*, a band]. The matter connecting the 2 centrosomes in a nucleus during mitosis.

centrolesithal (sen'tro-les'ith-al) [" + *lekithos*, yolk] "Term applied to ova with yolk centrally located"

centromere. A clear region on a chromosome which marks the junction of its two arms

centrophose (sēn'trō-fōz) [" + *phōs*, light]. A subjective sensation of a light spot having its origin in the optic brain centers. SEE *centrophose*.

centrosclerosis [" + *sklērosis*, hardening]. Ossification filling a bone cavity

centrosome [" + *sōma*, body]. The attraction center from which springs the reproductivity of a cell, central body. Structures that are generally double, associated with cell division and other cellular activities. SEE: *astrokinetic motions*, *centrosphere*.

centrosphere (sen'tro-sfēr) [" + *sphaera*, sphere]. The envelope encasing 2 centrosomes.

centrostaltic (sen'tro-stal'tik) [" + *stalsis*, contraction]. Pert to a center of motion.

centrotherapy [" + *therapeia*, therapy] Any local application that acts upon nerve centers

centrum (sen'trum) [L. from G. *kentron*, center]. 1 Any center, esp an anatomical one. 2 Body of a vertebra

c. semiova/le. A mass of white matter at center of each cerebral hemisphere

c. tendin'eum. Central tendon of the diaphragm

cephalad (sef'al-ad) [G. *kephalē*, head, + *L. ad*, toward] Toward the head.

cephalalgia (sef-ā-lal'jī-ā) [" + *algos*, pain]. Headache, pain in the head

A symptom of numerous diseases and disorders Commonly due to eyestrain and to gastrointestinal upset

cephalalgic (sef'al-al'jīk) [Of the nature of cephalalgia]

cephalea (sef'al-e'ā) [G. *kephalē*, head] Pain in the head, headache. SYN. *cephalalgia*.

cephaledema (sef-āl-ē-de'mā) [" + *oīdēma*, swelling]. Edema of the head

cephalemometer (sef-āl-ē-mom'et-er) [" + *metron*, measure] Apparatus for determining blood pressure in the head

cephalhematocele (sef'āl-hem-at'o-sēl) [" + *aima*, blood, + *kēlē*, tumor] A bloody tumor communicating with the dural sinuses

cephalhematoma (sef'al-he-mā-to'mā) [" + *aima*, blood, + *ōma*, swelling] A subcutaneous swelling containing blood, often found on the head of a baby several days after birth, when delivery was accompanied by use of forceps. It becomes absorbed within 2-3 months RS: *caput succedaneum*.

cephal'ic. 1. Cranial; pert. to the head 2 Superior in position

c. version. Turning the fetus during labor so head will present

cephalin (sef'al-in) [A substance resembling lecithin derived from brain substance of an animal. Uses Locally, to arrest hemorrhage]

cephalitis (sef'al-i'tis) [G. *kephalē*, head, + *-itis*, inflammation]. Inflammation of the brain and membranes.

cephalocele (sef'al-o-sēl) [" + *kēlē*, hernia]. Brain hernia.

cephalocentesis (sef-ā-lo-sen-te'sis) [" + *kentēsis*, puncture]. Surgical puncture of cranium.

cephalodynia (sef-al-o-din'ī-ā) [" + *odynē*, pain]. Pain in the head; headache, cephalalgia

cephalohemometer (sef-al-o-hem-om'et-er) [" + *aima*, blood, + *metron*, measure]. Instrument for determining changes in intracranial blood pressure.

cephalo'ma [" + *ōma*, tumor]. A soft carcinoma.

cephalomenia (sef-ā-lo-me'nī-ā) [" + *mēn*, month] Vicarious menstruation from the nose or head

cephalomeningitis (sef-ā-lo-men-in-jī'tis) [" + *menigz*, membrane, + *-itis*, inflammation] Inflammation of the cerebral meninges.

cephalometer (sef-al-om'et-er) [" + *metron*, measure]. Device for measuring the head

cephalometry (sef-al-om'e-trī). Measurement of the head

cephalomo'tor [G. *kephalē*, head, + *L. motus*, motion] Pert. to movements of the head

cephalone (sef'al-ōn) [" + *It. -one*, augmentative particle]. An idiot with a large head and sclerotic hyperplasia of the brain

cephalonia (sef-a-lo'nī-a). Macrocephaly with hypertrophy

cephalopathy (sef-al-op'ath-ī) [G. *kephalē*, head, + *pathos*, pain]. Any disease of the head or brain

cephaloplegia (sef-al-o-ple'jī-ā) [" + *plēgē* stroke]. Paralysis of muscles about head, or—less accurately—face

cephalorhachidian (sef'al-o-rā-kid'ī-an) [" + *rachis*, spine]. Pert. to the head and spine

cephaloscope (sef'al-o-skōp) [" + *skopein*, to examine]. Device for auscultation of the head

ceph'alostat [" + *statos*, placed]. Device for holding the head

cephalotome (sef'al-o-tōmī) [" + *tomē*, incision] Instrument for cutting the head of the fetus

cephalotomy (sef-āl-o-tō-mī) [" + *tomē*, cutting] Cutting the fetal head to facilitate delivery

cephalotractor (sef-al-o-trak'tor [" + *L. tractus*, drawing along]. Obstetrical forceps.

cephalotribe (sef'al-o-trib) [" + *tribein*, to crush]. Instrument for crushing head of fetus.

cephalotripsy (sef'al-o-trīp-sī) [" + *tribein*, to crush]. Crushing of fetal head in dystocia

cephalotrypsis (sef'al-o-trīp-e'sis) [" + *trypsis*, a boring]. Removing a bone disk from the skull. SYN. *trephination*.

ceptor (sep'tor) [L. *capere*, to take] A receptor

c., chemical. One which initiates chemical reactions in the body

c., contact. One which apprehends stimuli contributed by direct physical contact

c., distance. One which perceives stimuli at a distance, by aerial or etheral forces

cera (se'ra) [L. from G. *kēros*]. Wax.

c. alba. White wax

c. flava. Yellow wax

ceram'ics, dental [G. *keramos*, potters' clay]. The use of porcelain in dental work.

ceramodon'tia [" + *odous*, tooth]. Dental ceramics

ceramuria (ser-am-u'ri-ā) [' + *ouron*, urine]. Excessive phosphate excretion in urine. *Syn.* *phosphaturia*.

cerate (se'rat) [L. *ceratum*, from *cera*, wax]. Uncutuous substance of such consistency that it may be spread easily, at ordinary temperature, upon mudlin or similar material, with a spatula, and yet not so soft as to liquefy and run when applied to the skin, not often prescribed. Three cerates are official.

ceratocoele (ser-ā-to-se) [G. *keras*, horn, + *kēlē*, hernia]. Hernia of Descemet's membrane through outer layer of the cornea.

ceratofonusus (ser-ā-ton'o-sus) [G. *keras*, cornea, + *nosos*, disease]. A disease of the cornea.

ceratofome (se-ra'to-tōm) [' + *tomē*, incision]. A knife for division of the cornea.

ceratum (se-ra'tum) [L. waxed]. An uncutuous solid for application to the skin. *Syn.* *cerate*.

cercaria (ser-ka'ri-ā) [G. *kerkos*, tail]. A free-swimming stage in the development of a fluke or trematode. They develop within sporocysts or redia which parasitize snails or bivalve molluscs. The cercaria emerge from the mollusc and either (1) enter their final host directly or (2) encyst in an intermediate host which is eaten by the final host. In the latter case, the encysted tailless form is known as a *metacercaria*. *Ser.* *fluke, trematode*.

cerclage (sair-klazh') [Fr. an encircling]. Binding with metal wire of the ends of a fractured bone.

Cercomonas [G. *kerkos*, tail, + *monas*, unit]. A genus of free-living, oprozoid, flagellate protozoa. May be present in stale specimens of feces or urine; Non-pathogenic.

cercomoniasis. Infestation with *Cercomonas intestinalis* [like structure].

cercus (ser'kus) [G. *kerkos*, tail]. A hair-cerea *flexibilitas* (sēr-ē-ā fīeks-i-bil'tas) [L. *cera*, wax, + *flexibilitas*, flexibility].

Psy. A condition in which the limbs can be molded into any desired position.

ce'reals [L. *Cerealis*, pert. to Ceres, goddess of agriculture]. Edible grains.

COMP. The composition of all cereals is of a similar character. The carbohydrates are in greater proportion than are the other properties. They are mostly in the form of starch (70-80%, oatmeal 67%), and about 10-15% protein.

The albumin is radically different from animal albumin, being a protein requiring a much longer time for the enzymes to digest it. Less of it is absorbed. Nuclein is only in the bran or skin.

Vitamin B abundant in bran. Vitamin E is found in the germ. Sodium chloride small, potash and phosphorus predominate. Magnesium abundant, lime sufficient. Iron found in the germ and outer layer. Water low. The cellulose nearly all lost in grinding and bolting. The whole grain contains about 1% fat.

ABSORPTION OF CEREALS. Proteins, 85%; carbohydrates, 98%; fats, 90%.

Relative Value of the Organic Principles of Cereals

	Protein	Starch	Fats	Minerals
1st	Wheat	Rice	Oats	Barley
2nd	Barley	Corn	Corn	Oats
3rd	Rye	Wheat	Barley	Wheat
4th	Oats	Rye	Rye	Rye
5th	Corn	Oats	Wheat	Corn
6th	Rice	Barley	Rice	Rice

ACTION: Cereals do not seem to generate uric acid. Their reaction is due to lecthin and amylaceous bodies. They are completely and rapidly digested and incite glandular and muscular activity of the stomach and of the pancreatic secretion. They are primarily foods for intestinal digestion. They are antiseptic and prevent putrefaction, retard the absorption of lactose and facilitate the production of lactic acid. They are not irritating to the kidneys because of the absence of xanthic bases and low albumin content. *Siz.* *name of each*.

cerebellar (ser-e-bel'lar) [L. *dim cerebrum*, brain]. Pert. to the cerebellum.

cerebellifugal [' + *fugere*, to flee]. Extending or proceeding from the cerebellum.

cerebellipetal [' + *petere*, to seek]. Extending toward the cerebellum.

cerebellitis (ser-ē-bel-i-'tis) [' + G. *-itis*, inflammation]. Inflammation of the cerebellum.

cerebellospinal (ser-ē-bel-lo-spi'nal) [' + *spina*, a thorn]. Pert. to cerebellum and spinal cord.

cerebellum (ser-ē-bel'um) [L.] A portion of the brain forming the largest portion of the rhombencephalon. It lies dorsal to the pons and medulla oblongata, overhanging the latter. It consists of two lateral *cerebellar hemispheres* and a narrow medial portion, the *vermis*. It is connected to the brain stem by three pairs of fiber bundles, the inferior, middle and superior peduncles. The cerebellum is involved in synergic control of skeletal muscles and plays an important role in the coordination of voluntary muscular movements. It receives afferent impulses and discharges efferent impulse but does not serve as a reflex center in the usual sense, however it may intensify some reflexes and depress others.

cerebral (ser'ē-bral, ser-e'bral) [L. *cerebrum*, brain] Pert. to the cerebrum.

c. hemorrhage. The result of rupture of a sclerosed or diseased blood vessel in brain. Often associated with high blood pressure. *RS* *apoplexy, hemiplegia*.

c. cortex reflex (ser-ē-bral kor'tēks). Pupillary contraction of both eyes, when a bright object is brought within field of vision.

cerebralgia (ser-ē-bral'ji-ā) [' + G. *algos*, pain]. Cephalalgia, headache.

cerebrasthenia (ser'ē-bras-the'ni-ā) [' + *asthenia*, weakness]. Neurasthenia characterized by feelings of unreality, doubt and anxiety. *Syn.* *psychasthenia*.

cerebration (ser-ē-bra'shun) [L. *cerebratio*, brain activity]. Mental action of the brain.

cerebriform (sēr-ēb'ri-form). Resembling the brain in form or structure.

cerebrifugal (ser-ē-brif'u-gal) [L. *cerebrum*, brain, + *fugere*, to flee]. Away from the brain; pert. to efferent nerve fibers.

cerebrin (ser'ē-brin). One of a number of fatty nitrogenous principles from nerve tissue, containing phosphorus.

cerebripetal [L. *cerebrum*, brain, + *petere*, to seek]. Proceeding toward the cerebrum, as nerve fibers or impulses.

cerebritis [' + G. *-itis*, inflammation]. Inflammation of the brain, esp. the cerebrum.

cerebroid (ser'ē-broid) [' + G. *eidos*, resemblance]. Cerebriform; resembling the brain substance.

cerebrology (ser-ē-brol'ō-jī) [“ + *G. logos*, science]. Science of the brain.

cerebroma (ser-ē-bro'mā) [“ + *G. -ōma*, tumor]. Brain hernia, any mass in the brain.

cerebromalacia (ser-ē-bro-mal-a'sī-ā) [“ + *G. malakia*, softening]. Softening of the brain, esp. of the cerebrum.

cerebromeningitis (ser-e-bro'men-in-jī'tis) [“ + *G. meningis*, membrane, + *-itis*, inflammation]. Inflammation of the cerebrum and its membranes.

cerebrometer (ser-e-brom'et-er) [“ + *G. metron*, measure]. Device for registering cerebral impulses.

cerebroathy (ser-e-brop'ath-i) [“ + *G. pathos*, disease]. Any disease of the brain, esp. cerebrum.

cerebrophysiology (ser'e-bro-fiz-i-ol'ō-jī) [“ + *G. physis*, nature, + *logos*, study]. Physiology of the brain.

cerebropontile (ser-e-bro-pon'tīl) [“ + *pons*, *pont-*, bridge]. Pert. to the cerebrum and pons Varolii.

cerebropsychosis (ser-e-bro-sī-ko'sis) [“ + *psychosis*, life]. Any mental disorder due to cerebral lesion.

cer'e'brosclo'sis [“ + *G. sklērōsis*, hardening]. Hardening of the brain, esp. of the cerebrum.

cerebroscope (ser-e'bro-skōp) [“ + *G. skopein*, to examine]. Instrument for brain diagnosis.

cerebroscopic (ser-e-bro-skop'ik). Pert. to cerebroscopy.

cerebroscopy (ser-e-bros'ko-plī) [“ + *G. skopein*, to examine]. Diagnostic use of the ophthalmoscope as applied to the brain.

cerebrose (ser'e-brōs). $C_6H_{12}O_6$, a compound (brain sugar) derived from brain tissue.

cerebroside (ser'e-bro-sīd). A phosphorous-free class of compounds existing in the brain.

cerebrosis (ser-e-bro'sis) [*L. cerebrum*, brain, + *G. -ōsis*, infection]. Any brain disease. *SYN.* *encephalosis*.

cerebrospinal (ser'e-bro-spī'nal) [“ + *spina*, thorn]. Referring to the brain and spinal cord, as the cerebrospinal axis.

c. fever. Cerebrospinal meningitis. Inflammation of the meninges of the brain and spinal cord, sometimes called “spotted fever” because of rash on the body.

c. fluid. A water cushion protecting the brain and spinal cord from shock.

Shrinking or expanding of the cranial contents is usually quickly balanced by increase or decrease of this fluid. Possibly cell nourishment and the removal of waste are minor functions.

FORMATION OF The fluid is formed by the choroid plexuses of the lateral and third ventricles, that of the lateral ventricles passing through the foramen of Monro to the third, and through the aqueduct of Sylvius to the fourth ventricle. Here it may escape through the central foramen of Magendie, or the lateral foramen of Luschke into the *cisterna magna*, and so over the brain and cord surfaces, occupying the subarachnoid spaces. It is absorbed by the arachnoid villi and through the perineural lymph spaces of both brain and cord.

CHARACTERISTICS The fluid is watery, clear and colorless. Normally, the pressure of spinal fluid in a recumbent man (as determined by spinal puncture) is equivalent to 80-120 mm. of water; 200-300 mm. when sitting up. Amt: 100-150 cc. *Sp. Gr.* 1.006 to 1.008.

It shows from 1-6 cells per c.mm. (they should be counted at once and not remain in the fluid); not more than 0.03% protein (serum albumen and serum globulin, esp. the latter), and 0.05% of glucose, urea, and salts, varying with the site of puncture. Its concentration and alkaline reserve are similar to that of the blood. It does not clot in standing. Though the choroid plexuses can express certain blood constituents (e. g., iodides), changes in blood sugar, chloride, or urea will manifest themselves quickly in the fluid as well. Otherwise, changes take place largely subsequent to secretion. Turbidity suggests an excessive cell count, if due to red blood cells. Centrifugalization will show a red deposit.

INDICATIONS Formation of a web after a clear fluid has stood is characteristic of tuberculous meningitis (rarely other inflammatory reactions).

It usually shows a yellowish discoloration due to blood from the subarachnoid spaces (in contrast to blood from trauma of puncture), though for a few days the cells may not be entirely disintegrated. A similar appearance may result from a spinal block above the point of puncture, the yellow to tan or greenish fluid spontaneously coagulating due to an excessive albumen content.

If the blocking is inflammatory (leucic) the cell count is high, but even here 10% of albumen is almost diagnostic of block and if the count is low, even a smaller percentage is very suggestive of this so-called “From syndrome.”

Cell count increases, esp. in inflammatory conditions. In lethargic encephalitis there may be none, in poliomyelitis and polioencephalitis it is often 40-50. The same is true of tabes paretis and syphilitic meningitis. Other types of meningitis show greater reactions and an abscess may show enormous increases. Here polymorphonuclear cells are to be recognized by special straining methods. Occasionally, tumor and other cells may be discovered. *SEE* *circulation*.

c. nervous system. Nervous system of brain and spinal cord. *SYN.* *central nervous system*, *q. v.*

c. puncture. Surgical puncture, usually at the fourth lumbar interspace, to remove a specimen of the fluid for clinical examination.

RS cerebrospinal fluid, cisternal puncture, spinal puncture.

cerebrospī'nant. 1. Any agent affecting the brain and spinal cord. 2. Affecting the brain and spinal cord.

cerebrosuria (ser'e-bro-su'ri-ā) [*L. cerebrum*, brain, + *G. ouron*, urine]. Cerebrose in the urine.

cer'e'bro'tomy [“ + *G. tomē*, incision]. 1. Incision of the brain to evacuate an abscess. 2. Dissection of the brain.

cerebrum (ser'e-brum, ser-e'brum) [*L.*]. The largest part of the brain consisting of two hemispheres separated by a deep longitudinal fissure. They are united by three commissures, the corpus callosum and the anterior and posterior hippocampal commissures. The surface of each hemisphere is thrown into numerous fold or convolutions called *gyri* separated by furrows called *fissures* or *sulci*.

c. areas. On the basis of function, several areas have been identified and located. Among them are: (a) *Motor projection areas* which give rise to fibers carrying efferent impulses to effector organs, the skeletal muscles. (b) *Sen-*

MEDIAN SAGITTAL SECTION OF THE BRAIN.

sory projection areas which receive impulses from sense organs or sensory receptors by way of the brain stem. These include the somesthetic, (visual, auditory, gustatory, and olfactory areas), (c) association areas, which are concerned with the higher mental faculties.

c. basal ganglia. These are masses of gray matter deeply embedded within each hemisphere. They are the caudate, lentiform, and amygdaloid nuclei and the claustrum.

c. embryology. The cerebrum develops from the telencephalon, the most anterior portion of the prosencephalon or forebrain.

c. fissures and sulci. Lateral cerebral fissure (of Sylvius), central sulcus (of Rolando), parieto-occipital fissure, calcarine fissure, cingulate sulcus, collateral fissure, sulcus circularis, longitudinal cerebral fissure.

c. functions. The cerebrum is concerned with sensations or the interpretation of sensory impulses, and all voluntary muscular activities, it is the seat of consciousness and is the center of the higher mental faculties such as memory, learning, reasoning, judgment, intelligence, and the emotions.

c. gyri. Superior, middle, and inferior frontal gyri, anterior and posterior central gyri; superior, middle and inferior temporal gyri, cingulate, lingual, fusiform, and hippocampal gyri.

c. lobes. The principal lobes frontal, parietal, occipital, temporal, and central (insula or island of Reil).

c. structure. Each cerebral hemisphere consists of three primary portions, the rhinencephalon or olfactory lobe, the corpus striatum, and the pallidum or cerebral cortex. The cortex is a

layer of gray matter that covers the surface of each hemisphere. The part covering the rhinencephalon and phylogenetically the oldest is called archipallidum, the more recent and larger non-olfactory cortex is called neopallidum.

c. ventricles. Within the cerebrum are two cavities, the lateral ventricles (Nos. 1 & 2) and the rostral portion of the third ventricle.

c. vertebral. The cavity formed by the foramina of the vertebral column. Also called spinal canal, neural canal. It contains the spinal cord and its meninges.

c. Volkmann's. Small canals found in bone through which blood vessels pass from the periosteum. They connect with the blood vessels of Haversian canals or the marrow cavity.

c. white matter. The white matter or medullary substance of each hemisphere consists of three kinds of fibers (1) commissural fibers which pass from one hemisphere to the other, (2) projection fibers which convey impulses to and from the cortex, and (3) association fibers which connect various parts of the cortex within one hemisphere.

c. zygomatico-orbital. A canal in the zygomatic or malar bone that transmits branches of the zygomatic nerve and the lacrimal artery.

ceroma (se-ro'mă) [L. *cera*, wax, + -ōma, mass] A waxy tumor that has undergone amyloid degeneration.

ce'roplasty [L. *cera*, wax, + *plassein*, to mold] Manufacture of anatomical models and pathological specimens in wax.

cerosis (se-ro'sis) [L. *cera*, wax, + -ōsis, infection]. Morbid condition of membranes resembling waxlike scales.

cer'tifiable. Pert. to infectious diseases which must be reported to the health authorities.

cerumen (se-rü'men) [L *cera*, wax]. The waxlike, soft brown secretion found in the external canal of the ear, inspissated, dried earwax.

ceru'minal. Pert to the cerumen.

ceru'mino'sis [L *cera*, wax, + G. -ōsis, infection] Excessive wax formation

ceru'minous. Pert to cerumen.

c. glands. Modified sweat glands in the skin lining the external auditory canal, which secrete a yellowish brown substance, cerumen

ceruse (se'rūs) [L *cerussa*]. White lead.

cervical (ser'vik-al) [L *cervicalis*, pert. to neck] 1. Pert. to the neck or to any cervix 2. Gyn Pert. to the cervix uteri

c. plexus. That formed by loops joining the ant rami of first 4 cervical nerves, it receives communicating rami from the sympathetic ganglia **See plexus**.

c. region. That of the neck in relation to the position of the cervical vertebrae

c. vertebrae. First 7 bones of the spinal column. **See skeleton**.

cervicectomy (ser-vi-sek'to-mī) [L *cervix*, neck, + G. *ektomē*, excision] Removal of the cervix uteri

cervicoplex (ser-vik's-pleks) [C + *plexus*, a braid, a thing twisted]. The cervical plexus *

cervicitis [C + G. -itis, inflammation]. Inflammation of the cervix uteri

May be induced by invasion of the gonococcus

cervico- [L] Prefix Pert. to the neck **cervicobra'chial** [C + G. *brachion*, arm] Pert to the neck and arm

cervicobuc'al [C + *bucca*, cheek] Pert. to the buccal surface of neck of a molar or premolar tooth

cervicofa'cial [C + *faciēs*, face]. Pert to the neck and face

cervicoves'ical [C + *vesica*, bladder]. Pert. to the cervix uteri and bladder.

cervimeter (ser-vi-me-ter) [L *cervix*, neck, + G. *metron*, measure] Instrument for measurement of cervix uteri

cervix (ser'viks) [L] The neck or a part of an organ resembling a neck **See: "cervico-" words**.

c. laceration of. There may be (a) Slight tearing in most primipara; (b) usually heals naturally, (c) deeper tears in manual dilatation and use of forceps, (d) breech presentation may be a cause, (e) balloon bag used if manual dilatation is indicated, (f) prophylactic treatment indicated, (g) many do not make immediate repair of cervix

c. uteri. Neck of the uterus. The lower part from the internal os, outward to the external os.

It is rounded and conical in shape, and a portion protrudes into the vagina. It is about 1 in long, penetrated by the cervical canal through which the fetus and menstrual fluids escape. It is apt to be torn in childbirth, in which case it must be sutured. Laceration may be post., ant., single and bilateral, stellate and incomplete. **See cauliflower excrescence**.

c. vesicae, c., vesical. Neck of the bladder

cesarean section (sē-zar'ē-ān) [L. Caesar, because he was supposed to have been born in this manner]. Removal of the fetus by means of an incision into

uterus, usually by way of abdominal wall.

May be performed by the vaginal or extraperitoneal or intraperitoneal abdominal routes, the vaginal operation being limited to those cases before the end of the 7th month of gestation, where no great difficulty would be encountered in the passage of the fetus.

CONSERVATIVE One in which the uterus is not removed. **Classical** The incision is made across the fundus of the uterus **Low Fundal** The incision is made through the contractile portion of the uterus from a point just above the reflection of the bladder upward for a space of 2-3 inches. **Laparotrachelotomy** Low cervical cesarean section The incision is made in the noncontractile lower uterine segment after stripping back the bladder flap After removal of the fetus and placenta the uterus is sutured and the bladder flap is sewed up over the uterine scar, thus peritonealizing the scar **Extraperitoneal** An abdominal incision is made parallel to Poupart's ligament. The incision in the uterus is made extraperitoneally by pushing the bladder to the side **Portes Operation** A regular classical or low fundal operation is performed, but in closing the uterus is sutured to the abdominal wall in order that it may drain through the abdominal incision This operation is employed by the French in cases where the uterine cavity is infected, and at a later date when the infection has disappeared, the uterus may be closed and restored into the abdomen with closure of the abdominal wall

RADICAL Porro Cesarean section with removal of the uterus after the fetus has been taken out This is a supracervical hysterectomy **Total** This is a total hysterectomy after the removal of the fetus, used in cases of badly lacerated cervixes or in cases of early carcinoma of the cervix.

c. s., absolute. Where the child cannot be delivered through the natural passages under any circumstances.

IND (1) Contraction of the bony pelvis with a conjugata vera diameter of less than 5.5 cm. (2) Exostoses of the bony pelvis completely obstructing the birth canal (3) Tumor masses of the soft parts which hinder the passage of the fetus (fibroid tumors, ovarian cysts). (4) At the present time *placenta praevia centralis* with a living child is considered an absolute indication. (5) Previous cesarean section without an absolute indication but where the postoperative course was stormy and a weakened uterine scar is suspected

c. s., relative. Where the child could be delivered through the natural passages, but where such a delivery might jeopardize the life of the mother or the child.

IND (1) Moderate degrees of contraction of the bony pelvis with a conjugata vera diameter of about 9.5 cm. (2) *Placenta praevia marginalis* or *lateralis* where the life of the child is of great importance (3) Transverse presentation of the fetus. (4) Oblique presentation of the fetus. (5) A large baby with a moderate degree of disproportion. (6) Habitual death of the fetus during the course of labor. (7) Impacted brow or face presentation where the fetus is alive. (8) Preëclampsic toxemia in pa-

- tients where a difficult labor is anticipated. (9) Carcinoma of the cervix with rigidity. (10) In cases where hysterectomy is indicated and is to be done in conjunction with the cesarean section. (11) In cases where oophorectomy is indicated. (12) In cases where sterilization is desired, although to allow that patient to deliver normally and sterilize through the vaginal route at a later time is more satisfactory. There are several varieties of cesarean section differing mainly in the technic employed.
- cesarotomy** (sez-â-ro'tô-mî) [Caesar, + G. *tomê*, incision]. Cesarean* section.
- Cestoda** (ses-tôd'â) A subclass of the class Cestoidea, phylum Platyhelminthes, which includes the tapeworms. Have a scolex and a chain of segments (proglottids). Ex *Taenia*. They are intestinal parasites of man and other vertebrates.
- cestode** (ses-tôd) [G. *kestos*, girdle, + *eidos*, form]. A tapeworm, one of the Cestoda.
- cest'oid**. Like a tapeworm.
- Cestoidea** (ses-toi'de-â) A class of flatworms of the phylum Platyhelminthes. Includes the tapeworms.
- Cetraria** (sê-trâ'ri-â). 1 A genus of lichens, chiefly found in northern latitudes. 2 *C. islandica*, or Iceland moss, a lichen used in treating lung and bowel disorders.
- cevitamic acid** (sev-i-tam'ik). Crystalline vitamin C. This acid was first introduced as ascorbic acid, and is found in abundance in citrus fruits, many vegetables, such as cabbages, tomatoes, paprika, spinach, etc. It may also be prepared from adrenal glands, and from fermentation of certain sugars.
- Uses. Primarily, for prevention and in treatment of scurvy.
- Dosage. As a protective in infants, 1/6 gr (0.01 Gm.), corresponding to about 1 oz fresh orange juice, adult, 5/6 gr. (0.05 Gm.). Intravenously, 1 1/2 gr. (0.1 Gm.) to 15 gr (1 Gm.).
- INCOMPATIBILITIES. Iron salts, alkalies, and it should be protected from heat and oxidation.
- C. G. S.** Abbr for *centimeter-gram-second*, a name given to a system of units for distance, weight and time.
- C₂H₄**. Ethylene.
- CH₄**. Methane, marsh gas.
- C₂H₂**. Acetylene.
- C₆H₆**. Benzene.
- Chaddock's reflexes** (chad'dok). 1 Extension of great toe resulting from irritation around ext malleolus. 2 Flexion of wrist and fanning of fingers when forearm is irritated above and near wrist.
- chaeromania** (ke-ro-man'i-â) [G. *chaerein*, to rejoice, + *mania*, madness]. Mania characterized by exaltation and cheerfulness. SYN *amenomania*.
- chain** [Fr. *chaîne*, from L *catêna*, chain]. In bacteriology, 3 or more cells attached end to end. In chemistry, atoms held together by one affinity.
- c. reflex**. One in a consecutive series.
- chalarosis** (kal-ar-o'sis). Infection with *Chalara*, a fungus producing subcutaneous nodules which break down, forming ulcers.
- chalaça** (kal-a'zâ) [G. *sty*]. Inflammation of a meibomian gland causing small tumor of eyelid border. SYN *chalazion*.
- chalazion** (ka-la'zi-on) [G. dim. of *chalaça*, sty]. Small, hard tumor analogous to sebaceous cyst developing on the eyelids, formed by distention of a meibomian gland with secretion. A meibomian cyst. SEX: *chalaza*, *steatoma*.
- chalcosis** (kal-ko'sis) [G. *chalkos*, copper, + *-osis*, infection]. 1 Chronic poisoning from copper. 2. Copper deposits in lungs and tissues.
- chalice cell** (tshal'is) [G. *kaliz*, cup]. Crateriform shell remaining after mucus has been discharged from an epithelial cell. SYN *goblet cells*.
- chalcosis** (kal-i-ko'sis) [G. *chaliz*, limestone, + *-osis*, infection]. Lung disorder due to inhalation of stone particles. SYN *pneumoconiosis*, *q.*
- chalinoplasty** (kal-in'ô-plas-tî) [G. *chalin*, corner of mouth, + *plassein*, to mold]. Plastic surgery of the mouth and lips, esp. of corners of mouth.
- chalone** (kal'on) [G. *chaloun*, to relax]. An autacoid that inhibits the action of a hormone* or which diminishes cellular activity. SEX *autacoid*.
- chalybeate** (kal-i'b'e-ât) [L *chalybs*, from G. *chalybs*, steel]. 1 Pert. to or composed of iron, ferruginous. 2. Agent containing iron.
- Chamberland filter** (sham-ber-lan). An unglazed porcelain filter through which water can be forced under pressure. Intercepts all but ultramicroscopic microorganisms.
- chamber** (châm'ber) [G. *kamara*, vault]. Compartment or closed space.
- c., anterior**. The space bet. the cornea and iris.
- c., aqueous**. Ant and post chambers of the eye, containing the aqueous humor.
- c., posterior**. Space behind the iris, ant. to the lens.
- c., vitreous**. Cavity behind the lens in the eye containing the vitreous humor.
- chamomile** (kam'ô-mîl) [G. *chamamelon*, earth apple, so called from smell of its flowers]. Flowers of the *Anthemis* yielding a bluish volatile oil and a bitter infusion.
- chancere** (shang'ker) [Fr. anything that consumes, from L *cancer*, ulcer]. A hard, syphilitic, primary ulcer. The first sign of syphilis.
- INCUBATION. Two to 3 weeks.
- SYM. Begins as erosion or papule which ulcerates superficially. Generally single, sometimes multiple. Has a scooped out appearance due to level or sloping edges which are adherent. It has a shining red or raw floor with some deposit. Induration constant. No pain. Slightly purulent secretion. Heals without leaving scar. May appear on the penis, urethra, eyelid, conjunctiva, and elsewhere. SEX *dualism*, 2.
- c., hard; c., hunterian**. Primary lesion of syphilis. SEX *chancere*.
- c., simple; c., soft**. A nonsyphilitic venereal ulcer. SYN *chancroid*.
- c., true**. SEX *hard c.*
- chancroid** (shang'kroyd) [+ G. *eidos*, form]. A nonsyphilitic venereal ulcer, highly infectious, a simple or soft chancre.
- INCUBATION. Two to 3 days.
- SYM. Begins with pustule or ulcer; multiple, abrupt edges; rough floor, yellow exudate, purulent secretion, sensitive and inflamed. Scar remains. Rapid progress. May affect the penis, urethra, vulva, or anus.
- chancrous** (shang'krus). Pert. to or of the nature of chancre.
- change of life**. The menopause; * climacteric.*
- charbon** (shar-bon') [Fr. coal]. Infection with *B. anthracis*. SYN: *anthrax*.

charcoal (shär'xöl) [ME *charken*, to creak, + *coal*]. Wood charcoal. USP. Very fine powder prepared from soft charred wood

ACTION AND USES: Internally for absorption of gas

Dosage: Activated 15 gr. (1.0 Gm.), purified animal 5 gr. (0.3 Gm.).

C. fumes. See *carbon monoxide*.

Charcot-Leyden crystals (shar-ko'-lî'den). Elongated, double pyramid shaped crystals made up of spermine and found in the sputum of bronchial asthma

Charcot-Robin crystals (shar-co'-ro-ban'). Tiny crystals found in blood in leukemia.

Charcot's arthropathy (shar-ko'). Joint effusion seen in locomotor ataxia

C.'s disease. Multiple cerebrospinal sclerosis with locomotor ataxia.

C.'s joint. Result of disease of the sympathetic innervation, producing atrophic disorder of a joint.

Sym Lightninglike pains, swelling and effusion of liquid into the joint. Marked instability of joint, destruction of bone, and dislocation

chard [Fr *carde*, from L *carduus*, artichoke]. Av. SERVING 100 Gm Pro 2.6, Fat 0.4, Carbo 4.8 per serving Vit A + + +, B + to + +, FUEL VALUE: 100 Gm equal 38 cal Ca 0.150, Mg 0.071, K 0.318, Na 0.086, P 0.040, Cl 0.039, S 0.124, Fe 0.0025 A base forming food, alkalinity 5.8 cc per 100 Gm, .41 per 100 cal.

charlatan (shar'lā-tān) [Italian *ciarlatan*, seller of papal indulgences] A boasting pretender to special knowledge or ability, as in medicine **Syn** quack.

charlatanry (shar'lā-tān-ri) [Italian *ciarlataneria*]. Undue pretension to knowledge or skill or an instance of it **Syn** quackery.

Charles' law. All gases on heating expand equally, and on cooling contract equally, according to temperature relation. Same as Gay-Lussac's law

charley horse [slang] An athletic injury, usually a bruised or a torn muscle associated with cramping in the muscles

F. A. TREATMENT Cold applications

charpie (shar'pi) [Fr] Shreds of linen for dressing wounds

charta (kar'ta) [G *chartēs*, piece of paper] Preparation intended principally for external application, made either by saturating paper with medicinal substances or by applying the latter to the surface of the paper by the addition of some adhesive liquid

It should not be confounded with *chartula*, meaning "a little paper," folded so as to form a receptacle containing a dose of medicinal substance. There is no official paper

chart'ing. The making of a tabulated record of the progress of a disease, a clinical record

ITEMS TO RECORD Information about the patient and his treatment that may be gathered only by the nurse who is in constant attendance. The doctor may not sit at the bedside of the patient day and night, so he deputizes the nurse to gather the information he needs. Your notes then aid the doctor in making his diagnosis, and upon these notes of the patient's reactions and progress he bases his treatment. The nurse's responsibility for supplying this information is very great. Verbal reports are not sufficient; they take time, and make mistakes possible. Record the following:

General: BATHS AND PACKS: Record an accurate description of medicinal baths

and packs, also reaction to same. Under treatments, chart hot and cold applications. [marks.]

BLOOD PRESSURE: Record under "RE-COUNTERIRRITATION: Chart under treatment. State length of time applied and to what part of the body.

Diet If patient is on regular diet, it is sufficient to chart *Breakfast, Dinner, and Supper*, but when on any other diet, chart exactly what the patient takes. The amount of liquids taken should be charted, not "Water P R N" 1. Hours of giving. 2. Kind: full, light, soft, liquid, special 3. Appetite good, poor, special likes and dislikes

DISCHARGE OR DEATH Chart discharge or death of patient, with hour and date of same

DRESSING ROOM The Dressing Room Nurse is responsible for the charting of anything out of the ordinary done in the dressing room, such as a hypodermic infection, the removal of sutures, insertion or removal of a drain, or the application or removal of plaster casts

DRESSINGS Chart the change of dressings on wounds and the amount and character of drainage, remark "Specimen Saved" if this has been done 1. Hour 2. By whom done 3. Stitches or drains removed 4. Patient's reaction if pained or shocked by dressing

Drugs: Any unfavorable reaction from drugs or treatments should be charted. Chart time when drugs or treatments are administered. All medicines, treatments, preparation, etc., are to be charted by the nurse who administers same, whether she has charge of the patient or not. Confine name of medicine and dose to the prescribed column. When administering soluble salts, dispensed in solution, state number of grains administered, not the amount of solution. The administration of medicines other than by mouth should be indicated, as *per hypodermic*, *per injection*, *per inunction*, or *per rectum*. Any prominent or unusual therapeutic action or idiosyncrasy resulting from a drug should be recorded as a "Remark" A special prescription is written in full in the medication column the first time it is given. After that, chart 1. Medicine or 1. Capsule, as the case may be. After first charting, chart the name of principal ingredient, adding the word "Compound" Note discontinuance of medicine or treatment as a "Remark"

EYE When the eye is treated for the first time, or when treatment is changed, chart the exact medication in detail; afterwards the remark "Eye treated" may be used.

FLUIDS 1. Hours of giving 2. Kind. 3. Amount. The amount should be totaled and the total charted every 12 hours.

HEAT Chart by whose order heat is applied to an unconscious patient, and who executed the order.

INFANT FEEDING The formula should be charted the first time; afterwards, amount given, and if regurgitated, approximate the amount.

LABORATORY: 1. Hour. 2. Kind of specimen. 3. By whom taken. 4. By whom ordered (not necessary in case of routine urine specimen on admission).

MEDICATIONS: 1. Hour of giving. 2. Kind; name of drug and preparation. 3. Amount. 4. By whom given. 5. Manner of giving: mouth, hypo, rectum, intravenous, etc. 6. Patient's reaction.

Charting, Latin Abbr. Which May Be Used in, and Their Meanings

Abbr.	Phrase	Meaning
a or āā.	ana	of each
abs. feb.	absente febre	when there is no fever
a c.	ante cibos	before eating
ad	ad	to, up to
ad effect.	ad effectum	until effectual
ad gr acid.	ad gratam aciditatem	to an agreeable acidity
ad gr gust.	ad gratum gustum	to an agreeable taste
ad lib.	ad libitum	at pleasure, as much as is needed
ad neut.	ad neutralizandum	to neutralization
ad sat.	ad saturandum	to saturation
adst feb.	adstante febre	when fever is present
ad us.	ad usum	according to custom
ad us. ext.	ad usum externum	for external use
aeq.	aequales	equal
ag feb.	aggreddente febre	when the fever increases
agit ante sum.	agita ante sumendum	shake before taking
alt dieb.	alternis diebus	every other day
alt. hor.	alternis horis	alternate hours
alt. noc.	alternis nocta	every other night
aq	aqua	water
aq bull.	aqua bulliens	boiling water
aq cal	aqua calida	warm water
aq dest.	aqua destillata	distilled water
aq ferv	aqua fervens	hot water
aq frig	aqua frigida	cold water
aq menth pip.	aqua menthae piperitae	peppermint water
aq pur.	aqua pura	pure water
arg.	argentum	silver
bal.	balneum	bath
bal sin.	balneum sinapis	mustard bath
bib.	bibe	drink
b i d.	bis in die	twice daily
bis	bis	twice
bis in 7d.	bis in septem diebus	twice a week
b p.		blood pressure, boiling point
bull	bulliat	let it boil
C.		Centigrade
		carbon
		calory
c.	cum	with
cap.	capsula	a capsule
cat.	cataplasma	a poultice
cc		cubic centimeter
chart.	charta	paper
cito disp.	cito dispensetur	let it be dispensed quickly
c m	cras mane	tomorrow morning
c.m.s.	cras mane sumendus	to be taken tomorrow morning
c.n.	cras nocte	tomorrow night
cochl. amp	cochleare amplum	teaspoonful
cochl infant.	cochleare infantis	teaspoonful
coch. mag.	cochleare magnum	a tablespoonful
coch. med.	cochleare medium	a dessertspoonful
coch. parv.	cochleare parvum	a teaspoonful
comp.	compositus	compounded of
cong.	congius	a gallon
contra	contra	against
cont rem.	continuantur remedia	let the medicines be continued
c.v.	cras vespere	tomorrow night
cyath.	cyathus	glassful
cyath. vinos.	cyathus vinosus	wineglassful
D.	dosis	dose
d.	da	give
d d in d.	de die in diem	from day to day
decub.	decubitus	lying down
det	detur	let it be given
dieb. alt.	diebus alternis	on alternate days
dil.	dilue	dilute
dil.	diluidius	half
div.	divide	divide
div. in p. aeq.	divide in partes aequales	divide into equal parts
don.	donec	until
emp.	emplastrum	a plaster
en		enema
exhib.	exhibeatur	let it be given
ext.	extractum	extract
ext. liq.	extractum liquidum	liquid extract
Fahr.		Fahrenheit (temperature scale)
Fe.	ferrum	iron
f.h.	flat haustus	make a draught
f.m.	flat mistura	make a mixture
f.p.	flat pilula	make a pill

Charting, Latin Abbr. Which May Be Used in, and Their Meanings (Continued)

Abbr.	Phrase	Meaning
ft.	flat	let it be made
Gm.		gram
gr.	granum	grain
gtt.	gutta	a drop
h n	hac nocte	tonight
hor. som. or h. s.	hora somni	at bedtime
ind.	indies	daily
inf.	infusum	an infusion
inj.	infectio	an injection
liq.	liquor, oris	a liquor
m.	misc	mix
mod praes	modo praescripto	as prescribed
mor dict.	more dicto	in the manner directed
mor sol.	more solito	in the usual manner
n. b.	no'ta be'ne	note well
noct	nocte	night
non rep.	non repetatur	do not repeat
O	octarius	a pint
o d.	oculus dexter	right eye
ol	oleum	oil
o m.	omni mane	every morning
omn. bid	omnibus bidendis	every 2 days
omn. bih	omni bhoris	every 2 hours
omn. hor	omni hora	every hour
omn. noct	omni nocte	every night
o s	oculus sinister	left eye
p a a	parti affectae applicetur	let it be applied to the affected region
part aeq	partes aequales	equal parts
post. cib oi p c.	post cibos	after eating
p r	per rectum	by the rectum
p r. n.	pro re nata	as needed
pulv.	pulvis	a powder
p v	per vaginam	by the vagina
q i. d	qua'ter in di'e	four times a day
q l	quantum libet	as much as is wanted
q s.	quantum sufficiat	a sufficient quantity
q v	quantum volueris	at will
℞	recipe	take (thou)
rep	repetatur	let it be repeated
rep sem.	repetatur semel	let it be repeated once only
s a	secundum artem	by skill
sig	signetur	let it be labeled
sing	singulorum	of each
s o. s.	si o'pus sit	if necessary
ss	semi	one-half
stat.	statim	at once
sum.	sumat or sumendum	let him take, or let it be taken
s v	spiritus vini	spirits of wine
s v gall	spiritus vini gallici	brandy
T.		temperature
tab.	tabella, tabellae	a tablet, tablets
t i d	ter in die	thrice daily
tinct or tr	tinctura	tincture
ung	unguentum	ointment
ur.		urine

MENSTRUATION Note on nurse's notes. Note in red on temp. graph, using term "catamenia"

NURSING CARE 1. Hour. 2. Baths
shampoos, larks-pur cap. 3. Alcohol rubs,
decarbatus dressing 4. Special mouth
care 5. Sitting up for first time 6.
Out of bed for first time. 7. Walking
for first time. (Treatments are also
charted, but as treatments)

OPERATING ROOM Before taking chart
from hall to operating room, the nurse
is to assure herself that all laboratory
reports are in the chart. She records
second preparation for operation, and
any other treatment given at that time.
Record the name of interne or orderly
who performs male catheterism.

OPERATIONS: 1. Name of operation. 2.
Preparation for operation 3. Prelimi-
nary anesthetic if given by nurse or on
ward 4. Hour of going to O. R. 5. Hour
of return from O. R. 6. Condition on

return 7 Hour of recovery from anes-
thetic 8 Condition every half hour for
next 3 or 4 hours, depending on state
patient is in and severity of operation.

PHYSICIAN Record his visit. Doctor's
orders must be recorded and time when
they are carried out

PHYSIOTHERAPY. Occupational Ther-
apy 1 Hour of going for treatment 2.
Hour of return. 3. Condition of patient.

POSTOPERATIVE: Changing position of
postoperative patients should be re-
corded under "Remarks."

SPECIMENS. Record the taking of
specimens of bloods, of exudates, transu-
dates, etc. for examination The result
will be shown by the report of the
pathologist.

SURGICAL PREPARATIONS. The nurse who
does surgical preparations will sign her
name after "Preliminary preparation of
field of operation." Also observe the
same rule for narcotics.

SYMPTOMS: Record accurate descriptions of all symptoms, such as *character of pulse and respiration, psychic condition, description of pain, and nature of any discharge*, etc. The remarks should be appropriate and well chosen. *Subjective* as well as *objective symptoms* should be recorded.

TIME Everything relating to the patient's progress should be charted as it occurs. Record the *hour* with all statements on charts. Record on the first line of the sheet the *day and date of admission*, whether the patient *walked in*, or was admitted *per ambulance*, and *condition* of patient. Four-hour graphic charts are kept for all surgical and obstetrical cases the first 3 days (time 8-12-4), and for all patients whose temperature is above normal. The T. P. R. of all other patients are charted at 6 A. M. and 4 P. M.

TREATMENTS. 1. Hour of giving. 2. Nature of treatment. 3. By whom given. 4. Patient's reaction.

VISITS OF CLERGYMAN (specially important in case of Roman Catholic patients) 1. Hour. 2. Name of clergyman. 3. Rite performed.

X-RAY 1 Hour. 2. To x-ray room, or portable at bedside. 3. Return from x-ray room. 4. Condition of patient.

MISCELLANEOUS Any sudden or marked change in patient's condition. Notification of patient's relatives and clergyman. Special charts are also provided for certain purposes, such as the temperature, pulse and respiration chart, an anesthesia chart, generally kept by the anesthetist, blood-pressure chart, used in conditions apt to affect the blood pressure, intake and output charts used in nephritis, and laboratory records usually filed with the patient's chart. If any laboratory records have been made and not filed with the chart, their existence should be noted on the clinical chart at the time made and also upon the final page of the chart.

Physical Symptoms 1. **APPETITE:** Good. Poor. Special likes or dislikes.

2. **CONVULSIONS** Type. Duration. Consciousness lost. Aura.

3. **DEFECATION** SEE *Excretions and Feces*

4. **DIAPHORESIS** State whether slight, moderate, or profuse.

5. **EMESIS** State the *amount, color, odor, consistency* of the vomitus, and *manner of ejecting* (SEL. Nausea.)

6. **ENEMAS** Results and *unusual appearances*, distention before or after, describe *results* fully. Note whether or not flatus was expelled with the return of the enema. Chart the *solution, the strength, and amount* used. Also for douches and irrigations.

7. **EXCRETIONS** Chart *time, character, and other facts*.

8. **FECES** Enema or natural movement. Amount. Consistency. Abnormal constituents. Defecation accompanied by pain or tenesmus. [Rash.]

9. **GENERAL APPEARANCE** Color. Posture.

10. **HEMORRHAGES, DISCHARGES, ETC.:** Chart a *description*, etc. When unusual, *save specimens* for examination.

11. **NAUSEA** Accompanied by vomiting. Following certain foods, drugs or treatments.

12. **NERVES:** All nervous symptoms, excitability, etc.

13. **PAIN:** Location. Time of onset. Character: Sharp, dull, burning, grinding, throbbing. Duration: Constant, for how long. Intermittent, intervals.

14. **PATHOLOGICAL CONDITIONS:** Vomiting, convulsions, etc. Record *time, duration, severity, general appearance* of patient before, during, and after the attack. T. P. R. immediately after, and *what was done* to relieve condition. Chart explanation as to the cause.

15. **PULSE:** Rate: beats per minute. Character: full, bounding, weak, thready, faint. Rhythm: regular, irregular, intermittent.

16. **RESPIRATION** Rate per minute. Character: deep, shallow, difficult, easy, labored, quiet, stertorous, Cheyne-Stokes. Rhythm: regular, irregular, gasping.

17. **SLEEP** Record should be made of the *hours of sleeping* during the day, as well as at night. If impossible to estimate same accurately, approximate it. *Time and amount* of sleep obtained by the patient should be noted, if possible.

18. **TEMPERATURE** If for some legitimate reason temperature is omitted, write *hour* in designated space, leave temperature space unmarked. When recording next temperature, bring line across this space to the adjoining and record the next temperature. By mouth, rectum or axilla. Degree. Following chill, or treatment.

19. **T. P. R.** Temperature, pulse and respiration taken as ordered. The nurse charts the T. P. R. and general condition of the patient before going to the operating room, and the pulse and respiration with general condition upon return from the operating room.

20. **UNCONSCIOUSNESS OR COMA:** Time of onset. Duration.

21. **UNUSUAL CONDITIONS.** Chart these, such as appearance of blood, twitching, convulsions, coma, drowsiness, lethargy, unconsciousness.

22. **URINE:** State *time of voiding, the amount, color and appearance*, whether voided or per catheter. Note time of beginning 24-hour specimen, when bladder is emptied for the purpose, this specimen is sent to laboratory for qualitative test. Remark the *ending* of 24-hour specimen. Note *amount* on chart and on laboratory label. Send specimen to the laboratory for all patients remaining in the hospital over night. At 7 P. M. and 7 A. M., day and night nurses remark whether or not very ill patients voided during the day or night. Immediately upon admission begin 24-hour specimen of urine for all diabetic patients. Check may be used in the urine column. (a) When patient uses lavatory. (b) When he voids with defecation. At all other times the amount of urine is to be charted (totaled every 12 hours and total charted also). Accompanied by pain or burning. Any abnormal appearance. Specimen to laboratory.

23. **VOMITING:** Cause. Forceful or projectile. Vomitus. Amount. Color. Odor. Consistency. Any unusual constituents.

Mental Symptoms 1. Calmness. 2. Cheerfulness. 3. Delirium. Kind. 4. Depression. Degree. Apparent effect of visitors, etc., on. 5. Delusions, on what special subjects. 6. Hallucinations. 7. Illusions, on what special subjects. 8. Temper fits. 9. Willingness to cooperate. 10. Worry.

chartula (kar'tu-lă) [L. dim. of *charta*, piece of paper]. A paper containing a medicinal powder.

chaude-pisse (shôd-pës'). The burning sensation during urination in acute gonorrhea.

chauffage (sho-fazh') [Fr. *chauffer*, to heat]. A heated cautery at low temperature applied over a part about ¼ in. from it.

Chauffard's syndrome (sho-fars'). Peculiar symptoms of polyarticular joint disease with splenic and glandular enlargement in young children.

chaulmoogra, **chaulumugra**, **chaulmaugra** (tschawli-moo'gră, tschawli-mū'gră, tschawli-maw'gră). A vegetable oil used in treatment of leprosy, arthritis, and some chronic forms of dermatoses.

Chaussier's areola (sho-sl-ăs'). Indurated tissue around the lesion of a malignant pustule.

check. 1 To slow down or arrest the course of. 2 To verify

c. bite. Impression of teeth on plastic material to check articulation.

c. experiment. Control experiment, or one checked against another

cheek [A S. *cedce*, check]. Side of face forming lateral wall of mouth below eye
SEE: *bucca*, *buccal*, *buccinator*, *gena*, *malar bone*, *melitis*, *meloncus*. [icum.

c. bone. The malar bone, *os zygomatic*.

c. muscle. Buccinator.

c. refractor. Device for enclosing cheek at the mouth's angle for properly exposing operating field

cheese [A S. *cēse*, from L. *caseus*, cheese]. The compressed casein of milk, flavored and altered by bacterial action

COMP. (American): Pro 28.8, Fat 35.9, Carbo. 0.3.

FUEL VALUE: 100 Gm equal 434 cal. Amer red cheese has a little greater food value than has pineapple cheese. Other classes are lower in food values

ASH CONST Ca 0.931, Mg 0.037, K 0.089, Na 0.606, P 0.683, Cl 0.880, S 0.263, Fe 0.0013.

VITAMINS Vit A A very good source in whole milk cheese, 700 units per oz. or 560 per 100 cal. Cottage cheese contains the vitamins A, B, C, but G is lacking in all cheese.

ACTION: Cheese is slow to digest, but it is completely digested. Length of time in the cooking of cheese prolongs its digestion, but does not affect its digestibility. Over 97% of cheese is digested. SEE: *tyrogeous*, *tyroid*, *tyroma*.

cheilitis (ki-li'tis) [G. *cheilos*, lip, + *-itis*, inflammation]. Inflammation of the lip.

c. exfoliativa. Seborrheic dermatitis of the lips. SYM. Formation of slight, dry, adherent scales and crusts. Chronic. Exacerbates and improves at intervals. PROG: Obstinate and recurrent. TREATMENT: Ointments, lotions, x-rays.

cheilognathopalatoschisis (ki-lög'năth-ô-păi-ă-tôk'ki-sis) [+ *gnathos*, jaw, + L. *palatum*, palate, + G. *schisis*, cleft]. Malformation in which there is a cleft in the hard and soft palate, upper jaw and in the lip.

cheiloplasty (ki-lô-plas-ti) [+ *plassein*, to form]. Plastic operation upon the lips.

cheilosis (ki-lô'sis) [G. *cheilos*, lip, + *-osis*, disease]. Morbid condition of lips with reddened appearance and fissures at the angles, seen frequently in vitamin B deficiency, ariboflavinosis.*

cheilostomatoplasty (ki-lô-s-to-mat-o-plas-ti) [+ *stoma*, mouth, + *plassein*, to form]. Plastic building up of mouth.

cheilotomy, **chilotomy** (ki-lô'tô-mi) [+ *tome*, incision]. Excision of part of the lip.

cheloid (ke'lôid) [G. *chêle*, claw, + *eidos*, form]. Keloid skin disease with fibrous growths at site of a scar.

chem'ic, **chem'ical** [G. *chêmeia*, chemistry.]. Pert to chemistry

c. balance of the body. Foods burned within the body may produce either an alkaline or an acid ash.

Foods, then, may be either acid or base forming. As the blood and tissues are slightly alkaline, foods should be base forming in order to produce an alkaline reserve. All cereals, meat, fish and eggs are acid producing, as are most nuts, cranberries, and rice. Alkali producing foods include most vegetables and fruits, also almonds and milk. SEE *acidosis*, *alkalosis*, *ash*, *body*.

c. change. A change in which a substance breaks up or combines with other substances to make new substances with new properties or characteristics. Ex Oxygen and hydrogen combine together to form water. Sodium (a metal) and chlorine (a gas) combine together to form sodium chloride, or common salt. Oxygen combines with hemoglobin when the hemoglobin in the blood comes into contact with the oxygen in the air in the alveoli of the lungs to form oxyhemoglobin. The difference can be seen by comparing the bright scarlet of the arterial blood containing oxyhemoglobin with the bluish color of the venous blood containing hemoglobin

c. compound. (1) A substance consisting of two or more chemical elements in definite proportions and in chemical combination and for which a chemical formula can be written. Ex: water H₂O, salt (NaCl). (2) A substance which can be separated by chemical means into simpler substances.

c. elements. Common gases are oxygen, carbon dioxide, and nitrogen. SEE: *element*.

c. elements (in the human body):

Oxygen	65.	%
Carbon	18.	%
Hydrogen	10	%
Nitrogen	3.0	%
Calcium	1.5	%
Phosphorus	1.0	%
Potassium	0.35	%
Sulfur	0.15	%
Chlorine	0.15	%
Magnesium	0.05	%
Iron	0.004	%
Iodine	0.00004%	

Also traces of copper, zinc, manganese, silicon, fluorine, and perhaps arsenic, nickel, cobalt, and aluminum. These elements must be supplied daily in the food. Traces of other minerals and of gases in the body are arsenic, copper, iodine, and manganese. Gases are carbon dioxide, carbon monoxide, and methane, q v. SEE: *acid base balance*, *body*, *mineral elements*, *name of each element*.

c. reflex. Any reflex action initiated by a chemical stimulus.

chemicocautery (kem-ik-o-kaw'ter-i) [G. *chêmeia*, chemistry, + *kautêrion*, branding iron]. Cauterization by chemical agents.

chemicogen'esis [+ *genesis*, production]. Chemical fertilization of an ovum.

Chemical Elements and Composition of the Human Body

These elements are supplied to the body day by day in the food provided by nature, or in air or water, natural foods supply them in about the proper proportion to maintain perfect health.

		Lb.	Oz.	Gr.
1	O ₂Oxygen—A gas, will fill a space of 750 cubic feet	111	0	0
2	C ₁Carbon—Constitutes fat, used for fuel to create animal heat	21	0	0
3	H ₂Hydrogen—A gas, will fill a space of 3000 cubic feet	14	0	0
4	N ₁Nitrogen—Basis of muscles and solid tissues, supplied by nitrates	3	8	0
5	Ca ₁Calcium—The metallic base of lime, the bone base.....	2	0	0
6	P ₁Phosphorus—All phosphates contain phosphorus	1	12	190
7	S ₁Sulfur—All sulfates contain sulfur	0	2	210
8	Na ₁Sodium (Sodium)—The base of all the salts of soda.....	0	2	116
9	Cl ₁Chlorine—Constitutes with sodium, common salt.....	0	2	47
10	F ₁Fluorine—Found combined in the bones	0	2	0
11	K ₁Kalium (Potassium)—The base of all salts of potash.....	0	0	290
12	Fe ₁Ferrum (Iron).....	0	0	100
13	Mg ₁Magnesium—The base of magnesia and magn salts.....	0	0	12
14	Si ₁Silicon—The base of silex, found in hair, teeth, nails.....	0	0	2

The elements of a person weighing . . . 152 lbs.

† Positive (Alkali)

C—All things that have life contain carbon

‡ Negative (Acid)

O—½ of earth's crust, 8/9 of water, 1/5 of air.

H—1/9 of water N—4/5 of air.

The organic acids in the body combined with potassium undergo oxidation and are transformed into alkaline carbonates which render the urine and blood alkaline. They are found much more abundantly in vegetables than in animal food.

Compounds of the Human Body

The 17 combinations of these 14, or 16 elements, are all being used and consumed in the body continuously, and it is therefore necessary that they be supplied in proper food, or in pure air, or pure water.

		Lb.	Oz.	Gr.
1	H ₂ OWater, composed of oxygen and hydrogen	111	0	0
2	GelatinMany tissues are composed of this	15	0	0
3	Fat, CHO Constitutes the adipose tissue.....	12	0	0
4	Ca ₂ PO ₄Phosphate of lime, part of earthy matter of bones	5	13	0
5	FibrinForms the blood clot	4	3	3
6	AlbuminFound in the blood and almost every organ.....	4	3	0
7	CaCO ₃Carbonate of lime, also a part of the bones	1	0	0
8	Fe ₂ O ₂ H ₂ O Hemoglobin furnishes the coloring matter of the blood	0	9	150
9	CaF ₂Fluoride of Calcium, found in bones.....	0	3	0
10	Na ₂ SO ₄Sulfate of Soda, found in blood	0	1	170
11	Na ₂ CO ₃Carbonate of Soda, found in blood and bones.....	0	1	72
12	K ₂ SO ₄Sulfate of Potash, found in the blood.....	0	0	400
13	Na ₂ PO ₄Phosphate of Soda } In brain and nerves ...	0	0	400
14	K ₂ PO ₄Phosphate of Potash }	0	0	100
15	NaClChloride of Sodium (common salt) in the blood ..	0	0	376
16	Mg ₂ PO ₄Phosphate of Magnesia, in the bones with phosphate of lime	0	0	75
17	SiO ₂Silica, found in the hair, teeth and nails	0	0	3

The proximate principles in a person weighing 152 lbs.

cheminosis (kem-in-o-'sis) ['' + -osis, infection]. Any disease caused by chemical agents

chemiotaxis (kem-i-o-taks-'is) ['' + taxis, arrangement]. Cellular repulsion and attraction.

chemise (she-mêz') [Fr. shirt]. Surgical dressing to prevent hemorrhage after surgery upon bladder or rectum.

chem'ism [G. *chēmeia*, chemistry, + *ismos*, condition]. Chemical energy.

chemist (kem-'ist). One trained in chemistry.

chem'istry [G. *chēmeia*, chemistry]. The science that treats of the molecular and atomic structure of matter.

chemokine'sis ['' + *kinēsis*, movement]. Increased energy incited by a chemical substance.

chemolysis (kem-ol-'is-is) ['' + *lysis*, dissolution]. Chemical decomposition or decay.

chemomorphosis (kem-o-mor-'fo-'sis) ['' + *morphē*, form]. Change of form as the result of chemical action.

chemopallidectomy (kēm-ō-pāl-i-dēk'tō-mī) Chemical injection of absolute alcohol in the brain to destroy the globus pallidus in Parkinson's disease.

chemophysiol'ogy ['' + *physis*, nature, + *logos*, understanding]. Physiologic chemistry.

chemorecep'tor ['' + L. *receptor*, receiver].

(1) Side chain in a living cell having an affinity for chemical substances and fixing them. (2) A sense organ or sensory nerve ending which is stimulated by a chemical substance

chemore'flex ['' + L. *reflectere*, to bend back]. Reflex resulting from chemical stimulus.

chemosis (ke-mo-'sis) [G. *chēmē*, cockle-shell, + -osis, infection]. Swelling of conjunctiva about the cornea.

chemotactic (kem-o-tak'tik) [G. *chēmeia*, chemistry, + *taxis*, arranging] Pert. to chemotaxis.

chemotaxis (kem-o-tak'sis) [" + *taxis*, arrangement] Attraction and repulsion of living protoplasm to a chemical stimulus.

chemotherapy (kem-o-ther'a-pi) [" + *therapeia*, treatment] Application of chemical reagents in treatment of disease, that have a specific and toxic effect on microorganism causing the disease, without harming the patient.

chemotic (ke-mot'ik). Pert. to chemosis.

chemotropism (kem-ot'ro-pizm) [G. *chēmeia*, chemistry, + *tropos*, direction] Ability or impulse to progress or turn in a certain direction due to the influence of certain chemical stimuli SYN *chemotaxis*.

chenopodium oil (ken-o-po'di-um). USP. Oil of American wormseed. Colorless, a pale yellow volatile oil with pungent, irritating odor.

ACTION AND USES Anthelmintic against hookworm.

DOSAGE From 5 to 15 m (0.3-1 cc.).

cherophobia (ker-o-fob'i-ā) [G. *charein*, to rejoice, + *phobos*, fear]. Morbid fear of and aversion to gaiety.

cherries [G. *kerasion*, the fruit]. COMP. Contain much cellulose. They contain citric and malic acids. AV. SERVING: 75 Gm. PRO 0.8, FAT 0.6, CARBO. 12.5 per serving. VIT A+++, B+, C++, Ca 0.019, Mg 0.016, K 0.213, Na 0.023, P 0.031, Cl 0.014, S 0.011, Fe 0.0004. ACTION A drink made of cherry stems will act as a diuretic within an hour of its consumption. Cherries change uric acid into hippuric acid, and for this reason they are used in gout, but for intestinal trouble may result from too free use.

chest [AS *cest*, a box] The thorax.

MENSURATION Object First, to ascertain the comparative bulk of the 2 sides, second, to ascertain amt of expansion and retraction accompanying inspiration and expiration of the 2 sides.

The points of measurement are the spinous processes behind and the median line in front on the level of the 6th costosternal articulation. The right side is from half an inch to an inch larger than the left.

When a pleural cavity is distended with air or fluid the measurement of the affected side may exceed that of the healthy side by 2 or 3 inches, after removal of the fluid there may be an equal diminution in the measurement of the affected side, as compared with the healthy one. In emphysema the total difference bet the fullest inspiration and fullest expiration on the affected side will scarcely exceed 1/16 of an inch, while on the other side there may be a difference of 2 or 3 inches. The list of affections in which variations in expansion are to be estimated by measure is the same as that referred to under INSPECTION.

PALPATION: Serves to detect any thoracic tenderness, edema, friction fremitus or râles, and to determine the vocal fremitus and amt of expansion. Edema of chest walls is recognized by "pitting" when pressure is made with finger. It may be observed in empyema, after the application of a blister, and in general dropsy.

The friction sound of pleurisy and harsh, sonorous râles can sometimes be detected by palpation. Thoracic tenderness is observed in pleurisy; in phthisis and pneumonia from being associated

with pleurisy; in pleurodynia, in intercostal neuralgia (confined to certain spots); and in surgical affections like caries, and fracture of the ribs, and in contusion and inflammation of the parietes.

PERCUSSION *Precautions* Place finger being used as a pleximeter firmly against chest and preferably parallel to ribs. Make finger which is used as plessor strike the one on chest perpendicularly, fix forearm, and use no more force than can be obtained from a gentle swing of the wrist. Percuss all parts of chest anteriorly and posteriorly, both in inspiration and expiration. In comparing sides be sure to percuss corresponding parts.

Normal Resonance On the right side pulmonary resonance extends from half an inch to an inch above the clavicle, downward to upper border of 6th rib in front, and to a line drawn through the 10th spinous process posteriorly. On left side pulmonary resonance extends from a half inch to an inch above the clavicle downward, within the mammary line to the 10th rib and posteriorly to a line drawn through the 10th spinous process.

Cracked Pot Sound Modified tympany, can be simulated by percussing over the cheek when mouth is partially open. May be normally heard over the chest of a crying infant. In the adult it usually indicates a cavity which has a free communication with a bronchus. Best detected by keeping ear near open mouth of patient while percussing.

Dullness or flatness is recognized in (1) Phthisical condition, (2) pneumonic consolidation, (3) pleural effusions of all kinds, except air, (4) collapse of lung, (5) congestion and edema of lung; (6) enlargement of liver or spleen (at base), (7) morbid growths in the lung.

Hyperresonance is observed in (1) Pneumothorax; (2) cavities, tuberculous or bronchiectatic, (3) emphysema; (4) lowered pulmonary tension in the initial stage of pneumonia, and above a pleural effusion (Skoda's resonance); (5) flaccid distention of the stomach or colon frequently observed over the left base. A *tympanitic note* is a hollow, drum-like sound, like that which is normally obtained by percussing the larynx or empty stomach. The above conditions are also capable of producing tympany.

Pitch Depends largely upon the volume of air, tension of walls of cavity, and upon size of opening that communicates with the cavity. The less the air the greater the tension, and the smaller the opening the higher will be the pitch of the note. In beginning phthisical consolidation, the note over the affected apex is higher pitched. It must be remembered that normally the note over the right apex is higher pitched than that over the left.

Resistance The greater the dullness the greater will be the resistance; therefore, there is always more resistance over a large pleural effusion than over a pneumonic or phthisical consolidation. RS *barrel chest, breathing, Cheyne-Stokes respiration, fremitus, hydrothorax, pectoral, pectoralis, pectoriloquy, resonance, respiration, "thoraco-" words.*

c., emphysematous. In advanced emphysema thorax is short and round; anterior-posterior diameter is often as long as the transverse diameter; ribs are horizontal; angle formed by divergence of the costal margin from the sternum

is very obtuse or quite obliterated. Often termed "barrel shaped."

c. prominences and depressions. An unnatural prominence or depression is often observed over the lower part of the sternum and is generally congenital. The term "funnel" breast or "shoemaker's" breast (because it may result from pressure of tools) has been applied to the sternal depression.

A unilateral or local depression may be due to (a) Phthisical consolidation, (b) cavity; (c) pleurisy with fibrous adhesions

A unilateral or local prominence may be due to (a) Pleurisy with effusion, (b) pneumothorax, hydrothorax, haemothorax, (c) aneurysm or tumor, (d) compensatory emphysema, resulting from impairment of the opposite lung; (e) cardiac enlargements (left side); (f) enlargements of abdominal organs, esp liver and spleen

c., pththoid. Ant. post. diameter is short, thorax long and flat, ribs oblique Scapula prominent, spaces above and below clavicles are depressed. Angle formed by divergence of the costal margins from the sternum is very acute

c., rachitic. May resemble pththoid, but usually sides are considerably flattened and sternum prominent, so term pigeon breast has been applied. The sternal ends of the ribs are enlarged or "beaded" and this characteristic has given rise to the term "rachitic rosary" Is often a circular construction of the thorax at level of the xiphoid cartilage **See** *circulatory system.*

c. regions. Ant., post., and lateral **Ant. Divisions** (R and L). Clavicular, infra- and supraclavicular, mammary and inframammary, upper and lower **Sternal Post. Divisions** (R and L). Scapular, infrascapular and interscapular **Lateral Divisions** Axillary and infra-axillary

chest expansion, normal. In the male, 2 in. in the female, 2 1/2 in. Capacity Normal male, 22 yr old, 5 8 ft. 230 to 240 cu in Normal female, 19 yr. old, 5 25 ft. 145 to 150 cu in Expansion denotes capacity of air taken into lungs and is estimated to average about 23 cu in for each in of height This varies with age, the young adult having a greater capacity than the aged Those given to exercise or physical work have a greater lung capacity than others

chestnut [M. E. *chesten*, from G. *kastanon*, chestnut]. **AV. SERVING** (Roasted) 50 Gm Pro 2.6, Fat 2.3, Carbo. 17.7 per serving. **FUEL VALUE** 100 Gm. equal 244 cal. **VITAMINS** B+, G+. Ca 0.034, Mg 0.051, K 0.560, Na 0.065, P 0.093, Cl 0.006, S 0.068, Fe 0.0007

Cheyne-Stokes reflex (chān-stōks). Rhythmic acceleration, deepening, and stopping of breathing movements

Cheyne-Stokes respiration. An irregular type of arrhythmic breathing occurring in certain acute diseases of the central nervous system, heart, lungs, and in intoxications.

At first it is slow and shallow, then it increases in rapidity and depth until it

Diagram illustrating the respiratory movements in Cheyne-Stokes breathing.

reaches a maximum. Then it decreases gradually until it stops for 10 to 20 seconds, then repeating in the same manner. It frequently occurs before death. Associated with cerebral, cardiac, renal, and pulmonary affections.

chiasm, chiasma (ki'azm, ki-az'ma) [G. from *chiazen*, to mark with letter X]. 1. A crossing. 2. An incomplete crossing of the optic fibers (the outer fibers not crossing each other); the point of crossing of the fibers of the optic nerves.

chiasmometer (ki-as-tom'et-er) [G. *chiasmos*, crossed, + *metron*, measure] Instrument for measurement of deviation of optic axes.

chicken [A.S. *cicen*]. The flesh of domestic fowl cooked and served as food. **AV. SERVING** 230 Gm. Pro 49.6, Fat 5.8 per serving. Ca 0.058, Mg 0.118, K 1.694, Na 0.421, P 1.518, Cl 0.378, S 1.146, Fe 0.0150. **Vit. A** - to +, **B+**, **G+** **FUEL VALUE** 100 Gm equal 109 cal

c. breast. Abnormal prominence of the sternum **SYN** *pectus carinatum*.

c. fat clot. A yellowish blood clot.

chickenpox. A mild, contagious, infectious disease, marked by an eruption of vesicles on skin and mucous membranes **See** *varicella*.

chickory [G. *kichora*]. **COMP.** Low in mineral values **AV SERVING** 16 Gm. Pro. 0.3, Fat 0.1, Carbo 0.05 per serving. **ACTION** An aperient and stimulant **See** *condiments*.

chiggers. (1) The chigoe, jigger, or sand flea (*Tunga penetrans*) (2) Redbugs The six-legged larvae of mites of the family Thrombiculidae, order Acarina of the class Arachnida Also called rougets, harvest mites, scrub mites. They are parasitic on insects, various vertebrates, and man Eggs are laid on the ground and hatch in about 12 days, after which they attach to host at first opportunity The redbugs attach themselves to the surface of the skin and inject a salivary secretion which dissolves the surrounding tissues A tubular structure, a *stylosome*, is developed which is used in ingesting the semi-digested tissue debris The mites do not feed on blood The most common species attacking humans in N America is *Eutrombicula alfreddugesi* The irritation is the result of sensitization to the injected saliva

Treatment Alcohol or camphor allays itching Bathing with baking soda or ammonia gives relief Protection against redbugs can be obtained by rubbing dibutyl phthalate or benzyl benzoate or a 50-50 mixture of the two in clothing.

chignon fungoid (shēn-yon'). A bacterial invasion of the hair.

chigo, chigre (chēgo, chē'grā) [Sp]. A jigger or sand flea

chilblains (chil'blāns) [A.S. *cele*, cold, + *blegen*, to boil] Inflammation and swelling of the feet, toes, or fingers caused by cold.

SYM Reddish, violaceous plaques or patches on hands and feet, occasionally the ears. Persistent, giving rise to smarting, burning, itching, esp when parts become warm. In severe types frostbite corresponds to second degree burns, showing vesicles, bullae, ulcer, and necrosis **TREATMENT** Stimulants followed by iron tonics.

NP If circulation is not restored rub parts with warm hands; place patient in a cold room, give warm, nutritious drinks (no alcohol).

CHRONIC FORM: Warm, dry, woolen stockings should be worn, and thick, loose shoes. Wash the hands and feet daily in very hot water, drying quickly. Avoid sitting too close to a fire. For the itching, paint with tinct. iodine, or apply spirits of wine as a lotion, gently rubbed in. If broken, keep clean and covered with some soothing ointment, such as calamine, lanolin, or pure vaseline, spread on lint. The administration of calcium lactate is found to be of benefit in some cases.

To relieve inflammation and itching dissolve 3 drams of bicarbonate of soda in very hot water, then, holding a swab of wool in forceps, dab freely on and off the part for 10 minutes twice a day. Follow by rubbing in stainless iodine ointment.

child [A.S. *cild*]. A young person of either sex, bet. infancy and youth. *See* *pediatrics*, *pedophilia*, *puerile*, *puerilism*, *quadruplets*, *quintuplets*, *sibling*, *triplets*, *twins*

child/bed. Puerperium. Period during and immediately subsequent to parturition.

c. b. fever. Puerperal fever

Recently, vaccine has been injected into both sufferers from childbed fever and expectant mothers with excellent results. [child; parturition. *See* *labor*.

childbirth. The process of bringing forth a child crowing. Spasmodic closure of glottis, of brief duration, and succeeded by noisy inspiration. *SYN* *laryngismus stridulus*

chiloeptropion [G. *cheilos*, lip, + *ektropos*, turning out] Eversion of the lip

chilitis (ki-lit'is) [" + -itis, inflammation]. Inflammation of the lips *See*: *cheilitis*

chill (chil) [A.S. *celr*, cold] A disturbance of the heat regulating mechanism of the body, accompanied by shivering and fall of temperature.

Chills accompany various diseases, esp. malaria, and are coarse or fine, diffuse, trembling, etc

Etiol. (a) Onset of an exanthema. (b) Formation of pus somewhere in the body. (c) Onset of diseases such as pneumonia. (d) Puerperal infection, when following 2 or 3 days after childbirth. (e) Postoperative chill indicative of complications or infection

SYM A real chill is ushered in by extreme chilly sensation, chattering of the teeth and, in extreme cases, a marked tremor of the entire body and a rapidly rising temperature.

NP (a) Make patient comfortable by supplying external heat and extra blanket. (b) Give hot drink when permitted or tolerated. (c) Give patient moral support. (d) Take temperature as soon as possible, then again about 20 minutes after chill subsides. (e) Chart a report to attending physician, length of duration, degree of severity, and temperature. *See*: *ague*.

c., nervous. Accompanied by a chilly sensation but not with fever. It may follow severe pain or extreme nervousness. It usually passes quickly and is seldom serious

chilolangioscopy (ki-lo-an-jl-os'ko-pl) [G. *cheilos*, lip, + *ageion*, vessel, + *skopein*, to examine]. Microscopical examination of the circulation in the lip

chilognathopalatoschisis (ki-log'nath-o-pal-at-os'kis-ls) [" + *gnathos*, jaw, + *L palatum*, palate, + *G. schisis*, fissure]. Fissure of the lip, palate, and alveolar process.

Chilomas'tix mesnli. A species of *Mastigophora* that is parasitic in the intestines. [+ *schisis*, fissure]. Harelip.

chiloschisis (ki-los'kis-ls) [G. *cheilos*, lip, *chilostomatoplasty* (ki-los-to'ma-to-plas-ti) [" + *stoma*, mouth, + *plassein*, to form]. Plastic operation for harelip.

chilotomy [" + *tomé*, incision]. 1. Surgical removal of a portion of the lip for excision of a growth. 2. Cutting of an overgrowth at the articular end of a long bone to free its movement

chimney-sweeps' cancer. Epithelioma of the scrotum.

chin [A.S. *cin*, chin]. Point of the lower jaw; mentum, region below lower lip

c. cough. Whooping cough, *q v*

c. jerk. Reflex contraction of muscles of mastication on suddenly depressing the jaw.

c. reflex. Clonic movement resulting from percussing or stroking lower jaw.

chinfoon (kin'f-o-fon) USP A derivative of sulfonic acid, containing approximately 27% iodine.

Uses In treatment of amebic dysentery, and as a substitute for iodoform in surgical dusting powders

Dosage Orally, for adults, from 4-15 gr (0.25-1 Gm) 3 times a day; rectally, 15-75 gr (1-5 Gm) dissolved in 200 cc. water. Treatment combining both has been used in acute cases and serious chronic ones, and course of treatment requiring from 7 to 14 days

INCOMPATIBILITIES Moisture, mineral acids, ferric chloride, and oxidizing agents

chionablepsia (ki-on-ab-lep'si-ä) [G. *chiôn*, snow, + *ablepsia*, blindness]. Snow blindness

chirapsia (ki-räp'si-ä) [G. *chirapsia*, a touching with the hands]. Friction; massage

chirognostic (ki-rog-nos'tik) [G. *cheir*, hand, + *gnōstikos*, knowing] Having the ability to distinguish the right from the left

chirokinesesthesia (ki-ro-kin-es-the'si-ä) [" + *kinēsis* movement, + *aisthēsis* sensation] Subjective perception of motions of the hand

chiromegaly [" + *megas*, large]. Enlargement of the hands, wrists, or ankles

chiroplasty [" + *plassein*, to form]. A plastic operation on the hand

chiripodalgia (ki-ro-pod-äl'ji-ä) [" + *pous*, foot, + *algos*, pain] Pain in hands and feet *SYN* *acrodynia*

chiripodist (ki-ro-p'o-dist) [" + *pous*, foot] One who practices chiripody

chiripody (ki-ro-p'od-i) [" + *pous*, foot] Treatment of minor disorders of the feet

chirpompholyx (ki-ro-pom'fo-lik-s) [" + *pompholyx*, a bubble] Inflammatory disease of skin confined to hands and feet. *SYN* *pompholyx*, *q v*

SYM. Peculiar blebs or vesicles in groups.

chiropractic (ki-ro-prak'tik) [" + *L. practos*, done with the hand] A system of manipulative treatment which teaches that all diseases are caused by impingement on spinal nerves and can be corrected by spinal adjustments

chiropractor (ki-ro-prak'tor) One who practices chiropractic methods

chirospasm (ki-ro-spazm) [" + *spasmos*, spasm]. Spasmodic affection of muscles of hand, or writers' cramp.

chirurgery (ki-rur'je-ri) [" + *ergon*, work]. Surgery.

chirurgia (ki-rur'ji-ä). Surgery.

chirurgical (ki-rur'jik-al). Surgical.

chitinous (ki'tin-us) [G. *chitōn*, a tunic]. Pertaining to or composed of chitin.

c. degeneration. Amyloid degeneration

chloasma (klo-az'mā) [G. *chloazein*, to be green]. Pigmentary skin discolorations, usually those occurring in yellowish brown patches or spots

Error. Ordinarily nonpathological. In symptomatic types there may be abnormal physiologic function.

Sym. Areas rounded or oval with ill-defined margins, light yellow to black. In those due to external factors pigmentation develops only at sight of irritation or beyond. In symptomatic forms constitutional cause underlies

Treatment: Constitutional when indicated

c. gravidarum. Same as c. uterinum, q.v.

c. hepaticum. So-called "liver spot" following dyspepsia

c. idiopathic. C. caused by external agents, such as sun, heat, mechanical means, x-rays, etc

c. symptomatic. C. caused by various diseases, as syphilis or cancer

c. traumaticum. Skin discolorations from traumatic agencies

c. uterinum. Brown discolorations of skin in pregnancy.

chloroacetylation (klor-as-ēt-iz-a'shun). Production of local anesthesia by chloroform and glacial acetic acid

chloralamide (klor'al-ām'id) A hypnotic safer than chloral

Dosage 15-45 gr (10-30 Gm.)

chloral hydrate (klor'al). USP. Colorless, transparent crystals having aromatic, slightly acid odor, and caustic, faintly bitter taste, soluble in alcohol and water

Action and Uses. As a hypnotic in insomnia due to nervous excitation

Dosage From 10-30 gr (0.65-2.0 Gm.)

Incompatibilities In aqueous solution, acetanilid, alkaloids, borax, sodium bicarbonate, aromatic spirits of ammonia

Poisoning: Sym. Depresses and eventually paralyzes the central nervous system. There may be nausea and vomiting due to gastric irritation. Pulse is feeble, respirations are shallow and irregular, lassitude, weakness, dizziness, sleep

F. A. Treatment Dilute, then wash out stomach. Emetics do not work. Stimulants, esp. coffee, caffeine, or tea should be given in large doses. Keep patient warm. Administer artificial respiration

chloramphenicol (klor-ām-phēn'ī-cōl) USP syn for *chloromycetin*, q.v.

chloranemia (klor-an-e'mī-ā) [G. *chlōros*, green, + *a-*, priv., + *aima*, blood] An anemia resembling that of chlorosis occurring in some diseases, such as cancer and tuberculosis

chlorate (klor'āt). A salt of chloric acid. See *potassium chlorate*.

chlorbutanol. Colorless crystals, with taste and odor resembling camphor.

chlorbutol. Colorless crystals, with odor and taste resembling camphor. See: *chlorobutanol*

chlorcosane (klor-co-sān') (chlorinated paraffin). Used as a solvent for dichloramine T, q.v.

chloremia (klor-e'mī-ā) [G. *chlōros*, green, + *aima*, blood]. Anemia with diminution of hemoglobin and decrease in number of red corpuscles.

chloirephidrosis (klor-ef-i-dro'sis) [" + *ephidrosis*, perspiration]. Greenish perspiration.

chloretone (klō'rē-tōn). Colorless crystals, resembling camphor in odor and taste. See: *chlorobutanol*

chlorhydria (klor-hī'drī-ā) [" + *ydōr*, water]. Excess of hydrochloric acid in stomach.

chloride (klō'rīd) [G. *chlōros*, green]. A binary compound of chlorine; a salt of hydrochloric acid. Normal whole blood contains 450-500 mg. per 100 cc of blood, principally in the form of sodium chloride. Chlorides are increased in nephritis, eclampsia, anemia, and cardiac disease; decreased in fevers, diabetes, and pneumonia

Test for is determined on whole blood as a rule. Normal value for whole blood is 450-500 mg.; for blood plasma, 570-620 mg.; for blood serum 350-390 mg.

c. test for in urine. To a test tube half filled with urine is added a drop or 2 of nitric acid, which holds the phosphates in solution. Then a 3% solution of silver nitrate is added to the specimen, drop by drop, till about 6 drops have passed. This forms a white, curdy precipitate at once. The test should be compared with a known normal specimen of urine. *Diminished chlorides* are found in chronic nephritis, early stages of pneumonia, malignant disease, and in gastritis. Chlorides are increased in a diet rich in salt, in rickets, and hepatic cirrhosis.

chloridemia (klor-i-de'mī-ā) [" + *aima*, blood] Chlorides in the blood.

chloridimeter [" + *metron*, measure] An instrument for estimating amt. of chlorides in a fluid.

chloridimetry (klor-i-dim'e-trī). Determination of amt. of chlorides in the body fluids.

chloridrometer. Device for estimating amt. of chlorides in urine.

chloriduria (klor-id-ur'ī-ā) [G. *chlōros*, green, + *ouron*, urine] Presence or excess of chlorides in urine.

chlorinated (klor'in-ā-ted) [G. *chlōros*, green] Impregnated with chlorine.

c. lime. Calcium hypochlorite widely used in solution as a bleach, as an antiseptic, and as a ringworm preventive.

chlorina'tion. Treatment of water by addition of chlorine and its compounds for the killing of bacteria. 0.15 to 0.7 parts are used for million gallons of water.

chlorine (klō'rēn) [G. *chlōros*, green]. Syms. Cl A highly irritating gas and destructive to the mucous membranes of the respiratory passage-ways. It is very poisonous and excessive inhalation may cause death. Carefully inhaling ammonia or alcohol will counteract the effects of chlorine inhalation. Chlorine is an active bleaching agent and germicide. Both of these effects are due to its oxidizing powers. It is used extensively in the purification of water supplies and for disinfection. It is a chemical element with an atomic weight of 35.4

Functions: Chlorine is found combined with sodium in the blood and exercises some influence upon metabolism, and helps to maintain osmotic pressure, and aids in the regulation and stimulation of muscular action. The body fluids contain 0.85% salt solution. The inorganic salts keep in solution the proteins of the blood, milk, and other secretions. Chlorine is present in the hydrochloric acid of the gastric juice. It aids digestion, activates enzymes, and is essential to normal gastric secretion.

EXCRETION: The excretion of chlorine during a 31-day fast measured from 3.77 Gm. on the first day to 0.13 Gm. on the last day of the fast. It leaves the body in the form of chloride ions.

DEFICIENCY SYM (a) Hunger for salt, (b) loss of weight, (c) achlorhydria, (d) disturbances of digestion, (e) miner's cramps, (f) incomplete water retention.

c. preparations. Those used for disinfecting.

Chlorazene, or Dakin's solution, and other chlorine disinfectants are very effective in their germicidal power. As a disinfecting agent in washing dishes and utensils used by infected patients, 1/10 of 1% solution should be used, the dishes should then be washed well in soap and hot water and rinsed well, or boiled and then washed well after the boiling.

Stools. For disinfection of the stools of patients, 5% or even stronger solutions may be used for one-half hour or longer. The utensil is set aside and covered while the solution functions. Dakin's solution is nonirritating and is used as a wound disinfectant, but it must be carefully prepared daily by the laboratory and used only when fresh.

chlorite (klo'rit). A salt of chlorous acid, used as a disinfectant and bleaching agent.

chloroanemia (klor-o-a-ne'mi-ä) [G. *chlōros*, green, + *a-*, priv., + *aima*, blood]. Anemia occurring in cachectic conditions. **SYN:** *chlorosis*.

chloroazodin (klōr-ō-āz'ō-dīn). USP Syn for *asochloramine*, a germicidal preparation of chlorine.

chlorobutanol (klō-ro-bū'tan-ol). USP (Chlorbutol, chlorotone) Colorless crystals, with camphor odor and taste.

USES Antiseptic and local anesthetic, useful in relief of vomiting, and as a preservative in many pharmaceuticals.

DOSEAGE From 10 gr. (0.6 Gm.), preferably in capsule.

INCOMPATIBILITIES: Decomposed by alkalis, and should not be mixed with borax, carbonates, etc. Liquefies with menthol and phenol.

chloroform [L. *chloroformum*]. CHCl₃. USP. A heavy, clear, colorless liquid with strong ethereal odor, formed by the action of chlorinated lime on methyl alcohol.

ACTION AND USES: A general anesthetic, more dangerous than ether. Locally an irritant used in liniments. Internally a carminative and anodyne.

DOSEAGE 5 m. (0.3 cc.)

c. anesthesia. For some time chloroform anesthesia was more popular than ether. It is 6 times as strong, but it was found to be more harmful.

When employed, the chloroform is well diluted with air. It is not inflammable except when mixed with alcohol, although volatile at low temperatures. It tends to decompose and to form hydrochloric acid and carbonyl chloride and the latter substance is supposed to cause after-sickness. Chloroform should be kept in dark bottles in a dark, cool place.

ADVANTAGES: The period of excitement following anesthesia is relatively short. It does not irritate the mucous membranes and it produces excellent muscular relaxation. Neither does it cause excessive secretion of the respiratory mucous membrane. It has a pleasant

odor and it acts more agreeably than some other anesthetics.

PHYSIOLOGICAL ACTION: When inhaled it is promptly absorbed through the mucous membranes of the respiratory tract. After being eliminated by the lungs it seems to remain unchanged.

DANGERS. Dangerous symptoms may develop very suddenly. Circulatory depression may develop with cardiac arrest. It is a severe cardiac and respiratory depressant. It lowers chemical body pressure and body temperature, also blood pressure. It produces toxic changes in body chemistry, and is very detrimental to the bladder and kidney functioning. It should never be given without plenty of oxygen. In the proportion of 95% of air and 5% of chloroform. This form of anesthesia should not be used for a patient with a cardiac disease. Because it is not inflammable it may be used when work is to be done with a cautery, diathermy, or when the x-ray is used around the head or mouth. It also may be used in acute pulmonary pathology.

GENERAL REACTIONS: These include headache, nausea, vomiting, bronchial irritation and hysterical symptoms, but to a lesser extent than as a result of other anesthetics. Milk and lime water may allay vomiting and nausea, or lavage with a lukewarm solution of carbonate of soda. In stubborn cases a hypodermic injection of morphine, 1/4 gr (0.016 Gm.), may be ordered. **SEX:** *chloracization*, *chloroformin*, *chloroformism*.

chloroformin. A toxin extracted by chloroform from the tubercle bacilli.

chloroformism (klo'ro-form-izm). The habit of inhaling chloroform and the resulting symptoms.

chloroleukemia (klo-ro-lū-ke'mi-ä) [G. *chlōros*, green, + *leukos*, white, + *aima*, blood]. Leukemia with chlorosis.

chloroma (klo-ro'mä) [L. + *-oma*, growth]. A greenish sarcoma of the perosteum of cranial bones; "green cancer."

chloromycetin (klor-ō-mi-sē'tin). An antibiotic from a South American mold (*Streptomyces venezuelae*). Effective against epidemic typhus, Rocky Mountain spotted fever, undulant fever, urinary infections, bacillary dysenteries, whooping cough, psittacosis, virus pneumonia, scrub and murine typhus, rickettsialpox, and lymphogranuloma virus, and typhoid.

chloromyeloma (klo-ro-mi-cl-ō'mä) [L. + *myelos*, marrow, + *-oma*, growth]. Chloroma accompanied by multiple growths in bone marrow.

chloropenia (klo-ro-pe'ni-ä) [L. + *penēs*, poor]. Deficiency in chlorine, hypochloremia.

chloropenic (klo-ro-pēn'ik). Deficient in chlorine.

chlorophane (klo'ro-fän) [G. *chlōros*, green, + *phainein*, to show]. A green-yellow pigment in the retina.

chlorophyll, chlorophyll (klo-ro-fil) [L. + *phyllon*, leaf]. The green coloring matter in plants consisting of chlorophyll-a and chlorophyll-b. It acts as a catalytic agent in the process of photosynthesis in which carbon dioxide from the air reacts with water from the soil to form simple carbohydrates, which are used for energy or converted into more complex substances and stored.

chloro'pla [L. + *opsis*, vision]. Vision in which all things appear green.

chloroplast. Small round green bodies found in the cells of leaves and stem of plants which are important in the process of photosynthesis. They possess a stroma and contain four pigments chlorophyll-a, chlorophyll-b, carotin, and xanthophyll.

chloroplas'tid [' + *plastos*, form]. A chlorophyll granule.

chloroprivic (klor-o-priv'ik) [' + *L. privare*, to deprive of]. Lack of, or due to loss of, chlorides.

chlorop'sia [' + *opsis*, vision]. Vision in which all things seem green. *SYN:* *chloropia*.

chlorosarco'ma [' + *sarz*, flesh, + *-ōma*, tumor]. Sarcomatous form of chloroma.

chloro'sis [' + *-ōsis*, infection]. A form of anemia* in adolescent girls, perhaps due to faulty diet during puberty. Green sickness.

chlorotic (klo-rot'ik). Of the nature of or afflicted with chlorosis.

chloroxy'l (klō-roks'il). Cinchophen hydrochloride.

USPS AND DOSAGE: Same as cinchophen.

chlorpromazine. *SEE:* *Thorazine*.

chlōrum (klo'rum) [L.]. Official name of chlorine.

chloruremia (klor-ū-re'mī-ā) [G. *chlōros*, green, + *ouron*, urine, + *aima*, blood]. Urinary chlorides retained in the blood.

chlōrū'ria [' + *ouron*, urine]. Chlorides in the urine.

chlō'ryl. Anesthetic mixture of ethyl and methyl chlorides.

Ch.M. Abbr. for *Chirurgiae magister*, Master of Surgery.

choana na'rium (ko-ā'na) [G. *choanē*, funnel]. Post nares or opening into the nasopharynx of the nasal fossa on both sides.

choanoid (ko'an-oyd) [' + *eidōs*, shape]. Shaped like a funnel.

chocolate [Sp. from Mexican *choco*, cacao, + *latl*, water] 1. Preparation made by grinding roasted cacao or theobroma seeds 2. Beverage prepared by dissolving in water or milk *SEE:* *cocoa*.

choked disk. Inflammation of the optic disk. Also called papillitis or optic neuritis. *SEE:* *disk*.

choking [A.S. *aceocian*, to suffocate]. Obstruction within respiratory passage or constriction about the neck, interfering with breathing and circulation of brain.

SYM: Face purple, eyes protrude, arms thrown about, coughing. Constriction and injury about neck, cyanosis, dizziness, unconsciousness.

TREATMENT: Remove constriction. Artificial respiration. Slap violently on back. Severe blow bet shoulders. With children, compress chest with the hands squeezing suddenly and vigorously. If foreign body in throat, such as meat, insert thumb and forefinger and try to grasp it. If child, grasp by legs and reverse head for a moment. If the article is swallowed, do not give purgative. If sharp or angular, give plenty of rye or other bread, potatoes, and cheese. If lodged in throat and breathing is possible, interference should be limited until professional aid is at hand. *SEE:* *foreign bodies (in throat)*.

cholago'gia [G. *cholē*, bile, + *agein*, to lead forth]. Excretion of bile from gallbladder.

cholagogue (ko'lā-gog) [' + *agein*, to lead forth]. A purgative that stimulates the flow of bile. *EX:* *Calomel, inspissated oxgall, sodium glycocholate, and sodium taurocholate*.

cholangiogastrostomy (ko-lan'ji-o-gas-tros'to-mī) [' + *aggeion*, vessel, + *gaster*, stomach, + *stoma*, mouth]. Formation of a communication bet. a bile duct and the stomach.

cholangiography (ko-lan-ji-og'rā-fi) [' + " + *graphein*, to write]. X-ray or skialographic examination of the bile ducts.

cholangioma (ko-lan-ji-o'mā) [' + " + *-ōma*, tumor]. A tumor of the biliary ducts.

cholangiostomy (kol-an-ji-os'to-mī) [' + " + *stoma*, mouth]. The surgical formation of a fistula into the gallbladder.

cholangiotomy (kol-an-ji-ot'o-mī) [' + " + *tomē*, incision]. Incision of an intrahepatic bile duct for removal of gallstones.

cholangitis (ko-lan-ji'tis) [' + " + *-itis*, inflammation]. Inflammation of the gall or bile duct. May be obstructive or catarrhal.

cholascos (ko-las'kos) [' + *askos*, bag]. Escape of bile into the peritoneal cavity.

cholecyst (kol'e-sist) [' + *kystis*, cyst]. A pear-shaped sac on the undersurface of the right lobe of the liver, the reservoir for the bile. *SYN:* *gallbladder, vesica fellea*.

cholecystalgia (ko-lē-sis-tal'ji-ā) [' + " + *algos*, pain]. Biliary colic.

cholecystectasia (ko-le-sis-tek-ta'zi-ā) [' + " + *ektasis*, dilatation]. Dilatation of the gallbladder.

cholecystectomy (ko-le-sis-tek'to-mī) [' + " + *ektomē*, excision]. Excision of a gallbladder.

cholecystendysis (ko-le-sis-ten'dī-sis) [' + " + *endysis*, entrance]. Removal of a gallstone by incision, suturing wound in gallbladder and abdominal wall.

cholecystenterorrhaphy (ko-le-sist-en-ter-or'ā-fi) [' + " + *enteron*, intestine, + *raphē*, suture]. Suture of gallbladder to intestinal wall.

cholecystenterostomy (ko-le-sist-en-ter-os'to-mī) [' + " + " + *stoma*, opening]. Suturing of gallbladder to intestine.

cholecystic (ko-le-sis'tik) [' + *kystis*, cyst]. Pert to the gallbladder.

cholecystitis (ko-lē-sis-ti'tis) [' + " + *-itis*, inflammation]. Inflammation of the gallbladder. It may be acute or chronic.

ETIO. Gallstones, bacteria, parasites, organic or inorganic substances. *EXTENSION* of inflammation or growths from adjacent organs.

SYM. Distention through thickening of bile may give rise to pain and tenderness on palpation. Suppuration, ulceration, or gangrene may ensue. Jaundice appears when obstruction occurs.

TREATMENT: Principally dietetic, for which see *gallbladder*. Half teaspoonful Epsom salts in warm water on rising help to empty gallbladder. Fats in diet should be strictly limited. Surgery may be indicated.

NP: *Postoperative* Fowler's position to aid drainage. Watch for shock and symptoms of pneumonia. Sodium bicarbonate solution if needed to prevent vomiting. Stomach may have to be washed out. Flatus tube or carminative* enema, to relieve abdominal distention. An aperient 1st night, a saline aperient 3rd morning. Fluids in abundance and light diet after bowels have acted. Change soiled dressings. Remove drainage tube when it ceases to function. Prevent infection.

cholecystnephrostomy (ko'le-sist-nef-ros'-to-mi) [" + " + *nephros*, kidney, + *stoma*, mouth]. Making an anastomosis of gallbladder into renal pelvis.

cholecystocolostomy (ko-le-sis-to-ko-los'-to-mi) [" + " + *kolon*, colon, + *stoma*, mouth]. Making a passage from gallbladder to colon.

cholecystocolotomy (ko-le-sis-to-ko-lot'-o-mi) [" + " + " + *tomē*, incision]. Incision into gallbladder and colon.

cholecystoduodenostomy (kol-e-sis-to-du-o-den-os'-to-mi) [" + " + *L. duodeni*, twelve, + *G. stoma*, mouth]. Surgical formation of a passage from gallbladder to duodenum.

cholecystogastrostomy (ko-le-sis-to-gas-tros'-to-mi) [" + " + *gaster*, belly, + *stoma*, mouth]. Surgical formation of a passage from the gallbladder to the stomach.

cholecystogram [" + " + *gramma*, mark]. An x-ray picture of the gallbladder.

cholecystography (ko-le-sis-tog'rā-fi) [" + " + *graphein*, to write]. Examination of the gallbladder by x-ray.

cholecystostomy (ko-le-sis-to-ile-os'-to-mi) [" + " + *L. ileum* + *G. stoma*, mouth]. Forming a communication bet. the gallbladder and ileum.

cholecystojejunostomy (ko-le-sis-to-je-junos'-to-mi) [" + " + *L. jejunum*, empty, + *stoma*, mouth]. Forming a communication bet. the gallbladder and jejunum.

cholecystokinin (ko'le-sis-'tō-kī'nin) [" + " + *kinein*, to move]. A hormone supposed to stimulate action of the gallbladder.

cholecystolithiasis (ko-le-sis-to-lith-i'ā-sis) [" + " + *lithos*, stone]. Gallstones in the gallbladder.

cholecystolithripsy (ko-le-sis-to-lith-o-trip-si) [" + " + " + *tripsis*, a crushing]. Crushing of a gallstone in the unopened gallbladder.

cholecystomy [" + " + *tomē*, incision]. Cutting into the gallbladder. *Syn:* *cholecystotomy*.

cholecystopathy (ko-le-sis-top'ā-thi) [" + " + *pathos*, disease]. Any gallbladder affection.

cholecystopexy (ko-le-sis'to-pek-si) [" + " + *pēxis*, fixation]. Suturing the gallbladder to the abdominal wall.

cholecystoptosis (ko-le-sis-top'tō-sis) [" + " + *ptōsis*, fall]. Displacement of the gallbladder downward.

cholecystorrhaphy (kō-lē-sis-tor'ā-fi) [" + " + *raphē*, suture]. Suturing of the gallbladder.

cholecystostomy (ko-le-sis-tos'to-mi) [" + " + *stoma*, opening]. Surgical formation of a permanent opening into gallbladder through abdominal wall.

cholecystotomy (ko-le-sis-to'to-mi) [" + " + *tomē*, incision]. Incision of gallbladder through the abdominal walls for removal of gallstones.

choledochectasia (ko-led-o-kek-tā'zī-ā) [*G. choledochos*, common bile duct, + *ektasis*, distention]. Distention of the common bile duct or *ductus choledochus*.

choledochitis (ko-led-o-kī'tis) [" + " + *-itis*, inflammation]. Inflammation of common bile duct.

choledochoduodenostomy (ko-led'o-ko-du-o-den-os'-to-mi) [" + *L. duodeni*, twelve, + *G. stoma*, opening]. Surgical communication bet. the common bile duct and duodenum.

choledochointerostomy (ko-led'o-ko-en-ter-os'to-mi) [" + *enteron*, intestine, + *stoma*, opening]. Surgical passage bet. common bile duct and intestine.

choledocholithiasis (ko-led'o-ko-lith-i'ā-sis) [" + " + *lithos*, stone]. Calculi in the common bile duct.

choledocholithotomy (ko-le-do-ko-lith-ot'-o-mi) [" + " + *tomē*, incision]. Removal of a gallstone through an incision of the bile duct.

choledocholithripsy (ko-led-o-ko-lith-o-trip-si) [" + " + *tripsis*, a crushing]. Crushing of a gallstone in the common bile duct.

choledochoplasty (kol-e-do'ko-plas'ti) [" + *plassein*, to form]. Operation for repair of common bile duct.

choledochorrhaphy (ko-led-o-kor'rā-fi) [" + *raphē*, suture]. Suturing the severed ends of the common bile duct.

choledochostomy (kol-ed-o-ko'sto-mi) [" + *stoma*, mouth]. Surgical formation of an opening into common bile duct through abdominal wall.

choledochotomy (kol-ed-o-ko'to-mi) [" + *tomē*, incision]. Surgical incision of the common bile duct.

choledochus (ko-led'o-kus) [*G. cholē*, bile, + *dechesthai*, to receive]. The common bile duct. *Syn:* *ductus choledochus*.

choleemia (ko-le-he'mi-ā) [" + *aima*, blood]. Bile in the blood. *Syn:* *cholema*.

choleic (ko-le'ik) Cholic, pert. to the bile.

cholēlith [*G. cholē*, bile, + *lithos*, stone]. A bile stone.

cholelithiasis (kol-e-lith-i'as-is) [" + *lithos*, stone]. Formation of, or presence of, calculi or bilestones in the gallbladder or gallduct.

They may remain dormant or be responsible for few symptoms.

Sym. Digestive disturbances; heaviness in right hypochondrium, tenderness on pressure over gallbladder. Gallstone colic when passing through bile duct if obstructed. Pain may radiate to back and right shoulder. Colic usually manifest when stomach is empty. Jaundice if flow of bile is obstructed. Pain may be associated with vomiting, acidity, and sweating. Gallbladder may be palpated if distended. [necessary.]

Treatment. If colic is severe, surgery.

cholelithic (ko-le-lith'ik). Pert. to or caused by biliary calculus.

cholelithotomy (kol-e-lith-ot'-o-mi) [*G. cholē*, bile, + *lithos*, stone, + *tomē*, incision]. Removal of gallstones through a surgical incision.

cholelithotripsy (ko-le-lith-thot'rī-ti) [" + " + *L. tritus*, crushing]. Crushing of a biliary calculus.

cholemesis (kol-em'e-sis) [" + *emetn*, to vomit]. Bile in the vomitus.

cholemia (ko-le'mi-ā) [" + *aima*, blood]. Bile salts in the blood.

cholepathia (ko-le-path'i-ā) [" + *pathos*, disease]. Faulty contractions of bile ducts.

c. spas'tica. Spasmodic contraction of biliary ducts.

choleperitoneum (ko-le-per-i-to-ne'mi) [" + *peri*, around, + *temein*, to stretch]. Bile in the peritoneum.

cholepyrrhin (ko-le-pir'in) [" + *pyrrhos*, flame colored]. Impure bilirubin. *Syn:* *biliphein*.

chol'era [" + *rein*, to flow]. An acute, specific, infectious disease characterized by diarrhea, painful cramps of muscles, and tendency to collapse. Also called *Asiatic c.*, *Indian c.*, *algid c.*, *asphyctic c.*, *epidemic c.*, *malignant c.*, and *pestilential c.*

Etiol. Causative organism, *Vibrio cholera* (also called *Vibrio comma*, *Spirillum cholerae asiaticae*, *Spirillum chol-*

CHOLERA VIBRIO

Left, smear from young culture; right (higher magnification), stain for flagella.

erae, comma bacillus) which is found in the stools. Transmission may be through water supply, foods, immune carriers, or from man to man, either direct or indirect. The only portal of infection is the alimentary tract.

INCUBATION: A few hours to 4 to 5 days.

SYM: Four stages are usually described as follows:

Invasion: At the conclusion of the incubation period there is malaise, headache, diarrhea, and anorexia. Headache and slight fever are present. May last a few days, and then subside. Under such circumstances, may be termed cholerae. Sometimes this stage is lacking entirely.

Evacuation: Purging, violent, vomiting, and muscular cramps. Stools loose, copious, and watery, and present a typical rice water appearance. Sometimes there are particles of blood, as well as mucus. Vomiting severe and persistent, material expelled may also resemble rice water. Muscular cramps commonly start in extremities, involve calves of legs, and later even arms, hands, feet, and trunk. Thirst unquenchable and hiccup sometimes develops. Signs of depression soon terminate in collapse. Duration of stage, 2 to 12 hours, seldom more.

Stage of Collapse: Almost complete arrest of circulation, eyes sunken, cheeks hollow, nose pinched, skin dry and wrinkled, body surface cold, covered with clammy sweat, breath cool, temperature in axilla 85-95° F, while in the rectum it may be 103° F. or more. Respirations quickened, pulse weak, systolic blood pressure from 50 to 60, urine suppressed, evacuation and cramps may continue. Mind usually clear until toward the close when coma develops. Stage lasts from few hours to 1 or 2 days, and generally ends in death.

Stage of Reaction: Sometimes, even when death seems imminent, surface temperature begins to rise, vomiting ceases, bowel evacuations become less frequent, more feculent* and convalescence is established. Complete recovery may ensue in from 1 to 2 weeks. Occasionally, typhoid symptoms set in, temperature goes from 106-107° F. and outcome is fatal. Sometimes in this stage, an erythematous eruption or one of the urticarial type appears, particularly on extremities. Such eruptions have no special significance.

Sx: anticholera, "cholera-" words.

c. infantum. An acute disease of childhood, accompanied by vomiting, purging, and collapse.

ETIO: Inflammation of the gastrointestinal tract and possible disturbance of the sympathetic ganglia.

SYM. Onset gradual or abrupt. Diarrhea usually initial symptom. Stools thin, serous, musty odor, and alkaline reaction. Vomiting, everything rejected, thirst intense. Temperature 105-108° F., pulse rapid, feeble, urine scanty. Collapse follows and is indicated by pinched features, hollow eyes, sunken fontanelles, and cold body surface. Dehydration marked. Reaction may set in or death result from exhaustion. End may be characterized by symptoms of spurious hydrocephalus, restlessness, convulsions, irregular pupils, and coma, probably toxicemic, as there is no cerebral lesion.

PROG. Grave.

TREATMENT: Change of surroundings advisable. Fresh air and good hygienic surroundings most advantageous. Careful regulation of diet, which may be temporarily limited to barley water. If mother's health permits, breast feeding is preferable. Otherwise, utmost care and cleanliness are necessary in connection with artificial feeding.

c. morbus. An acute, sporadic disease, resembling cholera, but not excited by the comma bacillus of Koch.

SYM. Intense cramps in stomach, vomiting and purging of bilious material, moderate fever, and great prostration. In severe cases, discharges become serous and symptoms of collapse develop.

PROG. Favorable, death rarely occurs.

DURATION: Twenty-four to 48 hours.

TREATMENT: Hot applications to abdomen. Internal remedies, such as tincture of camphorated opium, are frequently helpful.

c. sicca. A term sometimes applied to a fulminating variety of cholera which occurs without vomiting or purging.

After death, intestines are found to contain rice water fluid not discharged during life on account of paralysis of muscular coat of the bowel.

COMPLICATIONS: Anuria, hyperpepsia, bronchopneumonia, parotitis, conjunctive keratitis, iritis, and gangrene of extremities.

DIFFERENTIAL DIAG. Cholera morbus, bacillary dysentery, food and metallic poisonings. Sometimes, cultural tests are necessary for definite diagnosis.

PROG. Most unfavorable in the old, young, and those suffering from chronic disease. Early collapse, cyanosis, and anuria are bad omens. Mortality averages about 50%.

TREATMENT: Prophylactic Quarantine, which should provide for screened enclosures. Protection of water supply, disinfection of stools and vomits, as well as contaminated articles. Personal cleanliness, esp of hands, and avoidance of uncooked foods.

Active: Absolute rest in bed and adequate warmth. Diet consists largely of barley water or whey. Use of cathartics inadvisable. Morphine of questionable value. Anticholera serum has met with little success. Atropine in doses of 0.01 gr., morning and night, seems helpful. In cases of collapse, normal salt solution at temperature of 98° in quantities of 500 cc. to 1000 cc., intravenously, should be given. Caffeine, sodium benzoate, camphor, and pituitary extract are also used.

IMMUNIZATION: Has been undertaken by a vaccine made from heat killed

cultures. It is administered subcutaneously in from 2 to 3 doses, beginning with 0.5 cc. and then 0.1 cc., each dose containing about 8,000,000 organisms per cc. The protection afforded usually lasts for at least 3 months.

choleraic (kol-ē-ra'ik). Pert. to cholera.

cholerae (kol'er-ās). The special bacteriolytic enzyme of cholera vibrio.

choleresis (kol'er-e'sis) [G. *cholē*, bile, + *ēresis*, removal]. The excretion of bile by the liver

choloretic (kol'er-et'ik). Pert. to choleresis, or any agent that increases excretion of bile by the liver.

choleric (kol'er-ik). Irritable; quick-tempered without apparent cause

cholericform (kol'er'f-form) [G. *cholē*, bile, + *rein*, to flow, + *L. forma*, shape]. Appearing like cholera

cholericogenous (kol'er-i'jen-us) [" + " + *gennan*, to produce]. Giving rise to cholera

cholérine (kol'er-ēn). A mild form or initial stages of Asiatic cholera.

cholérization (kol'er-i-za'shun) [G. *cholē*, bile, + *rein*, to flow]. Inoculation against cholera.

cholérophobia (kol'er-o-fo'be-a) [" + " + *phobos*, fear]. Morbid fear of acquiring cholera

cholerrhagia (kol'er-ra'j-ā) [" + *rēgnanai*, to burst forth]. A flow of bile.

cholerythrin (kol'er'f-thrin) [" + *erythros*, red] 1. Cholera-red 2. Pigment in urine of tropical residents

cholesta'sia [" + *stasis*, stoppage]. Arrest of the bile excretion

chol'estat'ic. Caused by arrest of biliary excretion.

cholesteatoma (kol-es-te-ā-to'ma) [G. *cholē*, bile, + *stear*, fat, + *-oma*, tumor] 1. (Primary) A pearl tumor or pearly nodules in brain 2. (Secondary.) One of suppurative otitic origin in presence of marginal perforations. Fatty degeneration of epithelium containing cholesterol crystals caused by nature's effort to arrest suppuration. Chloroform test to determine green ring.

cholest'erase [" + *stereos*, solid]. A cholesterol ferment

cholesteremia (kol-es-ter-e'mi-ā) [" + " + *ama*, blood]. Cholesterol in the blood

cholesterin (kol-es-ter-in) [" + *stereos*, solid]. Sterol; solid alcohol combined with fatty acids, forming a crystalline fat from bile and nerve tissue
It is held in solution in bile by the bile salts and is insoluble in water. It is deposited in the urine in the form of irregular flat platelets. It occurs in nearly every living tissue and makes it possible for the cells to hold large quantities of water. It checks the fat splitting enzymes and regulates fat metabolism, and absorption. The bile acids are derived from its mother substance. It also makes possible immunization from snake venom and neutralizes it.

DOSAGE: 3-5 gr. (0.2-0.3 Gm.).
DIAG: Normal content in blood is 150-170 mg. per each 100 cc. of blood. It increases after heavy, fatty meals, in diabetes, in some degenerative disorders, in pregnancy, arteriosclerosis, and obstructive jaundice. SEE: "*cholest-*" words.

cholesterinemia (kol-es-ter-in-e'mi-ā) [" + " + *ama*, blood]. Presence of cholesterol in the blood. SYN: *cholesterolemia*.

cholesterinuria (kol-es-ter-in-u'ri-ā) [" + " + *ouron*, urine]. Passing of cholesterol in the urine.

cholesterol (kol-es'ter-ol) [" + *stereos*, solid]. A monatomic alcohol, $C_{27}H_{46}OH$, found in fats and oils, esp. in the bile, making up the greater part of gallstones. Also found in the brain, the yolk of eggs, and seeds of plants.

DOSAGE: 3-5 gr (0.2-0.3 Gm.).

cholesterolemia (ko-le-s-ter-ol-e'mi-ā) [" + " + *ama*, blood]. Excess of cholesterol in the blood

cholesteroluria (ko-le-s-ter-ol-u'ri-ā) [" + " + *ouron*, urine]. Cholesterol in voided urine.

cholesterosis (ko-le-s-ter-o'sis) [" + " + *-osis*, infection]. Cholesterol deposition, esp. in excessive amounts, as in the gallbladder

choletelin (ko-let-el-in) [" + *telos*, end]. Yellow coloring derived from bilirubin.

choletherapy (ko-le-ther'ā-pi) [" + *therapeia*, treatment]. Use of oxgall as a medicine [urine]. Bile in urine.

choleuria (ko-le-u'ri-ā) [" + *ouron*, cholesterol] (ko-le-ver'din) [" + *L. viridis*, green]. Green pigment appearing in gallstones and in urine in jaundice. SYN: *biliverdin*.

choline (kōl'ēn) [G. *cholē*, bile]. A ptomaine found in bile and suprarenal extract, a decomposition product of lecithin essential for functioning of the liver. Claimed to be a Vit B complex.

cholinergic. Term applied to nerve endings which liberate acetylcholine
c. *fibers*. They include all preganglionic fibers (2) all postganglionic parasympathetic fibers (3) postganglionic sympathetic fibers to sweat glands (4) efferent fibers to skeletal muscle

cholochrome (ko'lo-krōm) [" + *chrōma*, color]. Any bile pigment

cholethemothorax (ko-le-hēm-o-tho'raks) [" + *ama*, blood, + *thōraz*, chest]. Bile and blood in the thorax.

chololith (kol'o-lith) [" + *lithos*, stone]. A gallstone, biliary calculus

chololithiasis (kol'o-lith-i'ās-is). Presence of concretions in the gallbladder. SYN: *cholelithiasis*.

cholorrhœa (kol-or-re'ā) [G. *cholē*, bile, + *roia*, flow]. Excessive secretion of bile.

cholescöpy (ko-lo's-ko-pi) [" + *skopein*, to examine]. Testing the biliary function.

chösis (ko-lo'sis) [" + *-ōsis*, infection]. A perversion of bile secretion.

choluria (ko-lu'ri-a) [" + *ouron*, urine]. Bile salts in the urine.

chondral (kon'dral) [G. *chondros*, cartilage]. Pert. to cartilage.

chondralgia (kon-dral'j-i-ā) [" + *algos*, pain]. Pain in or around a cartilage.

chondralloplasia (kon'dral-o-pla'zi-ā) [" + *altos*, other, + *plassein*, to form]. Presence of cartilage in abnormal places.

chondrectomy (kon-drek'to-mi) [" + *ektomē*, excision]. Surgical excision of a cartilage

chondric (kon'drik) [G. *chondros*, cartilage]. Pert. to cartilage.

chondrification (kon-dri-fi-ka'shun) [" + *L. facere*, to make]. Conversion into cartilage.

chondrigen [" + *gennan*, to produce]. Basal substance of cartilage, which turns into chondrin on boiling. SYN: *chondrogen*.

chondrin (kon'drin) [G. *chondros*, cartilage]. Gelatinlike matter obtained by boiling cartilage.

chondriosome (kon'dri-o-sōm) [" + *sōma*, body]. A constituent of cytoplasm in the protoplasm of a cell. May be concerned in the production of germ cells.

chondritis (kon-dri'tis) ["" + *-itis*, inflammation]. Inflammation of cartilage.

chon'droadeno'ma ["" + *adēn*, gland, + *-ōma*, tumor]. Cartilaginous tissue in an adenoma.

chon'droangio'ma ["" + *aggeion*, vessel, + *-ōma*, tumor]. Cartilaginous elements in an angioma.

chondroblast (kon'dro-blast) ["" + *blastos*, germ]. Cell of primitive cartilage in the embryo.

chondroclast (kon'dro-klast) ["" + *klastos*, broken into bits]. A cell concerned in the absorption of cartilage.

chondroconia (kon-dro-ko'ni-ā) ["" + *konis*, dust]. Reddish granules in myelocytes.

chondrocostal (kon-dro-kos'tal) ["" + *L. costa*, rib]. Pert. to costal cartilages.

chondrocranium (kon-dro-kra'ni-um) ["" + *kranion*, head]. The cartilaginous embryonic cranium before ossification.

chondrocyte (kon'dro-sit) ["" + *kytos*, cell]. A cartilage cell.

chondrodynia (kon-dro-din'i-ā) ["" + *odynē*, pain]. Pain in or about a cartilage.

chondrodysplasia (kon'dro-dis-pla'zi-ā) ["" + *dys*, bad, + *plassein*, to form]. Abnormal cartilage growth.

chondrodystrophy (kon-dro-dis'tro-fi) ["" + *dys*, difficult, + *trophē*, nourishment]. Defect in cartilage formation at epiphyses of long bones.

chondrofibroma (kon-dro-fī-bro'mā) ["" + *L. fibra*, fiber, + *G. -ōma*, tumor]. A mixed tumor with elements of chondroma and fibroma.

chondrogen (kon'dro-jen) ["" + *gennan*, to produce]. The cement substance of cartilage.

chondrogenesis (kon-dro-jen'es-is) ["" + *genesis*, production]. Formation of cartilage.

chondroid (kon'droid) ["" + *eidos*, resemblance]. Resembling cartilage, cartilaginous.

chondroituria (kon-dro-i-tu'ri-ā) ["" + *ouron*, urine]. Chondroitin acid in urine.

chondrolipoma (kon-dro-lip-o'mā) ["" + *lipos*, fat, + *-ōma*, tumor]. Cartilaginous and fatty tissue tumor.

chondrology (kon-dro-lo'ji) ["" + *logos*, study]. The science of cartilages.

chondrolysis (kon-dro-li'sis) ["" + *lysis*, dissolution]. The breaking down and absorption of cartilage.

chondroma ["" + *-ōma*, tumor]. A cartilaginous tumor of slow growth.

It may occur any place where there is cartilage. It causes no pain.

chondromalacia (kon-drō-mal-a'ci-ā) ["" + *malakia*, softening]. Softness of any cartilage.

chondromalacosis (kon-drō-mal-ā-ko'sis) ["" + "" + *-ōsis*, infection]. Cartilage softening. SYN *chondromalacia*.

chondromatous (kon-dro-mā-tus) ["" + *-ōma*, tumor]. Pert. to chondroma, or tumor of a cartilage.

chondromucoid (kon-dro-mu'koid) ["" + *L. mucus*, mucus, + *G. eidos*, form]. Mucin in cartilage.

chondromyoma (kon-dro-mi-o'mā) ["" + *mys*, muscle, + *-ōma*, tumor]. Myoma and cartilaginous neoplasm combined.

chondromyxoma (kon-dro-mik-sō'mā) ["" + *myxa*, mucus, + *-ōma*, tumor]. Chondroma with myxomatous elements.

chondromyxosarcoma (kon-dro-mik-sō-sar-kō'mā) ["" + "" + *sarx*, flesh, + *-ōma*, tumor]. A cartilaginous and sarcomatous tumor.

chondropathology (kon-dro-path'ol-o-jī) ["" + *pathos*, disease, + *logos*, study of]. Pathology of cartilages.

chondropathy (kon-dro-path-i) ["" + *pathos*, disease]. Any disease of cartilage.

chondrophyte (kon'dro-fit) ["" + *phyton*, a growth]. A growth from articular cartilage.

chondroplast (kon'dro-plast) ["" + *plassein*, to mold]. Cell of primitive cartilage in the embryo. SYN. *chondroblast*.

chondroplas'tic. Pert. to plastic operations on cartilage.

chondroplasty (kon'dro-plas-tī) [G. *chondros*, cartilage, + *plassein*, to mold]. Plastic or reparative surgery on cartilage.

chondroporosis (kon-dro-po-ro'sis) ["" + *poros*, passage]. The porous condition of cartilage, pathological or normal, during ossification.

chondroproteins (kon-dro-pro'te-ins) ["" + *prōtos*, first]. A group of glucoproteins found in cartilage, tendons, and connective tissue.

chondrosarcoma (kon-dro-sar-ko'mā) ["" + *sarx*, flesh, + *-ōma*, tumor]. Cartilaginous sarcoma.

chondro'sis ["" + *-ōsis*, infection]. The development of cartilage.

chon'droster'nal ["" + *sternon*, chest]. Pert. to sternal cartilage.

chondrotome (kon'dro-tōm) ["" + *tomē*, a cutting]. Device for dissection of cartilage.

chondrotomy (kon-diō'to-mī) ["" + *tomē*, incision]. Dissection or surgical division of cartilage.

chondroxiphoid (kon-dro-zi'foid) ["" + *xiphos*, sword, + *eidos*, form]. Pert. to the ensiform cartilage or xiphoid.

chondrus (kon'drus) [G. *chondrus*]. Cartilage.

Chopard's amputation (sho-pars'). Disarticulation at the midtarsal joint.

chor'da [G. *chordē*, cord]. A string or tendon.

c. dorsalis. The notochord.

c. gubernaculi. An embryonic structure forming a part of the gubernaculum testis in the male and the round ligament in the female.

c. obliqua. The oblique ligament, an oblique cord which connects the shafts of the radius and ulna. Extends from lateral side of tubercle of ulna to a point just below radial tuberosity.

c. tendinea. A small tendinous cord which connects the free edge of an atrioventricular valve to a papillary muscle.

c. tympani. A branch of the facial nerve which leaves the cranium through the stylomastoid foramen, transverse the tympanic cavity and joins a branch of the lingual nerve. Efferent fibers innervate the submaxillary and sublingual glands, afferent fibers convey taste impulses from ant. two thirds of the tongue.

c. umbilicalis. Umbilical cord connecting fetus and placenta.

c. Willisii. One of several fibrous cords across the superior longitudinal sinus.

chordal (kor'dal). Pert. to a chorda, esp. the notochord.

chordée (kor-dē) [Fr. *cordé*]. Downward, painful curvature of the penis on erection in gonorrhea caused by inflammatory infiltration of the corpus spongiosum which interferes with its distensibility.

A common occurrence in gonorrhea as the result of trauma.

chorditis (kor-dit'is) [*G. chordē*, cord, + *-itis*, inflammation]. Inflammation of a cord, esp. the spermatic, or a vocal cord.

c. nodo'sa. Formation of small, whitish nodules on one or both vocal cords.

Sym: Hoarseness, inability of singers to register tones properly.

Treatment Vocal hygiene. Surgical removal of nodules if they do not respond to conservative therapy.

chordoskeleton (kor-do-skel'et-on) [*' + skeleton*, a dried-up body]. That part of the skeleton in the embryo formed about the primitive spinal cord.

chordotomy [*' + tomē*, dissection]. Division of any cord to relieve pain.

chorea (ko-re'ā) [*G. choreia*, dance]. A nervous affection marked by muscular twitching.

See *Bergeron's chorea*, *tactitation*.

c., electric. Progressively fatal spasmodic disorder.

Etiol Possibly of malarial origin. Occurs usually in Italy. **Syn** *Dubini's disease*.

c., epidemic. Religious emotional neurosis, manifest in the 14th century in Europe, exhibited in form of dancing mania. **Syn** *dancing mania*.

c. gravidum. A form seen in some pregnant women, usually in those who have had chorea before, esp. in their first pregnancy.

c., Huntington's. A hereditary and chronic form manifested in adult life.

c., hyoscine. Movements simulating chorea, and sometimes accompanied by delirium, seen in acute hyoscine intoxication.

c., insaniens. Movements so violent patient is unable to walk, eat or even lie down.

Sym Fever develops, mind becomes delirious. Death frequently results from exhaustion. This form usually observed in adults, and esp in primipara.

Proc Frequently terminates fatally through exhaustion.

Treatment Quiet, hygienic life. Forced feeding. Severe cases complicating pregnancy will call for induction of premature labor. Constitutional remedies.

NP Rest in bed. Protect from injury by use of siderails. Light bed clothes, soft and free from wrinkles to avoid dermatitis. Isolation necessary. Visitors restricted; esp no children. If possible tub baths prolonged as sedative; warm water and hot sponging. Rhythmic breathing and rhythmic exercises as improvement sets in. Quietness. If violent, make bed on floor surrounded by bolsters. Rubber under sheets, soft blanket. Nourishing diet. Food in small pieces, as patient may not masticate. No glass utensils. Feed slowly. Precautions against bed sores. Mouth hygiene. Water bet. meals. Measure and test urine for albumin. No exertion.

c., major. C. with violent hysterical muscular action.

c., mimetic. C. due to imitative movements.

c., minor. Ordinary form of chorea.

c., posthemiplegic; c., postparalytic. Involuntary movements of patients subsequent to a hemiplegic attack.

c., rhythmic. C. with movements at regulated times.

c., senile. C. developing in senility.

c. Sydenham's. St. Vitus' dance. Occurs mostly in children.

Sym Lasts 6 to 8 weeks. Often accompanied with irritability, constipation, anemia, and loss of appetite; infectious. Movements of the head are irregular, and muscles of arms and face may be involved. Has a definite relation to scarlet fever, rheumatism and other infections.

Proc Usually recover in course of 2 or 3 months. Relapses not infrequent. Rare complication is death from heart disease. Among possible sequelae are imbecility and chronic chorea.

Treatment Rest of body and mind, remove child from school, place under most favorable hygienic conditions. Careful search should be made for reflex irritation as adherent prepuce, intestinal parasites, eyestrain, etc. All excitement avoided. Keep out of doors. Internal remedies.

choreal (ko-re'al) Pert. to chorea.

choreic (ko-re'ik). Pert to or of nature of chorea.

choreiform (ko-re'i'-form) [*G. choreia*, dance, + *L. forma*, form]. Of the nature of chorea.

choreomania (ko-re-o-ma'ni-ā) [*' + mania*, madness]. Epidemic chorea, as the dancing mania of the middle ages.

chorioadenoma (ko-ri-o-ad-en-o'mā) [*G. chorion*, skin, + *adēn*, gland, + *-ōma*, tumor]. Adenoma of the chorion.

chorioangioma (ko-ri-o-an-jī-o'mā) [*' + angion*, vessel, + *-ōma*, tumor]. A vascular tumor of the chorion.

choriocapillaris (ko-ri'o-kap-il-la'ris) [*' + L. capillaris*, hairlike]. Capillary layer of choroid.

choriocele (ko-ri-o-sēl) [*' + kēlē*, hernia]. A protrusion of the choroid coat of the eye through a defective sclera.

chorioepithelioma (ko-ri-o-ep-i-lē-o-mā) [*' + epi*, upon, + *thēlē*, nipple, + *-ōma*, tumor]. Excessive proliferation of chorionic epithelium. **Syn.** *syncytioma malignum*.

chorioid (ko-ri'oid). Vascular coat of eye bet sclera and retina. **Syn.** *choroid*, *q.v.*

chorioma (ko-ri-o'mā) (pl. *chorioma'ta*) [*' + -ōma*, tumor]. A tumor of the chorion.

choriomeningitis (ko-ri-o-men-in-jī'tis) [*' + menigr*, membrane, + *-itis*, inflammation]. Cerebral meningitis with cellular infiltration of the meninges.

c., acute lymphocytic. Disease resembling epidemic encephalitis, ant. poliomyelitis, and meningitis.

chorion (ko-ri'on) [*G.*]. Membrane developed from the external epiblastic layer and an internal mesoblastic layer which together form the wall of the primitive blastocyst.

It lies bet the amnion and decidua reflexa and it envelops, protects, and supplies nourishment to the embryo. The epiblastic epithelium is the trophoblast.

This layer is rapidly differentiated into 2 layers, the cytotrophoblast which immediately surrounds the ovum (cells of Langhans), and the plasmoditrophoblast which is undifferentiated trophoblast (syncytium), the cells of which erode the mucous membrane. The irregular trophoblastic buds are penetrated by mesoblastic tissue carrying with it fetal blood vessels and thus converting the buds into chorionic villi.

The cells of the villi are arranged in layers covering the vascular core of

CHORION

A, Chorion with villi. The villi are shown to be best developed in the part of the chorion to which the allantois is extending, this portion ultimately becomes the placenta. B, Extra-embryonic coelom. C, Amniotic cavity. D, Primitive gut or embryonic intestine. E, Yolk sac or umbilical vesicle.

mesoblast. (a) Layer of Langhans, inner layer of discrete cells. (b) Syncytium, outer layer of undifferentiated multinucleated protoplasm.

During the first few weeks of pregnancy, the entire surface of the ovum is covered with branching villi. The villi in contact with the decidua basalis rapidly multiply to form the *chorion frondosum*. Over the rest of the ovum the villi grow less rapidly and finally atrophy to disappear completely about the 4th month; this layer is called the *chorion laeve*.

SEE "chorio-" words.

c. **epithelioma**. Very malignant tumor of uterus occurring most commonly after a vesicular mole and sometimes after abortion.

chorionic (ko-ri-on'ik). Pert. to the chorion.

c. **villi**. The vascular projections from the chorion.

chorionitis (ko-ri-on-i'tis) [G. *chorion*, skin, + *-itis*, inflammation] 1 Inflammation of the chorion. 2 Inflammation of the true skin, or corium.

chorio-retinitis (ko-ri-o-ret'in-i'tis) [" + L *rete*, network, + G *-itis*, inflammation] Inflammation of choroid and retina.

chorista (ko-rist'a) [G. *chōristos*, separated] An error of development showing separation from the rudiments in a developing embryo.

choristoma (ko-ris-to'mā) [" + *-ōma*, tumor]. A neoplasm due to overdevelopment of embryonic rudiments.

choroid (kō'roid) [G. *chorioeidēs*, skinlike] Dark brown, vascular coat of eye bet. sclera and retina, extending from *ora serrata* to optic nerve.

Consists of blood vessels, united by connective tissue containing pigmented cells, and is made up of 5 layers: (1) suprachoroid; (2) layer of large vessels; (3) layer of medium sized vessels; (4) layer of capillaries; (5) *lamina vitrea* (homogeneous membrane placed next to pigmentary layer of retina).

Function: Nutrient organ for retina, vitreous, lens. SEE *auxilplexus*, "choroid-" words.

choroideremia (ko-roy-der-e'mī-ā) [G. *chorioeidēs*, skinlike, + *erēmia*, destitution]. Absence of the choroid coat of the eye.

choroiditis (ko-roid-i'tis) [" + *-itis*, inflammation]. Inflammation of choroid.

c., **anterior**. When outlets of exudation are at the choroidal periphery.

c., **areolar**. In which inflammation spreads from around the macula lutea.

c., **central**. Exudation is limited to the macula.

c., **diffuse or disseminated**. When the fundus is covered with spots.

c., **exudative**. When covered with patches of inflammation.

c., **metastatic**. When due to embolism.

c. **serosa**. Increase of fluids in eyeball raising intraocular pressure, resulting in atrophy of optic nerve and blindness. SYN *glaucoma*.

c., **suppurative**. When suppuration occurs.

choroidocyclitis [" + *kyklos*, a circle, + *-itis*, inflammation] Inflammation of the choroid coat and ciliary processes.

choroidiritis (ko-royd-o-i-ri'tis) [" + *iris*, iris, + *-itis*, inflammation] Inflammation of the choroid coat and iris.

choroidoretinitis (ko-royd-o-ret-in-i'tis) [" + L *rete*, network, + G *-itis*, inflammation]. Inflammation of choroid and retina.

choromania (ko-ro-mā'nī-ā) [G. *choros*, dance, + *mania*, madness] Epidemic dancing mania, choreomania.

Christian Science. A religion and system of healing disease of mind and body which teaches that all cause and effect is mental, and that sin, sickness, and death will be destroyed by a full understanding of the Divine Principle of Jesus' teachings and healing. (Webster's *New Int. Dictionary*, 2nd ed.)

Christison's formula. To estimate solids in urine per 1000 parts, multiply last 2 figures of specific gravity by 2.33.

Chrobak pelvis (krō'bak). A deformed pelvis caused by hip joint disease.

chromaffin (krō-mā'fin) [G. *chrōma*, color, + L *affinis*, having affinity for]. 1. Staining readily with chromium salts. 2. Noting pigmented cells forming medulla of the suprarenal glands and the paraganglia.

c. **system, c. tissue**. The mass of tissue forming paraganglia and medulla of suprarenal glands, which secretes adrenalin and stains readily with chromium salts.

Same kind of tissue is also found along abdominal aorta and in sympathetic nerves or ganglia. SEE *suprarenal glands*.

chromaffinoma (kro"maf-in-ōp-ā-thī) [" + " + G. -ōma, tumor]. A chromaffin cell tumor. SYN: *paraganglioma*.

chromaffinopathy (kro-maf-in-op-ā-thī) [" + " + G. *pathos*, disease]. Any disease of chromaffin tissue.

chromaphil (kro"maf-il) [" + *philein*, to love]. Pert. to a histological element or cell which stains readily with chromium salts. SYN: *chromaffin*.

chromate (kro"māt) [G. *chrōmatos*, color]. A salt of chromic acid. SEE *potassium c*.

chromateloopsia (kro"mat-ē-lop-sī-ā) [G. *chrōma*, color, + *ateleōs*, imperfect, + *opsis*, sight]. Color blindness.

chromatic. Pert. to color.

chromatin (kro"mā-tin) [G. *chrōma*, color]. Deeply staining substance of protoplasm in a cell nucleus which is considered as the physical basis of heredity.

The chemical carrier of inheritance in a cell, the principal substance in its nucleus, it determines the nature of daughter cells, *q.v.* SEE: "*chrom-*" words.

chromatinolysis (kro"mā-tin-ol'ī-sis) [" + *lysis*, dissolution]. 1 Destruction of chromatin. 2 The emptying of a cell, bacterial or other, by lysis.

chromatiorrhexis (kro"mā-tin-or-rek'sis) [" + *rēxis*, rupture]. Splitting of chromatin.

chromatism (kro"mā-tizm) [" + *ismos*]. 1 Unnatural pigmentation. 2 Chromatic aberration.

chromatodysopia (kro-mā-to-dis-o-pī-ā) [" + *dys*, ill, + *opsis*, sight]. Color blindness.

chromatogenous (kro-mā-toj'en-us) [" + *gennan*, to produce]. Causing pigmentation or color.

chromatolysis (kro-mā-to-lī-sis) [" + *lysis*, dissolution]. Tigrilysis, the disintegration and disappearance of the chromophil granules of a cell, esp. that occurring in neurons as a result of injury to the cell body or its axon.

chromatometer (kro-ma-toin-et'er) [" + *metron*, measure]. A scale of colors for testing color perception.

chromatopathy (kro-ma-top-ā-thī) [" + *pathos*, disease]. Any skin disease that is marked by pigmentation.

chromatophil, **chromatophilic** [" + *philein*, to love]. Staining easily.

chromatophore (kro-mat'o-fōr) [" + *pherein*, to bear]. A pigment bearing cell.

chromatopsia (kro-mā-to-sī-ā) [" + *opsis*, vision]. Abnormally colored vision.

chromatometry (kro-mat-op-tom'e-trī) [" + *optein*, to see, + *metron*, measure]. Measurement of color perception.

chromatosis (kro-mā-to'sis). Pigmentation.

chromaturia (kro-mā-tu'ri-ā) [" + *ouron*, urine]. Abnormal color of the urine.

chromicized. Mixed with a chromium salt.

chromidiosis (kro-mid-i-o'sis) [G. *chrōma*, color]. Overflow of chromatin and nuclear substance into cell protoplasm.

chromidium (pl. *chromidia*) [" + *-idion*, a dim. termination]. Central chromatic body of a blood platelet.

chromidrosis (kro-mi-dro'sis) [" + *idrōs*, sweat]. Excretion of colored sweat.

(a) It may be black. This may be present in hysteria due to indican in the sweat, and associated with constipation. (b) *Red sweat*. It may be due to an exudation of blood into the sweat glands, or to microorganisms in those glands.

Etiol. Occurs mostly in nervous, excitable women. May be due to ingestion or absorption of certain substances.

SYM Localized in eyelids, breasts, axillae, genitocrural regions, occasionally hands and limbs, grayish, bluish, violaceous, brownish, collecting on skin, giving a greasy, powdery appearance to parts.

PROG Obstinate and recurrent.

TREATMENT Relief of underlying nervous affection.

RS *anhidrosis*, *bromidrosis*, *hidrosis*, *hyperidrosis*, *uridrosis*.

chromium (kro"mī-um) [G. *chrōma*, color]. **SYMS** Cr At wt 52. A very hard, metallic element, steel gray in color.

c. compounds. Largely used in industries by dyers, furniture stainers and manufacturers of batteries in chromium plating. The salts are yellowish and often break up into particles, float in the air and are aspirated by patients. They lead to ulcerations of the nose and respiratory passages.

POISONING SYM A disagreeable taste in the mouth, pain, diarrhea, collapse and cramping.

TREATMENT Chalk, magnesia, and other weak alkalis to neutralize its acid effects. Wash out stomach and give soothing drinks.

chromoblast [" + *blastos*, germ]. An embryonic cell that becomes a pigment cell.

chromocholoscapy (kro-mo-ko-lo's'ko-plī) [" + *chole*, bile, + *skopein*, to examine]. Examination of the biliary function by a pigment extraction test.

chromocrinia (kro-mo-krin-i-ā) [" + *krinein*, to separate]. The secretion or excretion of pigmented matter.

chromocystoscopy (kro-mo-sis-tos'ko-plī) [" + *kystis*, cyst, + *skopein*, to examine]. Determination of functional activity of kidneys by use of dyes.

chromocyte (kro"mo-sit) [" + *kytos*, cell]. Any colored cell.

chromocytometer (kro-mo-si-tom-et'er) [" + *metron*, measure]. Instrument for determining the hemoglobin in red blood corpuscles.

chromodermatosis (kro-mo-der-mā-to'sis) [" + *derma*, skin, + *-osis*, infection]. Any pigmented skin disease.

chromodiagnosis [" + *dia*, through, + *gnōsis*, knowledge]. Diagnosis by change of color of the serum.

chromogen (kro"mo-jen) [" + *gennan*, to produce]. Any principle that may be changed into coloring matter.

chromogenesis [" + *genesis*, production]. Production of pigment.

chromogenic. Pigment producing.

chromolipoid (kro-mo-lip'oid) [G. *chrōma*, color, + *lipos*, fat, + *eidōs*, appearance]. Any lipid, such as carotin, that is pigmented. SYN: *lipochrome*.

chromolume (kro"mo-lūm) [" + *L. lumen*, light]. Device for producing colored light rays.

chromolysis (kro-mol'is-is) [" + *lysis*, dissolution]. 1. Destruction of chromatin. 2. Lysis of a cell. SYN: *chromatolysis*.

chromoma [" + *-ōma*, tumor]. Neoplasm assumed to be derived from chromatophore cells.

chromomere (kro"mo-mēr) [" + *meros*, part]. (1) One of a series of chromatin granules found in a chromosome. (2) A highly refractile purple granule which forms the central portion of a blood platelet.

chromometer (kro-mom'e-ter) [" + *metron*, measure]. Device for determining the pigment in a substance.

chromometry (kro-mom'et-ri). The estimation of coloring matter.

chromoparic [G. *chrōma*, color, + *L. parēre*, produce]. Producing color; chromogenic.

chromopexic [" + *pēxis*, fixation]. Fixing coloring matter, as the liver.

chromophage (kro'mo-faj) [" + *phagein*, to eat]. A phagocyte that destroys pigment believed to be present in the blanching of hair. SYN *pigmentophagocyte*.

chromophane (kro'mo-fān) [" + *phainēin*, to show]. Retinal pigment.

chromophile (kro'mo-fil) [" + *philein*, to love]. 1. Any structure that stains easily. 2. Staining readily.

chromophilic (kro'mo-fil'ik). Staining readily, chromophilous

chromophilous (kro'mo-fil-us). Chromophilic.

chromophobe (krō'mō-fōb) [G. *chrōma*, color, + *phobos*, fear]. Resistant to stain or a cell which does not stain.

chromophoric [G. *chrōma*, color, + *pherein*, to bear]. Pert. to or bearing color

chromophose (kro'mo-fōz) [" + *phōs*, light]. A subjective sensation of a spot of color in the eye SEE *centrophose*, *centrophose*.

chromophytosis (kro-mo-fī-to'sis) [" + *phyton*, plant, + *-ōsis*, infection]. Pigmentation of skin due to a vegetable parasite. Tinea, or pityriasis versicolor

chromoplasm [" + *plasma*, matter]. The network of a cell nucleus.

chromoplas'tid [" + *plastos*, formed]. A pigment granule in protoplasm.

chromoprotein (kro-mo-pro'te-in) [" + *prōtos*, first]. A pigmented conjugated protein made up of pigment and a simple protein, as hemoglobin

chromop'sia [" + *opsis*, vision]. Chromatopsia, colored vision.

chromotometer (kro-mop-tom'e-ter) [" + *optem*, to see, + *metron*, measure]. Instrument for determining keenness of color vision.

chromoradiom'eter [" + *L. radius*, ray, + *G. metron*, measure]. An instrument for measuring penetrative power of roentgen rays

chromoscope (krō-mō-skōp) [" + *skopein*, to examine]. Instrument for determining color perception

chromoscopy (krō-mos'kō-pl) [" + *skopein*, to examine]. 1. Examination for color vision. 2. Administration of dyes to stain the urine and in this manner make a diagnosis of kidney function.

chromosome (krō'mō-sōm) [G. *chrōma*, color, + *sōma*, body]. A microscopic rod, J- or V-shaped body which develops from the nuclear material of a cell and is especially conspicuous during mitosis. They stain deeply with basic dyes. They contain the genes or hereditary determiners.

The V-shaped, threadlike bodies formed by the breaking up of the chromatin network in the nucleus of a cell during mitotic division. From the network stage the chromatin assumes a tangled skein appearance, which again breaks into short, V-shaped lengths known as *chromosomes*. The number of chromosomes is constant for each species of animal. In man they number 48 or in 24 pairs, one derived from each parent. The germ cells, sperm and ova contain only one chromosome of each

pair. Their function is said to be concerned with the transmission of hereditary traits from the parents to their offspring, carrying the genes like beads on a string.

2. The unit of chromatin in the nucleus of a cell.

SEE *allosome*, *azoneme*, *heredity*.

c., accessory. An unpaired monosome, which does not divide, but goes into only 1 of the daughter cells. SYN: *allosome*, *heterochromosome*.

c., bivalent. Two chromosomes united temporarily.

c., sex. An accessory c, so named because it is thought to transmit sexual characteristics

c., X. The sex chromosome. Females possess two X-chromosomes in all somatic cells. The mature ovum contains one X-chromosome. In somatic cells of the male, the X-chromosome has a diminutive mate, the Y-chromosome. Half of the mature sperm contain the X-chromosome, half the Y-chromosome. Zygotes are either XX or XY. XX zygotes developing into females. XY zygotes developing into males. The X-chromosomes contain the genes for sex-linked characters

c., Y. The Y-chromosome is usually devoid of genes and is absent in the male of certain animals (some insects and nematodes)

chrom'other'apy [" + *therapeia*, treatment]. The use of colored light in the treatment of disease.

chromot'ox'ic [" + *toxikon*, poison]. Caused by toxic action on the hemoglobin.

chromoureterosc'opy (kro-mo-ū-ret-er-os'ko-pl) [" + *oureter*, ureter, + *skopein*, to examine]. Inspecting orifices of ureters after giving a substance to dye the urine.

chronaxia (kron-ak'si-ā) [G. *chronos*, time, + *axia*, value]. Time intensity relation of electrical stimuli

chronaximeter (kron-aks-im'et-er) [" + " + *metron*, measure]. Device for measuring chronaxia

chronaxy (kro'nak-si) [" + *axia*, value]. A number expressing the sensitiveness of a nerve to electrical stimulation.

It is the minimum duration, measured in seconds, during which a current of prescribed strength must pass through a motor nerve in order to cause contraction in the associated muscle; the strength of direct current (the rheobasic voltage) which will just suffice if given an indefinite time is first determined, and exactly double this strength is taken for the final determinations

chron'ic [G. *chronos*, duration]. Long drawn out, applied to a disease that is not acute.

chronic'ity (kro-nis'it-i). State of being chronic

chronobiol'ogy [G. *chronos*, time, + *bios*, life, + *logos*, study of]. Science of duration of life, and methods of prolonging it.

chronograph (kron'o-graf) [" + *graphein*, to write]. Device for recording short intervals of time

chronological (krōn'ō-lōj'i-kāl) [G. *chronos*, time, + *logos*, understanding]. Occurring in natural sequence according to time.

c. age. The number of years of one's life.

By educators, for those 16 and over, assumed to be 16 years, no matter how much greater it may be determined by the results of intelligence tests. SEE: *age*, *intelligence quotient*.

chronoscope [G. *chronos*, time, + *skopein*, to examine] Device for measuring extremely short intervals of time.

chronotropic [' + *trepein*, to turn]. Pert. to all that modifies periodically recurring action, such as the heart beat.

c. fibers. Those which control contraction of the heart.

chronotropism [' + + *ismos*, condition of]. Modification of periodical movements through external causes

chrysarobin (kris-ar-o'bin) (goa powder). USP A mixture of neutral principles obtained from a substance deposited in the wood of *Araroba*, a leguminous tree grown in South America

ACTION AND USES. Antiparasitic and an irritant. Employed in the treatment of fungous diseases of the skin in a 2 to 20% ointment.

INCOMPATIBILITIES. Turns brown on exposure to air, turns red in ammonia water, deep brown with nitric acid

chthonophagia (thon-o-fa'j-l-á) [G. *chthōn*, earth, + *phagein*, to eat]. Eating clay or dirt, geophagy

Chvostek's sign (shvos'teks) Local spasm following a tap on one side of face

chylangioma (ki-lan-ji-o-má) [G. *chylos*, chyle, + *ageion*, vessel, + *-oma*, tumor]. 1. Tumor of intestinal lymph vessels containing chyle 2 Retention of chyle in lymphatic vessels with dilatation.

chyle (kil) [G. *chylos*]. The milklike contents of the lacteals and lymphatic vessels of the intestine consisting of the products of digestion and principally absorbed fats. It is carried by the lymphatic vessels to the cisterna chyli and then by way of the thoracic duct to the left subclavian vein where it enters the blood stream. Four to five pounds are formed in 24 hours Sp gr 1.015. Reaction is alkaline

RS *achylia*, *achylosis*, *achyma*, *achymosis*, "chyl-" words, *cisterna chyli*, *oligochylia*, *receptaculum chyli*, *secretion*

chylemia (ki-le'mi-á) [' + *aima*, blood]. Chyle in the peripheral circulation

chylidrosis (ki-li-dro'sis) [' + *idrōs*, sweat]. A milklike sweat resembling chyle

chylifacient (ki-li-fa'shent) [' + *L. facere*, to make] Forming chyle.

chylifaction (ki-li-fak'shun) [' + *L. facere*, to make] The formation of chyle

chylifactive (ki-lif-ak'tiv). Forming chyle; chylifacient

chyliferous (ki-lif'er-us) [G. *chylos*, chyle, + *L. ferre*, to carry] Carrying chyle

chylification (ki-li-fi-ka'shun) [' + *facere*, to make] Formation of chyle

chylöcele (ki'lo-sél) [' + *kēlē*, tumor]. Infused chyle in *tunica vaginalis testis*.

chyloderma (ki-lo-der'má) [' + *derma*, skin]. Lymph accumulated in the enlarged lymphatic vessels and thickened skin of the scrotum, lymph scrotum; scrotal elephantiasis

chylology (ki-loi'o-ji) [' + *logos*, study of]. The study of chyle

chylomediastinum (ki-lo'me-di-as'ti-num) [' + *L. mediastinum*, being in the middle] Chyle in the mediastinum.

chylomicron (ki-lo-mi'kron) [' + *mikros*, small]. Small particle of fat in the blood after digestion and absorption of fat in the food, and perceptible under a microscope

chylopericardium (ki-lo-per-i-kar'di-um) [' + *peri*, around, + *kardia*, heart]. Chyle in the pericardium.

chyloperitoneum [' + + + *teinain*, to stretch]. Effused chyle in peritoneal cavity.

chylophoric (ki-lo-for'ik) [' + *phoros*, bearing]. Conveying chyle; chyloferous.

chylopoiesis (ki-lo-pol-e'sis) [' + *poiesis*, production]. Formation of chyle and absorption by lacteals in the intestines. **SYN** *chylification*.

chylopoietic (ki-lo-pol-et'ik) [' + *poiesis*, production] Pert to formation of chyle.

chylosis (ki-lo'sis) [' + *-osis*, infection]. Formation of chyle. **SYN** *chylifaction*, *q.v.*

chylothorax [' + *thōrax*, chest]. Chyle in pleural cavities

chylous (ki'lus) [G. *chylos*]. Pert. to or of the nature of chyle

chyluria (ki-lu'ri-á) [' + *ouron*, urine]. Chyle or fat globules in the urine.

chyme (kim) [G. *chymos*, juice]. The mixture of partly digested food and digestive secretions found in the stomach and small intestine during digestion of a meal. It is a varicolored, thick, but nearly liquid mass. **SEX** "chym-" words, *enchyma*, *oligochymia*.

chymification [' + *L. facere*, to make]. 1. Formation of food into chyme. 2. Gastric digestion

chymosin (ki'mo-sin) [G. *chymos*, juice]. Milk curdling enzyme found chiefly in gastric juice. **SYN** *rennet*, *rennin*.

chymosinogen (ki-mo-sin'o-jen) [' + *gen-az*, to produce]. A substance from which chymosin is formed

C. I. Abbr for color index; also chemotherapeutic index (parasitology)

CIBHA. Abbr for congenital inclusion body hemolytic anemia

chymotrypsin (ki'mo-trip'sin) A proteolytic enzyme of pancreatic secretion

cibistome (si-bis'ti-ōm) [G. *kibisis*, pouch, + *tomē*, a cut] Instrument for incision of capsule of the lens

cicatricial (sik-á-trish'al) [L. *cicatrix*, scar] Pert to a cicatrix

cicatricotomy (sik-á-trish-al-o'to-mi) [' + *G. tomē*, incision]. Incision of a cicatrix or scar

cicatrix (sik'a-triks, sik-a'triks) [L.]. A scar left by a healed wound

Lack of color is due to absence of pigmentation. Cicatricial tissue is less elastic than normal tissue, hence it usually presents a contracted appearance.

TREATMENT. Skin graft, carbon dioxide snow, x-rays, or radium

cicatrizant (sik-kat'riz-ant) [L. *cicatrix*, scar] Favoring or causing cicatrization.

cicatrization (sik-at-ri-za'shun) [L. *cicatrix*, scar]. Healing by scar formation. **SRV** *intention*

cicatrize [L. *cicatrix*, scar]. To heal by scar tissue

cilia (sil'i-á) (sing. *cil'ium*) [L. pl.]. 1. Eyelashes 2 Hairlike processes projecting from epithelial cells, as in the bronchi, which wave mucus, pus, and dust particles upward. **SEE** *biciliate*.

ciliariscope (sil-i-a'ri-skōp) [L. *ciliaris*, pert to eyelash, + *G. skopein*, to examine] Instrument for examination of the ciliary region of the eye.

ciliarotomy (sil-i-ar-o'to-mi) [' + *G. tomē*, incision]. Surgical section of the ciliary zone in glaucoma

ciliary [L. *ciliaris*, pert. to eyelash]. 1. Pert. to any hairlike processes. 2. An eyelid, and eyelash

c. arteries. Branches of the ophthalmic artery which supply the choroid layer

c. body. Extends from base of iris to ant. part of choroid, consists of ciliary processes and ciliary muscle

c. ganglion. A ganglion lying in the posterior part of the orbit. Receives preganglionic fibers through the oculomotor nerve from the nucleus of Edinger-Westphal of the midbrain. From it six short ciliary nerves pass to the eyeball. Postganglionic fibers innervate the ciliary muscle, sphincter of the iris, and the smooth muscles of blood vessels of these structures and the cornea.

c. glands. Glands of Moll, a form of sweat glands of the eyelid

c. muscle. Accommodation muscle of eye.

c. processes. Consist of about 70 folds arranged meridionally so as to form a circle, have same structure as rest of choroid and secrete nutrient fluids which nourish neighboring parts, as cornea, lens, vitreous body. They also serve as points of attachment for the suspensory ligament of the lens.

c. reflex. Normal movement of pupil in accommodation of eye

cil'iate [L. *cilia*, eyelashes] Having hair-like projections resembling cilia

ciliated (sil'i-a-ted) Possessing cilia.

c. epithelium. Epithelium with hair-like processes on surface. They waft only in one direction and line the respiratory tract and fallopian tubes

cilicectomy (sil-i-ek'to-mi) [L. *cilium*, eyelash, + G. *ektomē*, excision]. Excision of portion of ciliary muscle, body, or border of eyelid

ciliospinal (sil-i-o-spi'nal) [+ *spina*, thorn] Pert to the ciliary body and spinal cord

c. center. Spinal cord center which controls dilatation of the pupil

c. reflex. Dilation of pupil following stimulation of the skin of the neck by pinching or scratching the skin

cilotomy (sil-i-to'o-mi) [+ G. *tomē*, incision] Section of the ciliary nerves

cilium (sil-i-um) [L.]. 1. An eyelash 2. Hairlike process of certain cells

ciliosis (sil-i-o'sis) [L.] Twitching of an eyelid, spasmodically

cimbria (sim'be-ā) [L.] Slender band of white fibers crossing the ventral surface of a cerebral peduncle

Cimex lectularius (si'meks lek-tū-lā'ri-us). The bedbug

cinchona (sin'ko-nā) [Sp. *cinchon*, from Countess of Cinchon who was cured by bark in 1638] (Peruvian bark) USP. The dried bark of the tree cinchona, the source of quinine. Its preparation, the tincture and compound tincture, useful as a bitter tonic

DOSAGE 1 dram (4 cc.).

cinchonism (sin'kon-izm) [+ G. *ismos*, condition of] Poisoning from cinchona or its alkaloids

cinchonize (sin'ko-niz) [Sp. *cinchon*]. To bring under the influence of cinchona or its alkaloids, esp. quinine

cinchophen (sin'ko-fen) (atophan). USP. Light yellow powder with slightly bitter taste, a dangerous drug to use.

Action and Uses. An analgesic in gout and acute arthritis, an antipyretic. Often toxic.

DOSAGE. 5 m. (10 cc.).

c. poisoning. Out of 117 cases of poisoning reported there were 61 deaths.

Sym: Gastric irritation, nausea, vomiting, belching, heartburn, vertigo, weakness, diarrhea, itching, rash, jaundice,

stupor. When chronic it is often associated with profound liver damage. Those with gallbladder disease, inflammation, or cirrhosis of liver, the undernourished and those suffering from alcoholism are esp. susceptible

F A TREATMENT. Largely symptomatic. Wash out stomach, give large quantities of fluids and saline catharsis. Sugars, glucose, intravenously. Insulin if sugar appears in the urine

cinclisis (sin'klis-is) [G. *kikhklisis*, a wagging]. Rapid winking, or quick, spasmodic movements of any part of the body

cincture sensation (sink'tūr) [L. *cinctura*, from *cingere*, *cinctum*, to gird] Sensation of a tight girdle about the waist. SYN *zonesthesia*

cinematics [G. *kinema*, motion]. Science of motion, kinematics

cinematography (sin-e-mat'o-rā-dī-og'ra-fī) [+ L. *radius*, ray, + G. *graphein*, to write]. Radiography of an organ in motion

cineplas'tics [G. *kinem*, to move, + *plastikos*, formed]. Formation after amputation of muscles of a stump, so that it is possible to impart motion and direction to an artificial limb

cineraceous (sin-e-rā'shus) [L. *cinis*, ciner-, ash] Like ashes

cinerea (sin-e-rē-ā) [L. *cinerius*, ashen-hued] The gray matter of the brain and nervous system

cine'ral. Pert to gray matter of the nervous system

cineritious (sin-er-ish'us) [L. *cineritius*, ashen] Ashen, as the gray matter.

cinésalgia (sin-es-al'ji-ā) [G. *kinēsis*, motion, + *algos*, pain]. Pain caused by movement of muscles

cinési- [G. *kinēsis*, motion] Prefix Motion. See also *kinēsis*.

cinésia (sin-e-si-ā) [G. *kinēsis*, motion]. Motion sickness, as car sickness, seasickness

cinesthesia (sin-es-the'zi-ā) [+ *aisthēsis*, sensation] 1 The sense of motion. 2 The false sense of moving in space

cinetocytopenia (si-net'o-si-to-pe'ni-ā) [+ *penia*, poverty] Having an abnormally small number of cinetocytes in the blood

cingulum (pl. cin'gula) (sin'gu-lum) [L. *girdle*] (1) A band of association fibers in the cingulate gyrus extending from anterior perforated substance posteriorly to the hippocampal gyrus. (2) An eminence on the lingual surface of the incisor teeth especially the upper ones. It is situated near the gum. Also called *basal ridge*

cion (si'ōn) [G. *kiōn*, uvula] The uvula

cioni'tis [+ *-itis*, inflammation]. Inflammation of the uvula

cionoptosis (si-on-op-to'si-ā) [+ *ptōsis*, a falling] A lengthened uvula

cionotome (si-on'o-tōm) [+ *tomē*, incision] Instrument for excision of the uvula.

cionotomy (si-on-to'o-mi) [+ *tomē*, incision] Excision of uvula

circa (sir'kā) [L.]. Prefix: About.

circinate (sur'si-nat) [L. *circinatus*, made round] Circular.

cir'cle [L. *circulus*, dim. of *circus*, a ring]. Any ringshaped structure

c. of diffusion. One or more on projection plane of an image not in focus of the lens

c. of Willis. Union of the ant. and post. cerebral arteries (branches of the

carotid) forming an anastomosis at base of the brain.

c., vascular. One around the mouth formed by inf. and sup. coronary arteries

circuit [*L. circuire*, to go around]. Course or path of an electric current.

c. breaker. A safety device for opening an electrical circuit, a switch.

c., closed. A circuit through which electricity is passing or can pass.

c., electric. The path through conductors by which an electric current passes

c., ground. Ground or earth as part of electric circuit.

c., high frequency. A spark gap, condenser, and the oscillatory transformer or resonator

c., magnetic. The closed path of magnetic lines, *e. g.*, the magnetic circuit of a transformer.

c., open. A circuit having some break in it so that current is not passing or cannot pass This break may be intentional, as an open switch, or accidental, as a blown fuse, a loose connection, or a broken wire.

c., short. An accidental overflow of current due to the establishment of a low resistance bypass

circular [*L. circularis*, pert to a ring]

1. Shaped like a circle. 2. Recurrent

c. insanity. That in which manic and depressive attacks follow one another without intervals of lucidity.

circulation [*L. circulatio*, movement in a circle] Movement in a circular course

c. of the aqueous humor of the eye. SEE. *aqueous*.

c. of bile salts. The sodium glycocholate and taurocholate found in hepatic bile pass with it into the intestine, where they are absorbed along with the fats. They therefore pass with the blood of the portal vein back to the liver, where they are again used in making fresh bile.

c. of the blood. The blood leaving the left ventricle enters the aorta, from which it escapes into the various large arteries It thus reaches the coronary

arteries of the heart itself and the arteries of the head, body wall, abdominal viscera, and extremities. Passing through the various capillary systems, it is gathered into veins, of which there are 2 systems. (1) Most veins empty their blood into the *venae cavae superior* and *inferior*. (2) The veins from the stomach, pancreas, spleen, and intestine unite to form the *vena portae*, which runs to the liver. Here it breaks up into a new capillary system, which drains through the hepatic veins into the *vena cava inferior* The combined blood of the *venae cavae* and the coronary veins enters the right atrium, passes through the right ventricle, and is forced out into the pulmonary artery. The pulmonary capillary system drains by way of the pulmonary veins into the left atrium and thence into the left ventricle

c. of the cerebrospinal fluid. SEE: *cerebrospinal*

c., collateral. C through small vessels which enlarge to compensate for an obstruction in the large vessels

c. coronary. Circulation through the muscular tissue of the heart Blood leaves the aorta through the r. and l. coronary arteries which supply the myocardium Blood passes through capillaries and is collected in veins most of which empty into the coronary sinus which opens into the right atrium A few of the small veins open directly into the atria and ventricles

c., enterohepatic. SEE *c. of bile salts*.

c. fetal. Circulation through the fetus Blood, oxygenated in the placenta passes through the umbilical vein and ductus venosus to the inferior vena cava and thence to the right atrium from which it may follow one of two courses (1) through the *foramen ovale* to the left atrium and thence through the aorta to the tissues or (2) through the right ventricle, pulmonary artery, and ductus arteriosus to the aorta, and thence to the tissues In either case the blood bypasses the lungs which are not functioning before birth Blood is returned to the placenta through the umbilical arteries which are continuations of the hypogastric arteries. At

CIRCULATION

General scheme of the circulation of blood in man. Beginning with the lung, the abbreviations follow in this order: LV., left ventricle, Gast., gastrointestinal organs; Port. v., portal vein, Musc., System of voluntary muscles; Nerv., Nervous system, RV., right ventricle, Pulm. art., pulmonary artery.

birth or shortly after, the ductus arteriosus and the foramen ovale close establishing normal circulation. Failure of either to occur gives rise to a "blue baby".

c. of the lymph. Lymph is formed from the tissue fluid which fills the tissue spaces of the body. It is collected into lymph capillaries which carry the lymph to the larger lymph vessels. These converge to form one of two main trunks, the right lymphatic duct and the thoracic duct. The rt lymphatic duct drains the right side of the head, neck, and trunk and right upper extremity, the thoracic duct drains all the remaining portion of the body. The latter has its origin at the cisterna chyli which receives the lymphatics from the abdominal organs. It courses upward through the diaphragm and thorax and empties into the left subclavian artery near its junction with the l int jugular vein. The rt lymphatic duct empties into the rt subclavian vein. Lymph vessels have along their course lymph nodes which function as filtering structures filtering out bacteria and particulate substance preventing their entrance into the blood stream. Lymph flow is maintained by difference in pressure at the two ends of the system. Important accessory factors aiding the flow of lymph are breathing movements and muscular activities.

c., portal. Veins from the pancreas, spleen, stomach, intestines unite behind the pancreas and form the portal tube or vein. This takes blood, rich in the products of digestion, to the liver, where it breaks up into smaller vessels and capillaries.

c., pulmonary. The venous blood which is received into the right auricle passes through the tricuspid valve into the right ventricle. From there into the pulmonary artery, which divides into 2 branches, 1 going to each lung. (This is the only instance when an artery contains venous or dark blood deficient in oxygen.) The artery breaks up in the lung into capillaries, and here, by means of the hemoglobin in the red corpuscles, takes up oxygen from the inspired air. Red arterial blood returns to the heart by the 4 pulmonary veins, 2 from each lung entering the left auricle. (This is the only instance where veins contain oxygenated blood.)

c. rate. The minute volume or output of the heart per minute. In an average size adult with a pulse rate of 70, the amount is approximately 4 liters.

c., systemic. General circulation through the whole body except the lungs.

c., venous. C. of the blood via the veins.

circulation, words pert. to: adlemorrhysis, angioplastic, angioneurosis, arterial c., arteries, chiloangiopathy, circulatory, enterohepatic (see *bile acids*), fetal, fuliginous, heart, hypoxiphysia, infarct.

circulation time. The time required by a particle of blood to make the complete circuit of both the systemic and pulmonary systems. Circulation time is determined by injecting a substance into a vein and timing its reappearance in arteries at the point of injection or some other point in the body. Such would necessitate the blood with the contained substance passing through veins to the heart and through the right atrium and ventricle, through the pulmonary circuit to the lungs and

back through the left atrium and ventricle, and then out through the aorta and arteries to the place where detected. Dyes such as fluorescein, methylene blue or substances such as potassium ferrocyanide or histamine have been used as tracers. Ave circulation time is 18 to 24 seconds. Circulation time is reduced in anemia and hyperthyroidism, increased in hypertension, myxedema, and cardiac failure.

c. time, pulmonary. The time required for blood to pass through the lungs. Ave time 11 seconds.

c. time test. Saccharin may be injected into a vein at the elbow. The patient says "sweet" the instant a sweet taste is detected in the mouth. The time, measured with a stop watch, bet. the injection and detection of the sweet taste is the time required for the blood to flow from the arm through the right auricle and ventricle, the lungs, back to the left side of the heart, and up to the capillaries of the tongue. This is the "arm to tongue" circulation time which normally is 10-15 seconds.

circulatory. Pert. to circulation.

c. system, inspection of. Inspection detects any abnormal centers of pulsation,* the apex* beat and its position, force, and extent, and any unnatural prominence over the precordial region. SEE: abdomen, apex beat, chest, heart, lungs, pulsation.

circum- [L.]. Prefix Around, as *circumduction*.

circumarticular (sir'kum-ar-tik'ü-lar) [L. *circum*, around, + *articulus*, a joint]. Surrounding a joint. SYN *periarticular*.

circumcision (ser-kum-si'shun) [L. *circumcisis*, a cutting around] Removal of the end of the prepuce by a circular incision.

NP The foreskin is often tight after birth. It should be pulled back gently at the first bath to see that the meatus is clear, and then left alone for 8 days. After this, if still tight, it should be picked up in the thumb and finger and gently coated backwards twice a day. If it is inclined to bleed, smear it with an antiseptic ointment, such as yellow oxide of mercury. Care must be taken not to strip it backwards too far or constriction of the glans (paraphimosis) may occur. If tightness still persists or there is any difficulty in passing urine, a doctor should be consulted. Often the gentle passage of a probe by the doctor, underneath the skin of the prepuce, will obviate any need to circumcise. Strict asepsis must be maintained in the dressing of a circumcision. Pemphigoid skin rashes sometimes occur as a result of the infection of the wound.

PREPARATION FOR: Dorsal position. Screen. The patients are painted with alcohol (70%), picric acid, or mercuriochrome. Iodine is not used in genito-urinary surgery. Drape in a lithotomy sheet and 4 towels. SEE: *apellous*, *posthetyomy*.

circumcision (ser-kum-klu'zhun) [L. *circumcludere*, to shut in]. Acupressure by use of a pin under an artery and a wire loop over it, attached to each end of the pin.

circumcorneal [L. *circum*, around, + *corneus*, horny]. Around the cornea.

circumcrescent [" + *crecere*, to grow]. Developing around or over a part.

circumduction (sir-kum-duk'shun) [" + *ducere*, to lead]. 1. The action or swing of a limb, such as the arm, in such a manner that it describes a coneshaped

figure, the apex of the cone being formed by the joint at the proximal end, while the complete circle is formed by the free distal end of the limb. 2 Circular movement of the eye.

circumflex (sir'kum-fleks) [“ + *flectere*, to bend]. Winding around, as a vessel.

circuminsular [“ + *insula*, island]. Surrounding the island of Reil.

circumintestinal [“ + *intestinalis*, pert. to intestine]. Around the intestine.

circumlental [“ + *lens*, lens]. Situated around the lens.

circumnuclear [“ + *nucleus*, kernel]. Surrounding the nucleus.

circumocular [“ + *oculus*, eye]. Surrounding the eye.

c. core. A nucleus.

circumoral [“ + *os*, or-, mouth]. Encircling the mouth.

c. pallor. White area around the mouth contrasting vividly with color of face, esp. seen in scarlet fever.

circumorbital (sir'kum-or-bit-äl) [“ + *orbita*, orbit]. Around an orbit.

circumpolarization [“ + *polaris*, polar]. The rotation of a ray of polarized light.

circumrenal [“ + *renalis*, pert. to kidney]. Around or about the kidney.

circumscribed [“ + *scribere*, to write]. Limited in space.

circumstantiality [L. *circumstantia*, a standing around]. The mention of irrelevant facts and details in conversation.

circumvalate [L. *circum*, around, + *val-äre*, to wall]. Surrounded by a wall or raised structure.

c. papillae. V-shaped row of papillae at base of tongue.

circus movements (ser'kus). “Contraction or excitation wave traveling continuously in circular fashion around a ring of muscle or through the wall of the heart” (Lewis).

cirrhonosis (sir-ron'o-sus) [G. *kirros*, tawny, + *nosos*, disease]. Disease of the fetus marked by a golden yellow color of the pleura and peritoneum.

cirrhosis (sir-ro'sis) [G. *kirros*, yellow, + *-ōsis*, infection]. An interstitial inflammation with hardening, granulation, and contraction of the tissues of an organ, more esp. the liver.

Etiol. Deposits of connective tissue about the blood vessels causing, through contraction, an obstruction of the portal circulation.

c., alcoholic. That of the liver due to alcoholism.

c., atrophic. One marked by atrophy of the liver. **Sym:** Early enlargement of liver. Tongue coated, anorexia, fullness and distress after eating, vomiting of frothy mucus, flatulence, constipation, and dark urine. Gradual shrinking of the organ, with ascites, hypertension, hemorrhoids. As obstruction becomes greater portal blood finds new channels, and the superficial abdominal veins enlarge, notably about the umbilicus, forming the so-called *caput medusae*. **Proc:** Unfavorable except in early stages.

c., biliary. Affecting the liver and gall-bladder. **Etiol.** Chronic retention of bile. **Sym:** Jaundice, hypochondriac fullness, urine dark and bile stained; stools, clay colored. Loss of strength, indigestion, fever irregularly. **Diet:** No special diet. Prohibit all alcoholic liquors.

c., fatty. C with fatty infiltration of the liver cells.

c., hypertrophic. In which the connective tissue hyperplasia starts from the periphery of the capillary bile ducts instead of from ramifications of portal vein as in atrophic form.

Sym: Jaundice marked, liver large, yellow, and surface smooth or finely granular, spleen swollen. Disease may last 1 or 2 years, but abrupt termination may occur at any time in convulsions and coma.

Treatment. Constitutional.

c. of liver. A chronic disease characterized anatomically by a hyperplasia of the connective tissue and destruction of the secreting cells shown chiefly by symptoms of portal obstruction. **See, c., atrophic.**

c. of lung. A chronic disease of the lung, characterized by an overgrowth of fibrous tissue.

Sym: Moderate dyspnea and chronic cough—expectoration may be slight but is often profuse and fetid from having been retained in bronchiectatic cavities—no fever, and general health may be preserved for many years.

Proc: Incurable—duration from 10 to 20 years.

Treatment. Palliative—consists in good hygiene and use of remedies directed to the bronchiectasis.

c., portal. C with inflammation and ensuing obstruction to portal circulation.

cirrhotic (sir-rot'ik). Pert to or affected with cirrhosis.

cirsectomy (sir-sek'to-mī) [G. *kirros*, varix, + *ektome*, excision]. Excision of a portion of a varicose vein.

cirsenchysis (sir-sen'ki-sis) [“ + *enchysis*, a pouring in]. Injection of varicose veins.

cirsocele (sir'so-sēl) [“ + *kālē*, hernia]. Dilatation of veins of spermatic cord. **Syn:** *varicocele*.

cirsodesis (sir-sod'ē-sis) [“ + *desis*, ligation]. Ligation of varicose veins.

cirroid (sir'roid) [“ + *eidos*, resemblance]. Resembling a varix. **Syn:** *varicose*.

cirsomphalos (sir-som'fā-los) [“ + *omphalos*, navel]. Varicose veins around the navel.

cirsotome (sir'so-tōm) [“ + *tomē*, incision]. Instrument for cutting varicose veins.

cirsotomy (sir-sot'o-mī) [“ + *tomē*, incision]. Treatment of a varicosity by multiple incisions.

cisterna, cistern [L. a vessel]. Any reservoir cavity.

c. chyli. **BNA:** *Receptaculum chyli*. A dilated sac into which is emptied the intestinal, 2 lumbar, and 2 descending lymphatic trunks, the origin of the thoracic duct.

c. subarachnoid. Wide spaces in the cranial cavity between the arachnoid and the pia mater. Contains cerebral spinal fluid.

cisternal (sis-ter'näl). Concerning a cavity filled with fluid.

c. puncture. A spinal puncture with a hollow needle bet the cervical vertebrae, through the dura mater into the cisterna at base of brain.

Purpose. (a) To inject a drug or a serum as in cerebral meningitis or cerebral syphilis, or (b) to remove excess spinal fluid and consequent pressure which inhibits the flow of spinal fluid to the lumbar region, esp. when the fluid cannot be obtained by lumbar puncture. **See:** *cerebrospinal fluid, spinal puncture*.

Citelli's syndrome. Poor memory, mental backwardness, insomnia or drowsiness, and lack of concentration in those with adenoids or phenoid sinusitis.

citochol reaction (sit'ō-kol). The use of concentrated cholesterolized extract of heart muscle as the antigen for a rapid flocculation test. [and a base

citrate (sit'rāt). Compound of citric acid
c. solution. Used to prevent clotting of blood that has been shed.

citrin (sit'rin). Vitamin P. Antiscorbatic in action and found in lemon juice

citron [*L. citrus*, juniper fruit] (candied).
AV. SERVING 75 Gm Pro. 1.1, Fat 1.1, Carbo 58.6 per serving. Ca 0.121, Mg 0.018, K 0.210, Na 0.011, P 0.033, Cl 0.003, S 0.020 No iron A base forming food, alkalinity 98 cc. per 100 Gm, 3.0 per 100 cal.

Cl. Symb of chlorine.

cladosporeiosis (klad'o-spo-ri-o'sis) [*G. kladōs*, branch, + *sporos*, seed, + *-ōsis*, infection]. Infection with *Cladosporeium*, a fungus, marked by appearance of gummatous nodules

cladotrichosis (klad-o-thri-ko'sis) [' + *thrix*, hair, + *-ōsis*, infection]. Infection with *Cladotrich*

clam. A bivalve belonging to the phylum Mollusca AV SERVING (round) 90 Gm Pro. 9.5, Fat 0.9, Carbo 4.7 AV SERVING (long) 60 Gm Pro 8.1, Fat 1.0, Carbo 1.7 ASH CONST. (round) Ca 0.106, Mg 0.098, K 0.131, Na 0.705, P 0.046, Cl 1.220, S 0.224 ASH CONST. (long) Ca 0.124, Mg 0.079, K 0.212, Na 0.500, P 0.122, Cl 0.910, S 0.213.

clamp (klamp) [Danish, *klamp*, hook]. Device for compression of vessels

clang [*L. clangere*, to peal]. A loud, metallic sound.

c. finf. A delicate tone

clap [A S *claeppan*, to thread]. Popular term for gonorrhea

c. threads. Slimy threads of mucus and pus in urine during gonorrhea

clapotage, clapotement (klā-po-tazh', klā-pot-mon') [Fr.] Any splashing sound in succession of a dilated stomach

Clap-ton's lines. Green lines on dental margin of gums in copper poisoning.

clar'et stain or cheek [*L. clarētum*, light red]. Capillary nevus of cheek. SYN: *nevus flammeus*

clarificant (klar-if'ik-ant) [*L. clarus*, clear, + *facere*, to make] Any agent that clears the turbidity of a liquid

Clarke's bodies. Alveolar sarcomatous intranuclear bodies of breast.

C's column. Gray matter, the trophic center for the direct cerebellar tract, the vestibular column

clasmatoblast (klaz-mat'o-blast) [*G. klasma*, fragment, + *blastos*, germ]. A mast cell

clasmatocyte (klaz-mat'o-sit) [' + *kytos*, cell]. A large, wandering, uninucleated cell, with many branches

A fixed macrophage of loose connective tissue. They are capable of ingesting particulate material and have the property of electively storing certain dyes in colloidal solution. In inflammatory conditions they become actively ameboid.

clasmatocytosis (klaz-mat-o-sit-to'sis) [' + ' + *-ōsis*, infection]. Breaking up of clasmatocytes and islands of granules formed from their debris.

clasmatodendro'sis [' + *dendron*, tree, + *-ōsis*, infection]. A breaking up of astrocytic protoplasmic expansions.

clasmato'sis [' + *-ōsis*, infection]. Crumbling into small bits; fragmentation, as of cells. [Joint in cerebral palsies.

clasp-knife rigidity. Spastic action in a **clastic** (klas'tik) [*G. klastos*, broken, from *klein*, to break]. Causing division into parts.

clastothrix (klas'to-thriks) [' + *thrix*, hair]. Brittleness of the hair. SYN: *trichorrhæxis*.

claudication (klaw-dī-ka'shun) [*L. claudicare*, to limp]. 1 Limping. 2 Loss of function, temporarily due to spasm (arterial) in brain or heart. 3. An obstruction.

c., intermittent. Arterial spasm with subsequent painful cramping of the legs and lameness.

Claudius's cells (klaw/di-us). Large columnar cells external to the organ of Corti.

C's fossa. Small depression in post. part of pelvis, on either side, in which lies the ovary.

claustrophilia (klaws-tro-fil'ī-ā) [*L. claustrum*, a closed space, + *G. philein*, to love] Dread of being in an open space, as in neurasthenia or a morbid desire to be shut in with doors and windows closed.

claustrophobia (klaws-tro-fō-bī-ā) [' + *phobos*, fear] PSY Fear of being confined in any space, as in a locked room. Opp of *agoraphobia*.

claustrum (klaws'trum) [*L.* a closed space]. 1. A barrier. 2 Thin layer of gray matter separating the ext capsule from the island of Reil

clausura (klaws-su'rā) [*L.* closure]. Atresia of a passage, closure.

clava (kla'vā) (pl *claræ*) [*L.* club]. Enlarged extremity of the *funiculus gracilis* in post. portion of medulla oblongata. *Tuberculum gracile* [Clubshaped.

clavate [*L. clavatus*, pert. to a club].
c. nucleus. Collection of nerve cells within the clava.

clav'icle [*L. clavicula*, dim. of *clavis*, key]. The collarbone, a bone curved like the letter f, which articulates with the sternum and the scapula.

c., dislocation of. Forward. *Sternal end.* TREATMENT: (a) Knee placed against spine (b) Draw shoulders back. (c) Apply clavicle bandage with pad on dislocated end of bone

Outer Extremity. Bone upon upper surface of acromion, or upon ant. part of spine of the scapula. SYM: (a) Prominence upon surface of acromion which disappears when arm is raised. (b) Shoulders flattened, arm hanging close to trunk. TREATMENT: (a) Raise shoulder, draw backward. (b) Place pad in axilla, bringing elbow close to side. (c) Secure arm and forearm to chest with pad in axilla. (d) Pressure by pad and gutta percha plate on projecting clavicle strapped in place. SEE *yugulum*.

c., fracture of. SYM: (1) Swelling, pain, protuberance with sharp depression over the injured bone. (2) Patient supports arm at the elbow, arm useless.

F. A. TREATMENT: (a) Place ball of cloth, 1 or 2 handkerchiefs, tightly rolled, under armpit. (b) Apply arm sling. Bandage elbow to side, hand and forearm extending across the chest. (c) Or, lay patient on back, on the floor, with blanket beneath until medical aid arrives. This position keeps shoulders back and prevents broken ends of bone from rubbing.

TREATMENT (medical): (a) Have assistant draw arms and shoulders backward. (b) Raise shoulders and support in upward, backward, and outward direction. (c) Cover parts with adhesive plaster and bandage.

clavicular (kla-vik'u-lar). Pert. to the clavicle.

clavus (L. nail). 1. A corn or callosity. 2. A sharp head pain like the driving of a nail into the head.

clawfoot (klaw'fut). Muscular wasting with distortion, giving foot appearance of a claw. Syn. *pes cavus*.

clawhand. Muscular atrophy and clawlike flexion of fingers.

clearing agent. One that makes microscopical objects more transparent.

cleavage (kle'vej) [A.S. *cleofian*, to adhere]. 1 Splitting a complex molecule into 2 or more simpler ones. 2. Cell division following the fertilization of an egg. Syn. *segmentation*.

c. cell. The blastomere.

c., hydrolytic. Hydrolysis

c. lines. Those appearing in linear direction when a pin punctures a cadaver.

cleft [M.E. *clift*, crevice]. A fissure.

c. palate. A congenital palatine fissure forming a cavity for the nose and mouth.

c. sternum. A congenital fissure of the breastbone.

c. tongue. One with furrows.

cleido- (klí'do) [G. *kleis*, clavicle]. Prefix Pert. to the clavicle.

cleidorrhexis (kli-do-rek'sis) [G. *kleis*, clavicle, + *rēxis*, rupture]. Fracture or bending the clavicles of the fetus for delivery.

cleidotomy (kli-dot'o-mí) [" + *tomē*, a cutting]. Dividing a fetal clavicle to facilitate delivery.

cleptoma'nia [G. *kleptēin*, to steal, + *mania*, madness]. Impulsive stealing, the intrinsic value of the article not being the motive. Syn. *kleptomania*, *q.v.*

clergyman's sore throat. A form of granular pharyngitis.

Clevenger's fissure. *Sulcus temporalis inferior* bet 2nd and 3rd occipital convolutions

climacteric (kli-mak'ter-ik, kli-mak-ter'-ik) [G. *klimakter*, a round of a ladder]. That period that marks the cessation of a woman's reproductive period.

Usually takes place bet. the ages of 44 and 48. Seldom before or after. See: *change of life*, *menopause*.

c., grand. The 63rd year

climato'logy [G. *klima*, climate, + *logos*, study of]. Branch of meteorology which is the study of climate and its relation to disease. See *bioclimatology*.

climato'therapy (kli-mat'-ō-ther'ap-ī) [" + *therapeia*, treatment]. Change of climate as a treatment of a disease.

clí'max [G. *klimax*, ladder]. Period of greatest intensity.

clí'mograph [G. *klima*, climate, + *graphēin*, to write]. A graph of the effect of climate on health.

clí'nic (klin'ik) [G. *klinikos*, pert. to a bed].

1. Bedside examination. 2. A center for physical examination and treatment of ambulant patients living at home or who are not hospitalized.

clí'nic'al. 1. Pert. to the course of a disease, or the symptoms as opposed to anatomical changes. 2. Pert. to a clinic.

c. thermometer. One which measures body temperature.

They may be disinfected by first

cleansing with cotton and soap solution, using a rotary motion downward to bulb end. This removes adherent mucus which coagulates in some disinfectants, thereby retaining organisms. Rinse thoroughly in water and submerge in 70% alcohol for 10 minutes. Rinse before use. See: *thermometer*

c. unit. In biochemistry, a measure of the acidity of gastric juice. Thus, if it takes 24 cc. of N/10 NaOH to neutralize 100 cc of gastric juice, the juice is said to contain 24 clinical units; 100 clinical units = 0.3634% HCl.

clínician (klin-ish'an) [G. *klinikos*, pert. to a bed]. A practicing physician; clinician

clínodactylism (klí'no-dak'tí-lizm). Clíno-dactyly

clínodactyly (klí'no-dak'tí-le) [G. *klinein*, to bend + *dactylos*, finger]. Permanent deflection, either medial or lateral, of one or more fingers

clínoid (klí'no'id) [G. *klinē*, bed, + *eidos*, appearance] Resembling a bed in shape.

c. processes. Three pairs of prominences on upper surface of sphenoid bone.

clínom'eter [G. *klinein*, to decline, + *metron*, measure] Instrument for estimation of power of rotation of ocular muscles

clí'noscope [" + *skopein*, to examine]. Instrument for measuring the weakness of ocular muscles

clínostat'ic [G. *klinē*, bed, + *stasis*, position] Caused by assuming a recumbent position

clínostat'ism. The recumbent position.

clíseometer (klis-e-om'et-er) [G. *klistis*, inclination, + *metron*, measure] Device for measuring the female pelvic inclination

clíthrophobia (klith-ro-fō'bī-ā) [G. *kleithra*, keyhole, + *phobos*, fear]. Morbid fear of being locked in.

clí'tion (klit'-on) [G. *klitus*, slope]. A craniometric point in center of highest part of the clivus on the sphenoid bone.

clí'toridauxe (klit-or-id-awk'sē) [G. *kleitōris*, clitoris, + *auxē*, increase]. Hypertrophy of the clitoris.

clí'toridectomy (klit-or-ī-dek'tō-mí) [" + *ektomē*, excision] Excision of clitoris.

clí'toriditis (klit-or-id-ī'tis) [" + *-itis*, inflammation]. Inflammation of the clitoris

clí'toridotomy (klit-tor-ī-dot'ō-mí) [" + *tomē*, incision]. Incision of the clitoris.

clí'toris (klí'tor-is) [G. *kleitōris*]. One of the organs of the female genitalia. It is an erectile structure located beneath the anterior labial commissure and partially hidden by the anterior ends of the labia minora. It is homologous to the penis of the male.

Structure It consists of three parts: a body, two crura, and a glans. (a) The body, about an inch in length, consists of two fused corpora cavernosa. It extends from the pubic arch above to the glans below. (b) The two crura are continuations of the corpora cavernosa and serve to attach them to the inferior rami of the pubic bones. They are covered by the ischio-cavernosus muscles. (c) The glans which forms the free distal end is a small rounded tubercle composed of erectile tissue. It is highly sensitive. The glans is usually covered by a hood-like prepuce and its ventral surface is attached to the frenulum of the labia.

- c. crises.** Recurring crises of involuntary excess of sexual feeling culminating in a true orgasm with spasm of the clitoris followed by lancinating pains in the genital organs lasting for hours. Rare. *Etiol.* *Tubes dorsalis.*
- clitoris, words pert to:** anorthosis, balanitis, caudation, clitorism, corpora cavernosa, erectule, -ion, -or, frenulum, smegma.
- clitorism** (klit'or-izm) [G. *kleitōris*, + *ismos*]. The counterpart of priapism. A long continued, painful condition in the female with recurring erection of the clitoris with an occasional orgasm. *Etiol.* Intense masturbation, hysteria, nymphomania, or excessive coitus.
- clitoritis** (klit-o-ri'tis) ["" + *-itis*, inflammation]. Inflammation of the clitoris. *Syn:* *clitoriditis.*
- clivus** [L. a slope]. A surface that slopes, as the sphenoid bone.
- c. blumenbach'ii.** The slope at base of skull.
- cloaca** (klo-a'ka) [L. a sewer] 1. Cavity lined with endoderm at the posterior end of the body which serves as a common passageway for urinary, digestive and reproductive ducts. Present in adults of birds, reptiles and amphibia and in the embryos of all vertebrates. 2. An opening in the sheath covering necrosed bone.
- clonic** (klon'ik) [G. *klonos*, turmoil] Pert. to alternate contraction and relaxation of muscles.
- c. spasm.** One marked by muscular contraction and relaxation. Occurs in 2nd stage of epilepsy.
- clonicity** (klon-is'ti) [G. *klonos*, turmoil]. Being clonic.
- clonicotonic** (klon-i-ko-ton'ik) ["" + *tonikos*, tone] Both clonic and tonic, as some forms of muscular spasm.
- clonism, clonism'us** ["" + *ismos*, condition of]. Condition of being affected with clonic spasms, or a succession of them.
- clonograph** ["" + *graphein*, to write]. An instrument for registering spasmodic movements.
- clonospasm** ["" + *spasmos*, spasm] Rapid alternation of muscular contraction and relaxation.
- The rate is much slower than a tremor. In upper motor neurone paralysis, sharp flexion of ankle often produces ankle clonus.
- clonus** [G. *klonos*, turmoil] Spasmodic alternation of contraction and relaxation; opposite of *tonus*. *See:* *wrist clonus.*
- Cloquet's canal** (klo-kās'). An irregular passage (hyaloid) through center of the vitreous body in the fetus.
- closed core transformer.** A transformer having a continuous core of magnetic material (usually iron) without any air gap.
- Clostridium.** A genus of bacteria belonging to the family *Bacillaceae*. They are anaerobic, spore-forming rods and are widely distributed in nature. They are common in the soil and in the intestinal tract of man and animals, and are frequently found in wound infections. Several are pathogenic in man, being the primary causative agents for gaseous gangrene.
- Important species are:
- Cl. botulinum.** Grows in improperly processed food. Produces a powerful exotoxin, the cause of botulism, q v.
- Cl. chauvei.** Cause of backleg (quarter evil, symptomatic anthrax) in cattle.

- Cl. histolyticum.** A proteolytic organism found in wounds. Has a liquifying effect on human tissues.
- Cl. novyi.** Found in cases of gaseous gangrene. Produces a strong, soluble exotoxin.
- Cl. perfringens.** *Syn:* *Cl. welchii.*
- Cl. septicum.** Found in cases of gangrene in man, cattle, hogs, and other domestic animals.
- Cl. sporogenes.** Frequently associated with other organisms in mixed gangrenous infections.
- Cl. tetani.** The causative organism of tetanus or lockjaw. Produces a powerful exotoxin, a portion of which affects nerve tissue, another portion is hemolytic.
- Cl. welchii.** The most important cause of gas gangrene in wound infections. Produces a number of distinct toxins.
- clot** (klōt) [A.S. *clott*]. 1. To coagulate. 2. A thrombus; a coagulum, as of blood or lymph.
- See:* *blood, clotting of.*
- c., agony.** One formed in the heart when death ensues from prolonged heart failure.
- c., antemortem.** One formed in the heart or its cavities before death.
- c., blood.** A coagulum formed of blood.
- c., chicken fat.** A yellow-colored blood clot.
- c., currant jelly.** A clot of fibrin of reddish color and jellylike consistency.
- c., distal.** One formed in a vessel on distal side of a ligature.
- c., external.** One formed outside a blood vessel.
- c., heart.** A thrombus within the heart.
- c., internal.** One formed by solidification of blood.
- c., laminated.** One formed in a succession of layers filling an aneurysm.
- c., muscle.** One formed in coagulation of muscle plasma.
- c., passive.** One formed in the sac of an aneurysm.
- c., plastic.** One formed from the intima of an artery at the point of ligation.
- c., postmortem.** One formed in the heart or in a large blood vessel after death.
- c., proximal.** One formed on the proximal side of a ligature.
- c., stratified.** Thrombus consisting of layers of different colors.
- clothes louse.** *Pediculus corporis*; a body louse.
- cloth'ing** [A.S. *clāthan*, to clothe]. Clothes prevent use of too much fuel, a greater amt of carbon dioxide being given off when light clothing is worn.
- Air spaces in a fabric conserve heat. It is texture, not the material, that makes for warmth. Woolen fabrics lose in warmth when the material is matted down and the air spaces are destroyed. Wool and silk absorb more moisture than other fabrics but silk loses it more readily. Cotton and linen come next but linen loses moisture quicker than cotton. Open mesh is necessary to prevent chill from evaporation. Knitted fabrics absorb and dry more readily than woven fabrics of the same material. Temperature inside a hat worn by a man varies from 13° to 20° hotter than outside temperature. Body heat increased when moisture from wet garments cannot escape.
- clouding of consciousness.** *Psy:* A state of mental confusion characterized by insufficiency of perception and impaired attention, and resulting in loss of orienta-

tion of time and place, amnesia and ill-adjusted reactions. Occurs in toxic, febrile, and other deliria. SEE: *consciousness*

cloudy swelling. Degeneration in which the tissues swell and become turbid

clove-hitch. A knot consisting of 2 contiguous loops which are placed around an object, the ends of the cord being toward each other; used for making traction on a part for the reduction of dislocations or for restraining mental or delirious patients.

clove, oil of. USP. A volatile oil distilled from the dried flower buds of the clove tree. SYN *Caryophyllus*

ACTION AND USES. Antiseptic and aromatic. Useful also as an anodyne in dental practice

cloven spine. Spina bifida. Congenital defect of spinal canal walls caused by lack of union bet. laminae of the vertebrae.

clownism. Grotesque actions and attitudes

clubbed fingers. Rounding of ends and swelling of fingers in children with congenital heart disease and in older children and adults with long standing pulmonary disease.

clubfoot. Nontraumatic foot deviation SEE: *kylosis, talipes*.

clubhand. Deformity of the hand resembling clubfoot.

clumping [A.S. *clumpre*, a lump]. 1. Adhesion of wound surfaces. 2 Clumping of microorganisms in a culture when specific immune serum is added SYN *agglutination*.

clunes [L. pl.] The buttocks; nates
clupeine (klu'pē-en) [L. *clupea*, herring]. A protamine from the spermatozoa of the herring

clysis (klis's) [G. *klyzein*, to cleanse]. Injection of fluid for washing out the blood in a cavity

clysma (klis'mā) [G.]. An enema.*
clyster [G. *klystēr*, enema]. Rectal injection or enema, a clysma.

C. M. Abbr. for *chirurgus magister*, Master in Surgery

cm. Abbr. for *centimeter*.

cnemial (ne'mī-al) [G. *knēmis*, leg]. Pert to the leg, esp the shin

cnemis (ne'mis) [G. *knēmis*, leg]. Shin, lower leg, tibia.

cnemitis (ne-mi'tis) [' + -itis, inflammation]. Inflammation of the tibia.

CO₂. SYMS Carbon dioxide.

CO₂ therapy. Therapeutic application of low temperatures with solid carbon dioxide. SEE *refrigeration*.

co'activity [L. *coactāre*, to force]. Action that aids an enzyme to function, as the action of bile salts upon lipase, but not the same as that incited by an activator.

Dialysis will remove the bile salts, whereas an active enzyme cannot be transformed back to an inactive zymogen, proving the difference bet. coactivity and *activation*.

coadunation (ko-ad-u-na'shun) [L. *co*, together, + *ad*, to, + *unus*, one] Union or junction of dissimilar substances in 1 mass

coagglutina'tion [' + + *agglutinans*, gluing]. Clumping by an antigen and the homologous antibody of the corpuscles of another organism

coagglu'tinin. An antibody that is effective on 2 or more organisms

coag'ula [L. pl a blood clot]. Plural of *coagulum*.

coagulable (ko-ag'u-lā-bl) [L. *coagulum*, blood clot]. Capable of clotting; apt to clot

coagulant (ko-ag'u-lant) [L. *coagulans*, congealing]. 1 That which causes a fluid to coagulate 2 Causing coagulation

coagulase (ko-ag'u-lāz) [L. *coagulum*, blood clot] Any enzyme, such as thrombin, which causes coagulation SEE: *coagulin*, *coagulum*

coag'ulate [L. *coagilāre*, to congeal]. To lessen the properties of fluidity.

coag'ulated. Clotted or curdled

c. proteins. Derived proteins (insoluble), resulting from the action of alcohol on protein, or heat on p solutions

coagula'tion [L. *coagula'tiō*]. The process of clotting.

Coagulation depends upon the presence of five substances (1) prothrombin, (2) thrombin, (3) thromboplastin (thrombokinas), (4) calcium in ionic form, and (5) fibrinogen. Prothrombin is converted to thrombin by the action of thromboplastin in the presence of calcium ions. Thrombin then acts on the soluble fibrinogen of the plasma

COAGULATION AND DEFIBRINATION

A, A fresh clot contains fibrin threads, corpuscles, and serum. B, On standing, the fibrin contracts, retaining most of the corpuscles, but releasing some of the serum. C, If blood is stirred before and during the process of coagulation, the fibrin clings to the stirring rod and leaves the mixture of corpuscles and serum called defibrinated blood.

converting it to insoluble fibrin. The fibrin forms a meshwork of fibers in which the corpuscles of the blood become entangled thus forming a clot. Shrinkage of the fibrin causes the exudation of plasma minus fibrinogen which constitutes blood serum. When blood is shed through an injured vessel, thromboplastin is liberated from the injured tissues and from degenerating blood platelets. This initiates the clotting mechanism.

In schematic form, the clotting process is as follows: *prothrombin* + *thromboplastin* + *calcium ions* → *thrombin*

Thrombin + *fibrinogen* → *fibrin*.

Clotting is retarded by (1) cold, (2) smooth surfaces, (3) decalcifying substances such as citrates and oxalates, (4) neutral salts such as magnesium or sodium sulfate, (5) certain substances of biological origin such as hirudin, heparin, snake venoms, cysteine, and dicoumarol.

Clotting is hastened by (1) warming, (2) providing a rough surface, (3) use of chemical substance such as adrenalin, thrombin, thromboplastin.

coagulation time. "The time it takes for blood to clot when exposed to the air." This can be determined by (1) collecting blood in a small test tube and noting elapsed time from moment blood is shed to time it coagulates or (2) collecting blood in a small capillary tube and breaking off small pieces of the tube at 30 sec intervals. Coagulation is indicated by the appearance of fine threads of fibrin between the broken ends of the tube.

coagulative. Causing coagulation.

coagulin [L. *coagulare*, to congeal] A specific substance, produced in the body of an animal by an injection of a substance, which will cause quickened coagulation in that of another. **See** *coagulase*.

coaguloid (ko-ag-u-lin-oid) [" + G. *eidos*, form] A coagulin whose function has been destroyed by heating to 65°-70° C.

coagulometer (ko-ag-u-lom'et-er) [" + G. *metron*, measure] Device for measuring the blood's coagulability.

coaguloviscometer [" + *viscosus*, gummy, + G. *metron*, measure] An instrument for determining the rapidity of the coagulation of the blood.

coagulum [L.] 1 A blood clot. 2 A curd.

coalesce (ko-al-es') [L. *coalescere*, to grow together] To fuse; run or grow together.

coalescence [L. *coalescere*, to grow together]. Fusion or growing together of 2 or more parts of bodies.

coal tar. A tar that is produced in the destructive distillation of bituminous coal, as crude creosol.

coaptation [L. *coaptare*, to fit together] The adjustment of separate parts to each other, as the edges of fractures.

coarctate (ko-ark'tāt) [L. *coarctare*, to tighten]. To press or pressed together. **c. retina.** Funnel-shaped retina.

coarctation [L. *coarctatio*, a tightening]. 1. Compression of the walls of a vessel. 2. Shriveling. 3. A stricture.

coarctotomy (ko-ark-to'to-mi) [" + G. *tomē*, incision]. Cutting or division of a stricture.

cobra venom solution (kō'brā vēn'ūm). Minute quantities of the secretion of the cobra in sterile physiological salt

solution, and standardized so that 1 cc. is equivalent to 5 mouse units.

Recommended to be effective in relieving severe pains of inoperable tumors, and other intractable pains.

Its action is said to be slower than that of morphine, but of longer duration, and does not produce addiction.

Dosage: Intramuscularly, 0.5 cc. for first dose, the next day 1 cc., and this dose be administered for 2 or 3 successive days until definite relief is noted, after which 1 cc. every other day, or at longer intervals, according to the judgment of the physician.

cocaine hydrochloride (ko-kān'). **USP.** The hydrochloride of an alkaloid obtained from *Erythroxylon coca*.

Chief Uses: Local anesthetic. A habit-forming drug. (0.015 Gm.)

Dosage: Topical application of ¼ gr. **Poisoning Sym:** Initially, a stimulation of the nervous system, with excitement, incoherent talking, restlessness, hallucinations, etc., followed by profound depression, nausea, dizziness, tingling of hands and feet, alterations of pulse, increased respirations, dilated pupils, occasionally convulsions, collapse, and death.

Treatment: When taken by mouth, evacuate stomach. Administer tannic acid, strong, black coffee, or strong tea to dilute the poison and act as a stimulant. Apply external heat. Slapping or moving the patient valuable, but should not be overdone. Artificial respiration and injection of adrenalin.

cocainism (ko-kān'izm) [L. *cocaina*, + G. *ismos*, condition of]. The habitual use of cocaine, more rare than morphinism.

Cocaine is often used with morphine, or as a substitute.

Sym: Slight headache and dizziness, followed by a feeling of well being and increased mental activity, which does not endure, no sensation of hunger or fatigue. The addict is witty and active, with vivid illusions and hallucinations, usually of the pleasing and wishful type. When the effect wears off, activity diminishes and mood fluctuates from well being to irritability, moroseness, and suspicion. Patient becomes neglectful of home, work, and social obligations, will associate with other habitués, or prostitutes, exhibit pervertism, and may commit sexual crimes.

Prog: Usually due of cardiac failure, paralysis, or intercurrent disease due to debility. Abstinence produces gastric disturbances, and fearful hallucinations.

cocainization (ko-kān-i-za'shun). Inducing analgesia by use of cocaine.

cocainize (ko-kān'iz). To put under the influence of cocaine.

cocainomania (ko-kān-o-ma'ne-ā) [L. *cocaina*, + G. *mania*, madness]. Intense desire for cocaine and its results.

Coccidia (kō-sid'i-ā). An order of protozoa belonging to the class Spermatozoa. All are intracellular parasites usually infecting epithelial cells of the intestine and associated glands. They are principally parasites of lower animals causing great economic loss among domestic and game animals. Practically all domestic animals suffer from coccidial disease. Only one species, *Isospora hominis* infects humans and the area of infestation is largely confined to the far East.

coccidioidomycosis (kõk-sid-i-oyd-õ-mí-kõ'sis) A coccidioidal granuloma SYN: "valley fever," desert rheumatism," "San Joaquin Valley fever"

Exists in two forms (1) *primary coccidioidomycosis* which is an acute, self-limiting disease involving only the respiratory organs and (2) *progressive coccidioidomycosis*, a chronic, diffuse, malignant disease that may involve almost any part of the body

Etiol. Caused by a pathogenic fungus, *Coccidioides immitis*

Progn. For the primary type, favorable, for the progressive type, grave, often fatal

coccidiosis (kok-sid-i-õ'sis) [G. dim of *kokkos*, berry, + -osis, infection] Nodular formations scattered over the body due to infestation with *Coccidium* and resulting symptoms

coccobacilli (kõk-õ-bä-sil'i-ä). Bacilli which are short and thick and somewhat ovoid in form

coccogenous (kok-õj'en-us) [" + *gennan*, to produce]. Produced by cocci.

coccoid (kok'oid) [" + *eidós*, appearance]. Resembling a micrococcus.

coccus (kok'us) (pl. *cocci*) [G. *kokkos*, berry]. A type of bacteria which is spherical or ovoid in form When they appear singly they are designated *micrococci*, in pairs, *diplococci*, in clusters like bunches of grapes, *staphylococci*, in chains, *streptococci*, in cubical packets of eight, *sarcinae* Many are pathogenic causing such diseases as septic sore throat, erysipelas, scarlet fever, rheumatic fever, pneumonia, gonorrhea, meningitis, and puerperal fever SEE *Bacteria*

coccyalgia (kok-sí-al'j-i-ä) [G. *kokkys*, coccyx, + *algos*, pain]. Pain in the coccyx

coccydynia (kok-sí-din'i-ä) [" + *odynë*, pain]. Pain in or around the coccyx; coccyalgia.

Etiol: (a) Injury to bone of coccyx; (b) to soft parts around it; (c) disease of either, (d) hemorrhoids.

coccygeal (kok-síj'ë-al). Pert. to the coccyx.

coccygectomy (kok-sij-ek'to-mí). Excision of the coccyx

coccygodynia (kok-sí-go-din'i-ä) [" + *odynë*, pain] Pain in the coccygeal region, coccyalgia.

coccyodynia (kok-sí-o-din'i-ä) [" + *odynë*, pain] Pain in region of coccyx. SYN: *coccygodynia*.

coccyx (kok'siks) [G. *kokkys*]. Last 4 bones of the spine Usually ankylosed and articulating with the sacrum above.

Coccyx, posterior surface. 1. Cornu.

cochineal (koch'in-ël) [L. *coccinella*]. Dried female insect, used as carmine coloring matter for pharmaceutical products, and as a dye in laboratory work

Antispasmodic and anodyne, used in whooping cough and nervous affections

cochlea (kok'le-ä) [G. *kochliäs*, a spiral] A winding cone-shaped tube forming a portion of the inner ear It contains the *organ* or *Corti*, the receptor for hearing

The cochlea is coiled resembling a snail shell, winding two and three-quarters turns about a central bony axis, the *modiolus* Projecting outward from the modiolus is a thin bony plate, the *spiral lamina* which partially divides the cochlear canal into an upper passageway, the *scala vestibuli* and a lower one, the *scala tympani*. Lying between the two scales is the *cochlear duct*, in the floor of which lies the *spiral organ* (of Corti). The base of the cochlea adjoins the vestibule, at the cupulo or tip, the two scalae are joined at the *helicotrema*.

coclear (kok'le-ar). Pert. to the cochlea.

c. nerve. One supplying the cochlea.

cocleare (kok-le-a're) [G. *kochliarion*]. Spoonful.

cocleariform (kok-le-ar'i-form) [" + L. *forma*, shape] Spoonshaped.

coclelitis (kok-le-i'tis) [G. *kochliäs*, spiral, + -itis, inflammation]. Inflammation of the cochlea. SYN: *cocclitis*.

cocleoörbicular reflex (kok-le-o-or-bik'ular). Contraction of orbicularis palpebrarum muscle resulting from sudden noise being produced near ear.

TYPES OF BACTERIA

1. Diplococci. 2. Streptococci. 3. Staphylococci. 4. Bacilli. 5. Bacilli with spores. 6. Spirilla.

cochleopalpebral reflex (kok-lă-ô-pal'pē-bral). Contraction of orbicularis palpebrarum muscle resulting from sudden noise being produced near ear.

cochleovestibular (kok-le-ô-ves-tib'ul-lar) [*G. cochliās*, spiral, + *L. vestibulum*, from *vestis*, garment]. Pert. to the cochlea and vestibule of the ear.

cochliitis (kok-li'tis) [' + -itis, inflammation]. Inflammation of the cochlea.

cockroach [*Sp. cucaracha*]. *Blattia orientalis* A common insect belonging to the order Orthoptera, which infests homes and eating places. They are swift-running omnivorous insects averaging about 2 cm in length. Through their dual contact with filth and food, they may transmit mechanically, bacteria, protozoan cysts, and helminth ova. Common genera are *Blattia*, *Blattella* and *Periplaneta*.

COCL. Abbr. for cathodal opening clonus.

co'coa [*Sp. coco*, from *G. kokkos*, berry]. 1. A substance prepared from the seed of cacao or theobroma, with all possible fat expressed. 2. The beverage made from 1.

COMP. A nerve food of real nutritive value. Contains albumin, fats, and carbohydrates. Much of the fat of cocoa butter is removed in making powdered chocolate and cocoa. Cane sugar represents the carbohydrates. Oxalates abound and phosphate and sulfate of potassium and of magnesium are found in the ash. Theobromine dimethylxanthine is the active principle but is heavier in chocolate than in cocoa. Its reaction is about the same as caffeine. Sugar is higher in chocolate. A cup of cocoa made of 10 Gm., and one of chocolate made of 15 Gm. contains

Cal. Theobromine Oxalates

Cocoa	74	0 13	0 045
Chocolate ..	74	0 19	0 012

AV. SERVING (cocoa) .5 Gm. **PRO.** 1.1, Fat 1.4, Carbo 1.9 per serving. **AV. SERVING** (chocolate) .30 Gm. **PRO.** 3.9, Fat 14.6, Carbo. 9.1 per serving. **ASH CONST.** (cocoa) Ca 0.112, Mg 0.420, K 0.900, Na 0.059, P 0.709, Cl 0.051, S 0.203, Fe 0.0027. **ASH CONST.** (chocolate) Ca 0.092, Mg 0.293, K 0.563, Na 0.012, P 0.455, Cl 0.051, S 0.085, Fe 0.0027.

cocoa butter (oil of theobroma). **USP.** The fat obtained from the roasted seed of theobroma or cacao. **USES.** Suppositories and in toilet preparations as a lubricant.

co'comalt. A trade product in powder form to be mixed with milk as a beverage.

COMP. **PRO.** 13.06%, Carbo 78.31%, Fat 3.68%, Fiber 0.74%, Ash 3.33%. **ASH CONST.** Ca 0.30, P 0.33, Fe 0.02. In 1 oz. Ca 0.09, P 0.09, Fe 0.005 Gm. **VITAMINS:** D, 81 USP. Units per oz. A, B, G present in the beverage. **FUEL VALUE.** Adds 115.5 cal to a glass of milk, making a total of 73% caloric value. It increases in a glass of milk Ca 37.5%, P 52.9%, **PRO.** 46.7%, Carbo. 201.5% and Fats 12.2%.

cocon'sciousness [*L. co*, together, + *conscious*, aware]. A conscious objective state in which subconscious impressions rise to the surface.

In dual* personality, one character (only) may be cognizant of the other.

cocontraction (kô-kon-trak'shun) [' + *contractio*, a drawing together]. Adjustment of 2 muscles during contraction, said of antagonist muscles in coordination.

co'conut [fruit of *Cocos nucifera*]. Considerable cellulose. **AV. SERVING** (dried):

100 Gm. **PRO.** 4.3, Fat 41.0, Carbo. 44.5 per serving. **AV. SERVING** (fresh): 50 Gm. **PRO.** 2.9, Fat 25.0, Carbo. 14.0. **Dried:** Ca 0.059, Mg 0.059, K 0.597, Na 0.073, P 0.155, Cl 0.239, S 0.056. **Fresh** Ca 0.024, Mg 0.020, K 0.300, Na 0.036, P 0.074, Cl 0.120, S 0.056. **Vit.** (in both): A+, B+, G++.

coconut milk. **ASH CONST:** Ca 0.020, Mg 0.009, K 0.144, P 0.010, S 0.008. No sodium, chlorine or iron.

coctolabile (kok-to-la'bīl) [*L. coctus*, cooked, + *labilis*, perishable]. Incapable of remaining unaltered when subject to boiling water.

coctoprecipitin (kok-to-pre-sip'it-in) [' + *praecipitare*, to cast down]. A precipitin produced by injecting a serum that has been boiled.

coctostabile (kok-to-stab'īl) [' + *stabilis*, resisting]. Incapable of being altered or destroyed by boiling water.

cod (salt) [*A.S. codd*, small bag]. **AV. SERVING.** 60 Gm. **PRO.** 15.8, Fat 0.2 per serving. **Vit.** B++ . 100 Gm. equal 104 cal.

codeine (ko'de-in) [*L. codina*, from *G. kodeia*, poppyhead]. **USP.** An alkaloid obtained from opium.

ACTION AND USES. Analgesic, hypnotic sedative with effects resembling morphine.

DOSAGE: 1/4 to 2 gr. (0.015-0.13 Gm.).

POISONING SYM. Depression of central nervous system to the point of sleep.

TREATMENT. Similar to morphine.

INCOMPATIBILITIES. Ferrous iodide, Lugol's solution.

c. phosphate. **USP.** Phosphate of the alkaloid codeine with a preference because of its free solubility in water. **DOSAGE.** Same as codeine.

c. sulfate. **USP.** The sulfate of the alkaloid codeine. **ACTION AND USES:** Same as codeine. **DOSAGE.** Same as codeine.

Codivilla's extension (ko-di-vil'lā). One for fractures made by weight pulling on a nail passed through the lower end of the bone.

cod liver oil (oleum morrhuae). **USP.** A fixed oil obtained from the fresh livers of the cod fish. The official oil is standardized for its vitamin A and D content.

ACTION AND USES. Certain conditions of nutritive deficiency.

DOSAGE: 2 1/2 drams (10 cc.).

INCOMPATIBILITIES. Light and air, both being contributing factors toward rancidity.

coefficient (ko-ef-fish'ent) [*L. con*, together, + *efficere*, to produce]. A figure put before a chemical formula to express amt. or degree of normal change in a substance under stated conditions.

c. of absorption. Volume of gas absorbed by a unit volume of a liquid at 0° C. and a pressure of 760 mm.

c., Baumann's. Ratio of ethereal sulfates to all sulfates in urine.

c., biological. Amt. of potential energy used by body at rest.

c., Bouchard's. Ratio bet. amt. of urine and total solids of the urine.

c., Falta's. Percentage of ingested sugar eliminated from the system.

c., isotonic. Number showing the amt. of salt to be added to distilled water to prevent the destruction of erythrocytes when it is added to blood.

c., lethal. Concentration of disinfectant that will kill bacteria in the shortest length of time at 20-25° C.

c., urotoxic. Number showing toxicity of the urine: i. e. amt of toxic matter produced by 1 Kg. of the poison in 24 hours.

coelom. The cavity in an embryo between the split layers of lateral mesoderm. In mammals it develops into the pleural, peritoneal, and pericardial cavities.

c. extra-embryonic. In man, the cavity in the developing blastocyst which lies between the mesoderm of the chorion and the mesoderm covering the amniotic cavity and yolk sac.

coenocyte. A multinucleated mass of protoplasm, a mass of protoplasm in which cell membranes are between the nuclei, as in striated muscle cells, a syncytium.

coenzyme [L. *co*, together, + G *en*, with, + *zymē*, leaven]. Enzyme activators. **See** *coactivity*. A diffusible, heat stable substance of low molecular weight which when combined with an inactive protein, called *apoenzyme* forms an active compound or a complete enzyme called *holoenzyme*. Examples are adenylic acid, riboflavin, and coenzymes I and II.

coetaneous (ko-e-ta'ne-us) [+ *actās*, age]. Having the same age or date.

coexcitation (ko-ek-si-ta'shun) [+ *excitāre*, to arouse]. Simultaneous excitation of 2 parts or bodies.

coferment (ko-fer'ment) [+ *fermentātio*, ferment]. A coenzyme.

coffee [L. *cafeā*]. Seed of the berry of *Coffea arabica*.

COMP. Coffee has no nutritive value unless it be as a nerve food, but it is the most powerful stimulant that can be safely taken into the system. It contains some nitrogenous material, cellulose, aromatic oils, and fatty substances, sugar and dextrin, potassium phosphate, and a few mineral substances. Caffeine is its essential principle and this is combined with caffeotannic acid, making it slightly antiseptic.

A cup of coffee contains 1½ gr of caffeine. This principle is a trimethyl xanthine and it is related to the purin bodies, so that coffee increases the production of urinary uric acid. Coffee sometimes causes mild but enduring cardiac pain which disappears if the beverage is withdrawn. The purins amount to 2%.

AV. SERVING. 240 gr. Pro 0.5. Carbo. 34. Milk adds to its nutritive power and lowers the stimulating effect.

ACTION Stomach. Action is light and aids digestion. Cold coffee with plenty of water does not fatigue the stomach. Even with dyspepsia strong coffee does not always prove baneful.

Circulation. Raises the tension of the vascular and nervous systems. Raises the temperature, modifies the heart beats. Relieves fatigue, stimulates activity, esp cerebral and muscular activity. Prevents sleep through increased cerebral stimulation. Whether it diminishes the consumption of albumin is a debatable question. While it increases the power of production it does so as a stimulant, which must be compensated for by rest and sleep.

Kidneys: It is a diuretic, producing uric acid and taxing the suprarenal capsules. Overdoses are toxic, causing caffeineism, *q.v.*

IND. Use where a quick stimulation is necessary. As an antidote for morphine and opium, in acute alcoholism, and where it is necessary to keep one awake.

It is being used in Europe for low blood pressure.

CONTRA: Do not use in affections of the heart; in angina; hypertension; sclerosis; neurasthenia; dyspepsia; acne rosacea; psoriasis; uremia; gout; arthritis; liver complaints, and congestion of the visual organs, or when alkaloïds or quinine sulfate are being administered. **See:** *chocolate, cocoa, tea.*

c.-ground vomit. Vomit similar to coffee in pigment and consistency, occurring in cancer of the stomach.

coffeurin (kof-e-u'rin) [+ *G. ouron*, urine]. A principle said to exist in urine after excess use of coffee.

The urine then becomes brownish, deep brown, or red, and has the odor of coffee.

cognition [L. *cognōscere*, to know]. Awareness, having perception and memory.

cog/wheel respira'tion. A sudden, brief halt in inspiration and expiration.

cohabita'tion [L. *cohabitāre*, to dwell together]. 1. Sexual intercourse. 2. State of monogamy.

coherent (kō-hēr'ent). 1. Sticking together, as parts of bodies or fluids. 2. Consistent, making a logical whole.

cohe'sion [L. *cohaerere*, to adhere]. The property of adhering.

cohe'sive. Adhesive, sticky.

Cohnheim's fields. Irregular groups of fibrille seen in a cross section of a striated muscle fiber. Also called *Cohnheim's areas*.

Cohnheim's theory (kōn'hīmz). Theory that tumors result from embryonal cells not utilized for fetal development.

coil [L. *colligere*, to gather together]. 1. A spiral formed by winding some substance. 2. A coil of wire for passage of electric impulses.

c., Bris'fow. Small, portable faradic coil operated on 2 dry cells and the simple device of an iron core sliding in and out of the primary coil which allows a flexible regulation of the secondary current. It is used for muscle stimulation in weak but not paralyzed muscles.

c., choke. Coil of wire which may or may not be provided with a movable laminated iron core, used to limit the flow of current in alternating current circuits. An electrical device using the inductive properties of the alternating current to limit or retard the current entering or leaving an apparatus.

c., faradic. Device for the production of an induced current from a direct current source. Its essential parts are (1) a primary coil consisting of a few turns of insulated thick wire around a soft iron core, (2) a secondary coil consisting of many turns of insulated fine wire, (3) an interrupting device.

c., gland. Sweat gland.

c., induction. Large faradic coil.

c., Oudin (oo-dan'). A coil of fine wire with a large number of turns which increases voltage to such an extent that when the high frequency machine runs at full power there will be a corona discharge to the air from the Oudin (monoterminal) outlet.

c., primary. **See:** *faradic c.*
c., Ruhmkorff (rūm'korf). An apparatus consisting of 2 insulated coils, the primary made up of a few turns of coarse wire, the secondary consisting of many turns of fine wire, enclosing a core of soft iron wires. The primary coil is connected with current supply and an interrupter. Induction coil in which

secondary coil is not movable but is fixed at point of maximum intensity.

c., secondary. SEE *faradic c. or high frequency.*

c., spark. Specially designed faradic coil for graduated muscular contraction by electrical muscle stimulation

c., Tesla. Coil in a modern diathermy apparatus magnetically coupled to the first coil, and the 2 together are known as the resonator

coiled posture. A natural position with some, but esp assumed in cerebral diseases, in hepatic, intestinal, or renal colic SEE *posture, illustration, below.*

COILED POSTURE.

colonychia (koy-lo-nik'i-ā) [G *kolos*, hollow, + *onyx*, *onych-*, nail] Nails that have a concave outer surface

coin counting. A sliding movement of tips of thumb and index finger over each other in paralysis agitans

c. test. A metal-like sound heard in pneumothorax SYN *bell metal resonance, q v*

coital (ko'i-tal) Pert to coition

coition (ko-ish'un) [L *coitus*, a uniting] Cohabitation Sexual intercourse* bet man and woman *Coitation, coitus, concubitus, q v*

coitophobia (ko-i-to-fo-bi-ā) [C + G *phobos*, fear] Morbid fear of the sexual act

coitus (ko'i-tus) [L a uniting] Coition, copulation, *q v*. Sexual intercourse bet man and woman

c., à la vache. C with woman in knee-chest position

c. interruptus. Withdrawal of the penis from the vagina before the seminal emission occurs

The practice leaves the ejection centers still hyperemic and the seminal vesicles not completely emptied, inducing an earlier return of the libido Chronic congestion of the prostate may also ensue The tissues of the female genitalia are not depleted for some time which may induce chronic congestion The psychic reaction in both sexes is unfavorable and may lead to a more or less permanent conflict.

c. reservatus. 1 Same as *c. interruptus* 2 Onanism *

colalgia [G *kōlon*, + *algos*, pain] Pain in the colon

colation (ko-la'shun) [L *colatio*, from *colāre*, to strain] Straining, filtering

colause (kol-awks'e) [G *kōlon*, + *auxē*, increase] Distention of the colon

colchicum (kol'chik-um) [G. *kolchikon*] Colchicum seed, USP The seed of a plant of the same name An antineuralgic and analgesic, sometimes used in acute gout

DOSAGE. From 3 m (0.2 cc.).

cold [AS *cold, ceald*]. 1. A catarrhal affection of the respiratory mucous membranes known as the common cold 2. The opposite of heat, *q v*

cold, common. An acute catarrhal inflammation of the upper respiratory tract. Also called *coryza, rhinitis*

Etiology. Filterable virus or allergic and metabolic disturbances

Symptoms. Congestion of nasal mucosa with partial or complete occlusion of nostrils, continuous watery discharge with more or less continuous sniffing and blowing of nose Headaches and dull pains in the face and head

are common Constitutional symptoms may appear, such as fever, body aches, easy fatigability

Treatment. Treatment is mainly for the relief of symptoms Spraying with ephedrine hydrochloride or inhalation of benzadrine or menthol relieves congestion Coal-tar derivatives relieve malaise and aching Antihistamines are sometimes effective Codeine and papaverine in combination give relief in a high percentage of cases

c., asphyxia. Place body in cold room, rub with snow or ice water, use artificial respiration SEE *artificial respiration, asphyxia fr. cold, respiration.*

c., chest. Bronchitis * Inflammation of the bronchial mucous membranes

c. cream. USP White perfumed ointment used mainly as a cosmetic and for chapped skin, minor excoriations of the face, and herpes labialis

c., head. Coryza, * rhinitis * Acute catarrhal inflammation of the nasal mucous membranes

Treatment. Vitamin A does not prevent or reduce severity Codeine and opium derivatives in combination have given relief in 71% of patients.

c. pack. Used to reduce temperature

c. sore. Fever blister. Eruption of vesicles on an inflammatory base. SEE *herpes.*

colectomy (ko-lek'to-mī) [G. *kōlon*, + *ektomē*, excision] Excision of part of the colon

coleocele (ko'le-o-sēl) [G. *koleos*, sheath, vagina, + *kēlē*, hernia]. A vaginal hernia.

colecystitis (ko-le-o-sis-ti'tis) [C + *kystis*, bladder, + *-itis*, inflammation]. Inflammation of the vagina and bladder.

colectomy [C + *tomē*, incision]. Incision into the pericardium or into the vagina.

colibacillemia (ko-li-bas-il-le'mi-ā) [G. *kōlon*, colon, + L. *bacillus*, little rod, + G *aima*, blood]. Colon bacillus in the blood.

colibacillo'sis [C + C + G *-ōsis*, infection]. Infection with the colon bacillus.

colibacilluria (ko-lī-bas-il-u-rī-ā) [" + " + *G. ouron*, urine]. Colon bacillus in the urine.

colibacillus [" + *L. bacillus*, little rod]. The *Bacillus coli*.

colic (kol'ik) [*G. kōlikos*, pert. to the colon]. 1 Spasm in any hollow or tubular soft organ accompanied by pain. 2 Pert. to the colon.

SEX: cholecystalgia, tormina.

c., biliary. In bile ducts usually associated with a gallstone

c., infantile. Occurring in infants, principally first few months. **SYM** Extremities cold, abdomen distended and hard

c., intestinal. Pain may occur throughout the abdomen and is frequently due to errors of diet

c., lead. Associated with lead poisoning, occupational, painters, etc. Severe abdominal colic. Lead line may be found on gums and basic stippling in red blood cells

c., menstrual. Abdominal pain during menses due to some uterine disorder

c., renal. In region of one of the kidneys and toward the thigh. Pain radiates from kidney region around over abdomen into the groin. It accompanies the passage of calculus. Rigors pronounced

c., uterine. Painful menstruation. **SYN: dysmenorrhoea.**

col'ica [L]. 1. Abdominal colic. 2 Colic artery.

c. pictonum. Painter's colic.

c. scortorum. Abdominal pain in prostitutes

colicoll'itis [*G. kōlon*, colon, + *-itis*, inflammation] Colon inflammation due to *B. coli*.

colicople'gia [" + *plēgē*, stroke]. Lead poisoning with colic and lead paralysis

colicystitis (ko'il-sis-ti'tis) [*G. kōlon*, colon bacillus, + *kystis*, bladder, + *-itis*, inflammation] Inflammation of bladder. **ETIOL: Bacillus coli**

colicystopyelitis (ko'il-sis'to-pi-ē-li'tis) [" + " + *pyelos*, pus, + *-itis*, inflammation]. Inflammation of bladder and pelvis of kidney. **ETIOL: Bacillus coli.**

coliform [*L. colum*, sieve, + *forma*, form] 1. Sieve form, cribriform. 2 Pert to microorganisms resembling the *Bacillus coli communis*

co'li infection. Infection with *Bacillus coli communis*.

collysin (ko-lī'lī-sin) [*G. kōlon*, colon bacillus, + *lysis*, dissolution] A hemolysin formed by *Bacillus coli communis*.

colinephri'tis [" + *nephros*, kidney, + *-itis*, inflammation]. Nephritis caused by the colon bacillus

coliplication (ko-lī-pī-ka'shun) [" + *L. plica*, fold]. Operation for correcting a dilated colon

colipuncture (ko-lī-punk'tūr) [" + *L. punctura*, a piercing]. Puncture of the colon to relieve distention. **SYN: colocentesis.**

colipyuria (ko-lī-pī-u-rī-ā) [" + *pyon*, pus, + *ouren*, urine] Pus in urine due to *Bacillus coli*.

colisep'sis [" + *sepsis*, putrefaction]. Infection caused by the colon bacillus.

coll'itis [" + *-itis*, inflammation]. Inflammation of the colon

c., mucous. Colitis accompanied by large quantities of mucus. More common in women than in men and among nervous types. A secretory neurosis of the large intestine.

SYM: Attacks occur paroxysmally accompanied by constipation. Spastic, colicky pain in midabdomen. Tenacious, gelatinous mucus and shreds of mucous membrane may be passed.

c., ulcerative. Ulceration of inner lining of colon with dilatation.

SYM: Passage of watery, offensive stools with mucus and pus. Abdominal pain, tenderness, or colic. Maybe temperature, intermittent or irregular fever. Hemorrhage and perforation may occur.

colitoxemia (ko-lī-toks-e'mī-ā) [" + *toxikon*, poison, + *aima*, blood]. Toxemia caused by the colon bacillus

colitoxico'sis [" + " + *-osis*, infection]. Systemic poisoning caused by the colon bacillus

colitox'in [" + *toxikon*, poison]. A toxin generated by the colon bacillus.

coliuria (ko-lī-u-rī-ā) [" + *ouren*, urine]. Presence of *Bacillus coli* in the urine. **SYN: colibacilluria.**

collagen (kol'aj-en) [*G. kolla*, glue, + *gennan*, to produce] 1 A substance existing in the various tissues of the body, as in the white fibers of connective tissue. 2 A protein which can be prepared from connective tissue (tendons, etc.) and from which gelatin can be made

collagen disease. So called because all connective tissues are involved which may have a common origin in cell malformation, such as hardening of arteries, arthritis, rheumatic fever, and certain serious maladies, although symptoms and actions in each are different. Connective-tissue fibers have conspicuous alterations in each of these diseases, although the collagen diseases may result from the same cell dysfunction in each case. Disturbance in nuclei acid metabolism of the collagen-producing cells may be one of the factors in these changes

collapse' [*L. collapsus*, fallen to pieces] 1. An abnormal retraction of the walls of an organ. 2 A sudden failure of vital power due to reflex inhibition of the heart and respiratory system, or to loss of blood, low metabolism, or undue lowering of the blood pressure

The term **collapse** designates a profound degree of shock, *q.v.*, induced by functional inhibition of the vasomotor center, to distinguish it from the shock of exhaustion of the same center resulting from physical violence or impressions of fear. Intense fear may induce a complete collapse, as is sometimes seen in a victim about to be executed.

SYM: Similar to those of hemorrhage. The peripheral arteries are depleted of blood, and the veins, esp in the splanchnic region, are congested, apathy, extreme pallor, cold, clammy perspiration; thin, rapid pulse; fall of blood pressure; unconsciousness.

NP: The head of bed, or head and shoulders of patient should be lowered. Hot blankets and hot water bottles may be placed about the patient's body. The arms and lower extremities may be bandaged in critical cases. The heart needs sugar. The doctor may administer epinephrine into the circulation. A physician should be called in all cases of collapse. Raise blood pressure.

c. of lung. Artificially induced by (a) Artificial pneumothorax; (b) thoracoplasty, or (c) avulsion of phrenic nerve.

collap'sing. Falling into extreme and sudden prostration resembling shock.

c. pulse. Pulse of aortic insufficiency or regurgitation; water-hammer pulse. **Syn:** *Corrigan's pulse*.

collapsotherapy [L. *collapsus*, fallen to pieces, + G. *therapeia*, treatment]. Treatment of pulmonary affections by unilateral pneumothorax and immobilization of affected lung.

collar (kol'ar) [L. *collum*, neck]. 1. A band worn round the neck. 2. Structure or marking formed like a neckband.

c. of Venus, c., venereal. Mottled appearance of the skin of the neck occasionally seen in syphilis. **Syn:** *melanoleukoderma colli*.

collarbone. The clavicle, *q v* SEE *jugulum*.

collateral [L. *con*, together, + *lateralis*, pert. to a side] 1 Accompanying, a side by side 2 Subordinate or secondary 3 Not related linearly. 4 An accessory nerve or blood vessel 5. A minute side branch of the axon or axis cylinder of a neuron which passes outward at right angles to the axon

c. circulation. That of small anastomosing vessels, esp. when a main artery is obstructed.

c. eminence. An elevation in the floor of the lateral ventricle

c. fissure. A fissure on the median surface of the cerebral hemisphere

c. ganglia. Ganglia of the sympathetic division of the autonomic nervous system, located near origins of the celiac and mesenteric arteries. Include the celiac and mesenteric ganglia. Also called *prevertebral ganglia*

c. trigone. The angle between the diverging inferior and posterior horns of the lateral ventricle

collaterals [L. *con*, together, + *lateralis*, pert. to a side] Minute side branches of processes of axon or axis cylinder processes.

collecting plates. The electronegative element of a galvanic battery.

collecting tubules. Small ducts which receive urine from several renal tubules and discharge it into papillary ducts which open into a renal calyx at the tip of a papilla

collema (kol-e'mi-ä) [G. *kolla*, glue, + *ama*, blood] A colloidal form of matter in the blood causing capillary obstruction.

Colles' fascia (kol'ez). Inner layer of superficial fascia of perineum

C.'s fracture. The transverse fracture of the distal end of radius (just above wrist) with displacement of hand backward and outward

C.'s law. A theory, long accepted (since the advent of the Wassermann test), that a syphilitic child, born of a mother who is not affected by the nursing child, may affect others. Later in life it has been demonstrated that the mother may show signs of late tertiary syphilis, although her Wassermann was negative at the birth of child.

colliculectomy (kol-lik'u-lek'to-mi) [L. *colliculus*, mound, + G. *ektomē*, excision]. Removal of the *colliculus seminalis*.

colliculitis ["" + G. -itis, inflammation]. Inflammation of the *colliculus seminalis*.

colliculus [L. mound] A little eminence

c. anterior. The more forward eminence on the lamina quadrigemina

c. bulbi, c. bulbi intermedius. Erectile tissue encircling the male urethra at the entrance to the bulb.

c. cervicalis (urethrae muliebris). The crest on the posterior wall of the female urethra.

c. inferior. One of two elevations forming the lower portion of the corpora quadrigemina of the midbrain.

c. seminalis. An oval enlargement on the crista urethralis, an elevation in the floor of the prostatic portion of the urethra. On its sides are the openings of the ejaculatory ducts and numerous ducts of the prostate gland

c. superior. One of two elevations forming the upper portion of the corpora quadrigemina of the midbrain.

c. urethralis. C. seminalis.

collier's lung. Pulmonary disease due to inhalation of coal dust. **Syn:** *anthracosis*.

Colling's electrotome [G. *elektron*, amber, friction of which produces electricity, + *tomé*, incision]. Apparatus for using cutting current to relieve fibrous obstruction of neck of bladder in prostatic hypertrophy by endovesical or transurethral operation

Collip unit. Dosage unit of parathyroid extract. One-one hundredth of the quantity necessary to increase by 5 mg the amount of calcium in 100 cc of blood after 15 hours in a dog weighing 20 Kg

colliquation (kol-i-kwa'shun) [L. *con*, together, + *liqueare*, to melt]. 1 Abnormal discharge of a body fluid 2 Softening of tissues to liquefaction. 3. A wasting

colliquative (ko-lik'wä-tiv) Pert to a liquid and excessive discharge, as a *c. diarrhea*

collo'dium, collo'dion [L. from G. *kol-lodēs*, glutinous] Preparation intended for external use (protective for surgical dressings), having for its base a solution of pyroxylin or gun cotton, in a mixture of ether and alcohol. Two are official

c., flexible. USP A more elastic preparation of collodium, containing camphor and castor oil

colloid (kol'oid) [G. *kol-lodēs*, glutinous]

1 Gelatinous, like glue, opposite of crystalloid * 2 A particle invisible to the naked eye, which instead of dissolving, is held in a state of suspension 3 Gelatinous substance developing in colloid degeneration and carcinoma. Colloids are insoluble, incapable of crystallization, and not diffusible through animal membranes

A lessened amount of colloids results in increase of kidney stones. Acute physical distress depresses body-level of protective colloids, as do undersupply of Vitamin A or oversupply of Vitamin D, or a diet too rich in calcium, nitrogen, phosphates or alkali. **SfE** *kidney stone*.

c. cancer. One in which the tumor cells have a glue-like appearance

c. chemistry. This deals with such systems and substances, and with the problems of emulsions, mists, foams, and suspensions [liquid]

c. cyst. A sac containing a jellylike

c. degeneration. A mucoid degeneration seen in the protoplasm of epithelial cells [skin]

c. milium. Colloid degeneration of the *c. suspension*. A mixture holding particles in suspension, the forms of which change with the forces acting upon them, such as milk, fat etc

c. thyroid. Semi-fluid, jelly-like substance filling the follicles of the thyroid gland. It contains the thyroid hormone.

colloidal (kol-loyd'al) Pert to a colloid.

colloidal dispersion. A mixture containing colloid particles which fail to settle out and are held in suspension. They are common in animal and plant tis-

sues, the protoplasm of cells being a colloidal mixture. Particles of colloidal dispersions are too large to pass through cell membranes and such dispersions usually appear cloudy.

colloidin (kol-oid-in) A jellylike substance seen in colloid degeneration.

colloidoclasia (kol-oid-o-kla'si-ä) [G. *kol-lôidês*, glutinous, + *klasis*, fracture] A rupture of the body's colloid equilibrium.

colloidopexy (kol-oid-o-pek-si) ['' + *pêxis*, fixation] Fixation of colloids during metabolism.

collo'ma [G. *kolla*, glue, + *-ôma*, tumor]. 1. A colloid degeneration of a cancer. 2. A cyst containing a gelatinous substance.

colonema (kol-o-ne'mä) ['' + *néma*, yarn]. Tumor of mucoid tissue. *SYN.* *myxoma*, *myxosarcoma*.

collopectia (kol-o-pek'si-ä) [L. *collum*, neck, + G. *pêxis*, fixation] Fixation of the *cervix uteri*.

col'lum [L. neck] 1. The necklike part of an organ. 2. The neck.

collutory (kol'lu-to-ri) [L. *colluere*, to rinse] A gargle or mouth wash.

collyrium (kol-lu'i-um) [G. *kollyrion*, an eyesalve] An eyewash.

colobo'ma [G. *koloboma*, a mutilation] A congenital fissure of the choroid iris, or eyelids.

colocentesis (ko-lo-sen-te-sis) [G. *kôlon*, colon, + *kentesis*, puncture] Surgical puncture of the colon to relieve distention.

colocolocystostomy (ko-lo-kol-e-sis-tos'-to-mi) ['' + *chole*, bile, + *kystis*, bladder, + *stoma*, opening]. Surgical formation of a communication bet. colon and gallbladder. *SYN.* *cholocystocolostomy*.

colocleisis (ko-lo-kl'i'sis) ['' + *kleisis*, closure] Occlusion of the colon.

coloclysis (ko-lok'li-sis) ['' + *klysis*, washing] A colonic enema.

coloclyster (ko-lo-klis'ter) ['' + *klyzein*, to cleanse] A colonic enema.

colocolostomy (ko-lo-kol-os'to-mi) ['' + *kôlon*, colon, + *stoma*, mouth] Formation of a connection bet 2 portions of the colon.

colocynth (kol o-sinth) [G. *kolokynthê*, fruit of *Citrullus colocynthis*] USP. Dried pulp of unripe colocynthis fruit.

ACTION AND USES A drastic hydragogue cathartic. Dosage 2 gr (0.12 Gm.)

coloeenteritis (ko-lo-en-ter-i-tis) [G. *kôlon*, colon, + *enteron*, intestine, + *-itis*, inflammation] Inflammation of mucous membrane of small and large intestines.

colofixation ['' + L. *fixatio*, fixation]. Suspension of the colon in ptosis.

col'on [G. *kôlon*] The large intestine from the cecum to the rectum, 4 to 6 feet long, and divided into the ascending, the transverse, and the descending colon.

Beginning at the cecum, a pouch bet. the small intestines and the ascending colon, it passes the right kidney under the concave surface of the liver and lower part of the stomach to the spleen, descending past the left kidney to the sigmoid flexure.

c. bacteria. *Bacillus coli communis* is the most commonly found. Whatever digestion takes place in the colon is due to bacteria. A large number of fermentative bacteria are found in the middle portion of the colon. They change carbohydrates into carbon dioxide, alcohol, and lactic acid. This is the only way cellulose may be acted upon in the body. Putrefying bacteria are found in the lower part of the colon. These produce decomposition products which may be absorbed with toxic effect.

c. digestion. Mechanical Antiperistaltic waves move the food mass in the ascending colon back toward the cecum, which aids in further mixing it.

Chemical. No digestive enzymes are secreted in the colon, but an alkaline fluid aids in the completion of digestion begun in the small intestines. Those products of bacterial action which are absorbed into the blood stream are carried by the portal circulation to the liver before they get into the general circulation. There is also a great deal of water absorbed in the colon rather than in the small intestines. The fluids of the body are conserved in this way, and in spite of the large volumes of secretions (saliva, etc.) added to the food during its progress through the alimentary canal, the contents of the colon are gradually dehydrated until they assume the consistency of normal feces or even become quite hard.

SEE: absorption, colon, defecation.

colon, words pert. to: anus, appendices epiploicae, cecum, cholecystocolostomy, -otomy, colalgia, colitis, "colo-" words, diverticulitis, -ulum, haustra, -al, jejunum, pendulum movements, peristalsis, rectum, small intestines, vermiform appendix.

colnalgia (ko-lon-al'ji-a) [G. *kôlon*, colon, + *algos*, pain] Pain in the colon.

colonic (ko-lon'ik). Pert. to the colon.

c. irrigation. Injection into the colon of a large amt. of fluid which is intended to fill colon and flush it.

Administered not to induce defecation but to wash out material situated above the defecation area and to lave the wall of the bowel as high as the water can be made to reach. Two primary methods: 1 tube, involving filling colon to capacity through a single tube and allowing liquid to run out through the same tube, and 2-tube method, employing separate inflow and outflow tubes.

colanitis (ko-lon-i'tis) [G. *kôlon*, colon, + *-itis*, inflammation] Inflammation of the colon. *SYN.* *colitis*.

colonom'eter [L. *colonia*, colony, + G. *metron*, measure] Device for estimating colonies of bacteria on a culture plate.

colonopecty (ko-lon-o-pek-si) [G. *kôlon*, colon, + *pêxis*, fixation] Process of attaching part of colon to abdominal wall.

colonorraghia (ko'l'on-or-ra'ji-ä) ['' + *regnumai*, to burst forth] Hemorrhage from the colon.

colonorhea (ko'l'on-or-re'ä) ['' + *rota*, flow] Mucous colitis.

colonoscope (ko-lon-o-sköp) ['' + *skopein*, to examine]. Instrument for examination of the colon.

colonoscopy. Examination of upper portion of rectum with an elongated speculum.

col'ony [L. *colonia*]. A collection of microorganisms in a culture.

colopexos'tomy [G. *kôlon*, colon, + *pêxis*, fixation, + *stoma*, mouth]. Resection of the colon and fixation to abdominal wall to establish an artificial anus.

colopexotomy (ko-lo-pek-sot'o-mi) ['' + *-tome*, incision]. Incision and fixation of colon.

colopexy, colopexia (ko'lo-pek-si, ko-lo-pek'si-ä) ['' + *pêxis*, fixation]. Fixation of the sigmoid or cecum to the abdominal wall by suture.

coloplication (ko-lo-pli-ka'shun) ['' + L. *plica*, fold]. Making a fold in the colon to reduce its lumen.

coloproctitis [' + *prōktos*, anus, + *-itis*, inflammation]. Colonic and rectal inflammation

colorectostomy (ko-lo-prok-tos'to-mī) [' + " + *stoma*, opening] Making a communication bet a segment of colon and the rectum.

coloptosis (ko-lop-to'sī-ā) [' + *ptōsis*, dropping] Prolapsus of the colon, esp. of the transverse c

coloptosis (ko-lop-to'sis) [' + *ptōsis*, dropping] A downward displacement of the colon

colopuncture (ko'lo-punk-chur) [' + *L. punctura*, piercing] Puncturing the colon

col'or [L.] A visible quality, distinct from form, and light and shade

c. blindness. Inability to identify 1 or more of the primary colors Daltonism

c. hearing. A sense of color caused by a sound

c. index. The hemoglobin content of red blood cells compared with the normal, found by dividing the percentage of hemoglobin by that of erythrocytes *

It is an expression of the average amount of hemoglobin contained in each red cell. Normally this index is about 1, indices below 1 indicate that the red cells are abnormally small above 1, that they are abnormally large. See *volume index*

color, words pert. to: achromate, -tic, -topsia, -tosis, achromoderma, "acro-" words, alba, albedo, albicans, allochromism, aliochromasia, anerythroptasia, anisochromatic, aurantiasis, -ium, auric, canescent, carotene, "chrom-" words, flavescens, isochromatic, melanin, nigrescent, pigmentation, pigment-producing rays, rufescent, rubiginous, rubor, rufous, vermillion, versicolor, xanthic

colorectitis (ko-lo-rek-tī'tis) [G. *kōlon*, colon, + *L. rectum*, + G. *-itis* inflammation] Inflammation of colon and rectum. Syn *coloprocitis*

colorectostomy (ko-lo-iek-tos'to-mī) [' + " + G. *stoma*, opening] Formation of passage bet colon and rectum

colorimeter [L. *color*, color, + G. *metron*, measure] Instrument for measuring amt of pigments

colostomy (ko-lost'o-mī) [G. *kōlon*, colon, + *stoma*, mouth] Incision of the colon for purpose of making a more or less permanent fistula in treatment of carcinomatous stenosis of lower portion of colon, and in cases of inoperable carcinoma of rectum

c. diet. A low residue diet *

c. inguinal. Incision of colon to form artificial anus

NP Change dressings *p.r.n.* Protect skin around opening from discharge by covering with sterile zinc oxide ointment. Remove ointment when cleaning with sterile sweet oil. Chart amt and nature of discharge. Prevent impaction, watch diet orders, irrigate through upper or lower loop as ordered.

colostria'tion [L. *colostrum*]. Infant diarrhea assumed to be caused by colostrum.

colostorrhoea (ko-lost-ror-re-ā) [' + G. *roia*, flow]. Abnormal secretion of colostrum

colos'trum [L.]. Secretion from the lactiferous glands before the onset of true lactation 2 or 3 days after delivery.

The secretion contains, mainly, serum and white blood corpuscles. So-called

"first milk" Av. amt. sugar 3%, fat 6%, salts 6.4%

colotomy (ko-lot'o-mī) [G. *kōlon*, colon, + *tomē*, incision] Incision of colon. See *Catheter's operation*.

coloty'phoid [' + *typhos*, fever, + *eidos*, resemblance] Typhoid fever with ulceration of colon

colpalgia (kol-pal'jī-ā) [G. *kolpos*, vagina, + *algos*, pain] Vaginal pain.

colpatresia (kol-pat-re'zī-ā) [' + *a-*, priv. + *trexis*, a perforation]. Occlusion or pathological closure of the vagina

colpectasia (kol-pek-ta'sī-ā) [' + *ektasis*, distention] Dilatation of the vagina

colpec'tomy [' + *ektomē*, excision] Cutting out part of the vagina.

colpeurynter (kol-pu-rin'ter) [' + *eurynein*, to dilate] A bag for dilatation of the vagina sometimes used instead of the intracervical hydrostatic bag for the induction of labor

colpocury'sis (kol-pu'ris-is) [' + *eurynein*, to widen]. Enlarging of the vagina by surgery

colpitis (kol-plī'tis) [' + *-itis*, inflammation] Vaginitis. Inflammation of the vagina

Etiol. Most often produced by bacterial invasion, particularly by the gonococcus. May be caused by chemical irritation through the use of too strong chemicals for douching, and from a highly acid urine. Foreign bodies in the vagina (pessaries, etc.) may produce colpitis when there is poor sex hygiene.

Sym. Free, purulent vaginal discharge, sometimes offensive and occasionally stained with blood. There is irritation of the vulva, frequency of micturition, and smarting pain on the passage of urine. The vaginal mucous membrane is reddened and there may be superficial ulceration

Treatment. In general, colpitis is relieved by the use of cleansing douches after removing the etiological factors.

See *vaginitis*.

c. emphysematosa. Air bleb formation in the vagina as seen in *B. welchii* infection

c. mycotica. That due to the presence of yeasts and molds

c. senilis. That accompanied by atrophy of the mucous membrane with the formation of highly vascular papillae. Seen in elderly women who have passed the menopause

c. trichomonas. That due to the *Trichomonas vaginalis*. Characterized by punctate hemorrhagic spots in the vagina and a frothy yellowish leukorrhoea.

colpocele (kol'po-sēl) [' + *kēlē*, hernia]. Hernia into the vagina

colpoceliotomy (kol'po-se-lī-to'o-mī) [' + *kōlia*, belly, + *tomē*, a cut]. Entering the abdomen surgically through the vagina

colpocleisis (kol-po-klī'sis) [' + *kleisis*, a closure]. Operation of occluding the vagina

colpocystitis (kol-po-sis-tī'tis) [' + *kystis*, bladder, + *-itis*, inflammation] Inflammation of vagina and bladder.

colpocystocele (kol-po-sis'to-sēl) [' + " + *kēlē*, hernia] Prolapse of the bladder into the vagina.

colpocystoplasty [' + " + *plasmein*, to form]. Treatment of vesicovaginal fistula

colpocystosyrinx (kol'po-sis-to-sir'inks) [' + " + *syrinx*, fistula]. Fistula bet. bladder and vagina.

colpocystotomy (kol-po-sis-to'to'-mī) [" + *tomē*, incision]. Cutting into the bladder through the vagina.

NP: Prevent bladder distention. Record intake and output. If retention catheter is present, irrigate twice daily with solution ordered and be sure catheter is kept draining. If female patient, keep clean and comfortable with external irrigations over the vulva.

colpocystoureterocystotomy (kol"po-sis"-to-u-re"ter-o-sis-to'to'-mī) [" + " + *ourēter*, ureter, + *kystis*, bladder, + *tomē*, incision] Incision into the ureter through the walls of the bladder and vagina.

colpodesmorrhaphia (kol-po-des-mor-a'-fi-ā) [" + *desmos*, band, + *raphē*, suture]. Repair of the vaginal sphincter.

colpodynia (kol-po-din'i-ā) [" + *odynē*, pain]. Pain in the vagina. SYN: *colpalgia*.

colpohyperplasia (kol-po-hi-per-pla'zi-ā) [" + *yper*, over, + *plasis*, a forming]. Excessive growth of mucous membrane of the vagina

c. *cystica*. Infectious inflammation of the vaginal walls which is characterized by the production of small blebs.

colpohysterec'tomy [" + *ystera*, uterus, + *ektomē*, excision] Removal of the uterus through the vagina

NP. Watch for vaginal packs and remove as ordered. Watch for retention catheters and care for per routine orders

colpohysteropexy (kol-po-his'ter-o-pek-si) [" + " + *pēxis*, fixation] Fixation of uterus through the vagina

colpohysterot'omy [" + " + *tomē*, incision]. Incision through the vagina into the uterus, as for excision of a fibroma.

colpomyomectomy (kol-po-mī-o-mek'to-mī) [" + *mys*, muscle, + *-ōma*, tumor, + *ektomē*, excision] Removal of a fibroid tumor of the uterus through the vagina

colpomyotomy (-mot'o-mī) [" + " + " + *tomē*, incision] Incision of uterus through the vagina for removal of tumor.

colpopathy (kol-pop'ā-thī) [" + *pathos*, disease] Any pathology of the vagina

colpoperineoplasty (kol-po-per-in-ē-o-plas-tī) [" + *perinaion*, perineum, + *plassein*, to form] Plastic operation on vagina and perineum.

NP. Irrigate perineum with warm sterile water b.i.d. and after bedpan. Warm glycerine dressings are often applied to relieve pain and discomfort. If leg holders are not convenient, fold a sheet in triangular shape, roll towards point, place under knees of patient, drawing them up, bring one end over shoulder and under opposite arm, and tie. After operation, a towel should be pinned around limbs to hold in position. Light diet for few days

colpoperineorrhaphy (kol-po-per-in"e-or'raf-i) [" + " + *raphē*, suture] Operation for mending perineal tears in vagina. SYN: *colpoperineoplasty*.

colpopexy [" + *pēxis*, fixation]. Suture of a relaxed and prolapsed vagina to the abdominal wall.

colpoplasty (kol'po-plas-tī) [" + *plassein*, to form] Plastic operation upon vagina.

colpopotosis (kol-pop-to-sis) [" + *ptōsis*, a falling]. Prolapse of the vagina.

colporrhagia (kol-po-ra'ji-ā) [" + *reg-nunai*, to burst forth] Excessive vaginal discharge. Vaginal hemorrhage.

colporrhaphy (kol-por'ā-fi) [" + *raphē*, suture] Suture of vagina.

colporrhexis (kol-por-reks'is) [" + *r'xis*, rupture]. Operative repair of defective vaginal floor

colposcope (kol'po-skōp) [" + *skopein*, to examine]. An instrument for examining the fornices of the vagina and cervix uteri.

col'pospasm, **colpospas'mus** [" + *spasmos*, spasm]. Spasm of the vagina. SYN: *vaginismus*.

col'posta [" + *L stāre*, to stand]. Device for holding a radium applicator in the vagina

colpostenosis (kol-po-sten-o'sis) [" + *stenōsis*, narrowing] Stenosis or narrowing of the vagina

colpostenotomy (kol-po-sten-ot'o-mī) [" + " + *tomē*, incision] A cutting operation for dilating the lumen in stricture of the vagina

colpotherm (kol'po-thurm) [" + *thermē*, heat] Electrical device introduced into the vagina to convey heat

colpotomy (kol-po'to-mī) [" + *tomē*, incision] An incision of the vagina

colpoureterocystotomy (kol-po-u-re"ter-o-sis-to'to'-mī) [" + *ourēter*, ureter, + *kystis*, + *tomē*, incision] Exposure of the ureteral orifices by incision through the walls of the vagina and bladder

colpoureterot'omy [" + " + *tomē*, incision] Incision of the ureter through the vagina

colpoxerosis (kol-po-zē-rō'sis) [" + *zērō-sis*, dryness] Abnormal dryness of the vulva and vagina

columella (kol-ū-mel'lā) [L *dim* of *columna*, column] 1 A column 2 Bact. Portion of the sporangium upon which are borne the spores.

c. *nas'al*. The ant part of the septum of nose; *concha nasalis*, a turbinate bone

column (kol'um) [L *columna*, pillar] A supporting anatomical part resembling a cylinder.

c., *anterior*. Ant. portion of gray columns on either side of the spinal column

c. *of Clarke*. A group of column cells in the cervix of the post. gray column of the spinal cord

c., *direct cerebellar*. A bandlike tract of ascending white fibers immediately in front of the line of entrance of the post. nerve roots on the posterolateral surface of the spinal cord

c. *of Goll*. Inner division of the white column of the spinal cord, contains sensory fibers.

c. *of Gowers*. Tract of ascending fibers ant. to the direct cerebellar column, and on the lateral surface of the spinal cord.

c., *lateral*. Lateral white column of the spinal cord bet. lines of entrance and exit of ant. and post. nerve roots.

c. *of Morgagni*. One of several vertical ridges in mucous membrane at junction of anus and rectum.

c., *posterior*. Post. portion of gray columns of spinal cord.

c., postero-vesicular. Same as column of Clarke.

c., respiratory. Longitudinal fibrous bundle starting at upper portion of medulla and running down to the 4th cervical nerve.

c., Sertoli's. A columnar figure in testicle formed by collections of Sertoli's cells

c., spinal. The line of vertebrae from the head to the pelvis, making up the bony flexible case for the spinal cord.

c. of Turck. A subdivision of the white column of the spinal cord

c., vesicular. Line of ganglion cells on inner side of post column

columna (ko-lum'na) (pl. *columnae*) [L]. A column or pillar.

c. adiposa. Fat column.

c. bertini. Interpyramidal extension or renal column supporting renal blood vessels

c. carnea. A muscular projection within the cardiac ventricles.

c. nasi. Nasal septum

c. rugarum vaginae. Fold of mucous membrane of the vagina which is arranged in a columnar fashion

columnar layer. Retinal rod-and-cone layer

columning (kol'um-ing). Introduction of tampons in vagina to support the prolapsed uterus

colyone (ko'll-on) [G. *kôlyein*, to hinder]. An autacoid which inhibits hormone or cellular activity Syn *chalone*.

colypeptic (ko-li-pep'tik) ["" + *peptikos*, peptic] Slowing up digestive processes.

colyphrenia (kol-li-fre'nî-â) ["" + *phrênê*, mind] Abnormal tendency to mental inhibition

colyseptic (ko-li-sep'tik) ["" + *sepsis*, putrefaction] Antiseptic

colytic (ko-lit'ik) [G. *kôlyein*, to hinder] Inhibitory.

co'ma [G. *kôma*, a deep sleep] An abnormal deep stupor occurring in illness, or as a result of it, or it may be due to an injury. The patient cannot be aroused by external stimuli

Etiol. May be due to alcoholism, to hysteria, epilepsy, narcotics, poisons, gases, sunstroke, heat exhaustion, ure-

mia, or injury. More than 50% of cases are due to trauma to the head or circulatory accidents in the brain due to hypertension, sclerosis, thrombosis, tumor or abscess formation. The chief causes of coma are (a) Trauma, as in accidents, hemorrhage, and shock; (b) vascular disease, (c) organic disease of the central nervous system, (d) metabolic disorders, (e) acute infections of the brain or meninges, (f) acute infections and bacterial intoxications, as in fevers, botulism, and other diseases; (g) parasites, (h) the effects of drugs, alcohol, atropine, chloral, chloroform, cyanides, carbon dioxide, carbon monoxide, hyosine, phenols, paraldehyde, trional, sulphonal, veronal, ether, gases and various fumes; (i) extreme temperatures, (j) excessive loss of blood, (k) neurotic causes, as in malingering.

GENERAL TREATMENT First aid treatment should be strictly limited, patient should not be moved other than to slightly raise the head. Movement without aid of a physician is dangerous. The collar should be loosened. Cold compresses to head and hot ones to the spine and abdomen may be indicated. Stomach pump in case of poisoning indicated. Insulin injection for diabetic coma may be given unless the coma is due to too much insulin. Sugar may be administered if it can be taken. Urine should be examined for albumin, and dropsy looked for in pregnant women. In uremic coma, stimulate elimination. Lumbar puncture or bleeding may be necessary. Induce sweating. In hysterical coma no treatment is needed. The patient revives if ignored.

NP Test urine for cause, and for retention. Regulate bowels. Clean mouth, glycerine and borax may be used. Keep water out of trachea. Keep eyes cleansed. Apply an ointment to prevent lids from sticking together. Guard against bed sores. May have to be fed artificially. **Sx** *catochus*, *narcoma*.

c., alcoholic. Due to alcohol.

c., apoplectic. Due to cerebral hemorrhage or apoplexy, one side of body, or the extremities, 1 or more, will be paralyzed. No fever at first but 1 pupil may be larger than the other. Coma indi-

Diagnosis of Diabetic and Hypoglycemic Coma¹

	Diabetic Coma	Hypoglycemic Coma
Onset	Gradual.	Often sudden.
History	Often of acute infection in a diabetic or no previous history of diabetes.	Recent insulin injection, or inadequate meal or excessive exercise after insulin.
Skin	Flushed, dry.	Pale, sweating.
Tongue	Dry.	Moist.
Breath	Smell of acetone.	No acetone.
Respiration	Deep (air hunger).	Shallow.
Pulse	Rapid, feeble.	Normal or bounding.
Eye-ball Tension	Low.	Normal or raised.
Urine	Sugar and acetone.	None, unless bladder has not been emptied for some hours.
Blood Sugar	Raised [over 200].	Subnormal [40-70].
Blood Pressure	Low.	Normal.
Abdominal Pain	Common and often acute.	Sometimes sense of constriction.

¹ **Sears.** *Medicine for Nurses.*

cates pressure on the brain in most instances. SEE: *apoplexy*.

c., diabetic. Occurring in diabetes, due to presence of diacetic acid in system and to acidosis. Paralysis not present. **SYM:** Sweet breath, showers of short granular casts may appear in urine when diabetic coma is threatened by acidosis. Hyperglycemia is present, and softening of eyeballs may occur.

TREATMENT Insulin has prevented diabetic coma to a large extent but an overdose may induce it. It must not be given if coma is due to insulin. An initial dose of 30-60 units may be given ($\frac{1}{2}$ intravenously, $\frac{1}{2}$ subcutaneously), followed at $\frac{1}{2}$ -3 hr intervals by doses of 20 units or more subcutaneously. Examine urine hourly for dextrose, if urine is sugar-free, more dextrose must be given. More than 150 units in 12 hr. rarely needed. Young children usually require smaller doses and seldom more than 80 units in 12 hr. SEE: *insulin*.

c., uremic. The result of disturbed kidney metabolism, causing autointoxication through the retention of unknown substances in the blood and producing acidosis. Seen in nephritis as a result of lack of elimination of kidney toxins.

SYM In general, respiration stertorous, face livid, skin dry, hard and rapid pulse, blood pressure raised, sphincters relaxed according to cause, urinous odor on breath, urine scanty and containing many casts and albumin. Complete retention may occur.

c. vigil. Delirious lethargy with open eyes and partial consciousness.

comatose. In a condition of coma.

comedo (kom'e-do) [pl *comedones*] [L. a glutton] Blackhead, fleshworm. Discolored dried sebum plugging an excretory duct of the skin.

Error: Reflex or local disturbance causing increased activity of sebaceous glands. Constipation, dyspepsia, chlorosis, menstrual derangements are contributory factors. Also caused by the follicle or face mite, *Demodex folliculorum*, which lives in the hair follicles and sebaceous glands of various mammals.

SYM Commonly affects the face, back, and ears; chronic, frequently associated with seborrheic dermatitis, or acne, usually during adolescence.

Proc Obstinate and persistent, but amenable to treatment.

TREATMENT Aside from removal of plugs, treatment is essentially that of acne, *q.v.*

comes (ko'mêz) [pl *comites*] [L. companion]. A blood vessel which accompanies a nerve or another blood vessel.

comma bacillus [named from shape]. The causative organism of Asiatic cholera, *Vibrio cholerae asiaticae*.

comma tract. A longitudinal bundle of descending fibers in the *fasciculus cuneatus* of the spinal cord. Schultze's bundle.

commensal [L. *com*, together, + *mensa*, table] One of two organisms which live in an intimate, non-parasitic relationship, one to the other.

commensalism. The symbiotic relationship of two organisms of different spe-

cies in which neither is harmful to the other and one gains some benefit such as protection or nourishment. **EX** Nonpathogenic bacteria in human intestine.

comminute (kom'in-üt) [*cominuer*, to crumble] To break into pieces.

comminuted fracture. A crushed bone.

comminution (kom-in-u'shun) [L. *comminutio*, crumbling]. Reducing a solid body to varying sizes by grating, pulverizing, slicing, granulating, and by other processes. SEE: *attenuation*, *dynamization*.

commissura (pl *commissurae*) [L. a joining together]. A commissure.

c. anterior alba. A narrow band of white substance near ant median fissure of the spinal cord.

c. anterior cerebri. White bundle crossing from side to side in the ant. wall of the 3rd ventricle.

c. anterior grisea. Part of gray commissure in front of and bet the *commissura anterior alba*.

c. brevis. Post portion of inferior cerebellar vermiciform process.

c. hippocampi. A little triangular space bet the diverging crura of the fornix.

c. magna. Corpus callosum *.

c. simplex. Lobule on superior vermiciform process of the cerebellum.

commissural. Pert to a commissure.

commissure (kôm'i-shür) [L. *commissura*, a joining together]. 1 A transverse band of nerve fibers passing over the midline in the central nervous system. 2 A suture of the skull. 3 The coming together of two structures, as the lips, eyelids, or nymphae.

In gynecology the ant and post commissures of the vulva are used to denote its 2 ends. The ant commissure passes immediately above the clitoris, the post constitutes the ant edge of the perineum.

common bile duct. Duct carrying bile to the duodenum and receiving it from the cystic and hepatic ducts. **SYN** *ductus choledochus*. SEE *bile*.

communicable disease. A disease which may be transmitted directly or indirectly from one individual to another.

communicable disease, words pert. to: alternate host, carriers, contagion, -ious, -lum, cowpox, endemic, epidemic, epidemiology, immune, -ity, immunologic diseases, immunology, incubation, infection, isolation, lues, microbe, micrococcus, microorganism, quarantine, transmissible, vection, vector.

communicans [L. *communicare*, to connect with] One of a number of communicating nerves or arteries.

c. hypoglossi. The descending branch of the 12th cranial nerve.

c. peronei. Fibular connecting nerve.

c. poplitei. Lateral sural cutaneous nerve.

c. Willisii. Transverse artery at back of arterial ring at base of brain; posterior and communicating artery.

commutator [L. *commutare*, to change]. Device for reversing electric current direction, usually segmental ring attached to dynamo on which brushes slide. Also similar hand operated devices.

Method of Transfer of Some Common Communicable Diseases

Disease	How the Bacteria Leave the Bodies of the Sick	How They May Be Transferred	How They May Enter the Bodies of the Well
Typhoid.	Feces and urine.	Direct contact. Hands of nurse or attendant Linen and all articles used by and about patient. Hands of "carriers" soiled by their own feces Water polluted by excreta Food grown in or washed with such water Milk diluted or milk cans washed with such water Flies	Through mouth in infected food or water and thence to intestinal tract.
Diphtheria	Sputum and discharges from nose and throat	Direct contact "Droplet infection" from patient coughing Hands of nurse Articles used by and about patient	Through mouth to throat or nose to throat.
Scarlet fever	Discharges from nose and throat	Direct contact Hands of nurse Articles used by and about patient	Through mouth and nose
Pneumonia	Sputum and discharges from nose and throat	Direct contact Hands of nurse Articles used by and about patient	Through mouth and nose to lungs.
Influenza	As pneumonia	As pneumonia	As pneumonia
Smallpox	Discharges from nose and throat Skin lesions	Direct contact Hands of nurse Articles used by and about patient	Thought to be through mucous membrane of respiratory tract
Syphilis	Infected tissues Lesions	Direct contact May be by kissing or by sexual intercourse Dishes, food, toilets, towels, bathtubs, drinking cups, etc	Directly into blood and tissues through breaks in skin or membrane
Tetanus	Excreta from infected herbivorous animals and man.	Soil, especially that with manure or feces in it Dust, etc Articles used about stables	Directly into blood stream through wounds (Is anaerobe and prefers deep, incised wound.)
Tuberculosis, Human.	Sputum Lesions. Feces.	Direct contact, such as kissing "Droplet infection" from person coughing with mouth uncovered Sputum from mouth to fingers, thence to food and other things Soiled dressings.	Through mouth to lungs and intestines From intestines via lymph channels to lymph vessels and to tissues
Tuberculosis, Bovine		Milk.	Same as Tuberculosis, Human.
Cholera.	Excreta from intestinal tract.	As in typhoid, through feces	As in typhoid, through mouth to intestinal tract.

Method of Transfer of Some Common Communicable Diseases (Continued)

Disease	How the Bacteria Leave the Bodies of the Sick	How They May Be Transferred	How They May Enter the Bodies of the Well
Dysentery.	As above.	As above.	As above.
Hookworm.	Feces.	Direct contact with soil polluted with feces. Eggs in feces hatch in sandy soil. Feces may also contaminate food.	Larvae enter through breaks in skin, specially skin of feet, and, after devious passage through the body, settle in the intestine.
Meningitis.	Discharges from nose and throat.	Direct contact. Hands of nurse or attendant Articles used by and about patient. Flies	Mouth and nose.
Infantile paralysis.	Discharges from nose and throat.	Direct contact. Hands of nurse or attendant	Through mouth and nose
Gonorrhea.	Lesions Discharges from infected mucous membranes.	Direct contact, as in sexual intercourse Towels, bathtubs, toilets, etc Hands of infected persons soiled with their own discharges Hands of attendant.	Directly onto mucous membrane Through breaks in membrane
Ophthalmia neonatorum (gonorrheal infection of eyes of newborn).	Pus discharges from eye.	Direct contact with infected areas, as vagina of infected mother during birth Other infected babies Hands of doctor or nurse. Linens, etc.	Directly on the conjunctiva.
Whooping cough.	Discharges from respiratory tract	Direct contact with persons affected	Mouth and nose.
Mumps.	Discharges from infected glands and mouth	Direct contact with persons affected	Mouth and nose
Measles	Like scarlet fever.	Like scarlet fever.	Like scarlet fever
Trachoma.	Discharges from infected eyes.	Direct contact. Hands, towels, handkerchiefs, possibly clothing	Directly on conjunctiva.
Leprosy.	Uncertain, may be from lesions Bacilli found in nodules which may break down, forming lesions.	Uncertain.	Uncertain

Comolli's sign (ko-mol'lis) A triangular swelling corresponding to the outline of the scapula when fractured

comose (ko'mōs) [L. *comōsus*, hairy]. Hairy Having much hair

compact [L. *compactus*, joined together]. Dense, packed, solid

c. bone. Hard or dense bone which forms the superficial layer of all bones, in contrast to spongy or cancellous bone found chiefly in the ends of long bones

comparative anatomy. Human anatomy compared with that of animals.

compatibility [L. *con*, with, + *pati*, to suffer, + *habilis*, to fit]. State of suitability to be mixed or taken together without unfavorable results, as drugs

compatible. Not opposed to, able to mix with another substance without destructive changes.

compensating. Making up for a deficiency.
c. operation. Tenotomy of the associated antagonists in diplopia.

compensation [L. *cum*, with, + *pensare*, to weigh]. Making up for a defect, as cardiac circulation competent to meet

demands made upon it, regardless of valvular defect.

Psy. A far reaching psychic mechanism, best described by an example. The individual handicapped by a physical deformity or variation, or by a character defect, may escape the consciousness or revelation of the inferiority, by accomplishment resulting from compensatory ambition. More simple, the short man struts or the incompetent brags.

Sublimation* is often similar, but varies in the sense that the substitution of a higher (social goal) gratifies the infrasocial drive by replacement—rather than the going to the opposite extreme in a merely camouflaging manner.

c., failure of. Inability of heart muscle to cope with cardiac defect with ensuing muscle exhaustion. It indicates a diseased heart muscle.

ETIOI. Diseased myocardium; back pressure, due to mitral regurgitation, mitral or aortic stenosis, or aortic regurgitation.

complément [L. *complere*, to complete]. A substance or body producing bacteriolysis or hemolysis which, by means of an amoebocyte, is connected with a bacterial or animal cell.

It is present in all sera. Strictly speaking, c. is not an antibody, but a natural property of blood.

RS. *albumin, antialexin, antialbumate, antialbumin, anticomplement, Ehrlich's theory.*

c. unit. Smallest quantity of complement required for hemolysis of a given amount of red blood corpuscles with 1 amoebocyte unit present.

complemental, complementary. Supplying something that is lacking.

c. air. Amt. of air (1600 cc. or 3 pt.) that can be inspired over and above the tidal air by the deepest inspiration. **See** *air*.

c. colors. Any 2 primary colors which, when blended, produce white light.

complementoid [L. *complere*, to complete, + *G. eidos*, form] A complement, the lysis-causing power of which has been destroyed.

complementophil (kom-ple-ment'o-fl) [+ *G. philein*, to love] Having the power to combine with a complement.

com'plex [L. *complexus*, woven together].

1 **Psy.** A subconscious idea (or group of ideas) which have become associated with a repressed wish or emotional experience and which may influence behavior although the person may not have any appreciation of the connection between the repressed desire and his thoughts or actions. 2 All the ideas, feelings, and sensations connected with a subject. 3 Intricate.

In Freudian psychology a grouping of ideas with an emotional background. These may be harmless, and the individual fully aware of them, e.g., an artist sees every object with a view to a possible picture, and is said to have established a complex for art. Often, however, the complex is aroused by some painful emotional reaction, such as fright or excessive grief, which, instead of being allowed a natural outlet, becomes unconsciously repressed, and later manifests itself in some abnormality of mind or behavior. According to Freud, the best method of determining the complex is through the medium of psy-

choanalysis. Jung and Rivers, however, suggest finding out the complex by a series of time and reaction tests. **See:** *Oedipus and Electra c.*

RS: *castration complex, inferiority c., Jocasta c., superiority c.*

c., castration. Morbid fear of being castrated.

c., inferiority. A repressed state of mind in which one feels himself inferior to others.

c., superiority. Exaggerated conviction of one's own superiority; also pretense of being superior to compensate for a supposed inferiority.

complex'us [L.]. 1 The total indications or phenomena of a morbid state. 2 *Semispinalis capitis* muscle.

complica'tion [L. *cum*, with, + *placere*, to fold]. An added difficulty; a complex state. A disease or accident superimposed upon another without being specially related, yet affecting or modifying the prognosis of the original disease, e.g., pneumonia is a complication of measles, and is the cause of many deaths from that disease.

component. A constituent part of.

com'pos men'tis [L.]. Of sound mind; sane.

com'pound [L. *componere*, to place together]. A substance composed of two or more elements combined in definite proportions by weight and having specific properties of its own.

Compounds are formed in plants and animals and are of two types, *organic* and *inorganic*.

c. astigmatism. Myopia of both vertical and horizontal meridians.

c. cathartic pills. Ones composed of calomel, colocynth, gamboge, and jalap.

c. fracture. One having an open wound into seat of fracture.

c., inorganic. One of many compounds which, in general, contain no carbon.

c. microscope. One consisting of 2 or more lenses.

c. organic. A compound containing carbon. Examples are carbohydrates, proteins, and fats.

compress (kom'pres) [L. *compressus*, squeezed together]. 1 Cloth, wet or dry, folded and applied firmly to a part to prevent hemorrhage or to relieve inflammation, made of cotton, oakum, marine lint, jute, etc. 2 (kôm-près'). To press together into smaller space. 3. To close by squeezing together, as a wound.

c., abdominal. Three folds of linen reaching from sternum to pubis, overlapping sides of abdomen, wrung out of the water at 70° F., held in place by flannel binder little wider than linen, long enough to reach around the body.

c., chest. Application of 2 pieces of old linen of sufficient size to fit the entire chest from the clavicles down to the umbilicus, wrung out of water at 60° F., and covered with flannel.

c., cold. Linen cloth, several layers dipped in cold water, slightly wrung out, applied to given part. To secure constant temperature, compress is frequently renewed, ice bag or aluminum coil through which ice water is circulating is placed on it. Duration, 30-60 minutes.

c., forehead. A soft towel wrung out of water below 60° F. renewed at least every 2 minutes.

c., hot. Linen cloth folded into several layers, dipped in hot water (107-115° F.) slightly wrung out and placed on part to be treated, covered with a piece of flannel, large enough to overlap the linen slightly. Temperature is maintained at constant level by renewing compress or by coil through which hot water (107-115° F.) is circulating.

c., neck. Application of a soft towel wrung out of water bet 42-60° F.

c., precordial. Pad of 4 layers of linen cloth, moistened in water 60-65° F., is applied over the heart region. On this is placed a coil through which water at 60-65° F. is circulating. This water temperature is reduced until ice water is used. Duration, 10-45 minutes. Twice daily.

c., Priessnitz. Cold wet compress

c., spinal. Usually the application of a soft cloth wrung out of ice water, renewed every 2-3 minutes. Applied to cervical region for meningitis, cerebral congestion and nervous asthenia, dorsal region for hysterical vomiting and to lumbar region for renal and uterine hemorrhage.

c., throat. Application of 2 strips of linen 3 inches wide and long enough to reach from beneath 1 ear under the chin to the opposite ear, wrung out of water at 60° F., a piece of flannel 1/4 inch wider covers it and overlaps at top of head.

c., trunk. Consists of 3 folds of linen from axilla to pubis and reaching around the trunk, wrung out of water 60-75° F., covering with flannel bandage secured by pins. Changed every hour.

c., wet. Application of 2 or more folds of old linen wrung out of water at prescribed temperatures and covered with flannel.

compression [L *compressio*, a compression]. A squeezing together, state of being pressed together.

c., atrophy. That in a part due to steady compression.

c. of the brain. Same as cerebral compression, *q.v.*

c., cerebral. Pressure on the brain produced by increased intracranial fluids, embolism, thrombosis, tumors, and skull fractures. More serious than concussion.

Sxm. Deep unconsciousness, full, bounding pulse, deep, stertorous, slow respiration, flushed face, high blood pressure, pupils varying in size. Temperature may rise and there may be retention or incontinence of urine and feces. **Danger Signals.** Cheyne-Stokes respiration, rise in temperature, quickening of pulse.

NP. Watch for change of symptoms, pulse, respiration, color, urine, and bed sores, also convulsions, bleeding from ears and nose, and oozing at back of throat, or for cerebrospinal fluid from ears, which may indicate fracture. Constant care of mouth and eyes. **See:** *circumcision*.

c., digital. Arterial compression by means of the fingers.

c., myelitis. That due to pressure on the spinal cord, often due to a tumor.

compressor. 1. Instrument for making pressure on a part. 2. Contraction of a muscle, causing compression of another structure.

compulsion [L *compulsio*, an urging]. Act performed to relieve fear connected with obsession; dictation by the patient's

subconscious, arising against the subject's wishes and, if denied, causing uneasiness. Impulsive actions, on the contrary, often seem to express the personality.

c., neurosis. Obsession or psychoneurosis urging one to perform an absurd act or to say something silly.

compulsive. Exercising or applying compulsion.

c., ideas. **Psy.** An idea that continues to suggest against one's will the commitment of an overt act, such as murder or suicide.

compulsory. Compelling action against one's will.

c., movements. Movements caused by injury to a nerve center.

con- [L]. Prefix Together with, as *congenital*.

conarium (ko-na'ri-um) [G *konarion*, a little cone] The pineal gland. **Corpus pineale** (BNA).

conation (ko-na'shun) [L *conatio*, an attempt]. Any desire or impulse compelling action.

concassation (kon-kas-a'shun) [L *con*, with, + *quassere*, to crush] 1. Shaking of a precipitate in a bottle or pulverizing by beating. 2. Mental distress.

Concato's disease (kon-kā'tōs) Progressive inflammation of serous membranes. **Etiol.** Tuberculosis.

concave (kon'kāv) [L *con*, with, + *cavus*, hollow] Having a spherically depressed or hollow surface.

concavity [' + *cavitās*, a hollow] A hollowed surface, with curved, bowl-like sides.

conca'vocon'cave [' + *cavus*, hollow, + *con*, with, + *cavus*, hollow] Concave on opposing sides.

conca'vocon'vex [' + ' + *convexus*, vaulted] Concave on 1 side and convex on opp surface.

concentration (kon-sen-tra'shun) [L *concentratio*, in the center] 1. Increase in strength of a fluid by evaporation. 2. Medicine strengthened by evaporation. 3. Fixation of mind on 1 subject to exclusion of all other thoughts.

con'cept [L *conceptum*, something devised] An idea.

concep'tion [L *conceptio*, a conceiving] The union of the male sperm and the ovum of the female; fertilization.

With a cycle of 28 days, menstruation normally lasts 5 days followed by a period of repair and proliferation of 9 days. During this time a woman is usually sterile as ovulation has not occurred. Conception is most likely to occur during the 14-18th days of the cycle. During this period, the ovum is discharged from the follicle and makes its way through the Fallopian tube to the uterus. If fertilization does not occur during this time the ovum disintegrates and for the remaining portion of the menstrual cycle (the ten days preceding menstruation) conception is very unlikely to occur.

concha (kong'kā) [G. *koche*, shell]. 1. The outer ear or the pinna. 2. The inferior turbinated bone. 3. Patella. 4. Vulva.

c., auriculæ. A concavity on the median surface of the auricle of the ear, divided by a ridge into the upper *cymba conchæ* and a lower *cavum conchæ*. The latter leads to the ext. auditory meatus.

c., bullosa. Turbinated bone expansion, during chronic rhinitis.

MENSTRUATION, CONCEPTION, AND IMPLANTATION

(a) Menstruation (b) Growth (c) Ovulation, ovum becomes impregnated (d) Ovum in morula stage becomes implanted (e) Endometrium in pregravid stage, corpus luteum of pregnancy developing (e) Endometrium has become decidua and ovum is growing between D Capsularis and D Basalis

c. nasal. One of the three scroll-like bones which project medially from the lateral wall of the nasal cavity, a turbinate bone. The superior and middle conchae are processes of lateral mass of the ethmoid bone, the inferior concha is a face bone. Each overlies a meatus.

c. Santorini. C. nasalis suprema

c. sphenoidal. One of two curved plates located on anterior portion of body of sphenoid bone. Forms part of roof of nasal cavity.

conchitis (kong-ki'tis) [con + -itis, inflammation] Inflammation of any concha.

conchoidal (kong-ko'i'dal) [con + eidos, shape] Having the shape of a shell.

conchoscope (kong-ko-scōp) [con + skopein, to examine] Instrument for examination of the nasal cavity.

conchotome (kong-ko-tōm) [con + tomē, incision] Device for excision of middle turbinate bone.

concoc'tion [L. con, with, + coquere, to cook] The boiling of 2 or more substances together.

concom'itant [L. cum, together, + comēs, companion] Accessory; taking place at the same time.

concrement. A concretion as of protein and other substances. If infiltrated with calcium salts, such is termed a calculus.

conrescence (kon-kres'ens) [L. con, together, + crescere, to grow] The union of separate parts, coalescence.

concrete (kon-kret) [L. concretus, solid]. Condensed, hardened, or solidified.

concre'tion [L. con, with, + crescere, to grow]. 1. A calculus. 2. Solidification of a fluid substance.

concub'itus [L. concumbere, to lie together]. Copulation, coition, sexual intercourse.

concus'sion [L. concussus, shaken violently]. "Shaking" from impaction against an object.

c. of the brain. Cerebral concussion. A common result of a blow to the head, or fall on the end of spine with transmitted force, usually causing uncon-

sciousness, either temporary or prolonged. Return of consciousness may be gradual. Patient may suddenly draw up knees and vomit. Resembles result of skull fracture.

Sym. Vary with location and extent of injury from transient dizziness to various paralyses, or unconsciousness; unequal pupils, shock. If uncomplicated, patient comes round within several hours. **Period of reaction** accompanied by vomiting, temperature 99° or 100° F., rapid pulse, flushed face, restlessness, headache, cerebral irritation 12-24 hours afterwards.

F A TREATMENT. Keep patient quietly lying down with head and shoulders slightly elevated. Do not give stimulants. Transportation should be delayed if possible. Sedatives only if patient is hyperexcited. Cool applications to head and neck are soothing. Reassure patient if conscious. Heat to extremities if cold. Report any adverse symptoms, such as bleeding, at once. Darkened room best. **See** contusion, transportation of injured.

c. of labyrinth. Deafness resulting from a blow to the head or ear.

c., spinal. Lesion of spinal cord due to injury or jarring.

condensa'tion [L. con, with, + densare, to make thick]. 1. Making more solid. 2. Changing a liquid to a solid or a gas to a liquid. 3. **Psy.** The union of ideas to form a new mental pattern.

CHEM. A type of reaction in which 2 or more molecules of the same substance react with each other and form a new substance with higher molecular weight and different chemical properties.

condens'er [con + densare, to make thick]. Device for solidifying vapors and liquids. **See** capacitor.

c., electrical. Device for storing of electricity by using 2 conducting surfaces and a nonconductor.

condiment [L. condere, to pickle]. Appetizing ingredient added to food.

CLASSIFICATION: 1. *Aromatic:* Vanilla, cinnamon, cloves, chervil, parsley, bay leaf, etc. 2. *Acrid or Peppery:* Pepper, ginger, allspice, etc. 3. *Alliaceous or Allylic:* Onion, mustard, horseradish. 4. *Acid:* Vinegar, capers, gherkins, citron. 5. *Animal Origin:* Caviar, anchovies.

Too much is harmful and too little may do harm. They are not foods, with the exception of sugar. Some contain essential oils. They are helpful in the assimilation of food material.

Acction: They seem to stimulate the stomach and intestines, perhaps by chemical action although this is questioned. They do irritate, esp if taken in too large quantities. They are appetizers and through psychic influences stimulate the secretions. They are antiseptic.

Sugar is a food producing muscular energy and salt, a chemical substance maintaining the mineral equilibrium.

conditional reflex. An inherited reflex which is a physiological result of a non-specific stimulus that is automatic and instinctive, though commonly without the knowledge of the individual.

conditioned reflex. One acquired as result of training and repetition.

condom [L *condus*, a receptacle] A rubber or fish skin sheath worn over the penis during coition to avoid conception by retention of the semen within this artificial sac, or to prevent infection; the opp. of pessary.

conductance [L *conducere*, to lead] The conducting ability of a body or a circuit for electricity.

The best conductor is that which offers the least resistance. Examples of good conductors are gold, silver, and copper. When expressed in figures, conductance is the reciprocal of resistance. The unit is the ohm.

conduction [L *conducere*, to read]. **PHYS:** The process whereby a state of excitation affects successive portions of a tissue or cell, so that the disturbance is transmitted to remote points.

Conduction occurs not only in the fibers of the nervous system, but also in muscle fibers.

c., bone. Sound conduction through cranial bones.

conductivity. The specific electric conducting ability of a substance.

Numerically, conductivity is the reciprocal of unit resistance, or resistivity. The unit is the ohm per cm. Specific conductivity is sometimes expressed as a percentage. In such cases the conductivity is given as a percentage of the conductivity of pure copper under certain standard conditions.

conductor (kon-duk'tor) [L *conducere*, to lead]. 1. Medium transmitting a force. 2. A guide directing a surgical knife.

condylar (kon-dī-lār) [G *kondylos*, knuckle]. Pert to a condyle.

condylarthrosis (kon-dil-ar-thro'sis) [' + *arthrosis*, a joint]. A form of diarthrosis; * an ovoid head in an elliptical cavity.

condyle, condylus (kon-dīl, -lus) [G *kondylos*, knuckle]. A rounded protuberance at the end of a bone forming an articulation.

condylectomy (kon-dī-lek'to-mī) [' + *ektomē*, excision]. Excision of a condyle.

condylin (kon-dil'i-on) [G *kondylon*, knob]. Point on lateral (outer) surface of the mandibular condyle.

condyloid (kon'dī-loid) [G *kondylos*, knuckle, + *eidōs*, appearance]. Pert. to or resembling a condyle.

c. process. Articular process on ramus of mandible consisting of a capitulum and neck. Articulates with mandibular fossa of temporal bone.

c. tubercle. A tubercle on capitulum of condyloid process of the mandible for attachment of temporomandibular ligament.

condyloma (kōn-dī-lō'mā) [' + *-ōma*, tumor] A wartlike growth of the skin, usually seen on the external genitalia or near the anus.

There are 2 types, a pointed variety, and a broad, flat form which is usually of syphilitic origin.

c. latum. A mucous patch on the vulva or anus, coated with gray exudate, flattened in form, with delimited area, characteristic of syphilis.

condylomatous (kon-dī-lo'mat-us) [' + *-ōma*, tumor] Pert to a condyloma.

condylotomy (kon-dī-lō'to-mī) [' + *tomē*, incision]. Division without removal of a condyle.

cone (kōn) [G *kōnos*, cone] 1. A shape with circular base with sides sloping to a point above. 2. Retinal flask-shaped figure in layer of rods and cones. 3. A receptor cell concerned with color vision.

c. of light. Triangular light areas on the membrana tympani extending downward from the umbo.

c. ocular. Cone of light in int of eyeball.

confabulation [L *confabulāri*, to talk together] Psy. The relation of imaginary experiences to fill in gaps in the memory.

confectio, confectio [L *con*, with, + *facere*, to make] Sugarlike soft solids in which 1 or more medicinal substances are incorporated with the object of affording an agreeable form for their administration and a convenient method for their preservation. Not often prescribed, and not official.

confinement (kon-fin'ment) [Fr *confiner*, to restrain in a place] The puerperal state or period of childbirth.

conflict [L *con*, with, + *figere*, to strike]. 1. Opposing action of incompatibles. 2. Psy. The conscious or unconscious struggle bet two opposing desires or courses of action. A technical term applied to a state in which social goals dictate behavior contrary to more primitive (often subconscious) desires.

confluence of sinuses. The union of the sagittal sinus with the transverse sinuses; torcular Herophili.

confluent [L *confluere*, to run together]. Running together, as when the pustules in smallpox merge.

conformator (kon'for-ma'tor) [L *con*, with, + *forma*, form]. Apparatus for establishing cranial outlines.

confrontation (kon-frun-ta'shun) [' + *frons*, face]. The examination of 2 patients together, 1 with a disease and the other from whom the disease was supposed to be contracted.

congelation (kon-je-la'shun) [L *congelare*, to freeze] Freezing, or a frostbite.

congenerous (kon-jen'er-us) [L *con*, with, + *genus*, race]. Possessing the same function, as synergistic muscles.

congenital [L *congenitus*, born together]. Occurring during fetal life; not hereditary. **RS:** etiology, pathology, predisposition.

congested (kon-jes'ted) [L. *congerere*, to heap together]. Hyperemic; containing an abnormal amt. of blood.

conges'tion [L. *congerere*, to heap together]. A localized inflammation which may or may not be accompanied by infection, such as a felon, a boil, a carbuncle. SEE *affluxion*, *hyperemia*.

c. active. Congestion resulting from increased flow of blood to a part or dilatation of blood vessels.

c. passive. Hyperemia resulting from interference with flow of blood from capillaries into venules. May also result from myocardial insufficiency.

congestive (kon-jes'tiv). Pertaining to congestion.

c. fever. Malarial fever.

congius (kon'ji-us) (pl. *con'gi*) [L.]. A gallon.

congio'bate [L. *con*, with + *glōbāre*, to make round]. In 1 mass, as lymph glands

congloba'tion [" + *globus*, a ball]. Aggregation of particles in a mass.

conglom'erate [" + *glomerāre*, to heap] 1 An aggregation in one mass. 2 Clustered, heaped together

c. gland. A gland with several lobes

conglutin (kon-glu'tin) [L. *conglutināre*, to glue together] A protein resembling casein found in peas, beans, and almonds.

conglu'tinant. Promoting adhesion, as of the edges of a wound

conglu'tinate [L. *conglutinātiō*, an adhering]. Having the quality of adhesiveness.

conglutination (kon-glu-tin-a'shun) [L. *conglutinātiō*, an adhering]. 1 Coalescence, adhesion 2. Reaction, such as agglutination

coniāsis (kon-i'ā-sis) [G. *konis*, dust] Dustlike calculi in gallbladder and bile ducts

conidia (ko-nid'i-ā) (pl. of *conidium*) [G. *konidion*, a particle of dust] Asexual spores of fungi

conidiophore (kon-id'i-o-for) [" + *phoros*, bearing] The stalk supporting conidia

coniol'ogy [G. *konis*, dust, + *logos*, study of]. The study of dust and its effects

conio'sis [" + *-ōsis*, infection]. Any condition caused by inhalation of dust.

coniza'tion [G. *kōnos*, cone] Coring and removal of the mucous lining of cervical canal and its glands by the cutting high frequency current for treatment of chronic endocervicitis

conjugā'ta [L.]. Diameter of pelvis, measured from center of the promontory of the sacrum to the back of the symphysis pubis

c. vera. Sometimes written *c.v.* Same as conjugata, *c.v.*

conjugate (kon'jū-gāt) [L. *con*, with, + *jugum*, yoke]. 1 Paired or joined. 2. An important diameter of the pelvis, measured from the center of the promontory of the sacrum to the back of the symphysis pubis

c. deviation. Deviation of both eyes to either side.

c., diagonal. Measured from the lower edge of the symphysis to the sacrum, and can be determined during life, whereas the true conjugate cannot, except immediately after labor. It is about $\frac{1}{4}$ - $\frac{3}{4}$ in. longer than the true conjugate, or about 5 in

c. diameter. Same as conjugate (2).

c., external. Measured from the spine of the last lumbar vertebra to the front

of the pubes (this can be done only with calipers), and is normally about 8 in.

c., true. Same as conjugate (2). It should measure not less than $\frac{4}{4}$ in. and is sometimes as large as $\frac{4}{2}$ or $\frac{4}{3}$ in. If less than $\frac{4}{4}$ in., the pelvis is a deformed one.

conjugā'tion [" + *jugum*, yoke]. A coupling together. In biology, the union of two unicellular organisms, accompanied by an interchange of nuclear material as in *Paramecium*.

conjuncti'va [" + *jungere*, to join] Mucous membrane which lines eyelids and is reflected onto eyeball.

Divisions (1) Palpebral, covering under surface of lids; (2) bulbar, coating ant portion of eyeball, (3) fornix, transition portion forming fold bet. lid and globe

Inspection. Palpebral and ocular portions should be examined. Color and degree of moisture and presence of foreign bodies should be observed, also petechial hemorrhages and inflammation

PATH. CONDITIONS Trachoma and pannus as well as discoloration *Yellowish discoloration.* Seen in jaundice, certain fevers, and hemolysis. May be due to fatty deposits. *Bluish-white or pearly discoloration* Seen in anemia, nephritis, and phthisis. *Sky-blue coloring* is noted in whooping cough. *Pale conjunctivae* Observed in anemias

SEE *Calmette's reaction*, *catarrh*, *vernal*, *Krause's gland*, *limbus*.

conjunctival reflex (kon-junk-ti'val). Closure of eyelids when conjunctiva is touched or threatened

conjunctivitis (kon-junk-ti-vi'tis) [L. *con*, with, + *jungere*, to join, + G. *-itis*, inflammation] Inflammation of conjunctiva.

TREATMENT Directed against the specific type of infection.

c., acute contagious. Pink eye. *Etiol.* Koch-Weeks bacillus.

c., catarrhal. One due to irritation or cold

c., follicular. Type characterized by pinkish round bodies in retroarsal fold

c., gonorrheal. Acute c due to contact with the gonococcus

c., granular. Acute, contagious, inflammatory c with granular elevations on the lids which ulcerate and cicatrize **SYN** *trachoma*.

c., membranous. Acute conjunctivitis characterized by a false membrane; with or without infiltration

c., phlyctenular. Circumscribed type characterized by lymphoid tissue in small red nodules

c., purulent. That characterized by abundant purulent discharge. *Etiol.* Gonorrhea. **Ex:** *Ophthalmia neonatorum*.

c., vernal. One beginning in the spring and disappearing when cold weather begins.

conjunctivo'ma [" + G. *-ōma*, tumor]. A tumor of the conjunctiva

conjunctivoplasty (kon-junk-ti'vo-plas-ti) [" + G. *plassein*, to form] Removal of part of cornea, but replacing with flaps from the conjunctiva.

connective [L. *connectere*, to bind]. That which connects or binds together.

c. tissue. One of the four main tissues of the body. It includes an embryonic connective tissue (mesenchyme and mucous) and (b) adult connective tissue. The latter is subdivided into

four general groups (1) vascular tissues (blood, lymph), (2) connective tissue proper (areolar, white fibrous, yellow fibrous, reticular, adipose), (3) cartilage and (4) bone. Connective tissues are concerned primarily with supporting bodily structures and binding parts together. They also are involved in other functions such as food storage, blood formation, and defensive mechanisms of the body.

conoid [G *kōnos*, cone, + *eidōs*, shape]. Resembling a cone, conical

c. ligament. Lower and inner portion of coracoclavicular ligament

c. tubercle. Eminence on inf surface of clavicle to which is attached the conoid ligament

conomyoidin (ko-no-mi-oid'in) [+ *mys*, muscle, + *eidōs*, form] Contractile protoplasm in cones of the retina

consanguinity (kon-san-gwin'ti-ti) [L *consanguinitas*, kinship]. Relationship by blood

conscious (kon'shus) [L *conscious*, aware]. Being aware and having perception

consciousness [L *conscious*, aware]. Psy A state of awareness

It implies an orientation to time, place, and person, i. e., the individual knows approximately the date, the nature of his environment, his name and other pertinent personal data

The content of consciousness is a composite of memories and the comprehension of external reality, the emotional status and the individual's goals also enter. It is then a large part of that described as "personality" in its largest sense

Consciousness varies its intensity and extent from minute to minute. In crises, vivid ideational association may lead to an exaggerated state of awareness. In states of relaxed contentment, it lessens, to disappear completely in sleep. This differs from the pathologic condition of coma in which the patient cannot be aroused

In so-called pathologic sleep (*c. g.*, encephalitis lethargica) and in stupor, though aroused, the patient is unable to postpone again lapsing into dullness, normal sleep can be adequately combated by the demands of reality. Stupor is produced largely by the factors resulting in coma, the personality is relatively intact but "hazy." In contrast there are conditions in which a real personality change manifests itself. Clouding of consciousness may simulate the dullness but usually not the other characteristics of stupor. On the contrary, such patients may impress one as relatively alert.

The loss of orientation to time and place but not to person constitutes delirium. A quiet delirium may not easily reveal itself even in certain states of automatism in which one finds evidence of the "real personality"; there may appear on casual examination little to arouse suspicion, yet brutal acts, total absence of memory, reveal these as major abnormalities (*see epilepsy*). The "clouded" patient with obvious emotionalism (fear) and violent hallucinations is obviously psychotic

Clouding of consciousness may be diagnosed from the appearance of the patient in catatonic stupor and it may be difficult to realize the patient is quite lucid and that experiences are being registered accurately and can be later

recalled. In true clouding, stimuli usually fail to register.

Again, in some ambulatory states, experiences may register but cannot be recalled after return to a normal state. During a later secondary state, it is apparent that the failure of memory is only a repression and not its absence. Consciousness, on the other hand, may erroneously appear to be present in so-called "coma vigil" because the eyes are open and expression may be alert

c., clouding of. A phase of delirium in which the patient's consciousness is cloudy or not clear.

consciousness, words pert. to: absentia epileptica, anæsthetic, apperception, apraxia, attention, bathæsthesia, cæsthesia, cæstheopathia, cococonsciousness, luminal, subconscious, threshold of, unconsciousness

conscence (kon-sen-es'ens) [L *conscenscere*, to grow old] The state of growing old

consensual [L *con*, with, + *sentire*, to feel] Reflex stimulation from another part

c. light reflex. Contraction of unexposed pupil in sympathy with exposed pupil

c. reflex. Any reflex occurring on opposite side of body from point of stimulation

consolidation (kon-sol-id-a'shun) [L *consolidare*, to make firm] The act of becoming solid. Esp used in connection with the solidification of the lungs due to engorgement of the lung tissues, as occurs in acute pneumonia

constellation [L *con*, with, + *stella*, star]. Ideas arising from unexpressed emotions

constipation (kon-sti-pa'shun) [L *constipare*, to press together]. A sluggish action of the bowels

PREDISPOSING CAUSES. No habitual bowel movement from childhood, worry, anxiety, fear, sedentary life

DIRECT CAUSES. Failure to establish regular and definite time for bowel movement, improper diet, lack of physical exercise, ingestion of too much sugar, and a lack of bulk in the diet. It also may be due to *atonic* or *spastic* peristalsis, to reverse peristalsis, and to obstruction

GENERAL CORRECTIVE MEASURES. Plenty of fresh vegetables, fruits, milk, and an abundance of water. Limit coffee, tea, white sugar, meats, fish, and pastries. Cut down starches. Plenty of physical exercise, avoid all that worries, establish regular habit time for bowel movement, and do not eat when under the influence of strong emotion. Do not hurry defecation or read at the time, or go to stool when excited and greatly worried

RS colon, defecation, diet, feces, in testine, stool.

c., atonic. Lack of muscle tone due to lack of exercise of abdominal muscles, and to abdominal ptosis

TREATMENT. Exercise and diet of fruits and vegetables, bulky residue in the absence of colitis, massage, abdominal belt if ptosis of the abdomen exists, vitamin B, fats and water.

c., obstructive. Due to an obstruction in the intestines. Surgical aid needed. Preoperative diet should contain low residue and no gas forming foods.

c., spastic. Constipation accompanied by intestinal spasms.

Etiol. Excessive use of laxatives, nervousness, too much tobacco, alcohol, condiments, sugar, and irritants; also may be due to the presence of diverticula, or diverticulitis

Treatment Avoid irritating foods, atropine for the spasms

constitu^{ti}on [L. *constituere*, to establish] The physical makeup and functional habits of the body

constitu^{ti}onal. Pert to the body as a whole

c. disease. One which affects the entire body

c. psychosis. Functional psychosis, not of organic origin

constric^{ti}on [L. *constricare*, to draw] 1 A binding or squeezing of a part. 2 The narrowing of the caliber of a vessel by pressure.

constric^{ti}or [' + *stringere*, to draw] 1 That which binds or restricts a part 2 A muscle, such as a sphincter, which can narrow or close a canal

construc^{ti}ve metabolism. The binding up or anabolic process

consult^{ant} [L. *consultare*, to counsel] A consulting physician or surgeon who acts only in an advisory capacity.

consulta^{ti}on [L. *consultatio*] Diagnosis and proposed treatment by 2 or more physicians at one time

consumption (kon-sump'shun) [L. *consumere*, to waste away] 1 Tuberculosis * 2 Wasting 3 The using up of anything

consump^{ti}ve. Pert to or afflicted with tuberculosis

con^{ta}ct [L. *con*, with, + *tangere*, to touch] 1. Mutual touching or apposition of 2 bodies 2 Closing of an electric current 3 One who has been exposed to contagion

c., complete. When entire surface of 1 tooth touches entire surface of an adjoining tooth, proximally

c., direct. Communication of a contagious disease through a healthy person touching an infected body

c., immediate. Same as direct contact

c., indirect. The spread of a contagious disease by some medium other than direct touch of the sick person

c., lens. A thin bowl-shaped shell of glass made to fit over the cornea

c., mediate. Same as indirect contact

c., proximal or proximate. Touching of teeth on their adjacent surfaces

c. surface. Proximal surface of a tooth

con^{ta}ct breaker. Device for breaking a galvanic current

conta^{gi}on [L. *contingere*, to touch] The process of transferring a specific disease either by direct or indirect contact
See *virulent, virus*

contagios^{ity} [L. *contagiosus*, contagion] The state of being contagious.

conta^{gi}ous. That which is transmissible by contact, as "communicable diseases"

All contagious diseases are infectious, but not all infectious diseases are contagious.

Not communicable through the air.
See *eruptive*

contagium (kon-ta'ji-um) [L.]. The agent causing infection or contagion.

containers, care and handling of. As contamination of the container in which a specimen is to be placed may render the results of the examination futile, and so interfere with the doctor's diagnosis based upon it, extreme care must be observed by the nurse in handling all such articles.

1. See that they are perfectly clean, inside and outside, and that the surfaces are intact. Cracked and broken containers must not be used. The containers never must be completely filled.

2 If the presence of bacteria is suspected, the container must first be sterilized, unless this has already been done by the laboratory

To clean glassware (a) Using very little soap-powder, boil in water. (b) Brush well under running water. (c) Rinse well in running water. (d) Place potassium bichromate solution for 20 minutes (e) Rinse well in running water (f) Rinse in distilled water. (g) Rinse again in distilled water. (h) Invert in basket and drain dry.

Sterilization of glassware This is accomplished by hot air or dry heat, boiling water, flowing steam, steam under pressure, and the use of germicidal* chemicals.

3 **Labels** All containers should be labeled, when used, with the name of the patient and his room number, also the name of the attending physician "Request forms," sometimes used as labels, are made up to suit the individual laboratory or hospital Provision is made for recording necessary data as indicated, including date when specimen was taken, and under what circumstances, and for what substances the examination is to be done, together with other information desired

4 **Time** If the required specimen cannot be furnished at once, make a note of what is needed, inform the patient, the supervisor, and any other nurse who may attend to the patient in your absence

5 **Charting** Note on the chart all specimens sent to the laboratory, when sent, and any other data that seem pertinent

6 **Care of specimen** Cover immediately after depositing in the container; check label or "request form," and see that the container is intact, and that there is no danger of spilling while in transit.

contigu^{ity} (kon-ti-gu'i-ti) [L. *contiguus*, touching] Contact or proximity without continuity

c., amputation in. Amputation through a joint

c., law of. If 2 ideas occur in association they are apt to be repeated.

c., solution of. Dislocation or displacement of 2 normally contiguous parts

con^{ti}nence [L. *continere*, to hold back]. Self restraint, used esp in connection with refraining from sexual indulgence.

continuity (kon-ti-nu'i-ti) [L. *continuus*, continued]. The state of being continuous or intimately united

c., amputation in. Amputation through a long bone

c., solution of. Division of normally continuous parts by fracture, rupture, laceration, incision

contin^uous [L. *continere*, to hold together]. Without break, cessation, or interruption

c., spec^{tr}um. An unbroken series of wave lengths, either visible or invisible

Such a spectrum is produced by light from incandescent solids, liquids, or gases under high pressure passed through a prism. Also an unbroken range of radiations of different wave

- lengths in any portion of the invisible spectrum.
- confor'mon.** A twisting into an unusual shape
- contour** (kon'toor) [L. *con*, with, + *tor-are*, to turn around]. Outline or surface configuration of a part
- contoured** (kon'toord). Having an irregular, smooth, undulating surface resembling a relief map [*contraindication*]
- contra-** [L.] Prefix. Opposite, against, as
- contra-ap'erture** [L. *contra*, against, + *apertura*, opening] A 2nd opening made in an abscess.
- contraception** (kon-tra-sep'shun) [“ + *conceptio*, a conceiving]. The prevention of conception.
- contracep'tive.** Any agent or device used to prevent conception, such as condoms,* pessaries,* or medication None can be guaranteed to prevent conception.
- contract'** [L. *contrahere*, to draw together]. To draw together, reduce in size, or shorten
- contract'ile.** Able to contract or shorten.
- contractil'ity** [L. *contrahere*, to draw together] Having the ability to contract or shorten.
- contraction** [L. *contractio*, a drawing up]. A shortening, as that of a muscle, or a reduction in size, a shrinking See *cholepathia spastica*, *chronotropism*.
- contracture** (kon-trak'chur) [L. *contractura*]. Permanent contraction of a muscle due to spasm or paralysis
- c., **functional.** Decrease of a contracture during anesthesia or sleep.
- contra'fissura** (kon'trā-fī-shu'rā) [L. *contra*, against, + *fissura*, fissure] A fracture at a point opp from where the blow was received
- contraindication** (kōn'trā-in-dī-kā'shun) [“ + *indicare*, to point out] Any symptom or circumstance indicating the inappropriateness of a form of treatment, otherwise advisable.
- contralateral** [“ + *latus*, side] Originating in, or affecting, the opposite side of the body. ANTO' *ipsilateral*.
- c., **reflexes.** 1. Passive flexion of 1 part following flexion of another 2. Passive flexion of 1 leg causing similar movement of opposite leg.
- contrast sprays.** Those administered by sitting on side of bathtub, spraying feet and legs with warm water for 1 minute and cold water for 1 minute. Alternate for 10 minutes twice daily.
- contravolitional** [L. *contra*, against, + *velle*, to wish]. In opp. to or without the will, involuntary.
- countercoup** (kaun'tra-kōō) [Fr. counterblow.] Occurring on the opposite side
- c., **injury.** An injury to parts of the brain located on the side opposite that of the primary injury, as when the frontal and temporal lobes of the brain are forced against the irregular bones of the anterior portion of the cranial vault as a result of a blow on the back of the head
- contraction** (kon-trek-ta'shun) [L. *contrahere*, to handle]. 1. Examination by palpation. 2. Manipulation. 3. Impulse to embrace, caress or sexually dally with one of the opposite sex; spooning
- control** (kon-trōl') [L. *contra*, against, + *rotulus*, catalogue] 1 To regulate or maintain. 2 A standard against which observations or conclusions may be checked in order to establish their validity, as a control animal or a control experiment
- c., **animal.** An animal subjected to the same conditions as the experimental animal except for the specific factor being tested.
- c., **experiment.** An experiment in which all the factors or conditions are the same except for the one factor being tested Used to check the validity of the conclusions drawn from the test experiment
- c., **experiment.** Same as control (2).
- contrude** (kon-trūd') [L. *con*, with, + *trudere*, to thrust] 1. Abnormal lingual curve or line of dental arch. 2. To crowd together, as the teeth
- contru'sion.** Having the teeth crowded.
- contuse** (kon-tuz') [L. *contundere*, to bruise]. To bruise.
- contusion** (kon-tu'zhun) [L. *contusio*, a bruise] An injury in which the skin is not broken.
- SYM Pain, swelling and discoloration.
- F. A TREATMENT. Apply cold applications. Follow with firm bandage to prevent swelling. Twenty-four to 48 hours later, heat is desirable followed by massage SEE *concussion*.
- con'us** [G. *kōnos*]. 1. A cone. 2. Post. staphyloma of myopic eye.
- c., **arteriosus.** Right cardiac ventricle's upper rounded ant. angle, where pulmonary artery arises
- c., **medullaris.** Conical portion of lower spinal cord
- convalescence** (kon-val-es'ens) [L. *convalescere*, to become strong] The period of recovery after the termination of a disease or an operation.
- convales'cent.** 1 Getting well 2. One who is recovering from a disease or operation
- c., **diet.** A soft diet
- convection** (kon-vek'shun) [L. *convehere*, to convey] The transference of heat by means of currents in liquids or gases, which result from changes in density
- convective discharge.** Discharge from a high potential source in the form of visible or invisible stream of electrical energy passing through the air to the patient
- convergence** (kon-ver'jens) [L. *con*, with, + *vergere*, to incline] 1. Visual lines directed to a nearby point. 2 The moving of 2 or more objects toward the same point. SEE *Illustration*, next page.
- convergent** (kon-ver'jent). Tending toward a common point
- conversion** [L. *convertere*, to turn round]. Change from one state to another.
- c., **symptom.** PSY A term for a repressed emotion that becomes manifested through a physical symptom; seen in hysteria.
- converter, rotary.** Apparatus used to convert a direct current into an alternating one or *vice versa*.
- It consists essentially of a dynamo which, by varying the arrangement of its collecting mechanism, allows the collection of either a direct or alternating current at the other end.
- con'vex** [L. *convexus*, vaulted, arched]. Curved evenly; the segment of a sphere.
- convex'ocon'cave** [“ + *con*, with, + *cavus*, hollow]. Concave on 1 side and convex on opp. surface. SYN: *concavoconvex*.
- convexocon'vex** [L. *convexus*, arched]. Convex on 2 opp. faces.
- convolute** (kon'vo-lūt) [L. *convolvere*, to roll together]. Rolled, as a scroll.

CONVERGENCE

When an object is brought from a distant position (a) to a near position (b), the eyes are rotated medially to make the lines of vision meet at the object. The closer the object, the greater the degree of convergence as measured by the angles indicated by arrows

convoluted. Convolute, rolled

c. tubule. The proximal convoluted tubule lies between Bowman's capsule and the loop of Henle, the distal convoluted tubule lies between the loop of Henle and the collecting duct

convolution (kōn'vō-lū'shūn) [L *convolvere*, to roll together] 1 A winding motion 2 A turn or fold 3 ANAT A coil of tissue on the brain surface, separated by fissures 4 A gyrus

c., angular. A gyrus forming post. portion of inf parietal lobule

c.'s, annectant. The 4 gyri connecting the c's on upper surface of occipital lobe with parietal and temporo-sphenoidal lobes

c., ant. central. SEE: ascending frontal c.

c., ant. choroid. Gyrus choroides.

c., anteroparietal. SEE: ascending frontal c.

c., ant. orbital. One which lies in front of the orbital sulcus

c., Arnold's. Gyri posteriores inferiores.

c., ascending frontal. One forming ant. boundary of fissure of Rolando

c., ascending parietal. One parallel with ascending frontal c. separated from it by fissure of Rolando, except at extremities, where they are generally united.

c.'s, Broca's. The inf., or 3rd, frontal c.

c., callosal, callosomarginal. Gyrus fornicatus.

c.'s, cerebral. Those of the cerebrum.

c. of the corpus callosum. Gyrus fornicatus.

c., cuneate. Gyrus isthmus.

c., dentate. A small, notched gyrus rudimentary in man, situated in dentate fissure, below tenia hippocampi.

c., ext. olfactory. Small projections forming outer boundary of the olfactory grooves.

c., hippocampal. Uncinate gyrus.

c., inf. frontal. The lower and outer part of frontal lobe.

c., inf. occipital. A small one lying bet. middle and inf occipital fissures.

c., inframarginal. Superior temporo-sphenoidal c.

c., insular. One of a group of small c.'s forming the island of Reil, entirely concealed by the operculum.

c., int. orbital. The gyrus next outside of the gyrus rectus

c.'s, intestinal. The coils of the intestines

c., marginal. One beginning in front of locus perforatus anterior and bounding longitudinal fissure on mesial aspect of the hemisphere

c., middle frontal. One continuous post. with ascending frontal c. and extending forward over ant. end of hemisphere to its orbital surface

c., middle occipital. One bet. 1st and 3rd occipital c.'s

c., middle temporo-sphenoidal. A small gyrus continuous with the middle occipital or angular gyrus

c., occipitotemporal. Two small c.'s on lower surface of temporo-sphenoidal lobe.

c., olfactory. Olfactory lobe.

c.'s, orbital. Small gyri on orbital surface of frontal lobe.

c.'s, parietal. Ascending parietal c. and superior parietal c.

c., post. orbital. A small one on post. and outer side of orbital sulcus, and continuous with inf frontal c.

c., second (or middle) frontal. One continuous post with ascending frontal c.

c., sup. frontal. One which bounds great longitudinal fissure, arising post. from upper end of ascending frontal c.

c., sup. occipital. Upper of the 3 c.'s on sup. surface of occipital lobe

c., sup. parietal. Portion of parietal lobe limited ant. by upper part of the fissure of Rolando, post. by ext. parieto-occipital fissure, and inf. by intra-parietal sulcus

c., sup. temporo-sphenoidal. Upper of 3 c.'s forming temporo-sphenoidal lobe. It lies just below and is parallel with sylvian fissure

c., supramarginal. The ant. portion of inf parietal lobule behind inf. extremity of intraparietal fissure (sulcus), below which it joins the ascending parietal c.

c. of the sylvian fissure. The c. that bounds the fissure of Sylvius

c., transverse orbital. The gyrus occupying post. portion of inf. surface of frontal lobe, at ant. extremity of fissure of Sylvius

c., uncinate. One extending from near post. extremity of occipital lobe to apex of temporo-sphenoidal

convul'sant [L *convulsio*, a pulling together]. 1. An agent which produces a convulsion 2. Causing onset of a convulsion

c. poisons. The common ones are strychnine and other drugs of the nuxvomica groups, and various, special, infrequently used drugs, such as brucine, ignatia, picrotoxin.

SYM: These produce a sense of suffocation, dyspnea, and then muscular rigidity; there are powerful tetanic contractions which may be very painful. These spasms may be brought on by trivial stimuli, such as touching the patient or they may come on at vary-

ing intervals of from 3 to 30 minutes and may last from 1 to 5 minutes. Trismus, cyanosis, and tachycardia are frequent accompaniments. Death results from asphyxia or exhaustion.

TREATMENT. Dilute the contents of the stomach with milk, water, boiled tea, etc., and induce emesis by tilting the uvula, then administer a teaspoonful of pulverized charcoal, dilute tannic acid, or dilute potassium permanganate solution and again induce vomiting. Sedatives may be ordered by the physician. Oxygen and artificial respiration may be indicated.

convul'sion [*L. convulsio*, a pulling together]. Paroxysms of involuntary muscular contractions and relaxations generally in children.

Convulsions due to tetanus and hydrophobia are easily distinguished and for the most part involve a small portion of the voluntary musculature. On the contrary, strychnine poisoning convulsions involve the entire body. The word is accurately applied to unilateral attacks as seen in jacksonian epilepsy and, less likely, in hysteria. They are usually accompanied by unconsciousness. This is not the case in strychnine poisoning, hysteria, or in jacksonian epileptic attacks until the 2nd side is involved.

ETIOLOGY. In General Epilepsy, eclampsia, meningitis, tetanus, uremia. Poisoning from aspidium, brucine, camphor, cyanides, strychnine, santalin. In children the cause is often dietary, other causes, rickets, neuropathic tendency, spasmophilia, syphilis, malnutrition, malaria, acute infectious disease, cervical disease, toxemias, or unknown. Calcium is low. Guanidine should be considered. In adults, due to epilepsy, heat cramps, strychnine, or food poisoning.

TREATMENT. If an infant, put him in a bath of 95° F. or mustard and water at 85° F. Cold applied to head. Cause must first be found or injury may result from bath. If cause is undetermined, keep patient from injuring self. Soft pad bet teeth to avoid biting tongue or cheeks. Warm bath, with cold to head, if fever is present, tepid or cool bath. Sedatives or anesthesia may be advised by physician. *After Care.* Rest in bed, absolute quiet, careful diagnosis without unduly disturbing patient.

Recent successful method of therapy has been the injection, in 1 large dose, of 600,000 international units of Vitamin D.

c., clonic. One having intermittent contractions, muscles being alternately contracted and relaxed.

c., epileptiform. One accompanied by unconsciousness.

c., hysterical. C caused by hysteria.

c., puerperal. Eclamptic c. in pregnant or puerperal woman.

c., salaam. Spasm of sternomastoid muscles causing bowing motions of the body.

c., tonic. One in which the contractions are maintained for a time, as in tetany.

c., toxic. C caused by action of a toxin on nervous system.

c., uremic. C caused by uremic condition.

convulsion, words pert. to: anticonvulsive, athetosis, chill, chorea, epilepsy, hydrophobia, hysteria, ictus, jactitation, mi-

metic, paroxysm, spasm center, spasmodiphilia, strychnine poisoning, tetanus, tic, tremor.

convul'sive. Pert to convulsions.

c. reflex. Incoordinate contraction of muscles in a convulsive manner.

c. tic. Spasm of face.

cook'ing [*L. coquere, coctum*, to cook].

The process of preparing foods for eating. **Purpose.** Cooking makes most foods more palatable, easier to masticate, improves their digestibility, and destroys or inactivates harmful organisms or toxins which may be present.

PURPOSE AND EFFECT OF Action on Cellulose. The fibers of cellulose that consist of walls enclosing starch granules swell through absorption of water, and heat with water causes them to break. In chewing cooked food these small particles of cellulose are mixed with other parts and are thus made easier to digest. Too much cooking or too much water dissolves out minerals and vitamins.

Action on Protein. Soluble proteins become coagulated and their loss is thus prevented. The loss in steaming is 1½ less than in boiling.

Action on Soluble Substances. These are often lost in boiling, and even sugars, mineral substances and starches, though insoluble to a certain extent, suffer a certain loss in this process.

Action on Starch. The starch granules now swell and are changed from insoluble (raw) starch to soluble starch capable of being converted into sugar in the process of digestion and of being assimilated in the system.

Cooking releases the aromatic substances and extractives that contribute odors and taste to foods. These stimulate the appetite and make the food more palatable.

Most microorganisms are destroyed in the ordinary processes of cooking, but some require a higher degree of heat and longer cooking to effect this result, as pork.

Coolidge tube. An x-ray tube whose cathode consists of a spiral tungsten wire surrounded by a molybdenum tube.

coordinated reflexes (ko-or'din-at-ed). The reverse of convulsive reflexes in that action occurs coordinately.

coordination (ko-or-din-a'shun) [*L. con, with, + ordinare, to arrange*]. The working together of various muscles for the production of a certain movement.

More generally, the working together of different systems of the body in a given process as the coordination bet the system of glands and involuntary muscles in digestion.

copieopia (ko-pi-o'pi-ä) [*G. kopos, fatigue, + opsia, sight*]. Eyestrain causing fatigue.

copodyskinesia (ko-po-dis-kin-e'si-ä) [*'' + dys, difficult, + kinesis, motion*]. Occupational neurosis.

cop'per (cuprum) [*G. kupros*]. **SYMB:** Cu. At. wt. 63.57. A metal, small quantities of which are utilized by the body. Its salts are an irritant poison.

FUNCTION AND USES. It functions with iron in its transformation into such substances as hemoglobin, and it seems to be an activating principle when used in the treatment of blood dyscrasias. Salts of copper are used to color peas and other vegetables and fruits. The small consumption of it in this way seems harmless and it appears to be re-

tained by the liver. It aids tissue respiration and the synthesis of cytochrome. It is present in the liver at all times and is excreted by the kidneys.

DEFICIENCY SYM Anemia, weakness, impaired respiration and growth, and poor utilization of iron.

SOURCES Found in many vegetable and animal tissues. *SEE chalcosis, Clapton's lines, names of foods.*

copperas (kop'er-ās). Green vitriol. Pale bluish-green crystals. *SEE ferrous sulfate.*

cop'per sul'fate (blue vitriol). USP. Deep blue, shiny crystals or granular powder. **ACTION AND USES** Stimulant, astringent, and powerful emetic.

DOSAGE As an astringent, ¼ gr (0.016 Gm.), as an emetic, 5 gr (0.3 Gm.).

POISONING SYM A disagreeable, coppery, metallic taste, with tightness in the throat, nausea and vomiting, thirst; abdominal pains, cramps, and suppression of urine.

F. A TREATMENT Wash out stomach, give egg whites raw or beaten. Give demulcent drinks.

coprecip'itin [L. *con*, together, + *praecipitare*, to cast down] One which acts on 2 or more organisms.

copre'mia [G. *kopros*, feces, + *aima*, blood] Intestinal autointoxication, so called, caused by waste products in the blood.

coprohematol'ogy [' + + *logos*, study of] Study of the blood in the feces.

coprolagnia (kop-ro-lag'nī-ā) [' + *lagneia*, lust] An erotic satisfaction at the sight or odor of excreta.

coprolalia (kop-ro-lā'lī-ā) [' + *lalía*, babble] **PSY** A morbid desire to use sacrilegious or obscene words in ordinary conversation. Seen in obsessional neurosis or dementia precox.

coprolith (kop-ro-lith) [' + *lithos*, stone] Hard, inspissated feces.

coprology (kop-ro-lō-jī) [' + *logos*, study of] Examination of the feces. *SYN scatolgy.*

coproma (ko-pro'mā) [' + *-ōma*, tumor] Accumulation of feces in the rectum. *SYN fecaloma, scotoma, stercoroma.*

coprophagy (ko-prof'ā-jī) [' + *phagēin*, to eat] The eating of excrement.

coprophilia (kop-ro-fī'lī-ā) [' + *philein*, to love] Abnormal interest in feces, a perversion in adults.

coprophobia (kop-ro-fō'bī-ā) [' + *phobos*, fear] A morbid disgust at the sight of filth of any kind.

coprostasis (kop-rost'as-is) [' + *stasis*, a stoppage] The scybalous impaction of feces, constipation.

coprozo'a [' + *zōon*, animal] Protozoa in fecal matter outside of the intestine.

coprozo'ic. Pert. to coprozoa; found in feces or fecal matter.

copula (kop-u-lā) [L. *copulāre*, to bind together]. 1 An immune body. 2 Sexual intercourse. 3 A narrow part bet. 2 structures.

copulation (kop-u-lā'shun) [L. *copulātio*]. Sexual intercourse bet. the sexes. *SYN coition,* coitus,* cohabitation, concubitus.*

cor, cordis (kōr) [L.]. The heart.
c. adiposum. Fatty degenerative tissue in the heart.

c. bovinum. Hypertrophied heart.

c. hirsutum. Shaggy heart surface appearance.

c. juvenum. Heart disorder combined with orthostatic albuminuria.

c. tomentosum, c. villosum. *SIZE: c. hirsutum.*

coraco-acromial (kor'ā-ko-ā-kro'mī-āl) [G. *korax*, raven, + *akron*, point, + *ōmos*, shoulder]. Pert. to acromial and coracoid processes.

cor'acid [' + *eidos*, appearance]. Formed like the beak of a crow.

c. ligament. Ligament in upper region of shoulder blade.

c. notch. Notch in upper portion of scapula.

c. process. Projection from the shoulder blade.

coramine (cō'ra-mēn). A 25% aqueous solution of pyridine - beta - carboxydiethylamide.

USES As a circulatory and respiratory stimulant.

DOSAGE Orally, hypodermically, intramuscularly, or intravenously, from 15 to 30 m (1.0-2.0 cc), increased as condition demands.

Corbus' disease. Balanitis with gangrene.

corbus thermophore (kor'bus therm'o-fōr) Small round instrument with tapering metal tip 2 inches long carrying a thermometer in center for insertion in cervix or urethra for application of medical diathermy.

cord [G. *chordē*]. A stringlike structure.

c. bladder. Distention of the bladder without discomfort. Tending to void frequently and dribbling after urination.

Etiol. Lesion affecting the post. roots of the spinal column.

c. spermatic. Cord by which the testis is suspended to the abdominal inguinal ring. It consists of the ductus deferens, blood vessels, lymphatics, and nerves supplying the testis and epididymis. These are enclosed in the cremasteric fascia which forms an investing sheath.

c., spinal (*medulla spinalis*). That portion of the central nervous system contained in the spinal canal. The center of the cord consists of gray matter, which is composed of nerve cells, dendrites, and their processes. The white matter is arranged in tracts outside the gray matter. It consists of medullated nerve fibers which are (a) going to and from the brain, (b) connecting various layers of gray matter in the cord, (c) leaving and entering the spinal column. The cord serves as a center for the transmission of impulses to and from the brain. It is the center of reflex acts. *SEE "chord-" words*.

c., umbilical. One which connects the umbilicus of the fetus to the placenta.

cor'date. Shaped like a heart.

cor'diform [L. *cor*, heart, + *forma*, shape]. Shaped like a heart.

cordi'tis [' + G. *-itis*, inflammation]. Inflammation of a spermatic cord; funiculitis.

cor'dopexy [G. *chordē*, cord, + *pēxis*, fixation]. Operative fixation of an anatomical cord, esp. the vocal cords.

cordotomy [' + *tomē*, incision]. Spinal cord section of lateral pathways to relieve pain. *SYN chordotomy.*

coreclisis (kor-e-kli'sis) [G. *korē*, pupil, + *kleistis*, closure]. Occlusion of the pupil.

corectasia, corectasis (kor-ek-tā'zī-ā, -tā-sis) [' + *ektasis*, dilatation]. Dilatation of the pupil of the eye; corectastasis.

correctome (ko-rek'tōm) [' + *ektomē*, excision]. Instrument used for cutting or removing the iris. *SYN: iridectome.*

corectomedialysis (kor-ek'-to-me-dī-al'ī-sis) [" + + + *dialyein*, to set free]. Separating outer border of iris from its ciliary attachment

corectomy (ko-rek'-to-mī) [" + *ektomē*, excision]. Surgical removal of the iris. *SYN.* *iridectomy*.

corectopia (kor-ek'-to-pī-ā) [" + *ek*, out of, + *topos*, place]. Having the pupil to one side of center of iris

cored carbon. Electrode with carbon shell and core of metal or metal salt *SEE*: *impregnated carbon*.

corediolysis (ko-re-dī-al'is-is) [G. *korē*, pupil, + *dialysis*, separation]. Separation of iris' outer border from its ciliary attachment. *SYN.* *corectomedialysis*.

corediastasis (kor-ed-i-as'ta-sis) [" + *diasiasis*, a standing apart] Dilatation of pupil *SYN.* *corectasia*.

corelysis (kor-e-lī'sis) [" + *lysis*, destruction]. Obliteration of pupil because of adhesions of iris to cornea

coremorphosis (kor-e-mor-'fo-sis) [" + *morphē*, form, + *-ōsis*, infection] Establishment of an artificial pupil

corencleisis (kor-en-klī'sis) [" + *ekklein*, to enclose] Formation of an artificial pupil by ligating the iris through a corneal incision

coreometer (ko-re-om'e-ter) [" + *metron*, measure] Instrument for measurement of the pupil.

coreom'etry [" + *metron*, measure]. Measurement of the pupil of the eye.

coreoncion (kor-e-on'si-on) [" + *ogkos*, hook]. Double hooked iris forceps

coreoplasty (ko're-o-plas-tī) [" + *plastēin*, to form]. Any operation for forming an artificial pupil

corestenoma (kor-e-sten-o-mā) [" + *stenōma*, contraction]. Narrowing of pupil.

c. congen'itum. Partial congenital obliteration of pupil by excrescences

coretomedialysis (kor-et-o-mē-dī-al'is-is) [" + *temnein*, to cut, + *dialysis*, division]. Making of an artificial pupil through the iris

coretomy (ko-ret'o-mī) [" + *tomē*, incision]. Any cutting of the iris

Corex-D glass. Window glass which transmits the solar ultraviolet rays more fully than any other glasses except quartz.

corium (ko'ri-um) [G. *chorion*, skin]. The layer of the skin lying immediately under the epidermis, the dermis, or true skin. Consists of two layers, papillary and reticular. It is composed of loose connective tissue in which are numerous capillaries, lymphatics, and nerve endings. In it lie hair follicles, sebaceous glands, sweat glands and their ducts and smooth muscle fibers.

corn [G. *kormos*, a stem]. A short, solid, underground stem. *EX.* *Colchicum*.

corn [A.S.]. Indian corn or maize. *AV.* SERVING (sweet) 100 Gm. PRO. 3.1, FAT 1.0, CARBO. 19.2 per serving. *VIT. A+*, *B+* + *C*, *E+*, *G+*, *ASH* CONST. (sweet corn): Ca 0.008, Mg 0.033, K 0.113, Na 0.040, P 0.103, Cl 0.014, S 0.046, Fe 0.0008. *ASH* CONST. (corn meal): Ca 0.018, Mg 0.084, K 0.213, Na 0.039, P 0.190, Cl 0.146, S 0.111, Fe 0.0009.

corn [L. *cornu*, horn]. Horny induration and thickening of the skin, hard or soft, according to location. *SYN.* *clavus*. *ERROR.* Pressure or friction or both from ill-fitting shoes.

SYN.: Hard corns on exposed surfaces have a horny core of conical shape ex-

tending down into the derma, causing pain and irritation. Soft corns occur bet. the toes, kept soft by moisture and maceration, and may lead to inflammation beneath the corn. Infection with pyogenic organisms results in suppuration.

TREATMENT: Remove cause. Properly fitting shoes of soft leather and proper shape. Astringents or caustics, or dissection under local block anesthesia followed by painting with iodine or thymol iodide. Excision in suppurative cases followed by iodine or immersion in warm aqueous lysol solution. Soft corns dissected similarly with cotton pad protection to prevent maceration.

cor'nea [L. *corneus*, horny] Clear, transparent, ant., glasslike portion of coat of eyeball. It is nearly white in health. Curvature is greater than rest of eyeball

Composed of 5 layers: (1) Layer of epithelium, (2) Bowman's membrane (ant limiting membrane); (3) substantia propria, (4) Descemet's membrane, (5) layer of endothelium.

cornea, *words pert. to:* abrasio corneae, albugo, anterior chamber, appanatio c., arcus senilis, argema, "cera-" words, chemosis, circumcorneal, "kerat-" words, leukoma, macula corneae, megalocornea, microcornea, nebula, obfuscatio, pannus, peritomy, phlyctenula, rhytidosis, rutidosus, staphyloma, synchchia

cor'neal. Pert to the cornea
c. reflex. Closure of eyelids resulting from direct corneal irritation

corneitis (kor-ne-i'tis) [L. *corneus*, horny, + G. *-itis*, inflammation] Inflammation of the cornea *SYN.* *keratitis*.

corneicir'is [" + G. *iris*, iris, + *-itis*, inflammation] Inflammation of iris and cornea

corneomandibular reflex (kor-ne-o-man-dib'u-lar) Deflexion of mandible toward opposite side when cornea is irritated while mouth is open and relaxed

corneosclera (kor-ne-o-skle'rā) [" + *sklēros*, hard] The cornea and sclera considered together [hornlike].

corneous (kor'ne-us) [L. *corneus*]. Horny.
c. layer. Horny outer layer of the epidermis. *SYN.* *stratum corneum*.

c. tissue. Substance of the nails.

cornic'ulum [L. *cornu*, horn]. A small, hornlike process

c. laryn'gis. Small, hornlike nodule on arytenoid cartilage

cornifica'tion [L. *cornu*, horn, + *facere*, to make] The process of becoming hard

Corning-glass. Window glass substitute for transmitting the antirachitic rays of sunlight.

cor'nu [L. horn]. Any excrescence like a horn [brain].

c. ammo'nis. Hippocampus major of *c. cufa'neum*, *c. huma'num*. Hornlike excrescence on skin

cor'nu'al. Pert to a cornu.

c. myelit'is. Myelitis of ant. cornua of spinal cord.

coro'na [G. *korōnē*, crown]. Any structure resembling a crown.

c. capill'is. Crown of head.
c. ciliar'is. Circular figure on inner surface of ciliary body.

c. dent'is. Crown of a tooth. [penis]

c. gland'is. Post. border of *glands c. radiata*. 1. Radiating fibers from optic thalamus. 2. Layer of cells placed radially about the ovum.

- c. veneris.** Blotches on forehead parallel to hairline. A lenticular syphilide.
- cor'onal.** Pert. to a corona.
- c. suture.** One which joins the parietal and frontal bones of the cranium.
- coronary** (kor'o-na-ri) [L. *coronarius*, pert. to a crown or circle]. 1 A term applied to blood vessels of the heart which supply blood to its walls. 2 Encircling, surrounding.
- c. arteries.** Those of the heart supplying the heart muscle. There are also a right and left c. artery of the stomach. Narrowing and spasm of the c. heart arteries produce angina pectoris.
- cor'oner** [L. *corōnātor*, crown officer] County officer who investigates and holds inquests over those dead from unknown or violent causes.
- cor'onoid** [G. *koronē*, crow or crown, + *eidos*, appearance]. Shaped like a crow's beak or crown.
- c. fossa.** An oval depression on ant. surface of distal end of humerus. Receives coronoid process of ulna.
- c. process.** 1 A process on proximal end of ulna. Forms ant. portion of semilunar notch. 2 A process on the ramus of the mandible which serves for attachment of the temporalis muscle.
- coroparelysis** (kor'o-pai-el'si-sis) [G. *korē*, pupil, + *pareleken* to draw aside]. Bringing the pupil to one side in central corneal opacity.
- coroscopy** (ko-ros'ko-pli) [+ *skopein*, to examine]. Shadow test to determine refractive error of an eye. Syn. *skiascopy*.
- corot'omy** [+ *tomē*, incision]. Any cutting of the cornea.
- cor'pora** (sing. *corpus*) [L.]. Bodies.
- c. cavernosa penis.** Two columns of erectile tissue on dorsum of the penis.
- c. olivaria.** Two oval masses behind pyramids of the oblongata.
- c. quadrigemina.** Four rounded bodies of gray matter in the midbrain making up the lamina quadrigemina. The ant. pair is called the *nates*, the post., the *testes*.
- corpulence** (kor'pū-lēns) [L. *corpulentia*]. Fatness of the body. Syn. *obesity*.
- corpulent** (kor'pū-lēnt) [L. *corpulentus*]. Fat, obese.
- cor pulmonale** (kor pūl'mōn-āl-i) A serious condition caused by air pollution in presence of any respiratory infection. See *lung-heart disease*.
- cor'pus** [L. body] (pl. *corpora*). The principal part of any organ, any mass or body.
- c. albicans.** A mass of fibrous tissue which replaces the regressing corpus following rupture of the graafian follicle. It forms a white scar which gradually decreases in size and eventually disappears.
- c. amylaceum.** Mass having an irregular, laminated structure like a starch grain, found in the prostate, neuroglia, etc.
- c. annulare.** Pons Varolii.
- c. aranea.** Brain sand, psammoma bodies found in the pineal body.
- c. Arantii.** Tubercle found in center of semilunar valves.
- c. bigeminum.** Optic lobe.
- c. callosum.** The great commissure of the brain bet. the cerebral hemispheres.
- c. cavernosum.** Any erectile tissue, esp. the erectile bodies of the penis, clitoris, male or female urethra, bulb of the vestibule, or the nasal conchae.
- c. cillare.** Ciliary body.
- c. dentale, c. dentatum.** Gray layer in white substance of the cerebellum.
- c. flambriatum.** White layer edging the lower cornu of the lateral ventricle.
- c. flavum.** A waxy body seen in the central nervous system.
- c. geniculate.** The medial or lateral geniculate body, 2v., a mass of gray matter lying in the thalamus.
- c. hemorrhagicum.** Blood clot formed in the cavity left by rupture of the graafian follicle.
- c. highmorlanum.** Mediastinum testis.
- c. interpedunculare.** Gray matter bet. peduncles before the pons Varolii.
- c. luteum.** If pregnancy does not occur, the yellow body is known as the *corpus luteum* or *menstruation* or false corpus luteum. It reaches full size in about 10 days and then regresses rapidly being replaced by the *corpus albicans*. If conception occurs, the *corpus luteum* of pregnancy or the true corpus luteum continues to grow until about the 13th week when it reaches its full size (about 3 mm. in diam.), after which it slowly regresses. Function of the corpus luteum is an endocrine organ producing a hormone, *progesterone*, which acts synergistically with estrogens to bring about changes in the uterine mucosa during the second half of the menstrual cycle. It sensitizes the uterine mucosa inducing normal implantation of the blastocyst and the development of decidual membranes. In the absence of conception, regression of the corpus luteum with resulting diminution of hormone secretion brings about a shedding of the uterine endometrium or menstruation.
- c. mamillare.** A mamillary body, a rounded body in the anterior part of the interpeduncular fossa.
- c. pampiniforme.** Pampiniform.
- c. pyramidal.** 1 Pyramid of the oblongata. 2 A lobe of the epididymus.
- c. quadrigeminae.** The anterior pair are called *superior colliculi* the posterior or inferior pair, *inferior colliculi*.
- c. restiforme.** The restiform body or inferior cerebellar peduncle. A band of fibers, principally ascending, in the medulla oblongata which connects the spinal cord below with the cerebellum.
- c. rhomboidale.** See *c. dentatum*.
- c. spongiosum.** Erectile tissue surrounding the urethra.
- c. striatum.** A structure in the cerebral hemispheres consisting of two basal ganglia (the caudate and lentiform nuclei), and the fibers of the internal capsule which separate them.
- c. subthalamicum.** The subthalamic nucleus (*corpus Luysii*), lying in the ventral thalamus.
- c. vitreum.** Vitreous portion of eye.
- c. wolffianum.** Wolffian body.
- cor'puscle** [L. *corpusculum*, little body]. 1 A minute particle or corpusculum. 2 A small body. 3 A blood cell. There are 2 varieties, red and white, found in the blood.
- c. amolotic; c. amylaceous.** Starch-like rounded body found in tissue, usually nervous, showing degeneration.
- c. axile; c., axis.** The center of a tactile c.
- c., Bennett's.** See *Drysdale's* c.
- c., Blixoxero's.** Blood platelet.
- c., blood.** An erythrocyte or leukocyte.
- c., bone.** A bone cell.
- c., Burckhardt's.** Yellowish particles found in secretion of trachoma.

c., calcareous. A lime-containing cell found in dentine of a tooth.

c's., cancrroid. Characteristic nodule in cutaneous epithelioma

c., cartilage. A cell characteristic of cartilage.

c's., chorea. Hyaline bodies found in the corpora striata in chorea

c., chromophill. Tiny body found in cytoplasm of a nerve cell *SYN: Nissl's body.*

c's., chyle. C seen in chyle

c., colloid. *SEE c., amniotic.*

c., colostrum. Large c. found in colostrum.

c's., corneal. Connective tissue c's. found in fibrous tissue of cornea.

c. of Donne. *SEE colostrum c's.*

c's., Drysdale's. Elements found in the fluid of ovarian cysts.

c., educated. A cell derived from a mother cell which has overcome the toxic effects of bacteria of a disease.

c's., genital. Nerve terminals in the external genitalia

c's., Gierke's. Particles seen in the nervous system.

c's., Gluge's. Particles seen in diseased nervous tissue

c's., Golgi-Mazzoni. Tactile c's. with extensively branched nerve fibers and with few lamellae, found in subcutaneous tissue of the fingertips

c's., Hassall's. C's found in the thymus gland

c's., Krause's. Nerve endings in mucosa of genitalia, mouth, nose and eyes

c's., lymph. Leukocytes found in blood and lymph

c's., malpighian. C's found in the spleen and kidney.

c's., Mazzoni's. Nerve endings resembling Krause's c's

c's., Meissner's. *SEE tactile c's.*

c's., Norris's. Invisible disks in blood serum.

c's., pacinian. Largest of the end organs of the skin, found in the subcutaneous tissues

c., phantom. A red blood corpuscle which has lost its coloring matter

c., tactile. A rounded nerve ending found in the papillae of the corium, esp. of the fingers and toes

c., terminal. A nerve ending. *SEE: nerve.*

c., touch. *SEE: tactile c.*

c's., Wagner's. *SEE tactile c's.*

corpuscular. Pert. to corpuscles.

corpus'culum [L little body]. Corpuscle.

c. renis. Malpighian corpuscle and its capillaries in the kidneys, where secretion of the water in urine occurs

correct'ant, correct'ive [L *corrige*re, to correct]. 1. A drug that modifies action of another. 2. Pert. to such a drug.

Corrigan's disease. An abnormal condition caused by aortic regurgitation, and recognized by visible pulsation in the main arteries.

C's pulse. A full bounding pulse, which appears to be completely empty bet. beats, is associated with aortic insufficiency. *SYN: water-hammer pulse.*

corrosion [L *con*, with, + *rodere*, to gnaw]. Disintegration, esp. cautious disintegration of a tooth.

corrosive. Disintegrating, as eating away.

c. alkalies. These are corrosive hydroxides most commonly of sodium, ammonium, and potassium, as well as carbonates.

Because of their great combining power with water, and their action on the fatty tissues they cause rapid deep destruction. They have a tendency to gelatinize tissue with a somewhat grayish color forming a soapy, slippery surface, accompanied by pain and burning.

TREATMENT. First, dilute the poison before giving any emetic, and apply weak acids for prolonged periods.

Such dilution always delays absorption somewhat and makes it easier to induce vomiting. Second, remove the poison, this is best done by making the patient vomit. Emesis is more easily produced in a distended stomach. Titillate the uvula or pharynx with the finger, and again give the patient more fluid, repeating the process until the fluid returns clear. Among the most useful diluents and emetics for this purpose are (a) tepid water, (b) soapy water, (c) salty water, (d) baking soda (sodium bicarbonate) water (*do not use washing soda*), (e) milk. A useful and widely available first aid emetic of this type is warm, soapy, greasy dish water. Any of these emetics should be used in generous amounts in all ordinary cases. (About 4 to 7 glassfuls may be used).

Where the corrosives, such as lye or mineral acids, have been in the stomach for some time, there may be danger of perforating the stomach. In such cases there is excruciating abdominal pain, muscular rigidity, and often collapse. Following the washing of the stomach, the appropriate antidote may be administered if it is available.

c. poisons. These include (a) strong acids, alkalies, strong antiseptics, including bichloride of mercury, carbolic acid (phenol), lysol, cresol compounds, tincture of iodine, and arsenic compounds. They are destructive and have a disintegrating effect upon tissues similar to burns, and may result in death. If swallowed, any part of alimentary canal may be affected. Tissues involved are altered, easily perforated, or destroyed. Death comes very shortly from shock, or swelling of throat and pharynx, which causes choking, or by closure of esophagus, causing slow starvation.

SYM. Intense burning about mouth, throat, pharynx, and abdomen, abdominal cramping, retching, nausea, vomiting, and often collapse. There may be bloody vomitus (hematemesis) and diarrhea, the stools being watery, mucoid, bloody, and possibly stained with the poison or its products, resulting from its action on the contents of the alimentary tract. Stains about the lips, cheeks, tongue, mouth, or pharynx are often characteristic brown, violaceous or black stain on mucous membranes, which appear dry or parched. Carbolic acid or phenol leaves a white or gray stain resembling boiled meat; hydrochloric acid stains are grayish, nitric acid leaves a yellow stain; sulfuric acid leaves tan or dark burns.

cor'tex [L *rind*]. (*PL cortices*) 1. The outer layers of an organ as distinguished from its inner substance. 2. Outer layer of a bone or of the skull.

c. cerebri. The cortex of the brain, composed mainly of gray or cineritious substance. *SEE arm center.*

c. renis. The cortical substance of the kidney, made up of urinary tubes and blood vessels, supported by a stroma or matrix.

cortical. Of or pertaining to the cortex of an organ.

Corti's arches (kor'tēz). Arches formed by junction of Corti's rods. [of C

C.'s canal. Spinal canal in organ

C.'s cells. Hair cells of organ of C.

C.'s membrane. One that covers

Corti's organ.

C.'s organ. Prominence on inner portion of basal membrane in cochlear duct and containing terminal auditory apparatus [gan of C

C.'s rods. Supporting pillars of or

C.'s teeth. Henschke's* teeth; tiny

toothlike protuberances at edge of cochlear labium vestibulare.

C.'s tunnel. Corti's canal

cortidrenal (kor-ti-ad-re'nal) [+ ad, toward, + rēn, kidney]. Pert. to cortex of adrenal gland.

cortical. Pert. to the cortex.

corticifugal (kor-ti-si-fu-gal) [L. cortex, rind, + fugere, to flee]. Passing from the cerebral cortex.

corticipetal (kor-ti-sip'e-tal) [+ petere, to seek] Passing toward cerebral cortex.

corticoadrenal [+ ad, toward, + rēn, kidney] Pert. to cortex of adrenal gland.

corticoafferent [+ afferre, to bear to]. Passing toward the cerebral cortex. SYN: corticopetal.

corticoefferent [+ efferre, to bring out of]. Passing from the cerebral cortex. SYN: corticofugal.*

corticopeduncular [+ pedunculus, little foot] Pert. to cortex and cerebral peduncles.

corticopleuritis (kor-ti-ko-plū-ri'tis) [+ G. pleura, rib, + -itis, inflammation]. Inflammation of the outer parts of the pleura.

corticospinal [+ spina, thorn]. Pert. to cerebral cortex and spinal cord.

corticosterone. A hormone secreted by the adrenal cortex which influences carbohydrate metabolism. It is essential for normal absorption of glucose, the formation of glycogen in the liver and tissues, and the normal utilization of carbohydrates by the tissues.

corticotropin Pert. to corticotropin.

corticotropin. The adrenotropic factor or principle in the ant lobe of the pituitary gland. Stimulates adrenal cortex in secreting steroid hormones. SYN: ACTH. q.v.

cortin [L. cortex, rind] An assumed hormone of cortex of suprarenal gland.

cortisone (kor-ti-sōn) Abbr. for 17-hydroxy-II-dehydrocortico-sterone. A hormone from the cortex of the adrenal glands. Also known as Compound E. It relieves symptoms of rheumatoid arthritis, restores to normal abnormal brain-wave patterns in Addison's disease and possibly in epilepsy. It influences rate of utilization of sugars, fat and proteins and mineral balance and most of the vital life processes. RF: ACTH.

corusation. The subjective sensation of flashes of light.

coryleur (kor-il'er) [Fr.]. Coryl sprayer.

Corynebacterium diphtheriae. The diphtheria bacillus.

coryza (ko-ri'za) [G. koryza]. Cold in the head; an acute catarrhal inflammation of the nasal mucous membrane.

c. spasmodica. Hay fever.

cosen'stize [L. con, with, + sensitivus, sensitive] To sensitize to more than one infection.

cosmesis (kōs-mē'sis). A regard for the appearance of a patient.

cosmetic (koz-met'ik) [G. kosmētikos, pert. to adornment]. Powder or cream for improving complexion.

c. operation. One for correcting an unsightly skin formation or structural conformation of face. [tillage.

cos'ta (pl. costae) [L.]. Rib. SEX: carcos'tal. Pert. to a rib.

c. cartilage. Cartilaginous part of a rib articulating with the sternum.

costal'gia [L. costa, rib, + G. algos, pain]. Pain in the region of a rib; pleuralgia.

costectomy (kos-tek'to-mi) [+ G. ek-tomē, excision]. Excision of a rib.

cos'tive [L. contraction, from constipare, to press together] Constipated.

cos'tiveness [L. contraction, from constipare, to press together] Constipation.

costochon'dral [L. costa, rib, + G. chondros, cartilage]. Pert. to a rib and its cartilage.

costoclavic'ular [L. costa, rib, + clavicula, a little key]. Pert. to ribs and clavicle.

costocor'acoid [+ G. korax, crow, + eidos, form] Pert. to ribs and coracoid process of scapula.

costogenic (kos-to-jen'ik) [+ G. gennan, to produce] Pert. to defect arising from bone marrow of ribs.

costopneumopexy (kos'to-nū-mo-pek-si) [+ G. pneumōn, lung, + pēxis, fixation] Anchoring a lung to a rib.

costoster'nal [+ G. sternon, chest]. Pert. to a rib and the sternum.

costotome (kos'to-tōm) [+ G. tomē, incision] Knife or shears for cutting through a rib or cartilage.

costotomy (kos-to'to-mi) [+ tomē, incision]. Excision of a rib or part of one. SYN: costectomy, q.v.

costo'transverse [+ transvertere, to turn aside] Pert. to the ribs and transverse processes of articulating vertebrae.

costover'tebral [+ vertebra, joint]. Pert. to a rib and a vertebra.

cot'ton [ME cotton, from Ar qutun, cotton] Fluffy covering of the plant *Gossypium*.

c., absorbent. Cotton prepared to absorb liquids.

c., styptic. Cotton impregnated with an astringent.

c. wool sandwiches. These are used when a sharp pointed foreign body, such as a pin, has been swallowed.

Wisps of finely separated cotton wool are placed bet bread. Bread and butter may be used, but cotton wool is rather apt to collect into a pasty mass in the mouth with butter; therefore it is better to use only bread or bread and jam, or any jam containing pips which, mingling with the cotton wool, prevent its rolling up into a ball.

To prepare, cut thin pieces of bread, spread fine wisps of cotton wool onto it, and smear a little jam over it to make it stick to the bread. Care should be taken to arrange the cotton wool so that pieces will not be pulled out when the sandwich is bitten.

Several small sandwiches should be given at each meal until the pin has been passed in the feces.

cotyledon (kot-il'e'don) [G. kotylēdōn, hollow of a cup]. 1. Mass of villi on chorionic surface of the placenta. 2. Any of rounded portions into which the placenta's uterine surface is divided. 3. Seed leaf of a plant embryo.

cotyloid (kot'il-oid) [G. kotyloides, cup shaped]. Shaped like a cup.

c. cavity. The acetabulum or socket receiving the head of the femur.

coughing (kow'ching) [Fr. *coucher*, to lay down]. Displacement of the lens downward in cataract.

cough [M.E. *coughen*]. A violent expiratory effort preceded by a preliminary inspiration. The glottis is partially closed, the accessory muscles of expiration are brought into action, and the air is noisily expelled.

See. *antibechic*, *bechesthesis*, *bechic*, *begma*, *bez*, *convulsive*, *laryngismus stridulus*, *pertussis*.

c., aneurysmal. Brassy and clanging, heard in patients suffering from aneurysm.

c., asthmatic. More like an attack of dyspnea than a cough.

c., brassy. Met with in cases where there is pressure on the left recurrent laryngeal nerve, as in aortic aneurysm.

c., bronchial. Heard in cases of bronchiectasis.* May be provoked by change of posture, as in getting up in morning. *Sputum* Fetid odor and copious Dirty gray. That heard in bronchitis,* in earlier stages, is hacking and irritating; in later stages, looser and easier. *Sputum* Thin, frothy mucus.

c., diphtherial. Heard in laryngeal diphtheria, noisy and brassy, with stridulous breathing.

c., dry. One unaccompanied by moisture.

c., effective. When sputum is brought up.

c., hacking. A series of repeated efforts, as occurs in the early stages of pulmonary tuberculosis.

c., harsh. A metallic cough occurring in laryngitis.

c., hiccough. Singultus Seen in forms of hysteria, unfavorable if seen toward end of acute disease.

c., hysterical. Incessant and barking.

c., ineffective. When there is no sputum.

c., laryngeal. Seen in laryngitis.* Shrill and husky. *Sputum* Small plugs of mucus.

c., loud. Hysterical cough, q.v.

c., moist. A loose cough accompanied by moisture.

c., painful. The suppressed cough of the early stages of pleurisy and pneumonia.

c., paroxysmal. That occurring in whooping cough and bronchiectasis. Also described as spasmodic.

c., pulmonary. Hard and painful in pneumonia. *Sputum* 1 *Scanty*, very tenacious, rusty colored from being tinged with blood. In early stages of tuberculosis, hacking and irritating; in later stages, frequent and paroxysmal. 2 *Purulent*, greenish-yellow, may be streaked with blood. In later stages, nummular or coinshaped.

c., reflex. Due to irritation from the middle ear, pharynx, stomach, or intestine. It may occur singly or coupled, or it may be hacking in character.

c., short. A dry cough seen in the early stages of a common cold or catarrhal influenza.

c., whooping. Seen in pertussis.* Convulsive, short, followed by a whoop. *Sputum*: Tough mucus, followed by vomiting.

coulomb (koo-lom'). Unit of electrical quantity. It is the quantity of electricity transferred by 1 ampere in 1 second.

count. The number obtained by determining the number of units of the

object being counted per unit of volume, as bacteria count, red cell count, platelet count, reticulocyte count, differential count, parasite count, etc.

counteract. To act against or in opposition to.

counteraction. That action of a drug or chemical agent having an action opposing that of another agent.

counterextension (kown-ter-eks-ten'shun) [L. *contra*, against, + *extendere*, to extend]. Back pull or resistance to extension on a limb.

counterirritant [' + *irritare*, to excite]. An agent that is applied locally to produce inflammatory reaction with the object of affecting some other part, usually adjacent to or underlying the surface irritated. Ex *Mustard*, *chloroform*, *cantharides*.

There are 3 degrees of irritation produced by the following agents *rube-facients*, which redden the skin, the 1st degree, *vesicants*,* which produce a blister or vesicle, the 2nd degree, and *escharotics*,* which form an eschar or slough or death of tissue, the 3rd degree. See *aquapuncture* (2), *seton*.

counterirritation [' + *irritare*, to excite]. Superficial irritation, or agent producing it, which relieves some other irritation of deeper structures.

counteropening [' + *A.S.* open]. A 2nd opening, as in an abscess, not draining satisfactorily from 1st incision.

counterpressure instrument. To provide counter-retraction to offset that exerted by exit of needle.

counterpuncture [L. *contra*, against, + *punctura*, puncture]. Counteropening.* An additional opening made to help drainage, as an abscess.

coup de soleil (koo-da-sō-lay') [Fr.] Sun-stroke.

coupling [L. *copula*, bond]. Slow pulse, heart beats alternately strong or weak, seen in digitalis poisoning.

courses (kōr'siz) [L. *cursus*, a flowing] Menses, catamenia.

Coutard's method or technic. A method of x-ray irradiation consisting of 10 equal applications.

couveuse (koo-vuz') [Fr. a brooder]. Infant incubator.

cover cell (kūv'ér). A cell which serves to protect another cell of specialized function. See *cell*.

coverglass. Thin glass disc to cover a mounted object to be microscopically examined.

cowperitis [Cowper + G. -itis, inflammation] Inflammation of Cowper's glands.

Cowper's glands. The bulbo-urethral glands. A pair of compound tubular glands about the size of a pea beneath the bulb of the male urethra, and emptying a mucous secretion into it.

Discovered by Wm Cowper, an English anatomist (1686-1709). They are small round bodies, yellow in color. They correspond to the Bartholin's glands in the female. See *antiprostate*, *antiprostatitis*.

cowpox (kow'pox). Vaccinia; pustular eruption on teats and bag of a cow in form of bluish vesicles, containing a virus which may produce smallpox in a human being; also claimed to render a subject permanently immune from the disease.

coxa [L. haunch]. 1. The os *innominatum*. 2. The hip joint.

c. valga. Opp. of *c. vara*. Deformity produced when angle of head of femur with the shaft is increased above 120°.

c. vara. A deformity produced by decrease in angle made by head of femur with the shaft. Normally it should be 120° , but in c. vara it may be $80-90^\circ$. It occurs in rickets or may be due to bone injury.

coxal'gia [' + G. *algos*, pain]. 1. Pain in the hip. **SYN:** *coxodynia*. 2. Hip joint disease. **SYN:** *coxitis*.

cox'i'tis [' + G. *-itis*, inflammation]. Hip joint disease.

coxody'n'ia [' + G. *odynē*, pain]. Pain in the hip joint. **SYN:** *coxalgia*.

coxo'fem'o'ral [' + *femur*, thigh]. Pert. to the hip and femur.

coxo'tuberculo'sis [' + *tuberculum*, a little swelling]. Tuberculous condition of the hip joint.

c. p. Abbr. Chemically pure.

Cr. **SYMS** Chromium.

crab louse. *Phthirus inguinalis*. One that infests the pubic region.

crachotement (krā-shōt-mon(g')) [Fr]. Inability to spit, even with a strong desire to do so; usually accompanied by syncope following utero-ovarian operation.

cracked pot sound. Percussion sound resembling that heard when striking a cracked pot, indicative of a pulmonary cavity.

crad'le [A.S. *cradel*]. Frame for keeping bedclothes from pressing on a wound or fractured part.

craig'i'asis. Infection with *Craigia* micro-organism causing symptoms peculiar to dysentery.

cramp [M.E. *crampe*]. A spasmodic, esp. a tonic, contraction of 1 or many muscles, usually painful.

In certain occupations, the attempted use of muscle groups habitually employed may lead to a so-called "professional cramp," though other motor formulae are easily executed by the affected muscles. In writer's cramp, the attempt to write induces painful spasm of the hand muscles (similarly telegrapher's, watchmaker's, seamstress' cramp, etc.).

SYM Excruciating pain, hard and contracted lumps of muscle.

TREATMENT Depends upon cause and location. In muscular cramps try to extend muscle, compress it and apply heat and massage.

SEE bricklayer's cramp, heat cramp, systemma, writer's cramp.

c., clonic. Wryneck caused by rheumatism. **SYN** *rheumatic torticollis*.

cran'berries. A bright red, acid berry of the plant *Oxycoccus*.

They contain benzoic acid but have an excess of base. They increase acidity of urine because the benzoic acid is converted into hippuric acid. The same is true of plums and prunes. **AV. SERVING** 130 Gm. **Pro** 0.5, **Fat** 0.8, **Carbo.** 0.109 per serving. **Vit** A+, C+, Ca 0.018, Mg 0.007, K 0.077, Na 0.010, P 0.013, Cl 0.009, S 0.007, Fe 0.0006.

cran'ial [G. *kranion*, skull] Pert. to the cranium.

SEE: motor, trifacial, trigeminus, trochlear, Weber's syndrome, cranial nerves in Appendix.

c. bones. Those that comprise the cranium or brain case.

c. nerves. Also nerves #3, 4, 6, 11, and 12 are now considered to be mixed nerves as it is rather firmly established that they carry afferent proprioceptive impulses. These have their origin in

the brain, 12 in number. Name, number and functions of cranial nerves are as follows.

1st Pair—Olfactory. Special sense of smell.

2nd Pair—Optic. Special sense of sight.

3rd Pair—Oculomotor or Motor Oculi. Great motor of eye, supplies 5 of the 7 eye muscles.

4th Pair—Patheticus or Trochlear. Motor of superior oblique muscle of eye.

5th Pair—Trigeminus or Trifacial. Great sensory nerve of head and face; divides into 3 portions, viz., 1st Ophthalmic, Sensory, 2nd Sup. Max., Sensory, 3rd Inf. Max., Sensory, Motor and a lingual nerve of the sense of taste. Most difficult of all the cranial nerves to trace.

6th Pair—Abducens. Motor of external rectus of eye.

7th Pair—Facial or Portio Dura. Great motor nerve of face muscles, exclusively motor at its origin, but it subsequently receives fibers from the (5th) Trigeminus, which give it some sensory function.

8th Pair—Acoustic or Auditory, or Portio Mollis of 7th. Special sense of hearing.

9th Pair—Glossopharyngeal. In part a special nerve of taste, nerve of sensation, and also contains motor fibers.

10th Pair—Pneumogastric Vagus or Par Vagus (a mixed nerve). At its origin it is exclusively sensory, but lower down it is also motor and capable of providing both for sensation and motion in organs to which distributed.

11th Pair—Spinal Accessory. Considered to be exclusively motor, but some authorities claim for it sensory fibers. Accessory portion joins the vagus, to which it supplies its motor and some of its cardioinhibitory fibers. Spinal portion supplies the trapezius and sternomastoid muscles.

12th Pair—Hypoglossal. Exclusively motor. **SEE** Appendix.

LESIONS OF THE CRANIAL NERVES GIVE RISE TO THE FOLLOWING MANIFESTATIONS

First (Olfactory) Loss or disturbance of the sense of smell.

Second (Optic) Blindness, of various types depending upon the exact location of the lesion.

Third (Oculomotor) Ptosis (drooping) of the eyelid, deviation of the eyeball outward, dilatation of the pupil, double vision.

Fourth (Trochlear) Rotation of the eyeball upward and outward, double vision.

Fifth (Trigeminus) Sensory root: Pain or loss of sensation in face, forehead, temple and eye. **Motor root:** Deviation of the jaw toward paralyzed side, difficulty in chewing.

Sixth (Abducens) Deviation of the eye inward, double vision.

Seventh (Facial) Paralysis of all the muscles on 1 side of the face, inability to wrinkle the forehead, to close the eye, to whistle, deviation of the mouth toward the sound side.

Eighth (Auditory and Vestibular) Deafness or ringing in the ears; dizziness, nausea and vomiting, reeling.

Ninth (Glossopharyngeal) Disturbance of taste, difficulty in swallowing.

Tenth (Vagus) Disease of the vagus nerve is usually limited to 1 or more of its divisions. Paralysis of the main

trunk on 1 side causes difficulty in swallowing and talking, and hoarseness. The commonest disease of the vagus is of its left recurrent branch (see above) which causes hoarseness as its principal manifestation.

Eleventh (Spinal Accessory) Drooping of the shoulder; inability to rotate the head away from affected side.

Twelfth (Hypoglossal) Paralysis of 1 side of the tongue; deviation of tongue toward paralyzed side; "thick" speech.

craniectomy (kra-ni-ek'to-mi) [' + ek-tomē, excision]. Opening of skull for cerebral hemorrhage, tumor of brain, fracture of skull, or epilepsy.

NP Take blood pressure every 15 minutes for first 12 hours, every half hour for second 12 hours, and then as ordered until discontinued. Do not leave patient alone for first 24 hours. Watch for and report at once any changes in blood pressure, pulse, respiration, temperature, and any evidence of paralysis.

craniocèle (kra-ni-o-sēl) [' + kēlē, hernia]. Protrusion of the brain from the skull.

craniocer'ebal [' + L. *cerebrum*, brain]. Rel. to skull and brain.

cranioclast (kra-ni-o-klast) [' + *klastos*, broken]. Instrument for crushing fetal skull in delivery.

cranioclasty [' + *klastos*, broken]. Crushing of fetal head in dystocia.

craniocleidodysostosis (kra-ni-o-kil'do-dis-os-to'sis) [' + *klets*, clavicle, + *dys*, bad, + *osteon*, bone, + *-osis*, infection]. Defective ossification of bones of head, face and clavicles; a congenital condition.

craniograph [' + *graphein*, to write]. Device for making graphs of the skull.

craniology [' + *logos*, study of]. The study of the skull, its size, and shape, esp. in reference to different races.

craniomalacia (kra-ni-o-mal-a'si-ā) [' + *malakia*, softening]. Softening of the skull bones.

craniometer (kra-ni-om'et-er) [' + *metron*, measure]. Instrument for taking cranial measurements.

craniometric points. Any prominences or marks on skull for defining the configuration of the cranium, for use in craniometry.

craniometry [G *kranion*, skull, + *metron*, measure]. Study of the skull and measurement of it without its soft parts.

craniopharyngeal (kra-ni-o-far-in'je-al) [' + *pharynx*, the pharynx]. Pert. to cranium and pharynx.

craniopharyngioma (kra-ni-o-far-in-ji-o-mā) [' + *-ōma*, tumor]. Tumor of portion of the *hypophysis cerebri*.

cranioplasty (kra-ne-o-plas-ti) [' + *plasma*, to form]. Plastic operation on skull.

craniopuncture [' + L. *punctura*, puncture]. Puncture of the skull.

craniorhachischisis (kra-ni-o-rak-is'kis-is) [' + *rachis*, spine, + *schizem*, to split]. Congenital fissure of skull and spine.

craniostosis (kra-ni-os-to'sis) [' + *osteon*, bone]. Congenital ossification of cranial sutures.

craniotabes (kra-ni-o-ta'bēz) [' + L. *tabes*, a wasting]. Atrophy in infancy of cranial bones.

Etiol.: Malaria, rickets, or syphilis.

craniotome (kra-ni-o-tōm) [' + *tomē*, incision]. Device for forcible reduction of fetal skull in labor.

craniotomy (kra-ni-ot'o-mi) [' + *tomē*, incision]. 1 Breaking up fetal skull to facilitate delivery in difficult parturition. 2 Incision through the cranium.

craniotonomos'copy [' + *tomos*, tone, + *skopein*, to examine]. Auscultatory percussion of cranium.

craniotympanic [' + *tympanon*, kettle-drum]. Pert. to skull and middle ear.

cranium [L. from G *kranion*] That portion of the skull which encloses the brain, consists of single frontal, occipital, sphenoid, and ethmoid bones and the paired temporal and parietal bones.

See *skeleton*.

RS. *acrocephalia*, *antionion*, *craniology*, *craniomalacia*, *occipital*, *parietal bone*, *skeleton*, *vitreous*, *zygoma*, *zygomatic arch*.

crap'ulent, **crap'ulous** [L. *crapula*, excessive drinking]. Intoxicated.

crassamentum [L. *crassare*, to make thick]. Coagulum, blood clot.

crateriform [G *kratēr*, bowl, + L. *forma*, shape]. Bact. Saucer-shaped, craterlike, or goblet-shaped.

cravat' band'age [Fr *cravate*, a Croatian]. Triangular b. folded to form a band around the injured part. See *bandage*.

cream [L. *cremor*, thick juice]. The rich, yellowish part of milk.

AV. SERVING (medium, 1 oz.) 25 Gm. Pro 0.6, Fat 7.5, Carbo 0.9 per av. serving. Ca 0.086, Mg 0.010, K 0.126, Na 0.035, P 0.067, Cl 0.080, S 0.030, Fe 0.00022. Slightly alkaline reserve. Vit. A + + +, B + +, C + variable.

cream of tartar. Potassium bitartrate, $\text{KHC}_4\text{H}_4\text{O}_6$. An aperient and diuretic.

Dosage 1-4 Gm. Usually given in hot water with lemon juice to flavor. See *argol*.

crease (krēs) [L. *crista*, tuft]. A line c., *gluteofemoral*, c., *neofemoral*. The crease that bounds the buttocks below.

creatinase (kre-at'in-ās) [G. *kreas*, flesh, + *ase*, enzyme]. An enzyme that decomposes creatinine.

creatine (kre-at'in) [G. *kreas*, flesh]. Methylglycococamine, $\text{NH}_2\text{C}(\text{NH}_2)\text{N}(\text{CH}_3)\text{CH}_2\text{COOH}$ + H_2O , a colorless, crystalline substance that can be isolated from various animal organs and body fluids.

Dosage 1-2 gr (0.06-0.12 Gm.).

Found esp. in muscle juice and in blood. Not normally found in urine of adult men, but in women it obtains during menstruation, pregnancy, and in puerperium. It is constantly found in the urine of children and is present in fevers and during starvation. As it loses water it turns into creatinine before it is excreted in the urine.

creatinemia (kre-a-tin-e-mē-ā) [' + *aima*, blood]. Excess of creatine in circulating blood.

creatinine (kre-at'in-in) [G. *kreas*, flesh]. Methylglycococamidine, $\text{C}_4\text{H}_7\text{O}_3\text{N}_3$.

It can also be isolated as colorless crystals from animal material. It is one of the nonprotein constituents of blood, and increased quantities of it are found in advanced stages of renal disease. It is a normal and an alkaline constituent of urine and blood. About 0.02 Gm per Kg. of body weight is excreted by the kidneys per day. It generally represents 3 to 7% of urine nitrogen content.

Dosage 1-2 gr (0.06-0.12 Gm.).

creatinuria (kre-a-tin-u'ri-ā) [' + *ouron*, urine]. Creatinine in urine.

creatorrhea (kre-ā-tor-re-ā) [' + *roia*, flow]. The presence of muscle fibers in

the feces, seen in some cases of pancreatic disease.

creatotoxism (kre"ă-to-toks'izm) [" + *toxikon*, poisoning] Meat poisoning

crèche (krăsh) [Fr.]. A day nursery for children

Crédé's method (kre'day). 1 The means whereby the placenta is expelled by downward pressure on the uterus through the abdominal wall with the thumb on the post. surface of the fundus uteri and the flat of the hand on the ant. surface, the pressure being applied in the direction of the birth canal. 2. For treatment of the eyes of the newborn, the use of 1% silver nitrate solution instilled into the eyes immediately after birth for the prevention of *ophthalmia neonatorum* (gonorrheal ophthalmia).

cremaster [G. *kremas*, to suspend]. One of the fascialike muscles suspending and enveloping the testicles and spermatic cord.

cremasteric [G. *kremastos*, hanging] Pert. to the cremaster muscle

c. fascia. One of the coverings of the spermatic cord

c. reflex. Retraction of testis when skin is stroked on front inner side of thigh.

cremation (kre-ma'shun) [L. *crematio*, a burning] Reduction of bodies of the dead by heat as a substitute for burying.

cremor [L.] Cream

c. tartari. Cream of tartar.

crenate (kre'nat) [L. *crena*, a notch]. Notched or scalloped, as crenated condition of blood corpuscles

crenation [L. *crena*, a notch]. The conversion of normally round red corpuscles into shrunken, knobbed, starry forms, as when blood is mixed with salt solution of, say, 5% strength See *plasmolysis*.

creosote (kre'o-sôt) [G. *kreas*, flesh, + *sôzen*, to preserve] USP. A mixture of phenols obtained from wood tar.

Action and Uses Locally, antiseptic and anesthetic Internally, gastrointestinal antiseptic and as a stimulating expectorant in chronic bronchitis and tuberculosis

Dosage 4 m (0.25 cc)

crepitant (krép'i-tánt) [L. *crepitare*, to crackle] Crackling, having or making a crackling sound

crepitation (krép-i-tă'shun) [L. *crepitare*, to crackle] 1 A crackling sound heard in certain diseases, as the râle heard in pneumonia 2 A grating sound heard on movement of ends of a broken bone

crep'itus [L. *crepitare*, to crackle]. 1. The noise of gas discharged from the intestines. 2 Crepitation *

c. redux. Râle indicating approaching recovery in pneumonia

crepuscular (kre-pus'kü-lar) [L. *crepusculum*, twilight]. Pert. to twilight.

cre'scent [L. *crescere*, to grow] Shaped like a sickle or the new moon

c. of Glanzli (jân-noot'se) A crescent shaped group of serous cells lying at the base of or along the side of a mucous alveolus of a salivary gland, also called demilune of Heidenheim

c., myopic. Grayish patch in fundus of eye due to atrophy of choroid.

crescentic (kres-en'tik). Sickleshaped.

creosol (kre'sol). USP. Yellowish brown liquid obtained from coal tar, having 4 times germicidal properties of phenol.

Use. A surgical disinfectant in ¼ to 1% solution. Creosols possess distinct

advantage as disinfectants. In practice they are diluted, but they are far from being nonpoisonous. One disadvantage is their disagreeable odor. A compound solution of creosol has about twice the germicidal power of pure phenol On account of its saponaceous character, it is much used for disinfection of the skin, for lubricating the hands, and for vaginal douches in the form of aqueous solutions containing from 1-5%.

Dosage 1 gr (0.06 Gm)

creomania (kres-o-ma'ni-ă) [*Croesus*, wealthy king of Lydia, 6th Century B. C. + *G. mania*, madness] Hallucination of possessing great wealth

crest, water. One of the plants of the mustard family

Rich in iodide, and it has a high allyl content. Its mineral value is higher than nearly all the herbaceous vegetables. **Av. SERVING** 20 Gm **Pro** 0.2, **Fat** 0.2, **Carbo** 0.8 per av. serving.

VITAMINS A+++ , B+ , C+++ , G++ to +++ . **Ca** 0.187, **Mg** 0.034, **K** 0.287, **Na** 0.099, **P** 0.005, **Cl** 0.061, **S** 0.167, **Fe** 0.00297

crest [L. *crista*, tuft]. The ridge or part surrounding a process esp on a bone.

cre'tin [Fr.] One afflicted with congenital myxedema, an idiotic dwarf

A cretin is characterized by lack of stature and of mental development, rarely if ever exceeds the mental age of 10.

The skin is rough and dry, and the hair coarse, dry, and brittle Teeth erupt slowly and are of poor quality and irregularly placed The tongue is large and apt to protrude from a mouth which constantly drools saliva A cretin child is potbellied, swaybacked, and prone to umbilical hernia Adult cretin is myxedematous

TREATMENT Desiccated thyroid* or thyroxin

Prog Cannot be entirely overcome.

cretinism (kre'tin-izm) [" + *G. izmos*, condition]. Congenital affection, characterized by a lack of physical and mental development

Etiol A congenital deficiency in secretion of the thyroid hormones

Sym An abnormal condition of the thyroid gland, myxedema and idiocy or imbecility

c., endemic. **Sym** Stature short (3 or 4 feet), head large, flat antero-posteriorly and broad laterally, eyes wide apart, nose flat, lips thick, tongue large and may protrude, chest narrow, abdomen prominent, fingers short, genitalia not developed, subcutaneous tissues at root of neck are thickened from mucoid or fatty deposits, thyroid gland frequently enlarged, mental condition that of idiocy. Found in the Alps and Pyrenees

c., sporadic cases of. Present the same features but the thyroid instead of being larger is smaller. Found in various parts of world. **Sss** cretin.

cretinoid (kre'ti-noid) [" + *G. eidos*, resemblance]. Having the symptoms of cretinism, or resembling a cretin, due to a congenital condition

cre'tinous. Pert. to a cretin or to cretinism.

crevice (krev'is) [Fr. *crever*, to break, from L. *crepare*, to break]. A small fissure or crack.

c., gingival. The fissure produced by the marginal gingiva with the tooth surface.

crevicular (krev-ik'u-lar). Pert. to the gingival crevice.

cribrate [L. *cribrum*, a sieve]. Profusely pitted or perforated like a sieve.

cribra'tion [L. *cribrum*, a sieve]. The state of being perforated.

crib'riform [" + *forma*, form]. Sievelike.
c. fascia. Inner superficial fascia of thigh.

c. plate. The thin, perforated, medial portion of the horizontal plate of the ethmoid bone.

cricoarytenoid (kri-ko-ä-rit'en-oid) [G. *krikos*, ring, + *arytaina*, pitcher, + *eidos*, form]. Extending bet. the cricoid and arytenoid cartilages.

cricoderma (kri-ko-der'mä) [" + *derma*, skin]. Ringshaped infiltrations in center of indurations on the skin

cricoid (kri'koid) [" + *eidos*, form]. Ringlike.

c. cartilage. A ringlike cartilage forming the lower back part of the larynx.

cricoidectomy (kri-koid-ek'to-mī) [" + *ektomē*, excision]. Excision of cricoid cartilage.

cricoidynia (kri-koi-din'i-ä) [" + " + *odynē*, pain]. Pain in cricoid cartilage.

cricopharyngeal [" + *pharyngē*, gullet]. Pert to the cricoid cartilage and pharynx.

cricothyroidectomy (kri-ko-thi-re-ot'o-mī) [" + *thyreos*, shield, + *tomē*, to cut] Division of the cricoid and thyroid cartilage.

cricothyroid (kri-ko-thi'roid) [" + " + *eidos*, form]. Pert. to the thyroid and cricoid cartilages

cricotomy [" + *tomē*, incision]. Division of the cricoid cartilage.

cricotracheotomy [" + *trachea*, windpipe, + *tomē*, incision]. Division of the cricoid cartilage and upper trachea in closure of the glottis.

cricogenic (kri-n-o-jen'ik) [G. *kri-nein*, to secrete, + *gennan*, to produce]. Producing or stimulating secretion

crisis (kri'sis) [G. *krisis*]. 1. The turning point of a disease, a very critical period often marked by a long sleep and profuse perspiration 2. The term used for the sudden descent of a high temperature to normal or below, generally occurs within 24 hours. 3. Sharp parox-

ysms of pain occurring over the course of a few days in certain diseases, e. g., gastric c., vesical c., Dietl's c., laryngeal c., etc. See: *lysis*.

c., blood. The appearance in the blood of large numbers of nucleated erythrocytes over the course of a few days.

c., Dietl's. In cases of floating kidney, the ureter becomes kinked and urine is obstructed, producing symptoms of renal colic.

c., false. When temperature falls and the pulse rate remains high, suggesting that later on the temperature may rise again.

c., true. One accompanied by a fall in the pulse rate.

crista [L.] A crest or ridge.

c. ampullaris. A localized thickening of the membrane lining the ampullae of the semicircular canals; it is covered with neuroepithelium containing auditory cells

c. galli. A ridge on the ethmoid bone to which the *falx cerebri* is attached [crest]

c. lacrimalis posterior. The lacrimal

c. spiralis. A ridge on the spiral lamina of the cochlea *

critical (krit'ik-al) [G. *kri-nein*, to judge].

1. Pert to a crisis 2. Dangerous.

c. reflex. Abnormal tension of an area resulting from direct stimulation of that area

Crookes' dark space. Nonluminous region enveloping outline of the cathode in a discharge tube. See *cathode, dark space*.

C. tube. An early form of vacuum discharge tube devised by Sir William Crookes and used by him for the study of cathode rays

cross birth. Presentation of the fetus where the long axis of the fetus is at right angles to that of the mother and requiring version

crossed reflexes (kröst). 1 Passive flexion of 1 part following flexion of another.

2 Passive flexion of 1 leg causing similar movement of opposite leg.

cross eye. Manifest deviation of one eye when looking at an object. SYN *strabismus*,* *squint*.

crossing over. The process in which a group exchanges place with a similar group of genes on a homologous chromosome. It occurs during synapsis in meiosis

cross knee. Knock knee. SYN *genu valgum*.

crotophion (kro-ta'fi-on) [G. *krotaphos*, the temple]. Tip of greater wing of sphenoid bone

crotch'et (krotch'et) [Fr. *crochet*, small hook]. Sharp hook for extracting fetus after craniotomy.

croton oil (kro'ton) [G. *krotōn*, shrub]. (*oleum tiglii*). USP. A fixed oil expressed from the seed of the croton plant.

ACTION AND USES: Drastic cathartic, externally as a rubefacient.

DOSAGE: 1 m (0.06 cc.) diluted with sugar or olive oil.

POISONING. SYM: Severe abdominal pains, vomiting, marked diarrhea, and shock. Skin cold and clammy; face pinched; pulse rapid and small; collapse follows.

TREATMENT: Stomach pump or an emetic. Give soothing drinks, such as milk, barley water, or whites of eggs.

CRISIS

After Sears.

LYSIS

Stimulate; apply external heat. Atropine, belladonna, or morphine to relieve cramping.

crounotherapy (kroo'no-ther'ä-pl) [G. *krounos*, spring, + *therapeia*, treatment]. Use of mineral waters for therapeutic purposes.

croup (crôop) [Fr. *croupe*]. Disease characterized by suffocative and difficult breathing, laryngeal spasm, and sometimes by the formation of a membrane. **c., catarrhal.** Acute catarrhal laryngitis.

c., membranous. Croupous laryngitis or true croup. Inflammation of larynx with exudation forming a false membrane. **Sym** Those of laryngitis, loss of voice, noisy, difficult, and stridulous breathing, weak, rapid pulse, livid surface, fever moderate. **Prog** Grave. Death may come in 36 hours. **Treatment** Similar to that for diphtheria, q.v. Hot water to throat, emetics, and medicated inhalations. Produce vomiting. **See** *carpopedal spasm*, *steam tent*.

c., spasmodic or false. Catarrhal laryngitis without formation of false membrane, but with spasm of the glottis. Occurs in children. **Sym** Difficult breathing, metallic cough, swollen membrane with tenacious mucus. **Proc** Favorable. **Treatment** Hot foot bath, emetic, inhalation of steam.

croupous (kroo'pus) Pert to croup or having a fibrinous exudation

c. membrane. False membranous formation found in croup

c. pneumonia. Lobar pneumonia
crown'ing [L. *corôna*, crown] Stage in delivery when fetal head presents at the vulva.

crownwork [L. *corôna*, crown]. Artificial crown for a tooth

crucial (krü'shal) [L. *crucialis*, from *crux*, cross] 1 Cross shaped 2 Decisive

crucible [L. *crucibulum*] A vessel for melting substances with great heat.

cruciform [L. *crux*, cross, + *forma*, shape] Shaped like a cross

crude (krud) [L. *crudus*, unripe; raw]. Raw, unrefined, or in a natural state.

crü'ra (sing. *crus*) [L. pl. legs] A pair of elongated masses or diverging bands, resembling legs

c. cerebel'li. Cerebellar peduncles.

c. cer'ebri. Pair of bands joining cerebellum to medulla and pons.

c. of diaphragm. Two pillars connecting spinal column and diaphragm.

c. of the fornix. Arches made by division of the fornicate extremities

crural (kru'ral) [L. *cruralis*, pert to the leg]. Pert. to the leg or thigh, femoral.

c. arch. Femoral arch

c. hernia. Femoral hernia

crus (pl. *crü'ra*) [L.] 1 The leg. 2 Any structure resembling the leg

c. cerebri. Either of the 2 peduncles connecting the cerebrum with the pons.

crust, crust'a [L. *crusta*]. 1. A scab. A secondary lesion, dry serous or seropurulent, brown, yellow, red or green exudations on a free surface. 2. An outer covering or coat.

Seen in eczema, seborrhea, syphilis, impetigo, favus and *tinea tonsurans*, or scalp ringworm.

c. lactea. Seborrhea of scalp in nursing infants. **See** *galactophylis*.

cryaigesia (kri-al-je'zi-ä) [G. *kryos*, cold, + *algos*, pain] Pain from the cold. **Syn:** *cryodynina*.

cryanesthesia (kri-an-es-the'zi-ä) [' + *an-*, priv. + *aisthēsis*, sensation]. Loss of sense of cold

cryesthesia (kri-es-the'zi-ä) [' + *aisthēsis*, sensation]. Sensitiveness to the cold.

cryodynina (kri-mo-din'i-ä) [G. *krymos*, cold, + *odynē*, pain]. Pain from cold. **Syn:** *cryaigesia*.

cryophilic (kri-mo-fil'ik) [' + *philein*, to love] Showing preference for cold, as certain microorganisms

cryophylactic (kri-mo-fi-lak'tik) [' + *phylaxis*, guarding against] Resistant to cold

cryomother'apy [' + *therapeia*, treatment]. The use of cold in treating disease

cryo-aerotherapy (kri-o-a-er-o-ther'ä-pl) [G. *kryos*, cold, + *aēr*, air, + *therapeia*, treatment] Cold air bath in which, by degrees, the patient is accustomed to freezing temperature

cryocautery (kri-o-kaw'ter-i) [' + *kautē*, a burner]. Device for collection and application of solid carbon dioxide.

cry'ogen [' + *gennan*, to produce] Mixture of carbon dioxide snow at -176° F.

cryogenic (kri-o-jen'ik). Producing or pert to low temperatures

cryoglobulinemia (kri'o-glob'u-lin-e'me-ah) [' + L. *globulus*, globule + G. *haima*, blood] Presence in the blood of an abnormal protein which forms gels at low temperatures. Found in association with pathologic conditions such as multiple myeloma and leukemia

cryom'eter [G. *kryos*, cold, + *metron*, measure] A thermometer for measuring very low temperature.

cryophil'ic [' + *philein*, to love]. Preferring low temperatures

cryotherapy (kri-o-ther'ä-pl) [G. *kryos*, cold, + *therapeia*, treatment]. The therapeutic use of cold

cryotol'erant [' + L. *tolerāre*, to bear]. Able to tolerate very low temperatures.

crypt (kript) [G. *kryptein*, to hide] A tubule, follicle or pit

c. of Lieberkuhn. Intestinal glands, tubular depressions in the intestinal mucous membrane. They are lined with columnar epithelium and have circular apertures opening upon the surface

c's., Morgagni's. Recessions or pockets in rectal mucosa

c., synovial. Pouch in a joint's synovial membrane

cryptanamesia (kript-an-am-ne'zi-ä) [' + *an-*, priv. + *amnēsia*, forgetfulness]. Subconscious memory

cryptectomy (krip-tek'to-mi) [' + *ektomē*, excision] Excision of a crypt.

cryptesthesia (krip-tēs-the'zi-ä) [' + *aisthēsis*, perception] Intuition.

cryptic (krip'tik) [G. *kryptikos*, hidden]. Having a hidden meaning, occult

cryptitis (krip-t'itis) [G. *kryptein*, to hide, + *-itis*, inflammation]. Inflammation of a crypt or follicle.

cryptococcosis. (European blastomycosis, Torulosis, Busse-Buschke's disease) A sub-acute or chronic infection which may involve any organ of the body, lungs, skin, but having a marked predilection for the brain and its meninges

Etiol. **Syn** *Torula histolytica*, *Cryptococcus hominis* A fungus, *Cryptococcus neoformans*

Symptoms. Development of single or multiple abscesses in the cerebral type, headache, dizziness, vertigo, stiffness

of neck muscles, in final stages coma and respiratory failure. Often mistaken for brain tumor.

Proc: Grave, in cerebral form usually fatal.

Cryptococcus. *SYN Torula* A genus of pathogenic yeast-like fungi which is the causative agent of European blastomycosis (Cryptococcosis).

cryptodidymus (krip-to-did'i-mus) [" + *didymos*, twin]. One fetus concealed within another.

cryptogenetic (krip-to-jen-et'ik) [" + *gennan*, to produce]. Of unknown or indeterminate origin.

c. infection. The invasion of bacteria without outward evidence of entry into the body. *SEE injection.*

cryptoglia'ma [" + *glia*, glue, + *-ōma*, tumor]. A glioma that has not yet revealed itself.

cryptolith (krip'to-lith) [" + *lithos*, stone]. A concretion in a glandular follicle.

cryptomenorrhoea (krip-to-men-o-re'ā) [" + *mēn*, month, + *roia*, flow]. Monthly subjective symptoms of menses without flow of blood.

cryptomerorachischisis (krip'to-mer'o-rak-is'kis-is) [" + *meros*, part, + *rachis*, spine, + *schisis*, cleavage]. *Spina bifida occulta* without a tumor but with bony deficiency.

cryptomnesia (krip-tom-ne'zi-ā) [" + *mnēsis*, memory]. Subconscious memory.

cryptophthal'mus [" + *ophthalmos*, eye]. Complete congenital adhesion of eyelids to globe of eye.

cryptoplas'mic [" + *plasma*, matter]. Having existence in a concealed form.

cryptopodia (krip-to-po'di-ā) [" + *pous*, foot]. Fibromata of feet so diffuse as to resemble pads.

cryptopyic (krip-to-pi'ik) [" + *pyon*, pus]. Having concealed suppuration, as a pyemia without apparent etiology.

cryptoradiom'eter [" + *L radius*, ray, + *G metron*, measure]. Device for estimating penetrative power of x-rays.

cryptorchid (krip-or'kid) [" + *orchis*, testis]. One with testicles which have not descended into the scrotum.

cryptorchidectomy (kript-or-ki-dek'to-mē) [" + *-tē*, *ektomē*, excision]. Operation for an undescended testicle.

cryptorchidism (kript-or'kid-izm) [" + *-ismos*, condition of]. Failure of testicles to descend into scrotum.

Pregnant mare's gonadotropic hormone found in its urine causes descent and growth of testicles.

cryptorchis (kript-or'kis) [" + *orchis*, testis]. One with undescended testicles. *SYN cryptorchid.**

cryptorrhoea (krip-to-re'ā) [" + *roia*, flow]. Excessive secretion of a ductless gland.

cryptorrhoeic (krip-to-re'ik) [" + *roia*, flow]. Pert. to internal secretions. *SYN: cryptorrhetic.**

cryptorrhetic [" + *roia*, flow]. Pert. to the internal secretions.

cryptoscope (krip'to-skōp) [" + *skopein*, to examine]. Fluoroscope.

cryptotox'ic [" + *toxikon*, poison]. Having unknown toxic properties.

cry reflex (kri). Sudden painful response cry during sleep.

crys'tal [G. *krystallos*, clear ice]. A symmetrical shape produced by chemical compounds, certain salts, and by frost

c., blood. One composed of hematin.

c., Bottcher's. *SEE c., spermin.*

c., Charcot-Leyden. Found in asthmatic sputum, leukemic blood, etc. Octahedral and composed of a phosphate.

c., Charcot-Neumann. Spermin crystals found in semen and some animal tissues.

c., Charcot-Robin. A type formed in blood in leukemia.

c. hemin. Yellowish or brown crystals which appear when dried blood or hemoglobin is heated with a few drops of acetic acid and salt. They are crystals of hemin, the hydrochloride of heme. Their presence constitutes a delicate and reliable test for blood.

c., spermin. Composed of spermin phosphate and seen in prostatic fluid on addition of a drop of ammonium phosphate solution.

crystallin (kris'tāl-in). Globulin of the crystalline lens.

crys'talline. Resembling crystal.

c. deposits. **ACID GROUP** Includes the urates, oxalates, carbonates, and sulfates. **ALKALINE GROUP** Includes the phosphates, cholesterol, systine, ammonium urate.

c. lens. The lens of the eye in the capsule behind the pupil. It separates the aqueous from the vitreous humor. It is transparent and refracts the rays of light, impinging them upon the surface to bring them to a focus on the retina.

crystalliza'tion [G. *krystallos*, clear ice]. The formation of crystals.

crys'talloid [" + *eidos*, form]. 1. Like a crystal. 2. Opposite of *colloid*, a substance capable of crystallization, which in solution can be diffused through animal membranes, and is readily soluble, *e g.*, salt, sugar.

crystalloiditis (kris-tal-oid-i'tis) [" + *-itis*, inflammation]. Inflammation of crystalline lens.

crystalloph'bia [" + *phobos*, fear]. Abnormal fear of glass or objects made of glass.

crys'tallose. A sweetening agent (saccharinate of sodium) said to be many times sweeter than sugar and to be used as a substitute for it.

crystallur'ia. The appearance of crystals in the urine. May occur following the administration of sulfonamides. Their formation can be prevented by administration of adequate amounts of alkali.

crystalluridrosis (krist-al-u-rīd-ro'sis) [G. *krystallos*, clear ice, + *ouron*, urine, + *idrōs*, sweat]. Crystallization of urinary elements on the skin.

Cs. Sym for cesium, a metallic element.

Ctenocephalides (tēn-ō-sēf'ā-līds). A genus of fleas belonging to the order Siphonaptera. Common species are *Ct. canis* and *Ct. felis*, the dog flea and cat flea. The adults feed on their hosts while larvae live on dried blood and feces of adult fleas. Adults may attack man and other animals. They serve as intermediate host of the dog tapeworm, *Dipylidium caninum*, and may transmit other helminth and protozoan infections.

Cu. Symb. for copper (*cuprum*).

cubic measure. 1728 cubic inches (cu. in.) = 1 cubic foot (cu. ft.). 27 cubic feet = 1 cubic yard (cu. yd.).

cu'bital [G. *kubiton*, the elbow]. Pert. to the ulna, or to the forearm.

cu'bitus [L. from *G. kubiton*]. Elbow; forearm, ulna

c. valgus. An abnormal curvature of the humeral diaphysis, congenital or due to rickets

c. varus. Deformity due to fracture of either condyle of the humerus, the extended forearm deviating out from the axis of the arm; gunstock deformity, congenital

cu'boid [G *kubos*, cube, + *eidos*, resemblance] Like a cube

c. bone. *Os cuboideum*. Outer bone of tarsal or instep bones

cucumbers. Fruit of *Cucumis sativus* vine. AV. SERVING: 75 Gm. Pro 0.6, Fat 0.2, Carbo 1.3 per av serving Ca 0.016, Mg 0.009, K 0.140, Na 0.010, P 0.033, Cl 0.050, S 0.020, Fe 0.0002 Vit A - to +. Vit. B+. Vit. G++ to +++.

cucurbit (ku-ker'bit) [L *cucurbita*, gourd] Cupping glass.

cul-de-sac [Fr. *cul*, bottom, + *de*, of, + *sac*, bag] A narrow cavity or vessel open only at 1 end, as of the eye

c., Douglas'. The peritoneal pouch bet. the ant wall of the rectum and the post wall of the uterus.

-cule, -cle [L] Suffix Little, as *molecule*, *corpuscle*.

Cu'lex. A genus of small to medium sized mosquitoes of cosmopolitan distribution. Some species are vectors of disease organisms

C. pipiens. The common house mosquito Serves as a vector of *Wuchereria bancrofti*, the causative agent of filariasis

C. quinquefasciatus. Common in the tropics and sub-tropics, the most important intermediate host of *Wuchereria bancrofti*

Culicidae (kū-lis'i-dē). A family of insects belonging to the order Diptera. Includes the mosquitoes

culicifuge (ku-lis'i-fūj) [L. *culex*, gnat, + *fugere*, to flee] An agent to prevent mosquito attacks

cul'men [L *summit*]. Top or summit of a thing

c. cerebelli. Most prominent part of the vermis sup. near its ant extremity

cultiva'tion [L *cultivare*, to cultivate] Growing microorganisms in an artificial medium

cultural (kul'tu-ral) [L *cultura*, tillage]. Pert to cultures of microorganisms

culture [L *cultura*] Bact A mass of microorganisms growing in laboratory culture media

c., blood. Used in the diagnosis of specific infectious diseases. Test consists of withdrawing blood from a vein, under sterile precautions, placing it in or upon suitable culture media, and determining whether or not germs grow in the media. If organisms do grow, they are identified by bacteriologic methods

c., gelatin. A c. of bacteria on gelatin.

c., hanging block. A thin slice of agar seeded on its surface with bacteria, and then inverted on a cover slip and sealed in the concavity of a hollow glass slide. This method is used to study the mode of cell division.

c., hanging drop. A c. accomplished by inoculating the bacterium into a drop on a cover glass, and mounting it in the depression on a concave slide.

c. medium. A substance on which microorganisms may grow. Those most commonly used are broths, gelatin, and agar, which contain the same basic in-

gredients. Salt should be used in media if blood is added to them to prevent the blood from hemolyzing

c., negative. A c. made from suspected matter which fails to reveal the suspected organism.

c., physical. The training of the body by means of gymnastics

c., positive. A c. which reveals the suspected organism.

c., pure. The c. of a single form of microorganism uncontaminated by other organisms

c., stab. A bacterial c. made by thrusting into the c medium a point inoculated with the matter under examination.

c., stock. A permanent c. from which transfers may be made

c. tissue. The growing to tissue cells in artificial nutrient fluids

cu.mm. Abbr. for cubic millimeter

cumulative (ku'mu-la-tiv) [L. *cumulus*, a heap] Increasing in effect

c. drugs. Those which, after being received into the body in small doses, often repeated, are not immediately eliminated, but tend to accumulate in the system and suddenly produce symptoms of poisoning. Carbolic acid and mercurial preparations are examples of drugs which act in this way

cum'ulus. A raised place, a heap of cells.

c. cophorus. A mass of follicle cells which surrounds the ovum. It projects into the antrum of the Graafian follicle. Also called *discus proligerus*

cuneate (ku'ne-āt) [L. *cuneus*, wedge]. Wedgeshaped

c. fasciculus, c. funiculus. Continuation of posterolateral column of cord into the medulla

c. nucleus. Gray matter at end of cuneate fasciculus

cuneiform (ku-ne'i-form) [L *cuneus*, wedge, + *forma*, shape] Wedge-shaped

c. bones. Those of the tarsus, internal, middle, and external

c. cartilage. One of two small pieces of yellow elastic cartilage which lies in the aryepiglottic fold of the larynx immediately anterior to the arytenoid cartilage

c. hysterectomy. Excision of a wedge of uterine tissue

cuneo- [L] Prefix A wedge.

cu'neocu'boid [L *cuneus*, wedge, + *G. kubos*, cube, + *eidos*, shape] Pert. to cuboid and cuneiform bones

cuneohysterectomy (ku-ne-o-his-ter-ek'-to-mī) [+ + *ystera*, uterus, + *ektomē*, excision] Excision of a wedge of tissue from the post surface of the *cervix uteri* to correct abnormal antelexion.

cu'neus [L]. Wedgeshaped lobule of brain on mesial surface of occipital lobe

cunic'ulus [L. an underground passage]. Burrow in epidermis made by the itch mite

cunilingus (kun-nī-lin'gus) [L. *cunnius*, pudenda, + *lingua*, tongue] Application of tongue or mouth to the cunnius, q.v., a practice not peculiar to either sex and also observed among various animals.

cun'vus [L.]. 1. The vulva, * pudenda * 2. Vagina.

cup [G *kupe*, hollow] 1. Small drinking vessel. 2. A cupping glass.

c., foveus. Depression around a hair

c., glaucomatous. "Pressure excavation" of optic dish in glaucoma.

c. optic. In the embryo a double layered cuplike structure connected to the diencephalon by a tubular optic stalk. It gives rise to the sensory and pigmented layers of the retina.

c. physiologic. A slight concavity in the center of the optic disk.

cu'pola [L. *cúpula*, little tub]. The little dome at apex of cochlea and of spiral canal.

c. space. Tympanic attic.

cupping. Application of glass vessel from which the air has been exhausted by heat or a special suction apparatus to the skin in order to draw blood to the surface.

See. *leech*.

c., dry. Used to relieve kidney and in pneumonia to relieve congestion and pain, or to stimulate the kidneys, also to induce hyperemia in infected areas. **DURATION.** 10-20 minutes.

c., wet. Application of cupping after incision of the skin. Seldom now used. The area for both forms of cupping should first be shaved and sterilized.

cu'pum [L.] Abbr. Cu Copper, *q.v.*

curare, curari (ku-ráh-ré) [Spanish *curaré*, he, to whom it comes, falls] Toxic extract of *Strychnos* plant family used to paralyze motor nerve endings

Dosage $\frac{1}{16}$ gr (0.005 Gm.)

curarization (ku-ráh-rí-zá'shün) [Spanish *curaré*, he, to whom it comes, falls]. Condition following introduction of curare: eyelids heavy, nystagmus, husky voice, weak jaw and throat muscles, inability to raise head, arms and legs.

Employed to lessen severity of convulsions produced by metrazol shock therapy and relaxation of muscles as in tetanus, etc. C sets in with dosage in ratio of 1 cc. oi 10 mg. per 15-20 pounds body weight with males and older patients slightly more. Effects noted in 15 minutes.

curd [M.E.]. Milk coagulum. Milk coagulated in the stomach forming what is known as a "curd"

cure [L. *cura*, care]. 1 Course of treatment of patients. 2 Restoration to health.

curet, curette (ku-ret') [Fr. *curette*, a cleanser]. Scraping instrument for removing foreign matter from a cavity

curettage (ku-ret-aj) [Fr.]. Scraping of a cavity.

c., uterine. Scraping with a curette to remove impregnated ovum or its remnants clinging to uterine wall.

NP. 1 It is essential that the patient's buttocks are not pulled down below edge of table. If this is done when legs are elevated in leg rests or stirrups, an undue strain is apt to result in sacroiliac trouble. There is at least 1 case on record where gangrene of the foot followed prolonged pressure by stirrups.

2. The exterior surfaces are either scrubbed and irrigated with sterile water or painted, using either iodine or mercurochrome. The vaginal surfaces are included, as is also the cervix. The patient has already been placed on a Kelly pad, on which a sterile towel has been placed. A sterile towel is now placed across the pubes. Another is now placed crosswise across the buttocks. The "floating" nurse takes a strip of narrow adhesive plaster, about 18 in. long, holding it by the ends, well away from her. The "sterile" nurse then throws over the middle of the tape a sterile towel so that tape holds towel

in middle fold. The "floating" nurse places edges of tape around patient's hips so that sterile towel is stretched tightly across rectum. Sterile leggings are now pulled over patient's legs and a lithotomy sheet draped down on the perineum.

3. Uterine packing should be ready. This form of packing is usually of gauze $1\frac{1}{2}$ in. wide and 18 in. long.

curettement (ku-ret'ment) [Fr.]. The scraping of a part by means of a curette.

curie (ku-re'). The standard unit of quantity of radon, being the amt. in equilibrium with 1 Gm. of radium element.

cu'riagram [Curie + G. *gramma*, writing]. A radium photograph.

curietherapy (ku-rí-ther-á-pí) ["" + G. *therapeia*, treatment] Radium therapy.

curled. BACT Said of parallel chains in wavy strands, such as in anthrax colonies.

cur'rant. A small, seedless raisin.

AV. SERVING (fresh). 50 Gm. **Pro.** 0.8, **Fat** 0.2, **Carbo** 6.4 per serving. **Vit. C** + + +. **AV. SERVING** (dried): 50 Gm. **Pro.** 1.2, **Fat** 0.9, **Carbo** 32.1 per serving. **ASH CONSR.** (fresh) Ca 0.026, Mg 0.017, K 0.211, Na 0.007, P 0.058, Cl 0.006, S 0.14, Fe 0.0005. **ASH CONSR.** (dried). Ca 0.082, Mg 0.044, K 0.873, Na 0.081, P 0.195, Cl 0.060, S 0.044. **F** 0.0025.

cur'rant jelly clot. Postmortem, soft, red clot in heart and vessels

current [L. *currere*, to run]. A flow, as of water, or the transference of electrical impulses

c., alternating. A current which periodically flows in opposite directions. Alternating current waves may be either sinusoidal or nonsinusoidal. The alternating current wave used most commonly therapeutically is the sinusoidal. Its variations in strength in either direction are the same, i. e., starting from zero it rises with a gradual increase in voltage and amperage until a certain maximum is reached, when, without any pause or break, it decreases in the same gradual manner until the zero line is again attained, then, still without pause, the same process is repeated with equal intensity but in the opposite direction. This constitutes 1 cycle, 1 cycle equals 2 alternations. Furthermore, the cycle follows a definite law, the intensity of the current at any point being proportional to the sine of the angular displacement.

c., constant. **SEE** direct current.

c., continuous. **SEE** direct current.

c., cutting. Needle point or blade connected to 1 terminal of a high frequency machine producing current of undamped oscillations, large dispersive electrode is connected to other terminal. With appropriate strength of current, the needle or blade will cause rapid dissection due to molecular disruption along the line of application.

c., damped. An oscillating current of electricity in which the amplitude of successive alternations becomes less and less until it finally dies away.

c., d'Arsonval direct. **SEE** diathermy.

c., De Watt'eville. Combined use of galvanic and faradic current made possible by use of special switch known as De Watterville switch

c., direct. A current that flows in 1 direction only. When used medically it is called the "galvanic" current. This current has distinct and important con-

stant polarity and marked secondary chemical effects. *See: electrolysis.*

c., direct vacuum tube. A current obtained from a d.c. source by applying to the part to be treated a vacuum electrode connected to 1 terminal of the machine, the other terminal being grounded

c., electric cutting. *See: cutting current.*

c., farad'ic. An intermittent, alternating current induced in the secondary winding of an induction coil.

c., Frimandeau (frim-an'dô). Interrupted galvanic current obtained by use of Frimandeau coil. Is an unidirectional current

c., galvan'ic. A steady unidirectional current produced by chemical action in a single or multiple dry or wet cell, or obtained from a direct current lighting or power circuit ("main"), or from an alternating current circuit by the introduction of (a) motor generator, (b) rectifier, and (c) "B Battery" eliminator. Galvanic and so-called static currents are the only unidirectional currents and the only ones possessing constant polarity.

c., grounded. Ground on earth, a part of an electric circuit.

c., high frequency. A current having a frequency of interruption or change of direction sufficiently high so that tetanic contractions are not set up when it is passed through living contractile tissues.

c., induced. An electric current generated in an adjacent coil by varying the magnetic field or by means of a moving magnetic field, or by motion of the coil in a fixed field

c., interrupted. A current which is frequently opened and closed *See: interrupter.*

c., inverse. A term used to describe current flowing through a tube in the wrong direction as a result of imperfect rectification of alternating current or of current from an induction coil. The unused half of the voltage cycle in half-wave rectification of alternating voltage.

c., Lépique. Interrupted current of low frequency, unidirectional. Apparatus is a source of galvanic current, a metronome to interrupt the current, and 15 condensers of 2 microfarad capacity wired in parallel with a selector.

c., leakage. *See: grounded current.*

c., low frequency. An alternating current whose frequency in cycles per second is low in reference to a particular standard, such as the pitch frequency of "middle C" or, in some cases, the common frequency limit of audition. In general, low frequency currents are attended by tetanic contraction when passed through the body.

c., low tension. Same as low frequency currents

c., Morton wave. An interrupted current obtained from a static machine by applying to the part to be treated a flexible metal electrode connected to the positive terminal of the machine, the negative terminal being grounded, and a suitable spark gap being employed bet. the terminals.

c., oscillating. A current alternating in direction, and of either constant or gradually decreasing amplitude. An oscillating current of constant amplitude is called an undamped current; one

of gradually decreasing amplitude, a damped current.

c., pulsating. A current pulsating regularly in magnitude. As ordinarily used, applies to a unidirectional current.

c., sinusoidal (si'nus-oid-al). *See: alternating current.* An alternating current following the sine law and of such frequency as to afford the opportunity of separate (clonic) muscular contractions.

c., static. Electricity produced by friction.

c., surging. Interrupted or alternating current in which the strength attained during each period of flow gradually increases to a maximum and then gradually decreases to zero

c., undamped. An alternating current of electricity in which the amplitude of successive alternations is maintained.

c., unit of. Ampere, *q.v.*

c., Watteville. A faradic current reinforced by a constant current flowing through the secondary of the coil in the same direction as the current of break.

c., wave-o. Type of static current.

curriculum (kur-rik'u-lum) [L. a course]. A course of study

Curschmann's spirals (koorsh'mahnz). Coiled spirals of mucus seen in sputum of asthma, etc. *See: sputum.*

curtasil (kur-ta-sál'). An odorless, white, crystalline substance, composed of sodium and calcium formate, with a small amt of magnesium citrate.

Use. As a substitute for table salt, for salt-free diet in cardiac and renal diseases, etc.

Dosage. To suit the taste, as a rule requiring twice the amt. of table salt.

curvature (kúr'vâ-chûr) [L. *curvatura*, a slope] A bending or sloping away from a rectilinear surface, either normal or abnormal, a curve.

A flexure of the spine, caused by disease or relaxation of muscles and ligaments

See: kyphosis, lordosis, scoliosis.

curve [L. *curvus*]. A bend.

c. of Carus. An arc corresponding with the pelvic axis [curved

curvi- [L]. Combining form, meaning

Cus'co's spec'ulum. A duckbill vaginal speculum manipulated by a screw.

Cushing's disease. Adrenal cortical hyperfunction

C's syndrome. Pituitary basophilism due to the presence of a hypophysial adenoma. The disease is rare occurring most commonly in young women. Symptoms are adiposity of face, neck, and trunk; kyphosis, sexual dystrophy with amenorrhea in females, impotence in males; hypertrichosis of face and trunk, dusky appearance of skin with purple striae; vascular hypertension

cusp (kusp) [L. *cusps*, a point]. 1. Point of the crown of a tooth. 2. Central part of free edge of the leaflet of a valve of the heart

cuspid (kus'pid) [L. *cusps*, a point]. The 4 teeth with conic crowns (canine).

cuspidate (kus'pi-dât) [L. *cusps*, point]. Having cusps.

cutaneous [L. *cutis*, skin]. Pert. to the skin.

c. respiration. The transpiration of gases through the skin.

c. pupillary reflex. Especially the back of the neck.

c. reflex. Common gooseflesh.

cu'ticle (L. *cuticula*, dim. of *cutis*, skin).

1. A layer of solid or semisolid substance which covers the free surface of a layer of epithelial cells. It may be of a horny or chitinous consistency, sometimes it is calcified. Examples of a tooth, capsule of lens of eye. 2. The epidermis of the skin.

c. hair [of]. A single layer of clear cells which forms the outer layer of a hair.

c. inner root sheath [of]. A layer of scalelike cells which forms innermost layer of the root sheath. Lies next to the cuticle of the hair.

cuticula (ku-tik'-u-lă) [L. dim of *cutis*, cuticulariza'tion. Growth of epidermis over a sore or wound.

cutis (ku'tis) [L.]. The skin.

c. anserina. "Gooseflesh" caused by erection of skin papillae, as from cold or shock.

c. laxa. Dermatitis, or hypertrophy of the skin and subcutaneous tissue.

c. pendula. Flabby skin.

c. vera. The corium*, deep layer of skin.

c. verticis gyrata. Looseness and hypertrophy of the skin which may hang in folds.

cutisector (ku-tis-ek'tor) [L. *cutis*, skin, + *sector*, a cutter]. Device for excision of skin.

cutitis (ku-ti'tis) ["" + G. -itis, inflammation]. Inflammation of skin. SYN: *dermatitis*.

cutization (kü-ti'-za'shun) [L. *cutis*, skin]. Skinlike condition of a mucous membrane as result of continued exposure.

cut throat. Injury depends upon position in which it was caused.

NP *First Aid* Send for doctor. Have subject lying down, head and shoulders raised. Press head on chest. If trachea is severed, keep open and free from clot. Compress bleeding points with clean, wet cloths. Reassure patient, keep lips moist, do not leave him for an instant. Artificial respiration if necessary.

cyanemia (si-an-e'mi-ă) [G. *kyanos*, dark blue, + *aima*, blood]. Blue color of blood.

cyanephidrosis (si-ăn-ef-i-dro'sis) ["" + *ephidrosis*, sweating]. Bluish sweat.

cyanhidrosis (si-ăn-hi-do'sis) ["" + *idrosis*, sweat]. Exuding bluish sweat.

cyan'hemoglobin. A compound of hydrocyanic acid and hemoglobin which gives blood a bright red color. Present in hydrocyanic acid poisoning.

cyanide (si-ăn-id) A compound containing the radical -CN, as potassium cyanide (KCN) sodium cyanide (NaCN).

c. poisoning. Cyanides are among the most common and most deadly poisons known. They stop cellular respiration by inhibiting the action of cytochrome oxidase, carbonic anhydrase, and other enzyme systems.

Sym Start within a few seconds, rarely longer than 2 minutes. The patient utters a cry and falls insensible. Respiration is first rapid and convulsive, later slow and gasping. Death usually comes within 5 minutes. When smaller doses are taken, there is an acrid taste, a choking feeling, anxiety, dizziness, confusion, and headache. Convulsions with frothing of the mouth. Often incontinence. Pulse rapid, feeble, and irregular.

F. A. TREATMENT Must be very prompt. Empty stomach. Wash it out extensively. Mouth administration and intravenous injection of sodium thio-

sulfate sometimes helpful. Artificial respiration and cardiac stimulants should be tried. Methylene blue injections are sometimes of value.

cyno- [G.]. Combining form, meaning dark blue.

cyanochroia (si-an-o-kroi-ă) [G. *kyanos*, dark blue, + *chroia*, color]. Cyanosis.

cyanoderma ["" + *derma*, skin]. Blue discoloration of skin. SYN: *cyanosis*.

cyanogen. (1) The radical CN; (2) A poisonous gas, CN-CN.

cyanomycosis (si-an-o-mi-ko'sis) [G. *kyanos*, dark blue, + *mykēs*, fungus]. Development of blue pus due to *Micrococcus pyocyaneus*.

cyanopathy (si-an-op-ă-thi) ["" + *pathos*, disease]. Blue discoloration of skin. SYN: *cyanosis*.

cyanophil (si-an-o-flī) ["" + *philein*, to love]. Blue staining substance of plants and animals.

cyanophilous (si-an-of-il-us). Having an affinity for blue dyes.

cyanopia, **cyanopsia** (si-an-op-i-ă, -si-a) [G. *kyanos*, dark blue, + *opsis*, vision]. Vision in which all objects appear to be blue.

cy-anosed. Affected with cyanosis.

cyanosis (si-an-o'sis) [G. *kyanos*, dark blue, + -osis, infection]. Slightly bluish, grayish, slatelike, or dark purple discoloration of the skin.

When entire body is affected the color is dusky leaden.

Etiol Deficiency of oxygen and excess of carbon dioxide in blood caused by gas or any condition interfering with entrance of air in the respiratory tract, also by overdoses of certain drugs, or any form of asphyxiation.

TREATMENT Remove cause. Artificial respiration together with oxygen inhalation or oxygen plus carbon dioxide. Stimulants, heat and massage are valuable adjuncts. SEE *asphyxia*, *unconsciousness*.

c., congenital. Usually associated with stenosis of the pulmonary orifice, an imperfect ventricular septum, or a *patulous foramen ovale*.

c., enterogenous. Induced by intestinal absorption of toxins.

c., false. Due to abnormal pigment in the blood.

c. retinae. Bluish appearance of retina seen in congenital heart disease, polycythemia, and in certain poisonings, as dinitrobenzol.

cyanotic (si-an-ot'ik). Of the nature of, affected with, or pert to, cyanosis.

cyasma (si-az-mă) [G. *kyasis*, pregnancy]. Lenticular pigmentation of skin of pregnant women.

cyclarthrosis (si-klar-thro'sis) [G. *kyklos*, circle, + *arthron*, joint, + -osis, infection]. A lateral ginglymus or pivot joint which makes possible rotation.

cycle (si'kl) [G. *kyklos*, circle]. A series of movements or events, a sequence.

c., cardiac. The series of consecutive movements through which the heart passes in performing 1 heart beat; it includes contraction or *systole*, relaxation or *diastole*, and a short rest pause, the *diastasis*; a complete cycle corresponds to 1 pulse beat, which takes 0.8 of a second.

cyclectomy (si-klek'to-mī) ["" + *ektomē*, excision]. Excision of a portion of the ciliary body or muscle or ciliary border of eyelids.

cyclic. Periodic.

c. insanity. Manic depressive psychosis, a form in which mania, melancholia, and sanity succeed each other at intervals, circular insanity

c. vomiting. Periodical and recurring attacks of vomiting met with in those of a nervous temperament. The condition is usually associated with acidosis.

SYM Dizziness, loss of appetite, headache, nausea may occur. Patient then vomits about every $\frac{1}{2}$ hr for 1-2 days. Great thirst, slight rise of temperature, rapid pulse, prostration.

NP At first glucose, barley sugar, or easily assimilated carbohydrate. Nothing during attacks. Keep warm in bed; mouth washes.

SEE nausea, vomiting.

cycliectomy [G. *kyklos*, circle, + *tomē*, incision]. Cutting of the ciliary muscle

cyclitis [G. *kyklos*, circle, + *-itis*, inflammation] Inflammation of ciliary body.

SYM Tenderness in ciliary region, swelling of upper lid, circumcorneal injection, deposits on Descemet's membrane, reduced or hazy vision, increased or decreased tension. Pain in or about the eye, worse at night, and on pressure. Its course is rapid, progressively unfavorable.

COMPLICATIONS Iritis, choroiditis, scleritis, glaucoma.

TREATMENT Local (atropine, heat, diolins, protection from light), general (salicylates, diaphoresis, rest, treat underlying cause if possible).

c., plastic. Ciliary body inflammation accompanied by that of entire uveal tract, giving rise to a fibrinous exudate in ant chamber and vitreous.

c., purulent. Suppurative inflammation of ciliary body and iris [out iritis].

c., serous. Simple inflammation without iritis.

cyclo- G A combining form meaning

(1) circular or pertaining to a cycle.

(2) pertaining to the ciliary body of the eye.

cyclokeratitis (si-klo-ser-a-ti'tis) [G. *kyklos*, circle, + *keras*, cornea, + *-itis*, inflammation] Inflammation of cornea and ciliary body.

cyclochoroiditis (si-klo-ko-roi-di'tis) ["" + *choroideōs*, skinlike, + *-itis*, inflammation] Inflammation of ciliary body and choroid coat of eye.

cyclodialysis ["" + *dialysis*, dissolution]. Operation performed in certain types of glaucoma to produce communication bet. ant chamber and suprachoroidal space for the escape of aqueous humor.

cycloduction ["" + L *ducere*, to lead]. Movement of a part, as the eyeball, produced by the oblique muscle.

cycloid (si'kloid) ["" + *eidos*, form]. Extreme variations of mood from elation to melancholia.

cyclokeratitis ["" + *keras*, cornea, + *-itis*, inflammation] Inflammation of cornea and ciliary body.

cyclomastopathy (si'klo-mas-top'ā-thi) ["" + *mastos*, breast, + *pathos*, suffering]. Excessive tissue proliferation of the breast.

cyclophoria (si-klo-for'i-ā) ["" + *phoros*, bearing]. Rotation of eyeball due to insufficiency of oblique muscles.

cycloplegia ["" + *plēgē*, a stroke]. Paralysis of ciliary muscle.

cycloplegic (si-klo-ple'jik). Producing cycloplegia.

cycloplegic [G. *kyklos*, circle, + *plēgē*, a stroke]. Agents which cause paralysis of ciliary muscle.

cyclopropane (C₃H₈). A gaseous anesthetic agent, colorless, slightly heavier than air, with a not unpleasant odor. Administered with 70 to 95% oxygen it produces unconsciousness in 1 to 2 minutes. Fire and explosion must be guarded against.

cycloserine (si-klo-sēr'in [L *cyclo*, round, + *serine*]) An amino acid and antibiotic from a fungus. It blocks nutrients essential to the life of the tubercle bacillus, also effective in infections of the genitourinary tract.

cyclosis [G. *kyklōsis*, circulation]. A streaming movement of protoplasm such as is seen in certain plant and animal cells.

cyclothymia (si-klo-thi'mi-ā) [G. *kyklos*, circle, + *thymos*, mind]. Psy: Cyclic insanity.

cyclothymic. Pert. to cyclothymia.

c. personality. Psy: One in which periods of elation and sadness alternate. **SYN** *syntonic*.

cyesedema (si-e-se-de'mā) [G. *kyēsis*, pregnancy, + *oedema*, swelling]. Thickening of cutis, bloating in pregnancy.

cyesiology (si-e-si-o'lo-gi) ["" + *logos*, study of]. The study of pregnancy.

cyesis (si-e'sis) [G. *kyēsis*]. Pregnancy.

cyclic (si-et'ik). Pert. to pregnancy.

cyclotomy (sil-ik-o'to-mi) [G. *kykliō*, cup, + *tomē*, incision]. To cut ciliary muscle. **SYN** *cycotomy*.

cylindroadenoma [G. *kylinēdros*, cylinder, + *adēn*, gland, + *-ōma*, tumor]. An adenoma containing cylindrical masses of hyaline material.

cylindroid (sil-in'droid) ["" + *eidos*, shape] 1. Cylinder in shape. 2. A mucous, spurious cast in urine.

How to RECOGNIZE They have twists and turns, varying markedly in diameter in different places, most frequently pointed at the ends and frequently crossing an entire field. They do not usually have cellular intrusions.

cylindroma ["" + *-ōma*, tumor]. Malignant tumor containing a collection of cells forming cylinders.

cylindrosarcoma ["" + *sarx*, flesh, + *-ōma*, tumor] A tumor containing properties of cylindroma and sarcoma.

cylindruria (sil-in-dru'ri-ā) ["" + *ouron*, urine] Cylindroids in the urine.

cyllosis (sil-o'sis) [G. *kyllōsis*]. Clubfoot.

cymbocephalic (sim-bo-sef-a'lik) [G. *kymbē*, boat, + *kephalē*, head]. Having a boatshaped head.

cynanche (sin-ang'ke) [G. *kyōn*, dog, + *agchein*, to choke]. Severe sore throat.

c. maligna. Gangrenous sore throat.

c. tonsillaris. Tonsillitis, quinsy.

cynanthropy ["" + *anthrōpos*, man]. Insanity in which the patient behaves like a dog.

cynic spasm [G. *kynikos*, doglike]. Spasm of face muscles causing a grin or snarl like a dog.

cynobex (sin'o-beks) [G. *kyōn*, dog, + *bēx*, cough]. Dry, barking cough.

cynophobia (sin-o'fo-bi-ā) ["" + *phobos*, fear]. Unreasonable fear of dogs. **SYN:** *lyssophobia*.

cynorexia ["" + *orexis*, appetite]. Morbid appetite, bulimia.

Cyon's experiment (si'onz). A stimulus to an intact ant. spinal nerve root resulting in a stronger muscle contraction than the same stimulus to the peripheral end of a divided nerve root.

C.'s nerve. A filament of the vagus; depressor nerve of heart.

cyphoria (si-o-for'tā) [G. *kyos*, fetus, + *phoros*, bearing]. Pregnancy.

cyphoric. Pert. to pregnancy.

cytroph (si-o'tro-fi) [G. *kyos*, fetus, + *trophē*, nutrition]. Nourishment of the fetus.

cypridopathy (si'pri-dop'ā-thi) [G. *Kyp-ris*, Venus, + *pathos*, disease]. Any venereal disease.

cypridophobia (si'pri-do-fō'bi-ā) [" + *phobos*, fear] 1. Morbid fear of venereal disease. 2. Abnormal fear of the sexual act. 3. False belief of having a venereal disease.

cypriphobia (sip-ri-fō'bi-ā) [" + *phobos*, fear]. Morbid aversion to and fear of coitus.

cyrtometer (sir-tom'et-er) [G. *kyrtos*, bent, + *metron*, measure] Instrument for measuring circumference of chest and comparison of chest curves.

cyrtosis (sir-to'sis) [" + *-ōsis*, infection]. Having any abnormal curvature of the spine.

cyst (sist) [G. *kystis*, bladder, sac] 1. A bladder. 2. Any sac containing a liquid.

c., adventitious. C. formation around a foreign body.

c., blood. Bloody tumor. SYN: *hematoma*.

c., Boyer's. Subhyoid bursal cyst.

c., chocolate. Ovarian c. with darkly pigmented gelatinous content.

c., colloid. C. with gelatinous contents.

c., daughter. C. growing out of the walls of another cyst.

c., dentigerous. One containing teeth. SYN: *follicular odontoma*.

c., dermoid. One containing elements of hair, teeth, or skin.

c., extravasation. C. arising from hemorrhage into tissues.

c., follicular. C. arising from occlusion of small follicle or gland.

c., Gaertner's. Cyst of the remnants of the Wolffian duct.

c., Intrailegamentary. Cystic formation bet. the leaves of the broad ligament.

c., mucous. Retention cyst composed of mucus.

c., nabothian. Cystic formation caused by closure of the ducts of the nabothian glands in the cervix uteri by the healing of an erosion.

c., ovarian. Cystic formation in the ovary. SEE: *ovary*.

c., paraovarian. Cystic formation of the paraovarium.

c., piliferous. Same as dermoid cyst. Tumors made up of all 3 primary germ layers and containing hair, teeth, bone, sebaceous material, and skin.

c., retention. One retaining the secretion of a gland, as in a mucous or sebaceous cyst.

c., sebaceous. One of a sebaceous gland.

c., seminal. C. composed of semen.

c., unilocular. C. containing only 1 cavity.

c., vaginal. Cystic formation in the vagina.

cyst, words pert. to: acephalocyst, athroma, dermoid, echinococcus, encysted, endocyst, hydatid, hydrocyst, hydroma, mucocoele, nabothian, retention c., sac, saccate, saccule, testoma.

cystadenoma (sist-ad-en-o'mā) [G. *kystis*, bladder, + *adēn*, gland, + *-ōma*, tumor]. An adenoma containing cysts. Cystoma blended with adenoma.

cystalgia (sis-tal'ji-ā) [" + *algos*, pain]. Paroxysms of pain in the bladder.

cystatroph [" + *atrophia*, atrophy]. Atrophy of bladder.

cystauchenotomy (sis-law-ken-o'to-mī) [" + *auchēn*, neck, + *tomē*, incision]. Incision into the neck of bladder.

cystectomy (sis-tek'tā-si) [" + *ektasis*, dilatation]. 1. An operation for extracting calculus from the bladder by dividing the membranous portion of the urethra, and then dilating neck of bladder. 2. Dilatation of bladder.

cystotomy (sis-tek'to-mī) [" + *ektomē*, excision] Excision of cystic duct.

cysteine (sist'e-in) A sulfur-containing amino acid, beta-thio alpha-amino propionic acid, C₂H₅NSO₂, found among the decomposition products of proteins.

cystereithism [G. *kystis*, bladder, + *erethismos*, irritation] Irritability of the bladder, vesical irritation.

cystitis (sis-thi'tis) [G. *kysthos*, vulva, + *-itis*, inflammation]. Inflammation of the vulva.

cystus (sis'thus) [G. *kysthos*, vulva]. 1. Vulva 2. Anus

cysthypersarcosis (sist-hi-per-sar-ko'sis) [G. *kystis*, bladder, + *yper*, over, + *sarkōsis*, growth of flesh] Hypertrophy of muscular coat of the bladder.

cystic. Pert. to a cyst, or to the urinary bladder.

c. duct. The duct of the gallbladder which unites with the hepatic duct from the liver to form the common bile duct.

c. fibrosis. SYN: *fibrocystic disease of the pancreas*, *mucoviscidosis* A disease of infants, children, adolescents, and young adults involving the exocrine glands, especially those secreting mucus, and resulting in pancreatic insufficiency, chronic pulmonary disease, abnormally high sweat electrolyte levels, and, in some cases, cirrhosis of the liver. Incomplete forms lead to variations in the manifestations. It has become apparent that cystic fibrosis is not a disease of the pancreas, although this organ is frequently, but not necessarily, involved. The affection is believed to be genetically transmitted as a recessive trait. Although prognosis is poor, with the advent of effective antibiotics the life span of many of these patients has been prolonged to young adulthood.

c. tumor. Tumor composed of cysts.

cysticercosis (sis-ti-ser-ko'sis) [G. *kystis*, bladder, + *kerkos*, tail, + *-ōsis*, infection]. Infestation by larva *Taenia solium*.

cysticercus (sis-tis-er'kus) [" + *kerkos*, tail] Encysted larvae of tapeworms.

cysticolithectomy (sis'ti-ko-li-thek'to-mī) [" + *lithos*, stone, + *ektomē*, excision]. Removal of an impacted stone from the cystic duct.

cysticorrhaphy (sis-ti-kor'rā-fi) [" + *raphē*, suture]. Suture of the cystic duct.

cysticotomy (sis-ti-kot'o-mī) [" + *tomē*, incision]. Incision of cystic bile duct. SYN: *choledochotomy*.

cystidolaparotomy (sis'ti-do-lap'ar-o'to-mī) [" + *lapara*, flank, + *tomē*, incision]. Incision into bladder through abdomen after abdominal section.

cystidotrachelotomy (sis'ti-do-tra'ke-lot'o-mī) [" + *trachēlos*, neck, + *tomē*, incision]. Incision into neck of bladder. SYN: *cystauchenotomy*.

cystifelleotomy (sis'ti-fel-e-o'to-mī) [+ *L. fel*, bile, + *G. tomē*, incision]. Incision of gallbladder through abdominal walls. **SYN** *cholecystotomy*.

cystiform [+ *L. forma*, form]. Having the form of a cyst, cystic; cystoid.

cystigerous (sis-tij'er-us) [+ *L. gerere*, to bear]. Containing cysts.

cystin(e) (C₂H₄N₂S₂O₄) [*G. kystis*, bladder]. A sulfur-containing amino acid, which can be obtained by oxidation from cysteine and which is likewise obtained from proteins.

It is needed for tissue repair and growth. **SEE** *histidine*, *lysine*, *tryptophan*.

cystinuria (sis-tin-u-rī-ā) [+ *ouron*, urine]. Cystine in the urine, seen in jaundice and hepatic disease.

cystistax'ia [+ *staxis*, dripping]. Blood oozing from the mucous membrane of the bladder.

cystitis (sis-ti'tis) [+ *-itis*, inflammation]. Inflammation of the bladder of 2 types. Nonbacterial (trauma, chemicals), and bacterial (acute or chronic, superficial, interstitial, or complicated by pericystitis).

SYM Acute Frequent and painful strangury, diurnal and nocturnal, with possibly bacteria and blood in urine. Chronic Secondary to some other lesion with possibly pyuria as only symptom.

c. cystica and **granulosa**. Chronic Slight frequency of urination Leukoplakia Chronic pyuria and painful irritation, perhaps hematuria. **TREATMENT** Treatment of its cause, after which it cures itself. Relief of irritation by instillations and irrigations. **DIER** Milk diet, bland, unirritating foods, barley water, soda water, later, eggnog, eggs, milk pudding, fish, and fowls in this order.

c., ulcerative. Aside from tuberculosis, carcinoma, syphilis, there are elusive ulcer (violent chronic irritation of bladder without gross evidence of cystitis), solitary ulcer, incrustated ulceration (bacterial, causing intense cystitis).

cystitome (sis'ti-tōm) [+ *tomē*, incision]. Instrument for incision into sac of crystalline lens.

cystit'omy [+ *tomē*, incision]. 1. Incision of capsule of crystalline lens. 2. Incision into the gallbladder.

cysto- [*G.*]. Prefix Pert. to the urinary bladder or a cyst

cystoadenoma (sis'to-ad-en-o'mā) [*G. kystis*, bladder, + *adēn*, gland, + *-ōma*, tumor]. A tumor containing cystic and adenomatous elements.

cystobubonocoele (sis-to-bu-bo'no-sēl) [+ *boubon*, groin, + *kēlē*, hernia]. Hernia involving the bladder.

cystocarcino'ma [+ *karkinos*, ulcer, + *-ōma*, tumor]. Glandular tumor distended with fluid secretion of the gland.

cystocele (sis'to-sēl) [+ *kēlē*, hernia]. A bladder hernia.

Injury to the vesicovaginal fascia during delivery may allow the bladder to pouch into the vagina causing a cystocele.

cystocolos'tomy [+ *kōlon*, colon, + *stoma*, mouth]. Formation of communication bet. the gallbladder and colon.

cystodiaphanoscopy (sis'to-di-ā-fan-os'ko-pi) [+ *dia*, through, + *phanein*, to shine, + *skopein*, to examine]. Transillumination of abdomen by an electric light in bladder.

cystodyn'ia [+ *odynē*, pain]. Paroxysmal pains in the bladder. **SYN** *cystalgia*.

cystoelytropy (sis'to-el'tro-plas-ti) [+ *elytron*, vagina, + *plassein*, to form]. Repair of a vesicovaginal fistula.

cystoepiplocele (sis'to-ē-pi'lo-sēl) [+ *epiploon*, omentum, + *kēlē*, hernia]. Protrusion of a portion of the bladder and the omentum.

cystoepithello'ma [+ *epi*, upon, + *thēlē*, nipple, + *-ōma*, tumor]. Epithelioma in stage of cystic degeneration.

cystofelleotomy (sis-to-fel-e-o'to-mī) [+ *L. fel*, bile, + *G. tomē*, incision]. Incision of gallbladder through abdominal wall. **SEE** *cholecystotomy*.

cystofibro'ma [+ *L. fibra*, fiber, + *G. -ōma*, tumor]. Fibrous tumor containing cysts.

cystogram (sis'to-gram) [+ *gramma*, mark]. A radiographic film of the bladder.

cystography (sis-tog'rā-fi) [+ *graphein*, to write]. Making radiographs of the bladder.

cyst'oid [+ *eidōs*, appearance]. Bladderlike.

cystolith (sis'to-lith) [+ *lithos*, stone]. A vesical calculus.

cystolithectomy (sis-to-lith-ek'to-mī) [+ *ektomē*, excision]. Excision of a stone from the bladder.

cystolithiasis (sis-to-li-thi'ā-sis) [+ *lithos*, stone]. Calculi in the bladder.

cystolith'ic. Pert. to a vesical calculus.

cystolutein (sis-to-lu'te-in) [*G. kystis*, cyst, + *L. luteus*, yellow]. Yellow coloring matter in cysts.

cysto'ma (pl *cysto'mata*, *cysto'mas*) [+ *-ōma*, tumor]. A cystic tumor; a growth containing cysts.

cystometer [+ *metron*, measure]. Device for estimating the capacity of the bladder and its pressure reactions.

cystomor'phous [+ *morphē*, form]. Cystlike, cystoid.

cystomyxoadenoma (sis'to-mik'so-ad-en-o'mā) [+ *myxa*, mucus, + *adēn*, gland, + *-ōma*, tumor]. Myxoma and adenoma with cystic degeneration.

cystomyxo'ma [+ *-ōma*, tumor]. Myxoma with cystic formation.

cystonephro'sis [+ *nephros*, kidney]. Cystiform dilatation of kidney tubules.

cystoneural'gia [+ *neuron*, nerve, + *algos*, pain]. Neuralgia of the bladder or pain without apparent cause; cystalgia.

cystoparaly'sis [+ *paralysis*, a loosening from the side]. Paralysis of bladder.

cyst'opexy [+ *pēxis*, fixation]. Surgical fixation of bladder to wall of abdomen.

cystophotog'raphy [+ *phōs*, light, + *graphein*, to write]. Taking pictures of interior of bladder.

cystoplasty (sis'to-plas-ti) [+ *plassein*, to form]. Plastic operation upon the bladder.

cystoplegia (sis-to-ple'ji-ā) [+ *plēgē*, stroke]. Paralysis of the bladder.

cystopto'sia, **cystopto'sis** [+ *ptōsis*, a drooping]. Prolapse into the urethra of the vesical mucous membrane.

cystopyelitis (sis-to-pl-e-lit'is) [+ *pyelos*, pelvis, + *-itis*, inflammation]. Cystitis with pyelitis.

cystopyelonephritis (sis-to-pl-e-lo-nef-ri'tis) [+ *pyelos*, kidney, + *-itis*, inflammation]. Inflammation of urinary bladder, kidney, and pelvis of kidney.

cystoradiography (sī' + L. *radius*, ray, + G. *graphein*, to write). Radiography of the gall- or urinary bladder.

cystorectostomy (sis-to-rek-tos'to-mī) [' + L. *rectum*, + G. *stoma*, opening]. Making a surgical communication bet. the bladder and rectum.

cystorrha'gia [' + *rēgnunai*, to burst forth]. Hemorrhage from the urinary bladder.

cystorrhaphy (sist-or'ā-fī) [' + *raphē*, suture]. Suture of bladder.

cystorrh'e'a [' + *roia*, flow]. A discharge of mucus from the urinary bladder.

cystosarco'ma [' + *sarz*, flesh, + -ōma, tumor]. Sarcoma containing cysts

cystoscope (sist'o-skōp) [' + *skopein*, to examine]. Instrument for interior examination of bladder.

cystoscopy (sis-tos'ko-plī) [' + *skopein*, to examine]. Examination of the bladder with the cystoscope.

cyst'ospasm [' + *spasmos*, spasm] Spasmodic contractions of the urinary bladder.

cystospermifitis (sis-to-sperm-i'tis) [' + *sperma*, semen, + -itis, inflammation]. Inflammation of seminal vesicles

cystos'tomy [' + *stoma*, opening] Surgical incision into the bladder

cystotome (sist'o-tōm) [' + *tomē*, incision] Knife for incision of bladder

cystotomy (sist-ot'o-mī) [' + *tomē*, incision] Incision of bladder

cystotrachelotomy (sis-to-trak-e-lot'o-mī) [' + *trachelos*, neck, + *tomē*, incision]. Incision into neck of bladder. SYN *cystauchenotomy*.

cystoureteritis (sis-to-u-re-ter-i'tis) [' + *ourēter*, ureter, + -itis, inflammation]. Inflammation of ureter and urinary bladder

cystoureterogram (sist'ō-ū-rē'tēr-ō-grām) [' + *gramma*, mark]. A picture of the bladder and ureter

cystoure'throscope [' + *ourēthra*, urethra, + *skopein*, to examine]. Device for examining the post. urethra and urinary bladder

cy'tarrhagia (sit-ar-ra'jī-ā) [G. *kytos*, hollow, cell, + *rēgnunai*, to burst forth]. Hemorrhage from socket of a tooth.

cytase (sī'tās) [' + *ase*, enzyme]. A ferment in phagocytes

cyto- [G.] Indicating the cell.

cytoarchitectonic (sī'to-ark-i-tek-ton'ik) [G. *kytos*, cell, + *architektonikē*, architecture]. Pert. to structure and arrangement of cells

cytobiology (si-to-bi-ol'o-jī) [' + *bios*, life, + *logos*, study of]. Biology of cells.

cytobiota'xis [' + *taxis*, arrangement] Grouping and apparent cooperation bet. embryonic cells. SYN *cytocleisis*. [nucleus See *cyton*]

cytoblast [' + *blastos*, germ]. A cell

cytocentrum (si-to-sen'trum) [' + *ken-troon*, center]. Sphere of attraction.

cytoceras'fic [' + *kerastos*, mixed]. Pert. to cells changing to a higher form.

cytochemism (si-to-kem'izm) [' + *chemeia*, chemistry, + *ismos*, condition of]. Reaction of body cells to chemical agents or the injections of antitoxin.

cytochem'istry [' + *chemeia*, chemistry]. The chemistry of the living cell.

cytochrome (si'to-krom) [' + *chrōma*, color]. A heme compound widely distributed in animals and plants. It plays an important role in cellular respiration. It is a mixture of three hemochromogens, designated cytochromes A, B and C.

cytochylema (si-to-ki-le'mā) [' + *chylos*, juice]. The more fluid constituent of cell protoplasm.

cytocidal. Destructive of living cells.

cytocide (sī'to-sid) [G. *kytos*, cell, + L. *caedere*, to kill]. That which destroys cells.

cytoclas'tic [' + *klasis*, destruction]. Destructive to cells

cytocleisis (si-to-kle'sis) [' + *klēsis*, a call]. The apparent cooperation of cells with each other. SYN *cytobiota'xis*.

cytocyst (sī'to-sist) [' + *kystis*, a cyst]. The remains of a cell enclosing a mature schizont.

cytoden'drite [' + *dendron*, tree]. A dendrite given off from the body of a nerve cell

cytodiagno'sis [' + *dia*, through, + *gignoskein*, to know]. Diagnosis by examination of the contents of an exuding cell

cytodieresis (si-to-di-er'e-sis) [' + *di-aresis*, division]. Cell division, amitosis or mitosis.

cytodistal (si-to-dis'tal) [' + *distāre*, to be distant] Pert. to a neoplasm remote from the cell of origin

cytofin (sī'to-fīn) [G. *kytos*, cell]. An alloxur body allied to a purine formed by thymic acid

cytogenesis (si-to-jen'es-is) [' + *genesis*, origin]. Origin and development of the cell

cytogenous (si-to-jen-us) [' + *gennan*, to produce]. Cell forming, esp those of connective tissue

cytoglobin (si-to-glo'bīn) [' + L. *globus*, sphere]. A globin from lymphocytes and leukocytes.

cytoglycopenia (si-to-gli-ko-pe'nī-ā) [' + *glukos*, sweet, + *penia*, poverty] Deficient glucose of blood cells

cytog'on'y [' + *gonē*, seed] The formation of the cell

cytohistogen'esis [' + *istos*, web, + *genesis*, origin] The structural development of cells

cytohyaloplasm (si-to-hī'al-o-plazm) [' + *yalos*, transparent, + *plasma*, matter]. Reticular network of protoplasm.

cytoid (sī'toid) [' + *eidos*, form]. Resembling a cell

cytoinhibition (sī'to-in-hi-bish'ūn) [' + L. *inhibere*, to restrain] Phagocytic cell action in preventing the lysis of bacteria.

cytokeras'fic [' + *kerastos*, mixed]. Pert. to cellular development

cytokine'sis [' + *kinēsis*, movement]. Changes in cellular protoplasm outside of the nucleus during mitosis

cytology (si-tol'o-jī) [' + *logos*, study of]. The science of cell life and cell formation

cytolymph (si'to-līm) [' + L. *lymphā*]. Matrix of cytoplasm of cells.

cytolysis (si-tol'is-in) [' + *lysis*, dissolution]. An antibody which produces disintegration of cells.

cytol'y'sis [' + *lysis*, destruction]. Dissolution of cells by specific amboceptors and complements. *Hemolysis* is the term used in case of red blood corpuscles, and *bacteriolysis* for bacteria.

cytomachia (si-to-mak'ī-ā) [' + *machē*, fight]. Cellular activities and resistance during infection by microorganisms.

cytometaplasia (sī'to-met-ā-pla'zī-ā) [' + *metaplasia*, change]. Change of form or function of cells.

cytometer (si-tom'et-er) ["" + *metron*, measure]. Instrument for estimating the number of cells

cytom'etry ["" + *metron*, measure]. The counting and measuring of cells.

cytomicrosome (si-to-mik'ro-söm) ["" + *mikros*, small, + *söma*, body]. Minute granules in the protoplasm (cytoplasm) of the cell

cytom'itome ["" + *mitos*, thread]. Any part of the network of the cytoplasm.

cytomorphol'ogy ["" + *morphē*, form, + *logos*, study of]. The study of the structure of cells

cytomorphosis (si-to-mor-fo'sis) ["" + "" + *-osis*, infection]. The cellular transformations resulting from senescence or senile changes

cyton (si'ton) [G. *kytos*] 1. A cell. 2. The body of a nerve cell, also called perikaryon.

cytopathology (si'tō-pāth-ōl'ō-jī) ["" + *pathos*, disease, + *logos*, study]. Study of the cellular changes in disease

cytope'nia ["" + *penia*, lack]. Diminution in cellular elements of blood

cytophagocyt'osis ["" + *phagein*, to eat, + *kytos* + *-osis*, infection]. Destruction of other cells by phagocytes.

cytophagous (si-tof'ag-us) Devouring or destructive of cells

cytophagy (si-tof'aj-i) [G. *kytos*, cell, + *phagein*, to eat] Cell destruction by phagocytes SYN *cytophagocytosis*.*

cytophil(e) (si'to-nīl) ["" + *philein*, to love] Having an affinity for or attracted by cells

cytophylaxis (si-to-nī-lak'sis) ["" + *phylaxis*, guarding against]. The protection of cells against lysis

cytophylet'ic ["" + *phylē*, tribe]. Pert. to genealogy of cells

cytophys'ics ["" + *physikē*, study of nature] The physics of cellular activity

cytophysiol'ogy ["" + *physis*, nature, + *logos*, study] Physiology of the cell.

cytoplasm, cytoplasma (si'to-plazm, -plaz'ma) ["" + *plasma*, matter] 1. Protoplasm. 2. Cell plasma not including the nucleus.

cytoplas'tin [G. *kytos*, cell] The plastin substance of the cytoplasm

cytoproximal (si-to-proks'im-al) ["" + L. *proximus*, nearest] Pert. to a nerve fibril or axis cylinder nearest to the cell of origin.

cytoreticulum (si-to-ret-ik'u-lum) ["" + L. *reticulum*, network]. The fibrillar network supporting fluid of protoplasm.

cytosc'opy (si-tos'kop-i) ["" + *skopein*, to examine]. Microscopic examination of cells

cytosome (si'to-söm) ["" + *söma*, body]. The cell body which surrounds its nucleus

cytospongium (si-to-spun'ji-um) ["" + *spoggos*, sponge]. The network of a cell containing the fluid portion of protoplasm

cytost (si'tost) [G. *kytos*, cell]. A specific toxin from an injured cell

cytostasis (si-tos'tā-sis) ["" + *stasis*, stoppage] Stasis of white blood corpuscles, as in incipient stage of inflammation.

cytostromatic (si-to-stro-mat'ik) ["" + *strōma*, coverlet]. Pert. to the cellular stroma.

cytotactic (si-to-tak'tik) Pert. to cytotoxicity

cytotax'ia, cytotax'is [G. *kytos*, cell, + *taxis*, arrangement] Attraction or repulsion of cells for each other

cytother'apy ["" + *therapeia*, treatment]. Treatment by use of glandular extracts; organotherapy.

cytoth'esis ["" + *thesis*, a placing]. Restoration or repair of injured cells.

cytotoxin (si-to-toks'in) ["" + *toxikon*, poison] An exotoxin that attacks different organs and tissues, produced by injection of foreign cells.

SEE *endotoxin, erythrotoxin, exotoxin, leukocidin, lysis, neurotoxin*.

cytotrophoblast (si-tro'fo-blast) ["" + *trophē*, nourishment, + *blastos*, germ]. The thin inner layer of the trophoblast composed of cuboidal cells, the outer layer being the syntrophoblast; also called layer of Langhans

cytotropic (si-to-trop'ik) ["" + *tropē*, a turn] Having an affinity for cells.

cytozo'ic ["" + *zōon*, animal]. Living within or attached to a cell, as certain protozoa

cytozyme (si'to-zim) ["" + *zymē*, ferment] A supposed substance which produces thrombokinase.

cytula (si'tū-lā) [L. dim. of G. *kytos*, cell]. The impregnated ovum.

cyturia (si-tu'ri-ā) [G. *kytos*, cell, + *ouron*, urine] Presence of any kind of cells in the urine

Czermak's spaces (chär'mäks). The interglobular spaces in dentine because of failure of calcification

Czerny-Lembert suture (chär-nī-lam-bär'). An intestinal suture in 2 rows

Czerny operation (chär'nī). A radical hernia operation.

D. Abbr. for *da*, *detur*, let there be given; for *dexter*, right; in optics, for *dioptric*; in dentistry, for *deciduous*. **Syms** For Vitamin D potency.

Da Costa's disease. Retrocedent gout
dacrocystitis (dak'ro-sis-ti'tis) [G. *dakry*, tear, + *kystis*, bladder, + *-itis*, inflammation]. Inflammation of the lacrimal (tear) sac.

dacryadenal'gia [' + *adēn*, gland, + *al-gos*, pain]. Pain in a lacrimal gland.

dacryadeni'tis [' + " + *-itis*, inflammation]. Inflammation of a lacrimal gland
dacryadenoscirrh'us (dak-ri-ad-en-o-skir'-us) [' + " + *skirros*, hardening]. Induration of a lacrimal gland

dacryagogatresia (dak'ri-a-gog-ā-tre'si-ā) [' + *agōgos*, leading, + *a-*, priv, + *trēsīs*, perforate]. Occlusion of a tear duct.

dacryagogue (dak'ri-ā-gog) [' + *agōgos*, leading]. That which stimulates the secretion of tears

dacrycystal'gia [' + *kystis*, cyst, + *algos*, pain]. Pain in a lacrimal gland, dacrycystalgia

dacryleucosis (dak-ri-el-ko'sis) [' + *elkō-sis*, ulceration]. Ulceration of the lacrimal apparatus.

dacryoadenal'gia [G. *dakryon*, tear, + *adēn*, gland, + *algos*, pain]. Dacryadenal'gia; pain in a lacrimal gland.

dacryoadenitis (dak-ri-o-ad-en-i'tis) [' + " + *-itis*, inflammation]. Inflammation of lacrimal gland

Rare, seen as complication in epidemic parotitis (mumps of lacrimal gland), also present in Mikulicz's disease, may be acute or chronic. Neoplasms.

Sym. Redness, swelling of lid over it, febrile symptoms; pain.

Complications: Abscess

Prog Can abort, if seen early; otherwise guarded. Fistula through integument or into conjunctival sac Apt to be obstinate

Treatment Quiet. Internal remedies Better to open through conjunctival sac, instead of integument. Sometimes has a chronic form.

dacryoblennorrh'e'a [' + *blenna*, mucus, + *roia*, flow]. Discharge of mucus from a lacrimal sac, and chronic inflammation of the sac

dacryoceale (dak'ri-o-sēl) [' + *kēlē*, hernia]. Protrusion of a lacrimal sac.

dacryocyst (dak'ri-o-sist) [' + *kystis*, cyst]. The lacrimal (tear) sac

dacryocystalgia (dak-ri-o-sis-tal'ji-ā) [' + " + *algos*, pain]. Pain in the lacrimal sac.

dacryocystec'tomy [' + " + *ektomē*, excision]. The excision of membranes of the lacrimal sac

dacryocystitis (dak-ri-o-sis-ti'tis) [' + " + *-itis*, inflammation]. Inflammation of the tear sac involving mucous membrane of the lacrimal sac, together with submucous membrane, which later extends to connective tissue surrounding it, terminating in phlegmonous inflammation.

May be chronic, syphilitic, trachomatous, and tuberculous.

Sym: Epiphora, redness and swelling in area of sac which may also extend to lids and conjunctiva, pain, esp. on pressure over the lacrimal sac, overflow of tears.

Treatment: Hot compresses, incision, and drainage if fluctuant, attempt to restore permeability of duct with probe when acute symptoms have subsided; in chronic cases extirpate sac or do intranasal operation (dacryocystorrhinos-tomy).

Prog Guard against abscess and lacrimal fistula at side of nose

dacryocystoblennorrh'ea (dak-ri-o-sis'to-blen-or-re'ā) [' + " + *blenna*, mucus, + *roia*, flow]. Chronic blennorrh'ea of the lacrimal sac

dacryocystoceale (dak-ri-o-sis'to-sēl) [' + " + *kēlē*, hernia]. Protrusion of lacrimal sac

dacryocystopto'sis [' + " + *ptōsis*, a falling]. Prolapse of the lacrimal (tear) sac.

dacryocystorrhinos'tomy (dak-ri-o-sis-tor-in-os-to-mi) [' + " + *ris*, nose, + *stoma*, opening]. Lumen of tear sac brought into direct communication with nasal cavity.

dacryocystostyringotomy (dak'ri-o-sis'to-sir-in-jot'ō-mi) [' + " + *syrgiz*, tube, + *tomē*, incision]. Making an opening bet the lacrimal sac and the nasal cavity

dacryocystotome (dak-ri-o-sis'to-tōm) [' + " + *tomē*, incision]. Device for incision of lacrimal sac.

dacryocystot'omy [' + " + *tomē*, incision]. Incision of the lacrimal sac

dacryohemorrh'ea (dak'ri-o-hem-o-re'ā) [' + *ama*, blood, + *roia*, flow]. Shedding of bloody tears.

dac'ryolin [G. *dakryon*, tear]. An albuminous matter in tears

dac'ryolite, **dac'ryolith** [' + *lithos*, stone]. Concretion in lacrimal passages.

dacryoma (dak-ri-o'mā) [' + *-ōma*, tumor]. 1. A lacrimal tumor 2. Obstruction of lacrimal puncta producing epiphora

dacryon (dak'ri-on) [G. *dakryon*]. The lacrimal point of juncture of the lacrimal, frontal, and upper maxillary bones.

dacryops (dak'ri-ops) [G. *dakry*, tear, + *ops*, eye]. Constant flow of tears; dacryorrh'ea.

dacryopyorrh'ea (dak'ri-o-pi-o-re'ā) [' + *pyon*, pus, + *roia*, discharge]. Discharge of pus from lacrimal duct

dacryopyo'sis [' + *pyōsis*, suppuration]. Suppuration in the lacrimal sac or duct.

dacryorrh'e'a [' + *roia*, flow]. Excessive flow of tears.

dacryosolenitis (dak'-ri-o-so-len-i'tis) [' + *sōlēn*, duct, + *-itis*, inflammation]. Inflammation of a lacrimal or nasal duct.

dacryosten'o'sis [' + *stenōsis*, narrowing]. Stricture of a lacrimal or nasal duct.

dacryosyrinx [' + *syrgiz*, tube]. A lacrimal fistula.

dactyl (dak'til) [G. *daktylos*, finger]. A finger or toe, a digit of the hand or foot.

dactylion [G. *daktylos*, finger]. Adhesions bet. or union of fingers or toes.

dactylitis [' + -itis, inflammation]. Chronic disease of bones of fingers and toes in very young children.

Error: Usually tuberculous.

Sym: Bones enlarged, painful, chronically inflamed, pus may form and skin break, with sinuses.

dactylocampsodynia (dak'ti-lo-kamp-'so-din'-ä) [' + *kampsis*, bend, + *odynē*, pain]. Painful contraction of 1 or more fingers.

dactylogram [' + *gramma*, a mark]. A fingerprint.

dactylography [' + *graphein*, to write]. 1. The study of fingerprints 2 The act of using a machine for blind deaf mutes to convey by touch the signs of speech.

dactylogryposis (dak-ti-lo-grī-po'sis) [' + *gryposis*, curve]. Permanent contraction of the fingers.

dactylogy (dak-ti-lo-'o-jī) [' + *logos*, study] Representing words by signs made with the fingers

dactylomegaly [' + *megas*, large]. Abnormal size of fingers and toes

dactyloscopy [' + *skopein*, to examine]. Examination of fingerprints for purpose of identification

dactylospasm (dak'ti-lo-spazm) [' + *spasmos*, spasm]. Cramp of a finger or toe.

dactylus (dak'ti-lus) [G. *daktylos*]. A toe or finger.

Dakin's solution. A solution for cleansing wounds

It is prepared from washing soda (sodium carbonate) and chloride of lime and it makes a weak alkaline solution (0.4 to 0.5%) of sodium hypochlorite. See. *chlorine preparations*.

daltonism (dawl'ton-izm) Color blindness

dalm. A thin sheet of rubber to protect cavities or the field of dental operation from fluids

damp (damp). 1. Moist, humid. 2. A noxious gas.

d., after-. Air with large per cent of carbon dioxide.

d., black, choke. A gas formed by oxygen and the giving off of carbon dioxide by the coal

d., cold. Vapor charged with carbon dioxide

d., fire. Methane, CH₄, found in coal mines

d., stink. Hydrogen sulfide

d., white. Carbon monoxide

damped oscillation. A current alternating in direction and of gradually decreasing amplitude See *current, oscillating*.

damping. The steady diminution of the amplitude of successive vibrations, as of an electric wave or current.

dance, St. Vitus'. A disease characterized by involuntary and irregular jerking and movements in diverse groups of muscles. See *chorea*.

Dance's sign. Slight retraction in the right iliac region in some cases of intussusception.

dancing disease. Epidemic dancing mania of Italy, supposed to have been caused by the bite of the tarantula. See: *tarantism*.

d. mania. Epidemic chorea.

dandelion greens. Those of a well-known plant which grows both as a weed and cultivated. They are bitter and tonic, and are eaten like spinach

Comp: Nutrients: Av. Serving: 50 Gm. Pro. 1.2, Fat 0.5, Carbo. 5.3 per serving. Ash Const: Ca 0.105, Mg 0.036, K 0.461, Na 0.168, P 0.072, Cl 0.099, S

0.017, Fe 0.0027. Vit. A+++ , B++ , C+ , D+ , E+ , G++ .

dan'druff (*dermatitis seborrhoeica*). Exfoliation of the epidermis of the scalp in the form of dry, white scales which fall. Scalp scurvy. Sometimes due to seborrhea.*

Treatment: Salicylic acid, 1 dram; mercury chloride, 4 gr.; methylated spirit, 6 oz.

dandy fever (dan'di). Dengue. An acute, epidemic, febrile disease occurring in southern U. S. and East and West Indies, characterized by swelling and stiffness of the joints, severe pain, gastric disturbance, and a dermal exanthem. See: *dengue*.

Danielssen's disease. Anesthetic leprosy.

d'Arsonvalism (ar-son-val'izm). Obsolete term indicating the employment of d'Arsonval current therapeutically.

d'Arsonvalization (ar-son-val-iz-a'shun). The employment of the d'Arsonval current in the form of autocondensation, autoconduction, or the direct biterminal method See *diathermy*.

dartoid (dar'toid) [G. *dartos*, skinned, + *eidos*, form] Resembling the *tunica dartos* in its slow, involuntary contractions.

dar'tos [G]. The muscular, contractile tissue beneath the skin of the scrotum.*

d. muscle reflex. Wormlike contraction of dartos muscle following sudden cold application to perineum

dar'tre (dar'tr) [Fr]. Any chronic skin disease.

dar'trous [G. *dartos*, skinned]. Of the nature of herpes, herpetic.

darwinian ear. Congenital deformity of the ear in which the helix is absent at upper angle

d. tubercle. A blunt point projecting from upper part of the helix.

dasetherapy (das-e-ther'a-pi) [G. *dasos*, forest, + *therapeia*, treatment]. Treatment of disease by residence in a region of pine and spruce trees.

dasym'eter [' + *metron*, measure]. Device for estimating density of gases.

date. The fruit of the palm, an oblong berry with a grooved seed

Comp Nutrients (dried, E. P.): Av. Serving 13 Gm Pro 0.3, Fat 0.4, Carbo. 10.2 per serving Ca 0.065, Mg 0.069, K 0.611, Na 0.055, P 0.056, Cl 0.228, S 0.070, Fe 0.0030. Vit A+, B++ , G+. A base-forming food Alkaline reserve 11.0 cc. per 100 Gm , 3.2 per 100 cal.

daturine (da-tu'rin). The active principle of stramonium. A poisonous alkaloid. Uses Manias, epilepsy, as a hypnotic in insanity, etc. Action resembles atropine, a.v.

daughter cell. One formed by the division of a mother cell.

d. cyst. A small c. growing out of the walls of a large c.

d. nucleus. Formation of a new n. by a diaster.

Davidson's sign. The lessening of pupillary illumination when an electric light is held in the closed mouth Indicates presence of a tumor or fluid in the maxillary sinus.

Davis' law: "Ligaments or any soft tissue, when put under even a moderate degree of tension, if that tension is unremitting, will elongate by the addition of new material; or the contrary, when ligaments, or other soft tissues, remain uninterruptedly in a loose or lax state they will gradually shorten, as the effete material is removed, until they come to

maintain the same relationship to the bony structures with which they are united that they did before their shortening. Nature never wastes her time and material maintaining a muscle or a ligament at its original length when the distance between their points of origin and insertion is for any considerable time, without interruption, shortened."

day blind-. Inability to see well in a bright light.

de- [L.]. Prefix: Down or from.

deacidifica'tion [L. *de*, from, + *acidus*, sour, + *facere*, to make]. Neutralization of acidity.

deactiva'tion [" + *activus*, acting]. The process of becoming inactive.

dead [A.S. *dēad*]. Deprived of life.

When death has occurred in a public institution the patient's name, hour of death, and name of the ward should be written on a piece of paper and pinned to the front of the nightdress, or identified according to the custom of the institution. It is important that the "laying out" be completed before the commencement of rigor mortis. If the doctor is not present at the time of death immediate steps must be taken to inform him, since no preparation of the body may be begun until the doctor has officially pronounced the patient dead. It will sometimes happen that the private duty nurse will be asked to stay until after the funeral, but, in any case, she will not hurry away until assured everything in the room is in order, and that she can be of no further service. **SEE: death.**

d., care of. About 8 hours after death a change takes place in the body. The muscles gradually become stiff and rigid. To this change is given the name "rigor mortis," or cadaveric spasm.

Beginning in the muscles of the lower jaw and the back of the neck, the stiffness spreads to the muscles of the chest, the upper limbs, and the trunk, the lower limbs being the last part affected. Rigor disappears in the same order as it appeared, lasting, as a rule, about 4 or 5 days, depending on cause of death and the surrounding temperature.

As soon as death has been declared official, and friends have withdrawn, the nurse closes the eyes, keeping the lids in contact by pads of wet wool or lint. The lower jaw is prevented from falling back by passing a bandage round the point of the chin and over the head. A four-tailed bandage with a slit to receive the point of the chin may be used. After rigor mortis is well established, the bandage may be removed. Arms are crossed over chest and the wrists tied. Head and shoulders should be elevated. This aids in preventing discoloration of exposed portions of the body. Next, the limbs are straightened, and within 1 hour the body should be "laid out." After washing, the orifices are plugged with cotton wool, the legs are tied together, any wound or wounds are dressed, the hair is brushed; rings and earrings are removed (unless it is the special wish of the relatives that such be left), artificial dentures are inserted, and a clean nightdress is put on. A clean sheet is now placed over the corpse up to the level of the chin and the face is covered with a clean handkerchief.

When the patient is of Hebrew faith, the above procedure is carried out, except for the following. The body is not washed, no pins may be used, the hair

is not combed, the hands are not crossed, but are tied with arms at full length and the finger or toe-nails are not cut.

deaf mute. A deaf and dumb person.

deaf-mut'ism. The state of being both deaf and dumb.

deafness [A.S.]. Loss of ability to hear, complete or partial.

Error. May occur from several causes, such as (1) injury or disease of that part of the *cortex* controlling the center for hearing; (2) may be due to *hysteria*, without any abnormality of the ear or brain; (3) may be due to injury of the ear from *loud noises*, such as the firing of a gun at close range, (4) disease of the labyrinth of the internal ear, (5) an abnormal mental state may produce auditory aphasia or *psychic d.*, *q.v.*

Prostigmatism has proved effective in relieving both acute and chronic deafness.

D caused by pressure by eardrum on small mid-ear bones is helped by drilling hole behind ear through mastoid connecting with eardrum from behind. Progressive *d.* with roaring in ears helped by drilling hole into outermost semicircular canal and construct permanently open tiny window in ear.

RS. *anacusia*, *anacusic*, *aphemesthesia*, *asonia*, *barjecoia*, *bass deafness*, *mind deafness*.

d., bass. Inability to hear some of the low tones.

d., central. Deafness resulting from lesions of auditory tracts of the brain or auditory centers of the cerebral cortex.

d., cerebral. Due to brain lesion.

d., conduction. Deafness resulting from any condition which prevents sound waves from being transmitted to the auditory receptors. May be due to (a) wax obstructing ext. auditory meatus, (b) inflammation of the middle ear, (c) ankylosis of ear bones, (d) fixation of footplate of stirrup.

d., cortical. D. due to disease of the cortical centers.

d., mind. **SEE: psychic d.**

d., occupational. That which is caused by working in places where noise is very deafening.

d., perception or nerve deafness. Deafness resulting from lesions involving sensory receptors of cochlea or fibers of the acoustic nerve.

d., psychic. Condition in which auditory sensations persist, but due to lesions in auditory centers the sounds are not comprehended.

d., simulated. Malingering.

d., tone. Inability to distinguish musical sounds.

d., word. **SEE: psychic d.**

dealbation (de-al-ba'shun) [L. *dē*, from, + *albāre*, to whiten]. Bleaching.

deamidiza'tion [" + Fr. *amidon*, starch]. The decomposition of amino acids.

deaminase. An enzyme which causes deamination.

de'amina'tion. Removing of amino group — NH₂ from an amino-acid. **SYN: deaminization, q.v.**

deaminization (de-am-in-i-za'shun). A chemical decomposition whereby substances like the amino acids and alkaloids lose their amino groups and form ammonia.

Alanine can be deaminized to give ammonia and pyruvic acid: $\text{CH}_3\text{CH}(\text{NH}_2)\text{COOH} + \text{O} = \text{CH}_2\text{CO}\text{COOH} + \text{NH}_3$. Each tissue is supposed to deaminize its amino acids. Deaminization may be simple, oxidative, or hydrolytic. Oxidizing en-

zymes are called deaminizing enzymes, when the oxidation is accompanied by splitting off of amino groups.

deanesthesiant [L. *dē*, from, + G. *an-*, priv + *aisthesis*, sensation]. That which will overcome anesthesia.

deaquation (de-ā-kwa'shun) [“ + *aqua*, water]. Removal of water from anything, dehydration.

dearterialization [“ + G. *artēria*, artery]. Changing character of arterial into venous blood, deoxygenation.

death [A S *death*] Permanent cessation of all vital functions. **See** *dead*.
d., black. A term given to death from the plague.

d., causes. (a) Gradual wearing out of tissue and loss of energy with cessation of function without disease, as in *old age*, (b) as the result of disease represented by (1) the culmination of its ravages in the ordinary progress of the affection, or (2) as sudden death; also as the result of (c) injury from accidents. Injury is considered the major cause of death, although there is scarcely a disease known that may not be a cause of sudden death. Sudden death may be result of (a) circulatory failure, (b) cerebral causes, (c) respiratory causes, (d) neuroendocrinohumeral causes, (e) shock, (f) intoxications, (g) obstetrical causes, (h) infantile causes. In 10% of cases of sudden death no disease has been discovered.

d., local. Gangrene or necrosis of a part.

d., molar. **See** *local d*.

d., molecular. That of cell life.

d. rate. This is the number of deaths occurring per 1000 of the population in a given area within a specified time.

d. rattle. Sound heard in the throat of the dying.

d., signs of. The principal one is (a) cessation of the heart's action. Other indications are (b) opaqueness of the cornea, (c) the absence of reflexes, (d) manifestations of *rigor mortis*, (e) a mottled discoloration of the body, esp. over all parts where there is pressure. Many cases of death have been reported only to find after 24 hours that the person was not dead. For such reasons more or less elaborate tests have sometimes been used to determine without doubt whether life is or is not extinct. The signs mentioned usually are sufficient to confirm one's opinion that death has taken place. Call doctor.

d., somatic. That of the entire organism.

d. tests. (a) A drop of ether is instilled into the conjunctival sac of 1 eye, the other being used as control. A reddening of the conjunctiva proves that life is present. (b) Sometimes the physician may pass a stylet through a small incision in the first intercostal spaces to the heart. Any movement of the heart will be communicated through the stylet. Removing the stylet may induce cardiac movement which may be augmented by artificial respiration. (c) A piece of litmus paper has been used under the eyelid, an acid reaction being shown by contact with the tears, the blood, or the organ in contact with the paper if death has taken place. (d) If a blister on the skin caused by application of a flame contains fluid, death is said to only be apparent, but if the blister fills with air and bursts with a crackling noise, leav-

ing a dry skin, the person is dead. (e) Moisture appearing upon the face of a mirror held over the mouth and nostrils is indicative of the fact that life is not extinct.

d., to determine how long since it occurred. (a) The leg is divided from the ankle to the knee into 3 parts. (b) Beginning with the kneecap as a 4th part, the limb to the thigh is further divided into 6 parts, or 10 in all for the entire limb. If Section 1 is colder than Section 2, the body is assumed to have been dead for 1 hour; if Section 2 is colder than Section 3, the body has been dead 2 hours, and so on. Experiments conducted in temperatures bet. 40° and 80° F. proved fairly accurate in over 100 examinations. In an emergency, the usual symptoms of death are often found to be unreliable. Attempts at revivification should continue to be made indefinitely. No harm can be done in attempting to resuscitate one who seems to be deceased. Successes are numerous.

death, words pert. to: agonal, agonia, ante mortem, articulo mortis, autophonia, autopsia, autopsy, demise, euthanasia, in articulo mortis, in extremis, lethal, mors, mortuary, "nec-" words, posthumous, post mortem, putrefaction, putrescence, putrid, rigor mortis, ruidosus, suicide, thanatophobia.

death-bed statement. A declaration made at the time immediately preceding death.

Such a statement, if made with the consciousness and belief that death is impending, is held in law as equally binding with a s made under oath. **SYN** *ante-mortem statement*.

debilitant [L. *debilis*, weak]. A remedy used to reduce excitement. 2. That which weakens.

debilitate [L. *debilis*, weak]. To produce weakness or debility.

debility [L. *debilis*, weak]. Weakness of toxicity in functions or organs of the body. **See** *cataphrenia*.

debouchement (da-boosh-mon') [Fr.]. Opening or emptying into another part.

Debove's membrane (de-bôvz'). Layer of connective tissue cells bet. the epithelium and basement tissue of mucous membranes of air passages and intestinal mucosa.

débridement (da-bred-mon') [Fr.]. 1 Enlargement of a wound in operating. 2. Slitting a constricting band of tissue.

deca-, dec- [G *deka*]. Prefix Ten.

decagram (dek'a-gram) [G. *deka*, ten, + *gramma*, weight]. A weight of 10 Gm. or 154.34 gr.

decalcification (dē-kāl-si-fi-kā'shūn) [L. *dē*, down, + *calx*, lime, + *jacere*, to make]. The removal of or the withdrawal of lime salts from bone.

decalfify [“ + *calx*, lime]. To soften bone by removal of calcium or its salts by acids.

decaliter (dek'a-le-ter) [G. *deka*, ten, + *Fr litre*]. A measure of 10 liters; 610.28 cu. in.

decavalent (de-kal'vant) [L. *dēcalvāre*, to make bald]. Destroying hair or making bald.

decameter (dek'am-e-ter) [G *deka*, ten, + *metron*, measure]. A measure of 10 meters; 393.71 in.

decanormal (dek-ā-nor'mal) [“ + L *norma*, rule]. Pert to a solution 10 times as strong as a normal one.

decant [L. *dē*, from, + *canthus*, corner]. To pour off liquid so the sediment remains in the bottom of the container.

de'cant'a'tion [' + *canthus*, corner]. The gentle pouring off of a liquid from its sediment.

decapita'tion (dē-kāp-i-tā'shūn) [' + *caput*, head]. **SYN:** decollation. (1) The separation of the head from the body; beheading. (2) In obstetrics, the separation of the head of the fetus from the body to facilitate delivery. (3) Separating the head from the shaft of a bone.

decapsula'tion [' + *capsula*, little box]. Removal of a capsule of an organ.

decarboxylation, decarboxylization (dekar-boks-il-a'shūn, -i-za'shūn). A chemical decomposition whereby substances like the amino acids lose their carboxyl (COOH) groups, the example of histidine is given under *aporrhhegma*.

decay [L. *dē*, down, + *cadere*, to fall]. Decomposition of organic matter by the action of microorganisms in the presence of air and without the production of unpleasant odors.

SEE *cementoclasia, chemicolysis*.

decerebra'tion [' + *cerebrum*, brain]. Removal of the brain.

dechlorina'tion [' + *G. chloros*, green]. **SYN** *dechlorization*. Reduction in the amount of chlorides in the body by reduction of or withdrawal of salt in the diet, dechloridation.

dechlorura'tion [' + " + *ouron*, urine]. Decrease in chlorates excreted in the urine produced by diet. **SYN** *dechlorization*.

decholesterolization (de-ko-les-ter-o-il-za'shūn) [' + *G. cholē*, bile, + *stereos*, solid]. Reducing cholesterol from the system.

decholin (dek'o-lln) An oxidation product of cholic acid, derived from ox bile. Recommended to be used in chronic cholecystitis and as a diuretic.

DOSAGE 3 1/4-7 1/2 gr (0.25-0.5 Gm).

deci- [L.]. Prefix *Decimus*, tenth.

decibel (des't-bel) [L. *deci*, + *bel*, unit of sound]. The unit of intensity and volume of sound.

decidua (de-sid'u-ā) [L. *deciduus*, falling off]. The name given to the endometrium or mucous membrane when conception occurs and which envelops the impregnated ovum.

This may be seen in both the uterine and ectopic pregnancies. The gland structures of the endometrium and the interstitial cells undergo marked hypertrophy. The decidua divides itself into an outer, or compact layer, and an inner spongy layer.

d. basalis (*serotina*). That part of the decidua which unites with the chorion to form the placenta.

d. capsularis (*reflexa*). That part of the decidua which surrounds the chorionic sac.

d. graviditatis. The pregnancy decidua.

d. menstrualis. The layer of the uterine endometrium that is shed during menstruation.

d. parietalis. The nonplacental lining of the uterus, the decidua.

d. reflexa. Same as capsularis.

d. serotina. Part of the internal wall to which the ovum is attached.

d. vera. The true decidua that is present throughout the entire endometrium during gestation. **SEE** *caducous membrane*.

decidual (de-sid'u-al). Pert. to or resembling the decidua.

decidualitis (de-sid'u-al-i'tis) [L. *deciduus*, falling off, + *G. -itis*, inflamma-

tion]. A bacterial infection of the decidua.

deciduation (de-sid-u-a'shūn) [L. *deciduus*, falling off]. The loss of the decidua during menstruation.

deciduitis (de-sid-u-i'tis) [' + *G. -itis*, inflammation]. Inflammation of the decidua.

deciduoma (de-sid-u-o'ma) [' + *G. -ōma*, tumor]. A uterine tumor containing decidual tissue. Thought to arise from portions of decidua retained within the uterus following an abortion.

d., benign. The more or less normal invasion of the uterine musculature by the syncytium which disappears after the gestation is completed.

d. Loeb's. Decidual tissue produced within the uterus of experimental animals as a result of mechanical or chemical stimulation.

d., malignant. A tumor consisting of syncytial and Langhans cells which have a tendency to invade the general system by means of the blood stream, and having a high mortality.

ETIOLOGY This tumor arises following a full term pregnancy, an ectopic pregnancy, an abortion, a miscarriage, and particularly a vesicular mole.

DIAGNOSIS May be made by histologic study, aided by the symptoms and the Aschheim-Zondek test which remains strongly positive during the presence of this type of tumor.

TREATMENT The treatment is the surgical removal of the uterus, and adnexae, and any local growths that may be accessible. This should be followed by deep x-ray therapy over the pelvis and the secondary growths.

deciduomatosis (de-sid-u-o-mā-to'sis) [' + " + *-ōsis*, infection]. Excessive and irregular formation of decidual tissue in the nonpregnant state.

deciduosarco'ma [' + *G. sarx*, flesh, + *-ōma*, tumor]. Chorioma malignum, a tumor of the chorion.

deciduuous (de-sid'u-us) [L. *deciduus*, falling off]. Falling off.

d. teeth. The milk teeth or temporary teeth, 10 in each jaw. 4 incisors, 2 canines, and 4 molars. They usually appear at 6 months and fall out at the end of 6 years. Those of the lower jaw appear before the upper ones, as follows: *Lower central incisors*, at 6-9 months. *Upper incisors*, at 8-10 months. *Lower lateral incisors and first molars*, at 15-21 months. *Canines*, at 16-20 months. *Second molars*, at 20-24 months. **SEE:** *dentition*.

decigram (des'ig-ram) [L. *deci*, ten, + *G. gramma*, weight]. One-tenth of a gram, about 1.54 gr.

deciliter (des't-il-ter) [' + *Fr. litre*]. One-tenth of a liter; 6.1 cu. in.

decimeter (des'im-e-ter) [' + *G. metron*, measure]. One-tenth of a meter, 3.93 in.

decinor'mal [' + *norma*, rule]. Having one-tenth the standard strength.

declinator (dek'lin-a-tor) [L. *declinare*, to turn aside]. Instrument used during trephining for holding apart the dura mater.

decline (de-klīn') [L. *declinare*, to turn aside]. 1. Progressive decrease. 2. Declining period of a disease.

decli'vis cerebell'i. Sloping post. portion of the mottulus of the sup. vermis of the cerebellum.

decoct'ion [L. *dē*, down, + *coquere*, to boil]. A liquid preparation made by boiling vegetable substances with water.

When the strength and method of preparation are not otherwise specified, it is made by boiling 5 parts of the coarsely comminuted drug for 15 minutes with enough water to make 100 parts. There are no official decoctions. SEE: *apothem*, *apozeme*.

decollation (de'kol-a'shun) [“ + *collum*, neck]. Fetal decapitation. SYN: *de-truncation*.

decollator (de'kol-a'ter). Device for decapitation of the fetus.

décollement (de-kol-mon') [Fr. *unglu*ing]. Separation of 2 normally adherent structures.

decompensation [L *dē* + *compensare*, to make good again]. Failure of compensation, as in circulation of the heart.

decomplementize. To take away the complement from

decomposition (de-com-po-zish'un) [“ + *componere*, to put together]. 1. The putrefactive process, decay 2 Reducing a compound body to its simpler constituents SEE *fermentation*, *resolution*.

d., double. A chemical change in which the molecules of 2 interacting compounds exchange a portion of their constituents

d., hydrolytic. 1. Chemical change in substances due to addition of 1 molecule of water

d., simple. A chemical change by which a molecule of a single compound breaks into its simpler constituents or substitutes the entire molecule of another body for 1 of these constituents

decompression [“ + *compressio*, a squeezing together] 1 The removal of pressure, as from gas in the intestinal tract SEE *Wangenstein's method* 2 The slow reduction or removal of pressure on deep-sea divers and caisson workers to prevent development of bends, q v

d. explosive. In aviators, decompression resulting from an extremely rapid rate of descent Causes violent expansion of involved gases

d. illness or sickness. Caisson disease, or bends, q v, compressed air illness

decontamination. The process of rendering an object, person, or area free of a contaminating substance such as a poison-gas or radioactive substance

de'cortication [“ + *cortex*, bark]. The removal of the surface layer of an organ or structure, as the removal of a portion of the cortex of the brain from the underlying white portion

d. pulmonary. Removal of the pleura of the lung, or a portion of the surface lung-tissue.

d. renal. Removal of capsule of the kidney

decrement [L. *decrementum*, decrease]. Declining period of a disease

decrepitate [L *decrepitare*, to crackle] To cause decrepitation or a crackling noise.

decrepitation [L *decrepitare*, to crackle]. A crackling noise

decreptitude (de-kiep't-tud) [L. *decrepitare*, to rattle]. Senile breaking down.

decubation (de-ku-ba'shun) [L *dē*, down, + *cumbere*, to lie]. 1 The act of lying down. 2 The recovery stage of an infectious disease.

decu'bital [“ + *cumbere*, to lie]. Pert. to a bed sore.

decubitus (de-ku'bi-tus) [L a lying down]. 1. A bed sore.* 2. A patient's position in bed. SEE: *Andral's decubitus*.

d., acute. Bedsore due to presence of cerebral lesions.

decussate (de-kus'at) [L. *decussare*, to cross, as an x]. To cross, or crossed, as in the form of the letter x. Interlacing or crossing of parts.

decussation. 1. A crossing of structures in form of an x. 2. The place of crossing; chiasma.

d. of the pyramids. Crossing of fibers of pyramids of the medulla oblongata from 1 pyramid to the other.

d. optic. The crossing of the fibers of the optic nerves; the optic chiasma.

decussorium (de-kus-o'ri-um) [L. *decussare*, to cross, as an x]. Instrument for depression of the dura following trephining.

D-D-T. Dichloro-diphenyl-trichloroethane (2, 2-bis (parachlorophenyl) 1, 1-trichloroethane) An insecticide effective against more varieties of insects than any other medium, esp the flea, fly, louse, mosquito, bedbug, cockroach, Japanese beetle and European corn borer toxicity. When ingested orally may cause acute poisoning Symptoms are vomiting, numbness and partial paralysis of limbs, anorexia, tremors, depression and death.

deep reflexes (dēp) Opposite of superficial or skin reflexes, reflexes within, or fractional stretch reflexes

Deer fly. A biting fly belonging to the genus *Chrysops* which carries *Bacillus tularensis* to man

d. fly, malarial. Fever transmitted to man from rodents bitten by fly or other insects, or by direct contact. SYN: *tularemia*.

defat'ted [“ + A.S. *fælt*, to fatten]. Deprived of fat

defecalgiesophobia (def'e-kal-je-si-o-f'o-bi-ā) [L *defaecare*, to remove dregs, + G *algēs*, pain, + *phobos*, fear]. Fear of defecating because of pain

defecation (def-e-ka'shun) [L. *defaecare*, to remove the dregs]. Evacuation of the bowels

The bulk of the feces depends upon the amt of cellulose in the diet 170 Gm. is the average weight of the feces in 24 hr, if the diet has been a mixed one. A vegetable diet will raise this to 400-500 Gm.

The food residues, reaching the rectum, cause a sensation referred to as a “call to stool,” or the urge to defecate. The sensation is related to periodic increase of pressure within the rectum and contraction of its musculature

The expulsion of a fecal mass is accompanied by coordinated action of the following mechanisms (1) Involuntary contraction of the circular muscle of the rectum behind the mass followed by contraction of the longitudinal muscle; (2) relaxation of the internal (involuntary) and external (voluntary) sphincter ani, (3) voluntary closure of the glottis, fixation of the chest, and contraction of the abdominal muscles, causing intraabdominal pressure. SEE: *cacation*, *cacatory*, *constipation*, *feces*, *stool*.

defective [L. *defectus*, a failure]. 1. Not perfect 2 A person deficient in 1 or more physical, mental, or moral powers.

defensive protein. An antibody, q.v.

d. reflex. Retraction or tension in defense against an action or threatened action.

deferens [L carrying away]. Ductus or vas deferens.

deferent (de'fer-ent) [L. *deferre*, to carry away]. Away from or downward. SEE: *afferent*, *efferent*.

d. duct. Vas deferens.

deferentectomy (def-er-en-tek'to-mī) [“ + G. *ektomē*, excision]. Cutting of the vas deferens.

deferential (def-er-en'shal) [L. *deferre*, to carry away] Pert to or accompanying the ductus deferens

deferentitis (def-er-en-ti'tis) [“ + G. -itis, inflammation]. Inflammation of the vas deferens.

deferred shock. Delayed onset of symptoms of shock

deferves cence [L. *defervescere*, to become calm] The period that marks the subsidence of fever to normal temperature

defibrina'tion, defibriniza'tion [L. *dē*, from, + *fibra*, fiber]. Process of being deprived of fibrin SEE *coagulation*.

deficiency [L. *deficere*, to lack]. A lack, something missing.

d. disease. One due to a deficiency of a substance essential in body metabolism

The deficiency may be due to inadequate intake, inadequate digestion, inadequate absorption, inadequate utilization, or excessive loss through excretory channels

EXAMPLES . . . Night blindness and keratomalacia due to lack of vitamin A, beriberi, polyneuritis, due to lack of thiamine, pellagra due to lack of niacin, arboflavinosis due to lack of riboflavin, scurvy due to lack of vitamin C, rickets and osteomalacia due to lack of vitamin D, pernicious anemia due to lack of folic acid and vitamin B₁₂

definitive. Clear and final, without question.

deflagra'tion [L. *deflagrāre*, to burn furiously] Sudden, sharp combustion usually with a crackling sound

defloration (def-lo-ra'shun) [L. *dē*, from, + *flor*, flower] The destruction of the hymen, either during coitus, by accident, or vaginal examination As a rule the tear is in the post edge

deflores'cence. Disappearance of an eruption of the skin

defluvium (dē-flu'vi-um) [L. *defluere*, to flow down] Falling out or loss of the hair

d. capilorum. Falling out of the hair

d. unguium. Falling of or loss of nails

defluxion (de-fluk'shun) [L. *defluxio*, a down flowing]. A flowing down, copious discharge or loss of any kind.

deforma'tion [L. *dē*, from, + *forma*, form]. The act of deforming, a disfigurement

deformities. If present after injury, usually imply presence of fracture or dislocation, or both. May be due to extensive swelling, extravasation of blood, rupture of muscles, etc.

deformity. An unnatural alteration in the form of a part or organ. Distortion of any part or general disfigurement of the body. It may be acquired or congenital

RS' *cardiomorpha*, cat's ear, *chilochisis*, *Chrobak pelvis*, *orthomorpha*, *redressement*.

d., anterior. Abnormal ant. convexity of the spine. SYN' *lordosis*.

d., gunstock. One in which the forearm when extended makes an angle with the arm, because of displacement of axis of the extended arm. ETOL: Condylar fracture at elbow.

d., Madelung's. Distortion of the radius at its lower end, with ulnar displacement backward.

d., seal fin. Outward deflection of the fingers in rheumatoid arthritis.

d., silver-fork. The peculiar deformity seen in Colles' fracture.

d., Sprengel's. Congenital upward displacement of the scapula

d., Velpeau's. Silver-fork deformity, q.v.

d., Volkmann's. Congenital tibiotarsal dislocation

defunda'tion [L. *dē*, from, + *fundus*]. Excision of the uterine fundus

defurfura'tion [“ + *furfur*, bran]. Shedding of epidermis in scales, branny desquamation

Deg. Abbr for *degeneration* or *degree*.

degan'gionate [L. *dē*, from, + G. *gaglion*, tumor] To deprive of ganglia

degenerate [“ + *genus*, race] 1. A sexual pervers, loosely applied to a low mental or moral type 2 To deteriorate

degenerates [L. *degenerāre*, to degenerate] A term used to include all cellular masses whose staining reactions, form, size, etc. do not admit of classification Although the number of these cells is determined in each differential they do not enter into the per cents of the differential

degenera'tion. Deterioration or impairment of an organ or part in structure of cells and the substances of which they are a part

ETOL: Due to changes in size (decrease or increase) and other changes

d., Abercrombie's. SEE *amyloid d.*

d., adipose. SEE *fatty d.*

d., albuminoid. SEE *amyloid d.*

d., amyloid. Starch infiltration of tissue in various organs or parts, forcing the cells apart, a condition usually accompanied by pus and suppuration.

d., ascending. Nerve fiber d progressing to the center from the periphery.

d., bacony. SEE *amyloid d.*

d., calcareous. Deposits of lime salts in tissues and parts

d., caseous. Cheesev alteration in tissues seen in tuberculosis of same

d., cloudy swelling. A condition in which protein substances in cells become cloudy, the cells increasing in size, with minute droplets of protein substances Occurs in infectious diseases, and in those of the kidneys, liver, the heart and its muscles, and in the glands

d., colloid. Jellylike disorganization of a part

d., cystic. Cyst formation accompanying degeneration.

d., descending. Nerve fiber d. progressing toward the periphery from the original lesion

d., fatty. Disturbance of fat metabolism changing a part into an oily substance

d., fibroid. Change of membranous tissue into that of a fibrous nature.

d., gray. Gray d in nerve tissue due to chronic inflammation

d., hyaline. Caused by hyaline deposits, replacing musculoelastic elements of blood vessels with a firm, transparent substance which causes loss of elasticity. It is responsible for hardening of the arteries and is often followed by calcification or deposit of lime salts in dead tissue Calcification also may result in concretions.

d., lardaceous. SEE *amyloid d.*

d., mucoid. Disorganization of mucous cells.

d., myxomatous. SEE: *mucoid d.*

d., parenchymatous. *See:* cloudy swelling *d.*

d., secondary. *See:* wallerian *d.*

d., senile. Bodily and mental changes of the aged.

d., vitreous. *See:* hyaline *d.*

d., wallerian. Nerve fiber *d* after separation from its nutritive center.

d., waxy. Amyloid or lardaceous degeneration.

d., Zenker's. Amyloid *d* in muscular tissue.

degeneration, words pert. to: amylosis, "ather-" words, athetoid, atrophic, caecogenic, cacothenics, cardiomyoliposis, caseate, -tion, catalysis, cataplasia, ceroma, cerosis, chitinous *d*, colloid, heart, pythogenesis, sarcomatosis, scirrhus, steatosis, swelling, vitreous.

degenerative. Pert. to or accompanied by degeneration.

deglutible [*L. deglutire*, to swallow]. Capable of being swallowed.

deglutition (deg-lu-tish'un) [*L. deglutire*, to swallow]. The act of swallowing.

deglutitive. Pert. to deglutition

degustation [*L. degustare*, to taste]. The sense of taste

dehiscence (de-his'ens) [*L. dehiscere*, to gape]. A bursting open, as of a graafian follicle

dehydrate [*L. dē*, from, + *G. ydōr*, water]. CHEM. To deprive of or lose, or to become free of water

MED. To deprive the body or tissues of water

dehydration (dē-hī-drā'shūn) [" + *G. ydōr*, water]. The process of dehydrating. Occurs when output of water exceeds water intake. May result from deprivation of water, excessive loss of water, reduction in total quantity of electrolytes, or injection of hypertonic solutions.

dehydroandrosterone (de-hī-drō-drōs'tēr-ōn). SYN. *dehydroandrosterone* An androgenic substance $C_{19}H_{26}O$, present in urine with about one-fifth the potency of androsterone

dehydrocorticosterone (dē-hī-drō-kōrt-i-kō-ster-ōn). 11-dehydrocorticosterone (Kendall's compound A). $C_{21}H_{32}O_4$. A physiologically active steroid isolated from the adrenal cortex. It is important in water and salt metabolism

dehydrogenase (dē-hī-drog'ēn-ās). An enzyme which catalyzes the oxidation of a specific substance causing it to give up its hydrogen

dehydroisandrosterone (dē'hī-drō-i-sō-ān-drōs'tēr-ōn). A 17-ketosteroid excreted in normal male urine. It possesses androgenic activity.

Deiters's cells (dī'terz). 1 Supporting cells in organ of Corti 2 Spider cells of the neuroglia 3 Neuro cells, the neuraxons of which become the axis cylinders of nerve fibers *See cell.*

D.'s nucleus. Collection of cells back of the acoustic nucleus

D.'s process. Axis-cylinder process or neuraxon

dejecta (de-jek'tā) [*L. deicere*, to cast down]. Feces, intestinal waste.

dejection, dejecture (de-jek'shun, -ūr) [*L. deicere*, to cast down]. 1. A cast down feeling, or mental depression. 2. Defecation or act of defecation.

Dejerine's disease (da-zhē-rēns'). Interstitial neuritis of infants.

D.'s syndrome. S. with deep sensitivity repressed but with normal tactile sense, caused by lesion of long root fibers of post. column.

dekanormal (dek-ā-nor'mal) [*G. deka*, ten, + *L. norma*, rule]. Having 10 times the strength of normal, as a solution.

de Kraft blue pencil. Vulcanite fiber tube tightly packed with asbestos powder, metal cap at 1 end for attachment of ground chain, and blue metal tip covers end toward patient. Used for static brush discharge.

delacrimation [" + *lacrimare*, to shed tears]. Epiphora, more or less constant overflow of tears.

delactation (de-lak-tā'shun) [" + *lactare*, to suckle]. Weaning or cessation of lactation

delamination [" + *lamina*, plate]. The division into laminae, esp. that of a blastoderm into 2 layers, epiblast and hypoblast

delayed reflex (dē-lād'). Any in which the response is abnormally delayed.

d. symptoms. Delayed onset of symptoms, as of shock

delectatio morosa [*L.*] Dallying with voluptuous thoughts

deligation (de-lī-gā'shun) [*L. deligare*, to tie up]. The application of ligatures.

delimitation [*L. dē*, down, + *limitare*, to limit]. Determination of limits of an area or organ in diagnosis

deliquesce. To cause liquefaction.

deliquescence (del-ik-wes'ens) [*L. deliquescere*, to grow moist]. The process of becoming liquefied as result of absorption of water from the air

deliquescent (del-ik-wes'ent). Pert. to a substance which absorbs water from the atmosphere

delire de toucher (de-līr-dē too-shā') [*Fr.*]. An abnormal desire to touch things.

deliriant [*L. delirare*, to be out of one's head]. An agent that will produce delirium. Ex. *atropine*, *hyoscyne*.

delirifacient (de-līr'fā'shi-ent) [" + *facere*, to make]. A drug causing delirium. SYN. *deliriant*.

delirium (de-līr'ium) [*L.*] Disorientation for time and place, usually with illusions and hallucinations. A state of mental confusion and excitement

The mind wanders and speech is incoherent, and the patient is in a state of continual, aimless physical activity. There are many forms of delirium, depending mainly upon the cause, but 2 main types are generally recognized:

RS *alcoholism*, *carphologia*, *consciousness*, *clouding of*, *dipsomania*, *fever delirium*, *mussitation*, *potomania*; *restraints*.

d., acute. One developing suddenly and speedily, resulting in recovery or death

d., alcoholic. *See delirium tremens.*

d., chronic. D. of chronic psychoses, without febrile characteristics

d. constantium. D. of patients with reiteration of same fixed idea.

d. cordis. Violent heart beat.

d. epilepticum. D. either following an epileptic attack or appearing instead of an attack.

d. e potu. *See: d. tremens.*

d. ex inanitione. D. in cases of anæmia, occurring usually when fever subsides.

d., febrile. D. occurring with fever.

d. of grandeur. Condition in which patient exaggerates his own power and importance.

d. hysterium. Delirium of hysteria.

d., lingual. Form where meaningless sounds are muttered constantly.

d., maniacal. Often associated with high temperature and acute illness. The low muttering type accompanied by great physical exhaustion, as seen in cases of typhoid fever. Poisoning from certain drugs may induce delirium.

d., metabollcum. Form in which patient feels he is not using his own name and objects and people about him are not in their real characters and that they are spying upon him.

d., musiftans. Excitement causing lingual d.

d., of negation. Form in which patient thinks parts of his body are missing.

d., partial. D. reacting on only a portion of the mental faculties, causing only some of the patient's actions to be unreasonable.

d., of persecution. D. in which patient feels he is being persecuted by those about him.

d., toxic. D. produced by presence of toxins in the body.

d., traumatic. D. following injury or shock.

d., tremens. A psychic disorder involving hallucinations, both visual and auditory, found in habitual users of alcoholic beverages.

The lack of nicotinic acid is a factor in the development of d.

Sym. Hallucinations, as seeing snakes or monsters, hearing noises. Patient is excited and usually talking or yelling incoherently.

F. A. TREATMENT Sedatives, esp. paraldehyde and bromides. Treat for shock if present. Glucose and fluids in large quantities. Induce free perspiration. Restraints may be necessary. Hypodermics of apomorphine hydrochloride may be sedative in the maniacal individual.

NP. The patient must never be left alone for an instant, since attempts at suicide are frequent in such cases. The nursing of delirium needs endless patience, tact, and understanding. Restraint should be avoided if possible.

d., violent. Feverish d. with exaltation and great strength.

delitescence (del-it-es'ens) [L. *delitescere*, to be hidden]. An unusually complete and speedy resolution of an inflammation.

deliver [Fr. *delivrer*, to free]. To aid in childbirth by removal of a fetus or placenta.

delivery [Fr. *delivrer*, to free]. Expulsion of the child at birth with placenta and membranes from the mother. **See labor.**

d., abdominal. Removal of the child by Cesarean section.

d., forceps. Delivery of the child by the use of tractor instruments.

d., postmortem. Delivery of the child after death of the mother either by the abdominal or vaginal route.

d., precipitate. A precipitate delivery is one that occurs under nonaseptic conditions and when the physician is not present. In the true sense it is one which follows a precipitate labor regardless of who is present.

TO PREVENT A PRECIPITATE DELIVERY: Watch the patient carefully.

A multipara needs more careful watching against this predicament than a primipara. However, this should not be taken as an excuse because it is possible for it to occur in a primipara.

Do not wait for the head to be visible in a multipara if she is having frequent hard pains, particularly if they are bearing down in type, but have her seen by the physician immediately. In a primipara it is fairly safe to wait, in the majority of cases, until a small portion of the head is seen at the vaginal orifice during a pain before putting the patient up for delivery.

Remember to watch both the primipara and multipara who has received an analgesia, since precipitation can occur with little or no warning. This means watching for bulging of the perineum during the pains by viewing the vulva and not taking it for granted that because the patient is fairly quiet no progress is being made.

Encourage the patient to breathe through her mouth during each pain so that she does not bear down.

Administer drop ether if local custom permits. If pushed properly it can effectively stop contractions and may be employed safely for a reasonable time to prevent sudden expulsion of the child.

d., premature. Delivery of a fetus after the twenty-eighth week but before full term.

d., spontaneous. Delivery of the child without external aid.

delomorphous (del-o-mor'fus) [G. *dēlos*, evident, + *morphē*, form]. Having definite form and shape.

d., cells. Granular cells which stain easily, found next to basement membrane in stomach, glands in cardiac region.

delousing (de-lous'ing) [L. *dē*, from, + A.S. *lūs*]. Ridding of lice by their destruction.

del'ta for'nix [L.] A triangular surface on lower side of fornix, *commissura hippocampi*.

del'toid [G. *delta*, letter d, + *eidos*, resemblance]. Shaped like the Greek letter Δ.

d., ligament. Internal lateral l. of ankle joint.

d., muscle. The *musculus deltoideus*, which covers the shoulder prominence.

d., ridge. Ridge on humerus where deltoid muscle is attached.

de lunat'ico inquirendo [L.]. Legal process to determine alleged incompetence of a person.

delusion (de-lu'shun) [L. *deludere*, to cheat]. A false belief, as that the individual is Napoleon. Differs from hallucination which involves the false excitation of one or more of the senses.

MOST IMPORTANT DELUSIONS. Those which cause the patient to harm others, or himself, such as (a) Fear of being poisoned, causing the patient to refuse food, (b) those leading to suicide, or inflicting injury upon self, (c) false beliefs, such as having been guilty of the unpardonable sin; (d) those of persecution.

d., depressive. One causing a saddened state.

d., expansive. Conviction of one's own fineness, power or importance.

d., fixed. Those that remain unaltered.

d., fleeting. These come and go.

d., of grandeur. A false sense of possessing wealth or power.

d., of negation. **See nihilistic d.**

d., nihilistic (ni-hil-is'tik). One that causes the victim to believe that everything has ceased to exist.

d. of persecution. D. in which patient feels everyone about him is against him.

d., reference. One that causes the victim to read a meaning not intended in the acts or words of others, usually an interpretation of slight or ridicule.

d., systematized. Logical correlation with false reasoning and deduction.

d., unsystematized. D. without any correlation between ideas and surroundings.

delusional [L. *deludere*, to cheat]. Pert. to a delusion.

dement' [L. *de*, from, + *mens*, mind]. One who has lost his sanity.

demented (de-men'ted). Of unsound mind.

dementia (de-men'shi-ä) [L. *de*, from, + *mens*, mind]. Irrecoverable deteriorative mental state, the common end result of many entities

See *cataphrenia*, table, p D-10

d., alcoholic. D. in terminal portion of chronic alcoholic state

d., apathetic. D. with diminished sensitivity, occurring in the last stages of disease, usually

d., apoplectic. Form following cerebral hemorrhage or tumors

d., catatonic. A form of d precox

d., chronic. An incurable form occurring at any time of life

d., epileptic. That accompanied by mental deterioration, and due to long continued epilepsy

d., naturalis. Congenital form, idiocy.

d., organic. D. caused by lesions of nerve centers

d. paralytica. Paresis or general paralysis of the insane A paretic form of neurosyphilis occurring in syphilitics, characterized by progressive dementia and a diffuse generalized paralysis. Generally terminates in death if untreated. **EtioL** Antecedent syphilitic infection. **DURATION** Several months to 3 or 4 years

IN GENERAL (1) Often seen in the young who have inherited syphilis, usually 10 or 20 years later (2) If not treated, lead to deterioration, physical and mental, eventually fatal (3) Sometimes classified into 3 common types, spoken of as the *deluded*, the *depressed*, and the *demented*. (4) Without treatment, the disease may pass through 3 stages of development.

THE DFLUDED TYPE *The First Stage*

(1) Memory defective (2) Very ex-

citable. (3) Hallucinations of hearing. (4) Judgment defect. (5) Weaken self control. (6) Acute excitement may occur. (7) Peculiar "in and out" movement of tongue. "Trombone tremor." (8) Slurred, hesitating speech with drawing. (9) Ankle and knee jerks absent, increased, or floppy. (10) Restlessness and irritability. (11) Pleased with self. (12) Delusions of grandeur. (13) Feels unusually well. (14) Feels able to work when not fit. (15) Mental weakness steadily progresses. (16) Tremors of tongue, face, and hands. (17) Unsteady gait. (18) Loss of facial expression due to muscular weakness. (19) Irregular, unequal pupils without reflex to light. (20) Difficult urination.

The Second Stage. (1) About beginning of 2nd year. (2) Delusions may be repeated but gradually forgotten (3) Dull, stupid, shows no emotion. (4) Seizures occur (5) Patient becomes dull and flushed, then unconscious (6) Unconsciousness may last few minutes to an hour. (7) Seizures resemble epilepsy but less severe (8) Seizures followed by hemiplegia or monoplegia (9) Congestive attacks. (10) Rise of temperature before seizure (11) Physical signs more marked (12) Muscular weakness shown in gait, handwriting and in speech (13) Often becomes fat

The Third Stage (1) Little interest shown except in food (2) Evidence of mind disappears (3) Grinding of teeth. (4) Becomes wasted (5) Unable to control excretions (6) Becomes bedridden. (7) Seizures may continue

THE DEPRESSED TYPE (1) Remissions not so common (2) Depression (3) Physical signs same as the deluded type. (4) Runs longer course (5) Delusions of unworthiness or persecution. (6) Delusions are of much greater magnitude.

THE DEMENTED TYPE (1) All become demented but not noticeable from the start (2) Run a prolonged course (3) Delusions do not occur. (4) Dull, forgetful, unable to work. (5) Commonest type in females

TREATMENT Most effective treatment is artificial fever therapy for not less than 50 hr. at 105° F. in 10-15 sessions, combined with chemotherapy

NURSING OF GENERAL PARALYTICS (1) Patient must be under constant observation (2) Their bones are fragile, hence they should be handled carefully. (3)

Main Differential Diagnosis of Schizophrenia and Manic Depressive Psychoses

Findings in Mental Examination	Schizophrenia	Manic Reaction	Depressive Reaction
1. General behavior and activity.	Odd, incongruous, silliness, irrelevance, and incoherence of stream of thought	Pressure of talk and activity Flight of ideas and distractibility	Slowness of thought and activity Depressed facies.
2. Affective disorder present.	Loss of affect or inadequate affect	A frank elation or quick oscillations	A frank depression.
3. Trend reactions.	Delusions of various types, ideas of reference, ideas of influence, paranoid ideas. Hallucinations usually prominent.	Expansive ideas to fit in with elation. No hallucinations.	Self - condemnation and self - recrimination to fit in with depressive affect. Hallucinations rare
4. S e n s o r i u m changes.	Sensorium generally clear. Insight usually absent.	May be clouded. Insight may be present.	Often clouded. Insight often present.

Prevent decubitus (4) Artificial fever is sometimes induced. (5) Must be kept warm during rigors. (6) If patient has convulsions, he must be watched carefully to prevent him from injuring himself. (7) Watch for distended bladder. (8) Check on elimination. (9) Avoid all quarreling. (10) Patients have a tendency to eat greedily and may have difficulty in swallowing. Care must be exercised to prevent choking. (11) Watch for possible collapse. (12) Death may occur during a seizure. [no tendencies]

d. paranoides. D. piecox with **para-d.**, **paretic.** Paralytic dementia, *q.v.*

d. postfebrile. D. following severe cases of infectious diseases

d. precoc. Though a disease entity, it is best replaced by the term "schizophrenia," since it is not always associated with dementia nor always occurring in the young. It has been characterized as a "dream state," a psychosis represented by a dreaming mind in a sleeping body, the latter being easily aroused but not the former. Twenty per cent of the patients in the hospitals of the U S are afflicted with this psychosis.

d., presenile. One beginning in the 5th decade. **SYM** Apathy, loss of memory, disturbances of speech and gait.

d., secondary. D. occurring after a primary mental disease, such as mania

d., senile. That occurring in the aged. **SYM** Progressive mental deterioration with loss of memory, esp for recent events, with occasional intercurrent attacks of excitement [syphilis]

d., syphilitic. D. caused by lesion of **d. terminal.** D. following another form of mental disease. **SEE** **secondary d.** [use of some drug]

d., toxic. That due to the excessive

demerol (dem'er-ol) A white, colorless, crystalline compound, soluble in water, having a neutral reaction and an analgesic effect similar to morphine.

demi- [L] Prefix Half

demi-lune cells (dem'i-lun) [L *demi*, half, + *luna*, moon] Collection of marginal cells in form of a half moon in sub-maxillary gland

demineraliza'tion [L. *de*, from, + *minare*, to mine]. Loss of salts by excessive secretion and excretion. [Death]

demise' [L. *demittere*, to send from]

Dem'odex. Genus of mites and ticks of the class *Arachnida* and order *Acarina*.

D. folliculo'rum. The pimple mite, which often infests hair sacs and sebaceous follicles

demography [G *demos*, the people, + *graphein*, to write]. Statistical study of births, marriages, and deaths, and physical, moral, and intellectual development.

demonoma'nia [G *daemon*, devil, + *mania*, madness] Obsolete term for psychotic belief that one is possessed by demons

demonop'athy [' + *pathos*, disease] A mania in which one is convinced of being possessed of devils. **SYN** **demonomania.**

Demoirs' membrane (de-moor's). A fine membrane bet the endothelial layer of the cornea and the substantia propria. **SYN** Descemet's membrane, lamina elastica posterior.

demucosa'tion [L. *dē*, from, + *mucus*]. Excision of mucosa of any part of body.

demul'cent [L. *demulcere*, to stroke softly]. An agent that will soothe the part or soften the skin to which applied. The term is usually restricted to agents act-

ing on mucous membrane. **EX** *Glycerin*, *honey*, *lanolin*, *milk*, *mucilage of acacia*, *mucilage of tragacanth*, *olive oil*.

demutiza'tion [L. *dē*, down, + *mutus*, mute]. Overcoming mutism by teaching the patient to speak or to use the sign language

dena'tured [' + *natura*, nature]. Subject to having the nature of a substance changed, or to render unfit for consumption, as alcohol, *q.v.*

dendraxon (den-drak'son) [G *dendron*, tree, + *axon*, axle] The terminal filaments of the neuraxon of a nerve cell.

den'dric. Pert. to or possessing a dendron.

dendriform (den'dri-form) [G. *dendron*, tree, + *L* *forma*, shape]. Branching or like a tree in shape

den'drite [G *dendritēs*, pert. to a tree]. A branched protoplasmic process of a neuron which conducts impulses to the cell body. There are usually several to a cell. They form synaptic connections with other neurons

d. extracapsular. Dendrites of neurons of autonomic ganglia which pierce the capsule surrounding the cell and which extend for considerable distances from the cell body

d. intracapsular. Dendrites of neurons of autonomic ganglia which ramify beneath the capsule forming a network about the cell body

dendrit'ic. Tree-like in form

d. calculus. A renal stone molded in the form of the pelvis and calyces

dendroid (den'droid) [G *dendron*, tree, + *eidos* form] 1 Dendriform, pert. to dendrites 2 Arborescent, tree-like

dendron (den'dron) [G *tree*] A dendrite. A protoplasmic branch from a nerve cell

dendrophagocytosis (den'dro-fag-o-si-to-sis) [' + *phagein*, to eat, + *kytos*, cell, + *-osis*, infection] The absorption of portions of astiocytes by microglia cells

dener'vated [L. *dē*, from, + *G* *neuron*, nerve] 1 Excision, incision, or blocking of a nerve supply 2 A condition in which the nerve supply is blocked or cut off

dengue (deng'ga) [Sp] Acute, epidemic, febrile disease lasting 8 days, seldom fatal

Etiol. A virus transmitted by the mosquito, *Aedes aegypti*. **SYM** Two fever periods with intermissions, eruptions similar to measles, severe pain in muscles and joints. **SEE** *breakbone fever*.

denidation (den-id-a'shun) [L. *dē*, from, + *nidus*, nest] Removal during menstruation of the nidus of a fertilized ovum.

dens (pl *dentes*) [L] 1 A tooth 2 The odontoid process of the axis. A process on the body of the axis which serves as a pivot for the rotation of the atlas

d. bicuspidus. The bicuspid tooth, **d. premolaris** BNA

d. caninus. BNA. The canine tooth

d. deciduus. BNA. Milk tooth, first tooth.

d. incisivus. BNA. Incisor tooth.

d. molaris. BNA. Molar tooth, grinder.

d. permanens. BNA. One of the 32 teeth making up the permanent denture.

d. sapientiae. Late tooth, wisdom tooth, **d. serotinus.** BNA

densimeter (den-sim'e-ter) [L. *densus*, thick, + *G* *metron*, measure]. Instrument for measuring densities.

densitom'eter [' + *G* *metron*, measure]. A special densimeter for measuring bac-

terial growth and effect upon it of anti-septics and bacteriophages.

den'sity [L. *densitas*, thickness]. 1. Relative weight of a substance compared with some other substance of equal bulk. 2. The quality of being dense

dentag'ra [L. *dens*, tooth, + *G. agra*, seizure] Toothache

den'tal. Pert to the teeth.

d. arch. The arch formed by the cutting and chewing surfaces of the teeth

d. caries. Decay of the teeth. *See* caries

d. curve. The curve or bow of the line of the teeth in the jaw. The different portions of the curve are described as follows *Alignment c*. The line passing through the center of the teeth from the middle line through the last molar *Buccal c*. The curve extending from the cuspid to the 3rd molar *Compensating c*. The occlusal line of bicuspids and molars *Labial c*. The curve extending from cuspid to cuspid

d. disk. A thin, circular piece of paper, or cloth, or other substance charged with abrasive powder for cutting or polishing teeth and fillings

d. engine. A machine operated with foot power, or by an electric or a water motor, to give a swift rotary motion to drills, burs, and burnishers.

d. formula. A method of expressing briefly the dentition of mammals in which the numbers of the teeth are given in the form of a fraction, the numbers of the upper teeth forming the denominator, those of the lower teeth the numerator

The dental formula of man is:

$$i. \frac{2-2}{2-2} \quad c \frac{1-1}{1-1} \quad b \text{ or } pm \frac{2-2}{2-2} \quad m \frac{3-3}{3-3} = 32.$$

dentalgia (den-tal'ji-ä) [L. *dens*, tooth, + *G. algos*, pain]. Toothache

dentaphone (den'tä-fōn) [' + *G. phōnē*, sound] Device for conveying sound through the teeth

dentate (den'tät) [L. *dentatus*, toothed]. Notched, having short triangular divisions of the margin, toothed

den'tes [L.]. Teeth, plural of *dens*, *q.v.*

dentibuc'al [L. *dens*, tooth, + *bucca*, cheek] Pert to both the cheek and teeth

den'ticle. A small toothlike projection

dent'iculate [L. *denticulatus*, small toothed] Finely toothed

d. body. Corpus dentatum.

dentifica'tion [L. *dens*, tooth, + *facere*, to make] Conversion into dental structure

dentifrice (den'tif-ris) [' + *fricare*, to rub] A powder or other substance for cleaning teeth

dentigerous (den-tij'er-us) [' + *gerere*, to bear] Having or containing teeth.

dentila'bial [' + *labium*, lip]. Pert. to both teeth and lips

dentila'gual [' + *lingua*, tongue]. Pert. to both teeth and tongue

dentim'eter [' + *G. metron*, measure]. Device for measuring teeth

den'tinal. Pert to dentine

dentine, dentin (den'tēn, den'tīn) [L. *dens*, tooth] The osseous tissues of a tooth, enclosing the pulp cavity

dentifica'tion [' + *facere*, to make]. Formation of dentine

dentini'tis [' + *G. -itis*, inflammation]. Inflammation of dentine

dentinogenesis (den-tīn-ō-jen'ē-sis) Formation of dentine in development of a tooth

d. imperfecta. Aplasia or hypoplasia of the enamel and dentine of a tooth

d. nucleus. A mass of gray matter in the medulla of each cerebellar hemisphere

den'tinoid [' + *G. eidos*, form]. 1. Resembling dentine. 2. A tumor arising from dentine

dentino'ma [' + *G. -ōma*, tumor]. A dentine tumor

dentinos'teoid [' + *G. osteon*, bone, + *eidos*, form]. Small tumor arising from dentine *SYN.* *dentinoid*.

DENTITION—TEETH IN SITU

1. Third molar 2. Second molar 3. First molar 4. Lateral incisor. 5. Central incisor. 6. Canine. 7. First premolar. 8. Second premolar.

den'tist [L. *dens*, tooth]. A practitioner of dentistry.

dent'istry. That branch of medicine which deals with the care of the teeth and associated structures. It is concerned with the prevention, diagnosis, and treatment of diseases of the teeth, and gums. 2 The art or profession of a dentist.

d. esthetic. Repair and restoration or replacement of carious or broken teeth.

d., operative. Phase dealing with dental operations on mouth as contrasted with dental laboratory work.

d. prosthodontia (prōs-thō-dōn'shī-ă). The art of replacing defective or missing teeth through the use of artificial appliances such as bridges, crowns, artificial dentures, etc.

dentit'ion [L. *dentitū*]. The process and time of teething. SEE p D-12.

d., primary. Eruption of 20 deciduous, or milk teeth. ORDER OF ERUPTION Two central incisors, lower, 7th month. Four central and lateral incisors, upper, 8th and 10th months. Two lateral incisors, lower, 12th to 14th month. Four frontal molars, 12th to 14th month. Four canines, 18th to 20th month. Four post. molars, 24th to 30th month.

d., secondary (32 teeth). The eruption of the permanent teeth, beginning at about the age of six. Completed by the 15th year with the exception of the "wisdom" teeth, which appear bet the 18th and 25th years. ORDER OF ERUPTION The incisors and canines are followed by the same teeth. The frontal molars are followed by 1st bicuspid. The post. molars are followed by 2nd bicuspid, then the 1st, 2nd and 3rd molars follow. SEE teething.

SYN *odontiasis*, *teething*.

dentoalve'olar [L. *dens*, tooth, + *alveolus*, small hollow]. Pert to alveolus of a tooth.

dentoalveol'i'tis [" + " + G -*itis*, inflammation]. A purulent inflammation of the tooth socket linings, characterized by looseness of the teeth and gum shrinkage. SYN *pyorrhea alveolaris*.

den'toid [" + G *eidōs*, form]. Dentiform; odontoid, tooth shaped.

dentoliva (dent-o-liv'a) [" + *oliva*, olive]. Olivary body.

dentor'din. Organic substance of a tooth.

denture (den'chur) [Fr from L. *dens*, tooth]. A set of 32 permanent or of 20 deciduous teeth, either natural or artificial.

d., artificial. False teeth replacing natural teeth.

d., full. Complete set of artificial teeth.

denudeated (de-nu'kle-ăt-ed) [L. *dē*, from, + *nucleus*, kernel]. Deprived of a nucleus.

denuda'tion [L. *denudāre*, to lay bare]. Removal of a protecting layer or covering.

denutrition (de-nu-trish'un) [L. *dē*, from, + *nutrire*, to nourish]. Malnutrition.

deob'struent [" + *obstruere*, to block up]. Having the property of removing obstructions.

deodorant (de-ō'dor-ant) [" + *odorāre*, to perfume]. An agent which destroys or neutralizes foul odors. Those in common use are: Chloride of lime, creolin, izal, iodoform, permanganate of potash, chlorine and hydrogen peroxide. SEE *odor*.

deodorize (de-ō'dor-iz') [" + *odor*, odor]. To remove foul odor.

deodorizer (de-ō'dor-i-zer) [" + *odor*, odor]. That which deodorizes.

deontology (de-on-tol'o-jī) [G. *deonta*, things to be done, + *logos*, study of]. Medical ethics.

deop'pilation [L. *dē*, from, + *opplāre*, to stop up]. The doing away with obstructions.

deor'sum [L.]. Downward or turning downward.

d. ver'gens. Turning downward.

deorsumduction (de-or'sum-duk'shun) [L. *deorsum*, downward, + *ducere*, to lead]. Bending downward.

dees'ification (dē-ōs-i-fī-kā'shun) [L. *dē*, from, + *os*, bone, + *facere*, to make]. Loss of or the removal of mineral matter from bone or osseous tissue.

deox'idate [" + G *oxys*, sharp]. To deprive a chemical of oxygen.

deoxida'tion [" + *oxys*, sharp]. Process of depriving of oxygen.

deoxidizer (de-ok'si-di-zer) [" + *oxys*, sharp]. A deoxidizing substance.

depersonaliza'tion [" + L *persona*, person]. A sense of being someone else, a lessened sense of one's own identity.

depilate (dep'il-ate) [L. *depilāre*, to pluck out hair]. To strip of hair.

depilation (dep-il-a'shun) [L. *de* + *pilus*, hair]. The process of hair removal. SEE *epilation*.

depil'atory [" + *pilus*, hair]. An agent used for the removal of hair.

deplete (de-plēt') [" + *piere*, to fill]. To empty, as in blood letting; to produce depletion.

depletion (de-plē'shun) [" + *piere*, to fill]. Withdrawal of fluid, esp the blood.

deplumation (de-plu-ma'shun) [" + *pluma*, down]. Falling of eyelashes as result of disease.

depolariza'tion (dē-pō'lār-i-zā'shun) [" + *polus*, pole]. The process of reducing to a nonpolarized condition, destruction of polarity.

depos'it (de-poz'it) [" + *ponere*, to place]. 1. Sediment. 2. Matter collected in any part of an organism, normal or otherwise.

deprava'tion [L. *depravāre*, to impair]. 1. Deterioration, esp. of secretions. 2. Perversion.

depraved (de-prāv'd'). 1. Perverted, abnormal. 2. Deteriorated.

depress'ant [L. *depressus*, pressed down]. An agent that will depress a body function or nerve activity. Ex: *Bromides*, *aconite*, *chloral hydrate*.

d., cardiac. One which lessens heart action, so that it beats slower and weaker.

d., cerebral. One lessening brain activity, making patient dull and less active. Large doses may produce sleep.

d., motor. One which lessens contractions of involuntary muscles.

d., respiratory. A drug lessening frequency and depth of breathing.

d., secretory. One making gland secretions less.

depressed (de-pres't'). 1. Hollowed. 2. Low in spirits.

depression (de-pres'h'un) [L. *depressio*, a pressing down]. 1. A hollow or lowered region. 2. The lowering of a part, as the mandible. 3. The lowering of a vital function such as respiration. 4. A mental state characterized by dejection, lack of hope, and absence of cheerfulness. Observed in manic depressive psychoses.

d., averse. Melancholia.

d., cardiac. Notch in ant. margin of left lung for the cardiac apex.

depressomotor [' + *motor*, mover]. A drug which diminishes muscular movements by lessening the impulses for motion sent from the brain or spinal cord.

depressor (de-pres'or) [L.]. Instrument for depressing a part.

d. nerve. A nerve, the stimulation of which brings about a fall in blood pressure through reflex vasodilation and slowing of heart beat.

d. reflex. More or less transient stimulation of depressor fibers.

d., tongue. Device used to flatten tongue for throat examinations.

deprimens oculi [L.]. *Musculus rectus inferior*.

depriv'al [L. *dē*, from, + *privāre*, to remove]. Deprived of or without organs, parts, or functions.

depriva'tion [' + *privāre*, to remove]. Deprivation.

deprive'ment [' + *privāre*, to remove]. Being without function, parts or organs. SYN *deprival*.

depuliza'tion [' + *pulex*, flea]. Destruction of fleas which carry the plague bacillus.

depur'ant [L. *depurāre*, to purify]. A medicine that purifies through the removal of excreta.

depura'tion [L. *depurāre*, to purify]. Process of freeing from impurities.

depur'ative. Cleansing.

depura'tor [L. *dē* + *purus*, pure]. 1. That which purifies 2. An emunctory.

deradenitis (der-a-den-'tis) [G. *derē*, neck, + *adēn*, gland]. Inflammation of a lymph gland of the neck.

deradenocencus (der-ad'e-non'kus) [' + *ogkos*, tumor]. Swelling or tumor of a neck gland.

derangement (de-ranj'ment) [Fr disorder]. Disorder of the mental functions, especially those involving the intellect.

deratization (de-rat-'za-shun) [L. *dē*, from, + *rattus*, rat]. Extermination of rats.

Dorbyshire neck (dar'be-shēr). Goutier.

Dercum's disease (der'kūm). Dystrophy of subcutaneous connective tissue, painful. SYN *adiposis dolorosa*, *paratrophy*.

dereistic (de-re-is'tik). Pert to overexercise of the imagination to the extent of ignoring reality, as seen in day dreaming.

der'ic (der'ik) [G. *deros*, skin]. Pertaining to the skin or surface of the body as distinguished from enteric.

derivation (der-iv-a'shun) [L. *derivāre*, to draw off]. Diversion of fluids from 1 to another part.

deriv'ative [L. *derivāre*, to draw off]. 1. That which is not original or fundamental 2. Anything derived from another body or substance 3. That which produces derivation 4. In embryology that which develops from a preceding structure as the derivatives of the germ layers.

derm, derma [G. *derma*, skin]. The *cutis vera*, or true skin.

Dermacentor (dēr-mā-sēn'tor). A genus of ticks belonging to the order Acarina, family Ixodidae.

D. andersoni. The wood tick, a species of ticks which is parasitic on man or other mammals during some part of their life cycle. May transmit causative agents of Rocky Mountain spotted fever, tularemia, anaplasmosis, brucellosis, Q, and several forms of virus encephalomyelitis, also causes tick paralysis.

D. variabilis. A species of ticks similar to *D. andersoni*. The larvae in-

fest rodents; adults, principally dogs, but may infest man. May transmit same diseases as *D. andersoni*.

der'mad [G. *derma*, skin, + L. *ad*, toward]. Toward the skin; externally.

dermagra (der-mag'rā). [' + *agra*, seizure]. A deficiency disease. SYM: Debility, gastrointestinal disturbance, erythema, convulsions, and nervous and mental disorders. SYN *Pellagra*.

dermal. Relating to the skin or derma.

dermalax'ia [G. *derma*, skin, + *malaxis*, softening]. Morbid relaxation or softness of the skin.

dermalgia (der-mal'ji-ā) [' + *algos*, pain]. Pain in the skin.

dermame'tropathism (der'mā-mē-trōp'ā-thizm) [' + *metron*, measure, + *pathos*, disease]. Diagnosis of skin disease by observing the markings made by drawing a blunt pencil across the skin.

dermamyiasis (der-mā-mi-l'ā-sis) [' + *myia*, fly]. Skin disease caused by invasion of larva of dipterous insects.

dermanaplasty (derm-an'ā-plas-ti) [' + *anaplassein*, to reform]. Skin grafting.

dermapos'tasis [' + *apostasis*, a falling away]. Abscess formation accompanying a disease of the skin.

dermat-, dermato- [G.]. Prefixes Skin.

dermatagra (derm-ā-tag'rā) [G. *derma*, skin, + *agra*, seizure]. 1. Pellagra. 2. Dermatalgia 3. Gouty affection of the skin.

dermatalgia (derm-ā-tal'ji-ā) [' + *algos*, pain]. Paresthesia with localized pain in the skin. SYN *dermalgia*.

dermatatrophia (derm-at-ā-tro'fi-ā) [' + *atrophia*, atrophy]. Atrophy of the skin.

dermatauxe (der-mā-taw'k'se) [' + *auxē*, increase]. Hypertrophy of the skin.

dermatitis (der-mat-'tis) [' + *-itis*, inflammation]. Inflammation of skin evidenced by itching, redness and various skin lesions.

Etiol. Lack of Vitamin G, skin irritants, as poison ivy, corrosives, acids, alkalies or hypersusceptibility on part of patient.

TREATMENT Remove irritant by washing with soap and water, then by alcohol and ether. Dress with calamine lotion or bland oils or ointment.

d. aestivalls [L. *aestiva*, summer]. Hot weather dermatitis.

d. calorica [L. *calor*, heat]. That due to heat or cold, as sunburn, etc.

d. cercarial. Dermatitis resulting from infestation with the cercaria of blood flukes belonging to the genus *Schistosoma*, *Achistosoma* dermatitis or swimmer's itch.

d. congelatiōis [L. *congelatio*, cold]. Frostbite, chilblain. See *chilblain*.

d. exfoliativa. Acute or subacute inflammation of the skin commonly involving whole surface and characterized by redness and abundant flaky desquamation.

Etiol. Unknown.

SYM: May be primary with constitutional symptoms (fever, debility, and gastrointestinal upset), with sudden eruption, pink turning dark red, followed by thin, flaky, loosely adherent, grayish or brownish scales, tender skin, tension and stiffness. In secondary type it follows certain scaly diseases of the skin (eczema, seborrheic dermatitis, psoriasis); pigmentation (slate or mahogany color) is frequent.

PROG: Guarded. Recurrences are frequent and sometimes death follows.

TREATMENT. Attention to general health (drugs, tonics internally). Locally, soothing only applications. *SYN. pityriasis rubra.*

d. gangraenosa. Skin inflammation of gangrenous form

d. herpetiformis. Chronic, inflammatory disease characterized by erythematous, papular, vesicular, bullous, or pustular lesions with tendency to grouping and with itching and burning.

ETIOI. Direct cause unknown. Occurs mostly in adult males though no age is exempt.

SYM. Slight, constitutional. Lesions develop suddenly and spread peripherally. Disease is variable and erratic and attack may be prolonged for weeks or months. Secondary infection may follow from trauma.

PROG. Amelioration of attack, but permanent relief cannot be promised.

TREATMENT. Removal of sources of reflex irritation. Arsenic, sodium cacodylate, thyroid (with circumspection), quinine.

Soothing mixtures externally. Excoriated areas to be protected by mild antiseptics.

d. hlemalis [*L. hlems*, winter]. Dermatitis occurring in cold weather.

d. infectiosa eczematoides. Pustular eruption during or following a pyogenic disease. *SYN. Engman's disease.*

d. medicamentosa. Drug eruption.

ETIOI. Idiosyncrasy or sensitization to the drug in question. Most probably anaphylactoid, not true anaphylactic reaction. Cosmetics, arsenic (wallpaper, etc.), butyn, phenobarbital, etc., are some of the 50 drugs reported.

SYM. With exception of bromine and iodine, the eruption is not characteristic and may resemble almost any condition or disease.

TREATMENT. Removal of cause, saline cathartics, and alkaline diuretics.

d. multiformis. Form with lesions of a pustular nature.

d. papillaris capillitii. Formation on scalp and neck of surface elevations interspersed with pustules and ending in scarlike elevations resembling keloids.

d. repens. Inflammatory disease of the skin following injury.

ETIOI. Uncertain. One theory is of peripheral neuritis with secondary parasitic invasion. *Staphylococcus albus* may be present.

SYM. Serous undermining of upper layers of epidermis with formation of numerous white abscesses in adjacent rete. Begins as localized redness with vesiculation or pustulation, spreading until central patch of glazed, denuded rete is surrounded by ragged border of slightly elevated, seriously undermined horny epidermis. Denuded areas may be entirely healed before peripheral extension takes place.

PROG. Rebellious to treatment.

TREATMENT. Removal of material for bacteriologic examination and autogenous vaccine. Locally Ruggles' mixture (salicylic acid, tannic acid, alcohol), or potassium permanganate, and boric acid, formalin, silver nitrate.

d. seborrheica. Acute or subacute inflammatory skin disease beginning on the scalp, characterized by rounded, irregular, or circinate lesions covered with yellowish or brownish-gray greasy scales.

ETIOI. Lowered vitality, indigestion, excessive amounts of certain foods

(fats) are predisposing factors. Probably mildly infectious though not yet definitely proved.

SYM. On the scalp it may be dry with abundant grayish branry scales, or oozing and crusted, constituting eczema capitis,* and may spread to forehead and postauricular regions. On the forehead it shows scaly and infiltrated lesions with dark red bases, some itching, localized loss of hair, on eyebrows and eyelashes dry, dirty white scales, itching, on nasolabial folds or vermilion border of lips (see *Cheilitis exfoliativa*), on sternal region, greasy and unctuous to the touch, in interscapular, axillary, and genitocrural regions.

TREATMENT. Care to general health, restricted diet eliminating fatty foods. For inflamed areas. Soothing ointments. For cleansing Benzine followed by sweet or olive oil. No soap or water. Silver nitrate, sulfur, resorcin, ammoniated mercury, or salicylic acid.

SYN. *alopecia furfuracea, pityriasis capitis, seborrhea corporis, seborrhea sicca.*

d. venenata. Any inflammation caused by local action of various animal, vegetable, or mineral substances on the surface of the skin. Commonly called ivy poisoning.

ETIOI. Drugs, acids, alkalis, plants. Runs an acute course with recurrence.

SYM. Vary from simple hyperemia to gangrene and sloughing. Majority are erythematous, limited to part touched by irritant, becoming papular, vesicular, or pustular with burning or itching.

TREATMENT. Incision and drainage of bullae followed by alcohol sponge and preceded by soap and water to remove toxicodendron (poison ivy) oil. Locally aluminum acetate, lead acetate or lead lactate, or lead and opium water freely on gauze. When dry and scaly, calamine ointment by day and carbolized zinc oil by night. No soap and water until lesions heal. In ivy poisoning internal administration of rhus toxicodendron in minute doses cautiously increased. *SEE. skin.*

d. verrucosa. *SYN. Chromoblastomycosis q r.* A dermatitis characterized by the formation of wartlike nodules on the skin. These may enlarge and form papillomatous structures which sometimes ulcerate.

ETIOI. A fungus, *Hormodendrum pedrosoi*.

d., x-ray. Skin inflammation due to overdose of x-ray.

dermatograftoplasty (der-mat-o-graft-plas-ti) [*der* + *autos*, self, + *plassein*, to form]. Grafting of skin taken from some portion of the patient's own body.

Dermatobia (dér-mă-tô-bi-a). A genus of bot-flies belonging to the order *diptera*, family *Cuterebridae*.

D. hominis. A species of bot-flies found in parts of tropical America whose larvae infest man and cattle. The eggs are transported by mosquitoes of the genus *Psorophora*.

dermatobia'sis (der-mat-o-bi-as-is) [*der* + *bios*, life]. Infestation by the larvae of *Dermatobia hominis*. The larvae live in the skin forming marblelike boils.

dermatocoele (der-mă-to-sél) [*der* + *kēlē*, hernia]. Tendency of hypertrophied skin and subcutaneous tissue to hang loosely in folds. *SYN. dermatolysis.*

d. lipomato'sis. A pedunculated lipoma with cystic degeneration.

dermatocelidosis (der-mat-o-kel-i-do'sis) [G. *derma*, skin, + *kēlis*, spot, + *-ōsis*].

Freckles; a macular eruption.

dermatocellulitis (der-mat-o-sel-u-li'tis) [' + L. *cellula*, little cell, + G. *-itis*, inflammation]. Inflammation of subcutaneous connective tissue.

dermatocnolosis (der-mat-o-kon-i-o'sis) [' + *konis*, dust]. Occupational dermatitis caused by the irritation of dust.

dermatocyst (der'mat-o-sist) [' + *kystis*, cyst]. A skin cyst.

dermatodyn'ia [' + *odynē*, pain]. Pain in the skin, dermatalgia.

dermatofibro'ma [' + L. *fibra*, fiber, + G. *-ōma*, tumor]. A skin fibroma.

dermatogen (der-mat'o-jen) [' + *gennan*, to form]. Antigen from a skin disease.

dermatog'eous [' + *gennan*, to produce]. Of the nature of or producing skin or disease of skin.

dermatoglyphics (der-mā-to-glif'iks) [' + *glyphē*, a carving]. Study of surface markings of the skin, esp those of hands and feet.

dermat'ograph [' + *graphein*, to write]. 1. A device for marking the body for diagnosis. 2. A wheal made on the skin in dermatography.

dermatograph'ia, **dermatog'raphy** [' + *graphein*, to write]. 1. A treatise on the skin. 2. A form of urticaria in which wheals are made by piasuere.

der'matohet'ero-plasty [' + *eteros*, other, + *plassein*, to mold]. Grafting with grafts from another's skin.

dermatoid (der-mā-toid) [' + *eidōs*, form]. Resembling skin.

dermatokelidosis (der-mat-o-kē-li-do'sis) [' + *kēldōn*, to stain]. A macular eruption, freckle.

dermatol'ogist [' + *logos*, understanding]. A skin specialist.

dermatol'ogy [' + *logos*, understanding]. The science of the skin and its diseases.

dermatolysis (der-mā-to-lis-is) [' + *lysis*, a loosening]. Tendency of hypertrophied skin and subcutaneous tissue to hang in folds. Loose skin. SYN *cutis laza*, *cutis pendula*.

dermato'ma [G. *derma*, skin, + *-ōma*, growth]. Circumscribed thickening of skin.

dermatome (der'ma-tōm) [' + *tomē*, incision]. 1. Instrument for incising the skin or for cutting thin transplants of skin. 2. A segmental skin area innervated by various spinal cord segments. 3. The lateral portion of the somite of an embryo which gives rise to the dermis of the skin, the cutis plate.

dermatomere (der'mā-to-mer) [' + *meros*, part]. A segment of embryonic integument.

dermatomucosomyositis (der'ma-to-mū-ko'so-mi-o-si'tis) [' + L. *mucosa*, mucous membrane, + G. *mys*, muscle, + *-itis*, inflammation]. Inflammation of the skin, involving mucosa and muscles.

dermatomycosis (der'mat-o-mi-ko'sis) [' + *mykēs*, fungus, + *-ōsis*]. A disease of the skin due to a mycosis.

dermatomyo'ma [' + *mys*, muscle, + *-ōma*, tumor]. Myoma of the skin.

dermatomycosis (der'ma-to'mi-o-si'tis) [' + ' + *-itis*, inflammation]. Inflammation of the skin and muscles.

NP Rest in bed with skillful turning is essential. Mouth lesions should be irrigated frequently with hot boric acid or saline solution. Hot baths and hot fomentations help stiffness. Measures to promote free sweating every second day have been recommended. Hot, dry, flannel

bandages and baking half an hour 3 times daily have also been applied. Avoid fatigue and chilling. Massage, graduated exercise and electrotherapy are helpful in preventing or treating muscular atrophy and contractures.

dermatoneuro'sis [' + *neuron*, nerve, + *-ōsis*]. Skin disease of nervous origin.

dermatopath'ia [' + *pathos*, disease]. Any disease of the skin.

dermatopathol'ogy [' + ' + *logos*, study of]. Study of diseases of the skin.

dermatop'athy [' + *pathos*, disease]. Any skin disease. SYN *dermatopathia*.

dermatopho'bia [' + *phobos*, fear]. Abnormal fear of having a skin disease.

dermatophyte (dēr'māt-ō-fit) [' + *phyton*, plant]. A plant parasite which grows in or on the skin. They rarely penetrate deeper than the epidermis or its derivatives, hair, and nails. They cause such skin diseases as favus, tinea, or ringworm eczema, erythrasma. Important dermatophytes include the genera *Achorion*, *Microsporon*, *Trichophyton*, and *Epidermophyton*. All are fungi.

dermatophytide (der-mā-tof'i-tēd) [' + *phyton*, plant]. A toxic rash or eruption occurring in dermatomycosis.

dermatoplas'tic [' + *plassein*, to form]. Pert. to skin grafting.

dermatoplasty (der'mat-o-plas-ti). Transplanting living skin to cover cutaneous defects caused by injury, operation, or disease.

There are 4 methods. First, *Reverdin's*. Small grafts of cuticle only. Second, *Thiersch's*. Larger grafts including entire thickness of true skin. Third, *Wolfe's*. Large grafts of skin devoid of subcutaneous fat. Fourth, *Krause's*. Large grafts with underlying fat tissue.

NP Carefully disinfect the skin from which grafts are to be taken. The wound to which the grafts are applied should be dressed with narrow strips of gutta-percha tissue, rendered aseptic by washing with soap and water, rinsing thoroughly in sterilized water, immersing in 2% formalin solution for 1 hour; again rinsing in sterilized water, placing in physiologic solution until needed.

DRESSING: Safety pins. Gauze, cotton, roller bandage. Great care must be taken in adjusting bandage. If too much pressure is put on grafts they will die. These wounds are sometimes dressed with a light compress of sterilized gauze, saturated with a warm physiologic solution.

dermatorrhagia (der'mā-tor-ra'ji-ā) [G. *derma*, skin, + *regnnai*, to burst forth]. Hemorrhage into or from the skin.

dermatorrhea (der'mā-tor-re-ā) [' + *roia*, flow]. Excessive secretion of sebaceous glands.

dermatosclerosis (dēr-mā-tō-skl-rō'sis). Scleroderma. q v

dermatoscopy (der-mā-tos'ko-pl) [' + *skopein*, to examine]. Examination of the skin with a high powered lens.

dermatosiophobia (der-mā-to'si-o-fōb) [' + *-ōsis* + *phobos*, fear]. One having a morbid fear of acquiring a skin disease.

dermatosiophobia (der-mā-to'si-o-fō'bi-ā). Dread of skin disease.

dermatosis (der-mat-o'sis) [G. *derma*, skin, + *-ōsis*]. Any disease of the skin.

dermatosome (der'ma-to-sōm) [' + *sōma*, body]. Section of equatorial plate in mitosis.

der'matother'apy [' + *therapeia*, treatment]. Treatment of skin diseases.

dermatothlasia (der'mā-to-thla'zī-ā) [" + *thlasia*, a bruising]. An uncontrollable tic or impetus to pinch the skin.

dermatotome (der'mā-to-tōm) [" + *tomē*, incision]. 1. One of the fetal skin segments. 2. A knife for incising the skin or small lesions.

dermatotropic (der-mā-to-trop'tk) [" + *tropē*, a turning]. Acting esp. on the skin.

dermatoxerasia (der'mā-to-ze-ra'sī-ā) [" + *xerasia*, dryness]. Roughening of skin. SYN: *xeroderma*.

dermatozo'on [" + *zoon*, animal]. Animal parasite of the skin.

dermatrophia (der-ma-tro'fī-ā) [" + *atrophia*, atrophy]. Atrophy of the skin.

dermic (der'mik) [G. *derma*, skin]. Pert. to the skin.

dermis (der'mis) [L.]. The skin; *cutis vera* or true skin.

dermitis [G. *derma*, skin, + *-itis*, inflammation]. Inflammation of skin.

dermoblast [" + *blastos*, germ]. Part of mesoblastic layer, developing into the corium

dermographia, **dermography** (der-mo-graf'i-ā, -mog'raf-i) [" + *graphein*, to write]. The appearance of elevated red marks on the skin as the result of pressure or stroking its surface, seen in vasomotor ataxia

dermoid [" + *ekdos*, form] 1. Resembling the skin. 2. A dermoid cyst

d. cyst. A nonmalignant cystic tumor in which are found elements derived from the ectoderm, such as hair, teeth, or skin. They occur frequently in the ovary but may develop in other organs such as the lungs. 2. An ovarian teratoma

dermoidec'tomy [" + " + *ektomē*, excision]. Excision of a dermoid cyst.

dermolysin [" + *lysis*, loosening]. A substance in the blood supposed to be capable of dissolving the skin.

dermolysis [" + *lysis*, loosening]. A rare destructive disease of the skin.

dermomyco'sis [" + *mykēs*, fungus, + *-osis*]. A skin disease produced by a vegetable parasite. SYN: *dermatomycosis*.

dermonosol'ogy [" + *nosos*, disease, + *logos*, study of]. The pathology of skin affections

dermopathy (der-mop'ath-i) [" + *pathos*, disease]. Any skin disease

dermophlebitis (der-mo-fle-bl'tis) [" + *phleps*, vein, + *-itis*, inflammation]. Inflammation of superficial veins and surrounding skin

dermophylaxis [" + *phylax*, a guard]. The protective function of the skin in warding off infections.

dermophyte (der'mo-fit) [" + *phyton*, plant]. A vegetable skin parasite. SYN: *dermatophyte*.

dermorrhagia [" + *rēgnunai*, to burst forth]. Hemorrhage from or into the skin. SYN: *dermatorrhagia*.

dermoskel'eton [" + *skeleton*, skeleton]. The skin, teeth, hair, and nails.

dermostenosis (der-mo-sten-o'sis) [" + *stenōsis*, narrowing]. A tightening of the skin. SEE *scleroderma*.

dermosynovitis (dēr-mō-sin-ō-vī'tis) [" + *syn*, with, + *L. ovum*, egg, + *G. -itis*, inflammation]. Inflammation of the synovial sheaths and the adjacent skin

dermosyphilopathy [" + *syn*, together, + *philein*, to love, + *pathos*, disease]. Any syphilitic disease of the skin

dermotrop'ic [" + *tropē*, a turning]. Acting esp. on the skin.

dermovac'cine [" + *L. vaccinus*, pert. to a cow]. A vaccine for skin inoculation.

desanmania (des-an-i-ma'ni-ā) [L. *dēs*, without, + *animus*, mind, + *G. mania*, frenzy]. Amentia, dementia.

desaturat'ion [L. *dē*, from, + *saturāre*, to fill]. A process whereby a saturated organic compound is converted into an unsaturated one, as when stearic acid, $\text{CH}_3(\text{CH}_2)_{10}\text{COOH}$, is changed into oleic acid, $\text{C}_{17}\text{H}_{33}\text{COOH}$. The product is likely to differ in other ways as well.

Desault's apparat'us or ban'dage (de-sōz'). Bandage used for fracture of clavicle. SEE *bandage*.

descemetitis (des-em-et-i'tis) [G. *-itis*, inflammation]. Inflammation of Descemet's membrane on the corneal post. surface, serous cyclitis

Descemet's membrane (des'māz). A fine membrane bet. the endothelial layer of the cornea and the substantia propria; *lamina elastica posterior*. SEE *Demours' membrane*.

descemetocoele (des-se-met'o-sēl) [G. *kēlē*, hernia]. Protrusion of Descemet's membrane

descendens (de-sen'dens) [L. *dē*, from, + *scandere*, to climb]. Descending; a descending structure

d. hypoglossal, **d. noni**. A branch of the hypoglossal nerve given off at the point where it curves around the occipital artery, which passes down obliquely across the sheath of the carotid vessels (sometimes within it) to form a loop just below the middle of the neck with branches of the 2d and 3rd cervical nerves

descensus (de-sen'sus) [L. a falling] Falling, descent. SYN: *plosis*.

d. testis. BNA. Passage of the testicle down into the scrotum. SYN: *migration of testicle*

d. uteri. Defective pelvic floor allowing the uterus or part of the uterus to protrude out of the vagina

VARIETIES *First Degree*: Where the cervix uteri reaches down to the vaginal introitus *Second Degree*. Where the cervix uteri protrudes out of the vagina. *Third Degree* Where the entire uterus lies outside of the vagina. This is the condition known as procidentia uteri.

Error. This condition may be congenital or acquired, although it is most usually acquired. The etiological factors are congenital weakness of the uterine supports, as in the virginal types of prolapsus, injury to the pelvic floor or uterine supports during childbirth.

SYM. The condition is most often seen following instrumental deliveries, or where the patient has been allowed to bear down before the cervix is fully dilated. With it there is frequently associated a prolapsus of the ant. and post. vaginal walls, as seen in cystocele and rectocele. In the early stages there are dragging sensations in the lower abdomen, backache while standing and on exertion, sensation of weight and bearing down in the perineum, frequency of urination and incontinence of urine in cases associated with cystocele. In the later stages a protrusion or a swelling at the vulva is noticed on standing or straining, and leukorrhea. In procidentia there is frequently pain on walking, inability to urinate unless the mass is reduced, and quite commonly a cystitis.

TREATMENT: The treatment depends upon the age of the patient, the degree

of prolapsus, and the associated pathology. In general, there is orthopedic, postural, or surgical treatment. Where conservation is desired the use of the pessary is clearly indicated, or conservative surgery (round ligament shortening and pelvic floor repair) may be practiced. In the elderly patient where the uterus is pathological, a hysterectomy (abdominal or vaginal) accompanied by vaginal plastic work is indicated, depending upon the preferences of the operator. In the presence of large cystocele the interposition operation may be of value. In the old patient who may be a poor surgical risk, colpocleisis (surgical closure) is of value.

SYN: prolapsus uteri.

desensitization. Term applied to the condition when sensitized animals on recovering from an anaphylactic shock do not react to a subsequent injection of the antigen within a reasonable period.

desensitize [L. *dē*, from, + *sentire*, to perceive] 1. To deprive of or lessen sensitivity by nerve section or blocking. 2. To abate anaphylactic sensitiveness.

desexualize [" + *sezus*, sex]. To castrate, or to perform ovariectomy or testectomy.

deshydr'mia [" + *yđor*, water, + *aima*, blood]. Lack of fluid elements of the blood.

desiccant (des'ik-ant). Causing desiccation or dryness.

des'iccate [L. *desiccāre*, to dry up]. To dry.

desicc'ation [L. *desiccāre*, to dry up]. The process of drying up. SEE: *electrodesiccation*.

d., electric. Electric therapy to cure a lesion.

desiccative (des'ik-a-tiv, des-sik'a-tiv). Causing to dry up.

desmalgia (dez-mal'jī-ā) [G. *desmos*, band, + *algos*, pain]. Pain in a ligament.

desmectasia, desmectasis (des-mek-ta'si-ā, -tā-sis) [" + *ektasis*, dilatation]. The stretching of a tendon.

desmepithelium (des-mep-ith-e'll-um) [" + *epi*, upon, + *thelē*, nipple]. The epithelial lining of vessels and synovial cavities.

desmitis (des-mi'tis) [" + *-itis*, inflammation]. Inflammation of a ligament.

desmo- [G. *desmos*]. Prefix: A bond, a ligature.

desmobact'ria [" + *baktērion*, little rod]. Group of bacteria of a filiform shape; similar to genus *Bacilli*.

desmocyste (dez-mo-sit) [" + *kytos*, cell]. A supporting tissue cell. SYN: *fibroblast*, *fibrocyste*.

desmocy'toma (dez-mo-si-to'ma) [" + " + *ōma*, tumor]. A tumor formed of desmocytes; a sarcoma.

desmodyn'ia [" + *odynē*, pain]. Pain in a ligament.

desmo'enzyme. An enzyme which is bound to the protoplasm of cells and incapable of being extracted by present known methods, in contrast to *lyoenzymes* which can be readily extracted.

desmogenous (des-moj'en-us) [" + *genan*, to produce]. Of connective tissue origin.

desmo'glycogen. A poorly soluble form of glycogen. Differs from the more soluble form (lyoglycogen) in that it is composed of polymers of greater molecular weight.

desmog'raphy [" + *graphein*, to write]. A description of or treatise on ligaments.

des'moid [" + *eidos*, form]. 1. Tendon-like; fibroid. 2. A very tough and firm fibroma.

desmology (des-mol'o-jī) [" + *logos*, science]. Science of tendons and ligaments.

desmo'ma [" + *-ōma*, tumor]. A tumor of the connective tissue.

desmoneoplasm (dez-mo-ne'o-plazm) [" + *neos*, new, + *plasma*, matter]. A connective tissue tumor.

desmopathy (des-mop'a-thī) [" + *pathos*, disease]. Any ligament disease.

desmopexia (des-mo-peks'i-ā) [" + *pēxis*, fixation]. Fixation of round ligaments to the abdominal wall for the correction of uterine displacement.

desmoplas'tic [" + *plassein*, to form]. Causing or forming adhesions.

desmopyknosis (dez-mo-pik-no'sis) [" + *pyknosis*, a condensation]. Dudley's operation. Shortening of round ligaments by attaching them by loops to the ant. uterine wall.

desmorrh'axis (des-mor-reks'is) [" + *rēxis*, rupture]. Rupture of a ligament.

desmosis (des-mo'sis) [" + *-ōsis*]. Any disease of the connective tissue, esp. of the skin.

desmosome (des'mo-sōm) [" + *sōma*, body]. A small thickening in an intercellular bridge.

desmotomy (des-mot'o-mī) [" + *tomē*, incision]. Dissection of ligament.

desoxy. Prefix meaning deoxidized or a reduced form of.

desoxycholic acid. 3, 12 dihydrocholanolic acid (C₂₄H₄₄O₆), an acid found in bile.

desoxycortic'one (dēs-ōk-i-kōr-ti-kōs'tēr-ōn). An active steroid hormone produced by the adrenal cortex. It plays an important role in the regulation of water and salt metabolism.

d. acetate. An acetate ester of desoxycorticosterone and the form in which the hormone is usually administered in its therapeutic use. It may be injected intramuscularly or implanted as pellets subcutaneously.

desoxyephedrine (dēs-ōk'ī-ēf'ēd-rīn). A synthetic compound, related to amphetamine and ephedrine, which acts as a cerebral stimulant and vasoconstrictor. Usually used in the form of dextro-desoxyephedrine hydrochloride for the relief of fatigue, to overcome sleepiness or drowsiness, and to counteract a depressed mood.

desoxyribose (dēs-ōk'ī-rib-ōs). A phosphoric ester of a pentose present in nucleic acid. Occurs in the nuclei of all cells.

desoxyribonuclease. An enzyme produced by certain streptococci which hydrolyzes desoxyribonucleoprotein of the nuclei of cells. It is utilized in surgery for the liquifying of thick pus thus facilitating drainage.

desoxyribonucleic acid. Thymonucleic acid or desoxypentosenucleic acid. A compound originally extracted from the thymus gland and later found to be universally present in the nuclei of all cells. One of two principle classes of nucleic acids; contains desoxyribose.

desoxycholaner'sis. Increased amount of desoxycholic acid in the bile.

despumation (des-spu-ma'shun) [L. *dē*, from, + *spuma*, froth]. Separation of froth or scum from a liquid.

des'quamate [" + *squamare*, to scale off]. To shed or scale off the surface epithelium.

desquamation (des-kwa-ma'shun) [" + *squama*, scale]. Scaling of the skin or cuticle.

desquamative (des-kwam'ă-tiv) ["" + *squamare*, to scale off]. Of the nature of desquamation or pert. to, or causing it.

desquamous (des-kwam'us) ["" + *squamare*, to scale off]. Scaling or falling off, as the skin.

dessertspoon. One holding about 2 fluid drams. Spoons are not all uniform in capacity.

desudation (de-su-da'shun) [L *dē*, from, + *sudare*, to perspire]. Excessive sweating often followed by slight pustular eruption.

defelec'tasis ["" + *ektasis*, dilatation]. Lack of normal inflation, collapse of an organ.

defe'rgent [L *detergere*, to cleanse]. A medicine that purges or cleanses, cleansing.

deteriora'tion [L *deteriorare*, to deteriorate]. Retrogression, said of impairment of mental or physical functions.

determina'tion [L *determinare*, to limit]. 1 A tendency in a definite direction, as of blood, to a part. 2 A quantitative analysis.

deter'miners [L *determinare*, to limit]. Genes* or the element in chromosomes* supposed to be responsible for inherited traits.

determinism (de-term'in-izm) ["" + G. *ismos*, condition of]. The theory that all human action is the result of innate urges although they may not be conscious ones.

deter'sive [L *detergere*, to cleanse]. Detergent; cleansing or purging.

dethy'roidism [L *dē*, away, + G. *thyreoides*, like a shield]. Condition resulting from removal of the thyroid.

dethy'roidized ["" + G. *thyreoides*, like a shield]. Without a thyroid gland.

de'fonating chamber. A muffler surrounding the discharging balls of a static machine or resonator to deaden the sound of a spark discharge.

defona'tion [L *dētonare*, to thunder loudly]. A violent noise caused by an explosive combustion.

deto'xicate [L *dē*, from, + G. *toxikon*, poison]. To remove the toxic principle of a substance. SYN *detoxyfy*.

detoxyfy (de-toks'i-fi) ["" + "" + L. *facere*, to make]. To remove the toxic quality of a substance. SYN *deto'xicate*.

detrition (de-trish'un) ["" + *terere*, to wear]. The wearing away of a part, esp. through friction, as that of the teeth.

detritus (de-tri'tus) ["" + *terere*, to wear]. Any broken down or degenerative tissue or carious matter.

detruncation (de-trun-ka'shun) ["" + *truncus*, trunk]. Decapitation, esp. of a fetus. SYN *decollation*.

detrus'or uri'nae [L]. Ext. longitudinal layer of muscular coat of bladder.

detumes'cence [L *dē*, down, + *tumescere*, to swell]. 1. Subsidence of a swelling. 2. Subsidence of erectile tissue of genital organs (penis and clitoris) following erection.

diencephalon (dūt-en-sef'ă-lon) [G. *dēnteros*, second, + *egkephalos*, brain]. The interbrain. SYN: *thalamencephalon*.

deuteranopia, **deuteranopsia** (du-ter-an-o'-pē-ă, -op'sy-ă) ["" + *anopia*, blindness]. Green blindness, so named because green is the 2nd of the primary colors. SEE: *protanopia*, *tritanopia*.

deuterium (dū-ter'i-um) [G. *dēnteros*, second]. Heavy hydrogen; the mass 2 isotope of hydrogen, symbol H² or D. d. *oxide*. Heavy water.

deuteroal'bumose ["" + L. *albumen*, white of egg]. An albumose formed in peptic digestion of proteins.

deuteroelast'ose ["" + L. *elasticus*, elastic]. A deuteroalbumose formed in the peptic digestion of elastin.

deuteromyosinose (du-ter-o-mi-o'sin-ōz) ["" + G. *mys*, muscle]. A product of myosin digestion.

deuteropath'i'a, **deuterop'athy** ["" + *pathos*, disease]. A disease caused by a preceding disease.

deuteroplasm ["" + *plasma*, matter]. SYN *paraplasm*. Inclusion bodies.

deutoscolex (du-to-sko'lex) ["" + *skolez*, intestinal worm]. Secondary daughter cysts which develop on the inner wall of a hydatid cyst.

devasa'tion [L. *dē*, away, + *vasa*, vessel]. Destruction of blood vessels.

devasculariza'tion ["" + *vascularis*, pert. to a vessel]. Loss or draining of blood from a part.

devel'opment [Fr. *développeur*, to unwrap]. Growth to full size or maturity. Progress of an egg to the adult state. Evolution.

development, words pert. to: anoria, aplasia, aplastic, apposition, ateliosis, atellotic, auxanology, auxology, cacogenesis, carvogenesis, cavalry bone, cenopsychic, chondrification, chondrosis, chorista, choristoma.

developmental (de-vel-op-men'tal) [Fr. *développeur*, to unwrap]. Pert to development.

devia'tion (de-vi-a'shun) [L. *dē*, from, + *via*, way]. Going out of the way, departure from normal.

d. *conjugate*. Deviation of face and eyes to the same side in paralytics.

d. *minimum*. The smallest deviation that a prism can produce.

d. *of complement*. Incapable of hemolysis.

deviom'eter ["" + "" + G. *metron*, measure]. Device for estimating degree of strabismus.

deviscera'tion (de-vis-er-a'shun) ["" + *viscus*, viscer-, internal organ]. Removal of viscera. SYN *evisceration*.

devitaliza'tion ["" + *vita*, life]. 1 Destruction or loss of vitality. 2 Anesthetizing sensitive pulp of a tooth, known as "killing the nerve."

devolu'tion [L. *deolvere*, to roll down]. Catabolism, degeneration.

dew cure. Walking with bare feet in grass wet with dew. SYN *kneippism*. d. *point*. Temperature at which dew begins to form.

dexiocar'dia [G. *dexios*, right, + *kardia*, heart]. Displacement of heart on right side of the body.

dexter (dēks'ter) [L. *dexter*, right]. On the right side.

dextrad (dēk'trad) [L. *dexter*, right, + *ad*, toward]. Toward the right side.

dextral (dēk'tral). Pert to the right side.

dextran [L. *dexter*, right]. C₆H₁₀O₅. A monodextrin.

dextrase [L. *dexter*, right]. An enzyme that splits dextrose and converts it into lactic acid.

dextrin [L. *dexter*, right]. A yellowish-white powder which forms mucilaginous solutions in water and can be prepared by the action of heat or acid on starch.

It is a *carbohydrate* of the formula (C₆H₁₀O₅)_n. In digestion it is soluble or gummy matter into which starch is converted by diastase and is the result of the 1st chemical change in the digestion of starch.

dextrinuria (deks-trin-u'ri-ä) [" + G. *ouron*, urine] Dextrin in the urine.

dextro- [L. *dexter*, *dextr-*]. Prefix: To the right.

dextrocardia (deks-tro-kar'di-ä) [" + G. *kardia*, heart]. Having the heart on the right side of body.

dextrocardiogram [" + " + *gramma*, a writing] A cardiogram representing action of the right ventricle.

dextrocular [" + *oculus*, eye]. Having a stronger right eye than the left one.

dextrocularity (deks-trok-ü-lar'i-ti) [" + *oculus*, eye]. The condition of having the right eye stronger than the left.

dextroderivation [" + *ducere*, to lead]. The movement of visual axis to the right.

dextrogastria [" + G. *gaster*, belly]. Having the stomach on right side of body.

dextrogyrate. To turn to the right. Bending of light rays to the right.

dextrogyre (deks-tro-jü) [" + *gyräre*, to turn]. A substance turning to the right.

dextromanual [" + *manus*, hand]. Right-handed.

dextropedal [" + *pēs*, *ped-*, foot]. Having greater dexterity in using the right leg than the left one.

dextrophobia [" + G. *phobos*, fear]. Abnormal aversion to objects on right side of body.

dextrorotatory (deks-tro-rö'tä-tor-i) [" + *rotäre*, to turn]. Turning rays of light to the right.

dextrose (deks'troz) [" + *ose*, chemical name for sugar]. A simple sugar of the monosaccharose group, also known as glucose, or grape sugar $C_6H_{12}O_6$, a crystalline solid which can be made by the action of acids on starches and occurs naturally in the juices of plants and the body fluids of animals.

It is very soluble in water, is an important constituent of corn syrup and honey, and is an example of the *carbohydrates*, *q.v.* The most important of the monosaccharide group. It is usually associated with levulose. Its presence in the urine in large amounts is symptomatic of diabetes. This may also obtain in brain injuries, cirrhosis of the liver, in normal pregnancies, and as a result of the administration of adrenalin or thyroxin. It is formed in the digestive tract by the action of enzymes on carbohydrates. It occurs naturally.

Dosage 6 oz (180 Gm.) daily.

NP For rectal or subcutaneous injection 5% watery solutions are used. 1 oz. of glucose to 1 pt. of water, or added to normal saline.

USP See *disaccharose*, *glucose*.

RS *diabetes*, *glycosuria*, *glycuresis*, *hyperglycemia*, *hypoglycemia*.

dextrosinistral (deks-tro-sin-is'träl) [" + *sinister*, left]. From right to left.

dextrosuria (deks-tros-ü'ri-ä) [*dextrose* + G. *ouron*, urine]. Dextrose in the urine.

dextrotróp'ic, **dextrotrópous** [L. *dexter*, right, + G. *tropos*, a turning]. Turning to the right.

dextroversion [" + *vertere*, to turn]. Turned toward the right.

dezymotize (de-zí'mo-tíz) [L. *dē*, from, + G. *zymē*, leaven] To free of ferments or germs.

rho'bie itch. Tropical name for form of *Tinea cruris* that is more intense than that of temperate zone.

di- [G.]. Prefix. Twice.

diabetes (di-a-be'tēz) [G. *dia*, through, + *baïnein*, to go].

d. bronze, *hemochromatosis*. A disease of metabolism characterized by

deposition of pigment in various organs of the body, cirrhosis of the liver and pancreas, and diabetes.

d. descipiens. *D. mellitus* minus polyuria.

d., gouty. *D.* in people leading a life of too much food and too little exercise.

d. hepatogenes. *D. mellitus* caused by liver disease.

d., hysterical. Polyuria induced by a hysterical attack or state.

d. insipidus. Polyuria * **SYM**. Enormous amounts of urine, pale and watery. **Sp. gr** 1.002-5. No sugar or albumin. More common in the young. Thirst, weakness, dry skin. **ETIOI**. Tumors of pituitary, head injury, etc. **PROG**. Essentially chronic. **TREAT**. Pitressin jelly in nostrils for polyuria. **Surgery**.

d. mellitus. A disease of metabolism. **ETIOI**. Perhaps a result of overactivity of the adrenal and pituitary gland, or a lesion in the pancreas, the result of the destruction of certain cells in the islets of Langerhans. May be caused by temporary but severe overactivity of the ant. pituitary lobe rather than malfunction of islets of Langerhans, which may be secondary though direct cause.

SYM. Inability to utilize glucose because of the failure of the pancreas to secrete insulin in sufficient quantity to take care of the glucose in the normal diet. An abnormal discharge of urine is another characteristic.

Urine **sp. gr** 1.020-40, sugar excessive; urine shows diacetic acid, betaoxybutyric acid, acetone in last stages. Constitutional and more common in men and after the age of 40. Increased thirst, frequent urination, 3 to 10 qt. a day; itching, frequently about the genitals. Fasting blood sugar raised above normal range of 90 to 120 mg. per 100 cc. of blood, boils and carbuncles, loss of weight, emaciation, weakness, and debility. Coma ensues with weakness, and sweet odor of breath, nausea, headache, vomiting, dyspnea, sense of intoxication, delirium, deep coma, and death.

COMPLICATIONS. Very little resistance to infections, cellulitis and gangrene may set in as a result of injury to the skin. Albuminuria and pulmonary tuberculosis not uncommon.

PROG. Younger the age, the more unfavorable. Life may be prolonged although no cure has as yet been found.

TREATMENT. X-ray applied to the adrenals and pituitary glands is being tried, rather successfully. This relieves the necessity for frequent hypodermic injections of insulin. Measured, balanced diet, reduction of carbohydrates and foods containing them; at least until sugar in urine is greatly lowered, or disappears, and without an increase of sugar in the blood. Quantitative 24 hr. examination for sugar in urine to determine carbohydrate tolerance. When normal caloric food requirements are met, and sugar excretion continues, with an excess of sugar in the blood, insulin may be necessary. Its use is not required in every case and may be dangerous if not properly given. Avoid excitement and worry. Regular, quiet living, and outdoor mild exercise.

DIET. Some would treat with low carbohydrate intake and smaller or no insulin intake, in which case the ketogenic-antiketogenic ratio should never exceed 2 to 1, or if a larger carbohydrate intake is permitted and increased insulin intake is necessary, in this case any

foods are given except those containing sugar. The first objective is to make the urine sugar free and acetone free. A small amt. of fat is permitted to overcome the acetone condition. The first diet should be below maintenance requirements.

Give large quantities of water, tea, or clear broth, until excess glucose is eliminated and the urine is sugar free. The diet may now be increased in P., C and F., until the glucose tolerance has been reached. Fat may be increased if diet is below energy requirements, $\frac{1}{2}$ to twice the amt of glucose in the diet. Authorities differ on diet. Glucose may have to be added if the glucose tolerance is too low, but insulin may be necessary to care for excess glucose. Low blood sugar is called *hypoglycemia*, which may cause insulin shock and result in death. This may be overcome by feeding carbohydrates such as orange juice, or administering glucose, but it must be done quickly. All food should be weighed to meet estimate of C, P, and F necessities. Too much glucose will cause *glycosuria*.* Vitamins, minerals, and bulk must also be considered in the diet. Three meals per day, carbohydrate in dilute form, as found in 5% and 10% fruits and vegetables, although cereals may be allowed for breakfast but a lower percentage of vegetables and fruits for the other 2 meals.

No gluten flours, as most of them contain starch excepting diabetic flours or similar preparations containing no starch or sugar. Washed bran may be added to such flours, or combined with agar, to make wafers. They merely add bulk.

Individualized diet for each patient, according to grams of C, P and F ordered by a physician, is the safest.

Prvs. The total glucose in any diet is equal to all the carbohydrates plus 58% of the proteins, plus 10% of the fat. Glucose is necessary in the utilization of carbohydrates as well as proteins and fats. The carbohydrates are reduced to monosaccharides, principally glucose, the proteins to amino acids which are deaminized in the liver and changed to glucose and fatty acid and then oxidized. (Fifty-eight per cent of the protein molecule is converted into glucose and 45% to fatty acids.) Ninety per cent of fats are changed to fatty acids and 10% to glucose. Glucose is necessary to complete the oxidation of the fatty acids. Incomplete oxidation of fatty acids produces acetone bodies which, if accumulated, result in acidosis,* the cause of diabetic coma.

Most authorities use a ratio of Fat: Acid 1.5 to 1 of glucose, or 2 to 1. Normal range of glucose is 0.07% to 12%, the average 10%. In diabetes this may be raised to 0.15%, to 2% or 3%, or higher. High blood sugar is known as *hyperglycemia*.* It is the excess sugar that renders diabetics susceptible to infections.

Globin insulin for cases not controlled by protamine zinc insulin. Impaired vision with retinal bleeding helped by large doses of vitamin B and C.

NP: The nursing care of the patient with diabetes includes general hygienic care, giving insulin, collecting specimens, preventing and treating complications, serving the prescribed diet, and teaching how to take care of himself.

General hygienic care: Care of the skin and feet. The skin must be kept scrupulously clean. Daily warm baths are essential. Irritation or bruises should be promptly attended to, as any break in the skin heals with difficulty, and diabetics are susceptible to bedsores, infection and gangrene. Because of the poor circulation in the feet they should have special care. They should be kept clean and dry, especially between the toes. Care should be taken in trimming the toenails, as the slightest abrasion of the skin may become infected. Olive oil or lanolin to keep the feet soft and smooth. Tight shoes must be avoided. The care of the mouth and teeth is most important. The teeth should be brushed well at least 3 times a day and a mouthwash should be used before and after eating. The patient should be encouraged to see his dentist regularly. The bowels should be kept open by regulation of the diet, if possible, or by laxatives or enemas. Constipation should be guarded against as it predisposes to coma.

Administration of Insulin. The dosage and frequency in which insulin is given will depend on the individual patient and the physician prescribing it. In administering the drug, precautions necessary in giving hypodermic injections should be observed. Care taken not to inject the drug repeatedly in the same area and trauma should be avoided. Every diabetic patient should be taught to give himself insulin or if he is unable to give it to himself, some member of the family should be taught the full particulars.

Collecting Specimens. Both single and 24-hour specimens may be collected in 24 hours. They are usually examined daily. It is especially important that the specimens are accurately collected, labeled and sent to the laboratory on time. The diagnosis and treatment is based mostly upon the results of the urine examination. Specimens of blood may be collected by the physician, for blood chemistry. The specimen is taken early in the morning before the patient has his breakfast.

Prevention of Complications. Close observation of the patient is necessary. Shock may be avoided if the patient is closely watched or if the patient has been taught that when he has the slightest symptom of insulin reaction to call the nurse. He may be instructed to eat a lump or 2 of sugar to keep a chocolate bar within his reach.

Acidosis and coma may also be prevented by the recognition of first symptoms and prompt treatment. The chief symptoms of acidosis are pain in the abdomen, nausea, vomiting, drowsiness, and difficult breathing. The doctor should be notified when the first symptoms appear. The patient kept warm with blankets and hot water bottles. He should not be left alone. His pulse should be closely watched. Heart stimulants are given if necessary.

The Diet. The diet is the most important factor in treatment. While the nurse may not be directly responsible for the preparation of the food, she should know how to prepare and calculate a diabetic diet. She should be able to teach the patients their foods, their caloric value, and methods of preparing them. It is her responsibility to see

that the patient eats his diet. She should see that it is prepared and served as palatable and attractive as possible. Food left on the tray should be carefully measured or weighed. The quantity actually eaten should be recorded.

Teaching the Patient. There is perhaps no other disease in which it is as important that the patient is taught all the factors involved in the management and treatment. The patient should understand that he will have to continue treatment all his life and that he must abide strictly by everything taught him in the hospital. His mouth and teeth should be kept in good condition. It is necessary to pay particular attention to his feet. His diet must be followed. He should also understand the complications that may arise and the measures he may take to prevent them. He is taught to take his insulin and examine his urine. He should be taught importance of reporting to physician for frequent check-ups.

RS *alcuronat, Cantani's diet, casoid, coma, diabetic, hyperglycemia, insulin, insulin shock, melituria*

d., pancreatic. D associated with disease of the pancreas

d., phlorizin. Glycosuria caused by administration of phlorizin.

d., puncture. See *artificial d.*

d. renal. Renal glycosuria. Condition characterized by a low renal threshold for sugar. Glucose tolerance is normal and diabetic symptoms are lacking.

d., true. See *d. mellitus*

diabetic (di-ab-et'ik). Pert to diabetes

d. center. Area in the floor of the fourth ventricle

d. ear. Otitis media diabetica

d. neuritis. Multiple neuritis of diabetics

d. sugar. Glucose in the sugar of the urine of diabetics

d. fabes. Diabetes with neuritic pains in leg and loss of knee jerk

diabetide (di-ab-et'id). A cutaneous form of diabetes

diabetin (di-ä-be'tin) [G *dia*, through, + *baein*, to go] Pure crystallized levulose used as a substitute for cane sugar in diabetes

diabetogenic (di-ab-et-o-jen'ik) [" + " + *gennan*, to produce]. Causing diabetes

diabetogenous (di-ab-e-toj'en-us) [" + " + *gennan*, to produce]. Diabetogenic*; caused by diabetes.

diabetometer (di-ab-et-om'e-ter) [" + " + *metron*, a measure] A device for measuring sugar in diabetic urine

diab'olep'tic [G. *diabolos*, devil, + *lepsis*, a seizure] One professing to have supernatural communication, esp. with the devil.

diabro'sis [G. *diabro'sis*, an eating through]. A corrosion causing perforation.

diabrot'ic [G. *diabro'sis*, an eating through]. 1. Corrosive. 2. An escharotic or corrosive

diacela (di'as-el) [G. *dia*, between, + *kollos*, a hollow]. The 3rd ventricle of the brain

diacetate (di-as'et-ät). A salt of diacetic acid.

diacetemia (di-as-et-e'mi-ä) [diacetic acid + G. *ama*, blood]. Diacetic acid in the blood.

diace'tic acid. Acetoacetic acid, found in acidosis and in the urine of the diabetic.

It is similar to acetone and is found in serious diabetes and in persistent vomiting after anesthesia

d. a. TEST FOR IN URINE. Half fill a test tube with freshly voided urine. Then add, drop by drop, some ferric chloride solution, which will cause a deposit of iron phosphate to form. Now filter the mixture and add a few more drops of ferric chloride. If diacetic acid is present a port wine color develops. The specimen is now divided into 2, 1 being used as a control. One-half is boiled, when the color will quickly disappear if it is due to diacetic acid

diacetonu'ria [diacetic acid + G. *ouron*, urine] Diacetic acid in urine, diaceturia.

diaceturia (di-as-ë-tu'ri-ä) [" + G. *ouron*, urine] Diacetonuria, diacetic acid in urine.

diac'id [G *dis*, twice, + L *acidus*, soured]. Having 2 atoms of hydrogen replaceable with a base

diac'lasia (di-ak-la'si-ä) [G *dia*, through, + *klaia*, to break] A fracture, esp. breaking a bone before surgery

diac'lasi (di-ä-klä'si) [" + *klaia*, to break] Device for perforating the fetal skull

diacrinous (di-äkr'in-us) [G. *diakrinein*, to separate] Pert to cells which secrete outwardly, exocrine

diacrisis (di-äkr'i-sis) [G. *diakrissis*, separation] 1. A change in the character of a secretion. 2. Any disease having an altered secretion. 3. A critical discharge.

diacrit'ic, diacrit'ical [G *dia*, apart, + *krinein*, to judge]. Diagnostic, said of symptoms

diad (di'ad) [G *dis*, twice]. An element or radical having an atomicity of 2; a bivalent.

di'aderm. Blastoderm composed of ectoderm and endoderm, and containing between them the segmentation cavity.

diadochokinesia (di-ä-dok'o-ki-ne'si-a) [G. *diadokos*, succeeding, + *kinesis*, motion] Ability to make antagonistic movements, as pronation and supination, in quick succession

di'agnose [G *dia*, through, + *gignoskein*, to know] To determine the cause and nature of a pathological condition; to recognize a disease

diagnosis (di-ag-no'sis) (pl *diagnoses*) [" + *gnosis*, knowledge] Recognition of disease states from symptoms, auscultation, inspection, palpation, percussion, posture, reflexes, general appearances, abnormalities and abnormal attitudes and habits, microscopic and chemical examinations, x-ray, mechanical, and other means

d., clinical. One determined by symptoms alone. They may be *objective* (visible symptoms); *subjective* (those of internal or mental origin), and *cardinal* (those pert to respiration, pulse, and temperature). Symptoms may be *local* or conditions may be pathological. Each disease seems to have some symptom or symptoms in common with some other disease

d. cytological. D. based on cells present in body tissues or exudates

d., differential. Comparison of symptoms of 2 similar diseases to determine from which the patient is suffering. See: *differential diagnosis*.

d. by exclusion. True d. by elimination of all others

d. pathological. D. based on structural lesions present.

d., physical. D. by external examination only.

d. roentgen. D based on roentgenograms

d., serum. D by means of serum and its effects

diagnosis, words pert. to: abdomen, acatalepsia, anaphia, appetite, auscultation; autoserodiagnosis, blood, breathing; cerebroscopy, chest, chromodiagnosis; chromoscopy; colic, coma, constipation, convulsion; cough, diffusion, ear, examination, physical, eyeball, eye, face, fatigue, feces, fever, food poisoning, gait, gums; head, examination of, headache, hunger, inspection; infection, inflammation, nail, nausea, organ, see name of, pain, palate, pallor, palpation, palpitation, percussion, perspiration, position, posture, pulse, pupil, pus, reflexes, respiration, skin, sputum, syncope, teeth, temperature, tongue, unconsciousness, urine, vertigo, vomiting

diagnosis'tic. Pert to a diagnosis.

diagnosti'cian, di'agnost [G *dia*, through, + *gignoskein*, to know] One skilled in diagnosis

diagraph (di'ă-graf) ["" + *graphein*, to write]. Device for recording outlines, esp of the cranium

dial. A derivative of barbital,* but more active

Uses Sedative and hypnotic.

Dosage $\frac{1}{2}$ -1½ gr (0.01 Gm.). See *barbital*

dialec'trol'y'sis [G *dia*, through, + *ēlekttron*, amber, + *lysis*, loosening] Treatment by ionization

Dialis'ter pneumosin'fes. A bacterium found in the nasal secretion at beginning of influenza

dialy- [G] Prefix To separate

dialysate (di-al'is-ăt) [G *dia*, through, + *lyein*, to loosen] A liquid that has been dialyzed

dialysis (di-al'is-is) ["" + *lysis*, loosening] 1 The passage of a solute through a membrane 2 A process in which a liquid to be purified or studied is enclosed in a thin, membranous sack and exposed to water or any other solvent which continually circulates or changes outside the sack

Diffusible substances pass through the membrane, but colloidal material does not. See *absorption*, *diffusion*, *osmosis*.

dialy'tic. Belonging to or resembling the process of dialysis

di'alyze [G *dia*, through, + *lyein*, to loosen]. To make a dialysis or to have made one

dialyzable (di-al-iz'ă-bl). Capable of dialysis.

dialyzer (di'al-iz-er) [G *dia*, through, + *lyein*, to loosen] Membrane used in performing dialysis

diamagnet'ic ["" + *magñēs*, magnet] Repulsion by the magnet.

diameter (di-am'et-er) ["" + *metron*, a measure] The distance from any point on the periphery of a surface, body, or space to the opposite point.

d., anterior transverse, of the fetal head. See *temporal d.*

d., anteroposterior, of the pelvic cavity. The distance bet middle of symphysis pubis and upper border of 3rd sacral vertebra

d., a., of the p. inlet. The distance from upper part of symphysis pubis to promontory of sacrum

d., a., of skull. The distance in a straight line bet the metopic point and the most remote point upon the external surface of the tabular portion of the occipital bone, or bet. most prominent

point of the glabella and the most prominent point upon the external surface of the occipital bone

d., basilobregmatic. Distance in a straight line bet basilon and bregma.

d., Baudeloque's. See: *external conjugate d. of pelvis*.

d., blauricular. 1. Distance in a straight line bet 2 points on a line passing over the vertex and uniting the 2 auricular points, each immediately above the ridge which continues the zygomatic arch backward 2 Transverse distance bet the centers of external auditory meatuses, or bet middle point of the upper margins of each external auditory meatus

d., biglenoid. Distance bet the center of 1 glenoid cavity of the temporal bone and that of the other

d., bigoniac. Distance bet. the 2 gonions

d., bijugal. Horizontal distance bet 2 malar points

d., bijugular. Transverse distance bet. 2 jugular points

d., bimalar. The transverse distance bet 2 malar points

d., bimandibular. Transverse distance bet tubercles on the inferior borders of the inferior maxilla

d., bimastoid. Transverse distance bet 2 mastoid processes of the temporal bone

d., biparietal. Transverse distance bet parietal eminences on each side

d., bisacromial. Transverse distance bet 2 acromial processes.

d., bisiliac. Transverse distance bet. most distant points of the crests of the 2 ilia SYN *intercristal d.*

d., bisiliadic. See *transverse d. of pelvis*.

d., bitemporal. Distance bet. 2 most distant points of the coronal suture

d., bitrochanteric. Distance bet the highest point of 1 trochanter major and that of the other. SYN *intertrochanteric d.*

d., bizygomatic. Greatest transverse distance bet most prominent points of the zygomatic arches

d., cervicobregmatic. Distance bet anterior fontanel and junction of the neck with floor of the mouth.

d., diagonal conjugate, of the pelvis. The distance from the upper part of the symphysis pubis to the most distant part of the brim of the pelvis

d., external biorbital. Greatest transverse distance bet outer borders of external orbital apophyses of the frontal bone

d., external conjugate, of the pelvis. Anteroposterior d. of the pelvic inlet measured externally, distance from the skin over the upper part of symphysis pubis to the skin over a point corresponding to the sacral promontory.

d. of fetal skull. Important diameters at full term are. Suboccipitobregmatic, 3½ in.; cervicobregmatic, 8½ in.; fronto-mental, 3 1/5 in.; occipitomenal, 5 in.; supraoccipitomenal, 5½ in.; occipito-frontal, 4½ in.; suboccipitofrontal, 4 in.; biparietal, 3¾ in.; bitemporal, 3 1/5 in.

d., frontomenal. Distance from top of forehead to point of chin

d., inial. Distance in a straight line, in median line of skull, bet. most prominent points of the inion and the glabella.

d., internal biorbital. Greatest transverse distance bet. inner borders of the

external orbital apophyses of the frontal bone

d., interspinous. Distance bet 2 anterior superior spines of the ilia.

d., maximum anteroposterior, of the skull. Distance, in the median line, bet. the most prominent part of the glabella and the most prominent point in the middle line upon the tabular portion of the occipital bone

d., m. frontal. Distance bet. 2 stephaniae

d., m. occipital. Distance in a straight line bet. 2 asterions

d., m. transverse, of the skull. Longest horizontal transverse line that can be drawn within the cranium.

d., mentobregmatic. Distance from chin to middle of anterior fontanel

d., minimum frontal. Distance bet. 2 extremities of supraorbital line.

d., occipitofrontal. That extending from root of the nose to most distant point of the occiput.

d., occipitomental. Greatest distance bet occiput and chin.

d. of pelvis. OBST *Anteroposterior* the distance bet the sacrovertebral angle and the symphysis pubis *Bischal* Bet the ischial spines *Conjugata diagonalis* Bet the sacrovertebral angle and the symphysis pubis *Conjugata vera* The true conjugate Bet. the sacrovertebral angle and the middle of the post aspect of the symphysis pubis (about 15 cm. less than the diagonal conjugate) *Deventer's Oblique* Bet the sacroiliac synchondrosis on 1 side and the ileopectineal eminence on the other side *Intercristus* Bet the crests of the ilium. *Interspinous* Bet the spines of the ilium. *Intertrochanteric* Bet the greater trochanters when the hips are extended and the legs are held together *Internal conjugate* Bet the promontory of the sacrum and the upper edge of the symphysis pubis *Pelvic.* Any diameter of the pelvis found by measuring a straight line bet any 2 points. *Transverse d. of the inlet* Bet the 2 most widely separated points of the *linea terminalis*, at right angles to the *conjugata vera* *Transverse d. of the pelvic outlet* Bet the tuberosities of the ischium. SEE *pelvis*.

d., sacrosupubic. Distance bet. middle of promontory of sacrum and middle of lower border of the triangular ligament of pubic symphysis

d., sagittal. SEE *basilobregmatic d.*

d., sternovertebral. Distance from sternum to vertebral column, measured externally

d., suboccipitobregmatic. That extending from middle of ant. fontanel to lowest accessible point of the occiput

d., suboccipitofrontal. Greatest distance bet forehead and junction of occiput with the neck

d., subtemporal. Distance bet point upon sphenotemporal suture which is crossed by the ridge upon the inferior surface on the greater wing of the sphenoid bone of 1 side and a similar point on the other side.

d., temporal. Greatest horizontal distance bet 2 opposite points upon the line passing over the vertex and uniting the 2 auricular points, on surface of the temporal bones.

d., trachelobregmatic. D. bet. ant. fontanel and meeting point of neck with floor of mouth.

d., vertical, of fetal head. That extending from highest point of head to ant margin of foramen magnum

diamide (di-am'id) [L *di*, two, + *amide*] A double amide SEE *hydrazine*.

diamine (di-am'in) [L *-i*, amine]. A chemical compound with 2 NH₂ radicals

diaminuria [" + " + G *ouron*, urine]. Diamines in the urine

diapason (di-ä-pa'sun) [G *dia*, through, + *päson*, all] A diagnostic tuning fork used in diseases of the ear.

diapedesis (di-ä-ped-e'sis) [" + *pëdan*, to leap]. Passage of blood cells, esp leucocytes by amoeboid movement through the unruptured wall of a capillary vessel

diaphane (di-ä-fän) [" + *phainem*, to appear] 1 The investing membrane of a cell 2 A very small electric light utilized in transillumination

diaphanometer (di-ä-fan-om'et-er) [" + " + *metron*, a measure] A device estimating amt of solids in a fluid by its transparency.

diaphanometry [" + " + *metron*, measure] Determination of translucency of a fluid, as the urine

diaphanoscope (di-ä-fan'o-sköp) [" + " + *skopein*, to examine] Device for electric examination of body cavities

diaphanocopy [" + " + *skopein*, to examine]. Examination of fluids by the diaphanoscope

diaphemetric (di-ä-fe-met'rik) [" + *aphë*, touch, + *metron*, measure] Pert to degree of tactile sensibility

diaphoresis (di-ä-for-e'sis) [" + *pherein*, to carry] Profuse sweating

diaphoretic (di-ä-for-et'ic) [" + *pherein*, to carry] A sudorific or an agent which increases perspiration The term sudorific is usually confined to those active agents that cause drops of perspiration to collect on the skin Ex *camphor*, *opium*, *pilocarpine*. Heat may also be included as such an agent

d. drugs. These produce their effects either by stimulation, or general applications, or both

d., nauseating. One, such as warm drinks or sweat baths, which dilates superficial capillaries and causes relaxation

d., refrigerant. One that acts on sweat centers in the spinal cord and medulla, and reduces circulation, i.e., lobelia, tobacco.

d., simple. One that stimulates sudoriferous glands, such as sulfur.

diaphragm (di-ä-gram) [" + *phragma*, wall] 1 Thin membrane such as one used for dialysis, 2 In microscopy, an apparatus located beneath the opening in the stage by means of which the amount of light passing through the object can be regulated, 3. A rubber or plastic cup which fits over the cervix uteri and used for contraceptive purposes, 4 A musculomembranous wall separating the abdomen from the thoracic cavity with its convexity upward. It contracts with each inspiration, flattening out downward, permitting the descent of the bases of the lungs. It relaxes with each expiration, elevating it and restoring its inverted basinshape. The deeper the inspiration the lower the descent of the diaphragm, the greater the expiration, the higher does it rise.

Its origin is at a level with the 6th ribs or intercostal spaces ant., and the 11th or 12th ribs post. The right half rises higher than the left. The lower surface is in relation to the suprarenal

ACTION OF THE DIAPHRAGM

A. Expiration
B. Inspiration

bodies of the kidney, the liver, spleen, and cardiac end of the stomach. It aids in defecation and parturition. It becomes spasmodic in hiccoughs and sneezing.

SEE *midriff*, *phrenic*, "*phren-*" words, *tendineum centum*.

d., hernia of. Protrusion of abdominal contents through the diaphragm. ETIOI. Congenital or through injury.

d., pelvic. The musculo-fascial layer forming the lower boundary of the abdominopelvic cavity.

It is funnel-shaped, and is pierced in the midline by the urethra, vagina, and rectum. Consists of a muscular layer made up of the paired levator ani and coccygeus muscles. The fascial layer consists of 2 portions, the parietal and visceral layers, the former being made up of the peritoneum continuous with the connective tissue sheaths of the psoas and iliac muscles, the visceral layer is split from the parietal layer at the white line passing downwards and inwards to form the upper sheath of the levator ani muscles, the ant. part of this layer unites the bladder to the post. wall of the pubes.

The middle portion splits into 3 parts: (a) The vesical layer investing bladder and urethra; (b) rectovaginal layer forming the rectovaginal septum; (c) the rectal layer investing the rectum, the post. part is the base of the broad

ligament where it sheaths the uterine arteries and supports the cervix.

d. urogenital. Urogenital trigone, or triangular ligament. A musculo-fascial sheath which lies between the ischio-pubic ram. It lies superficial to the pelvic diaphragm and in the male surrounds the membranous urethra, in the female it surrounds the vagina.

diaphragmal'gia [G. *dia*, through, + *phragma*, wall, + *algos*, pain]. Pain in the diaphragm.

diaphragmat'ic. Pert. to the diaphragm.

diaphragmat'itis [G. *dia*, through, + *phragma*, wall, + *-itis*, inflammation]. Inflammation of the diaphragm.

diaphragmatocele (di'-ă-frag-mat'o-sēl) [" + " + *kēlē*, hernia]. Hernia of the diaphragm.

di'aphragm'itis [" + " + *-itis*, inflammation]. Inflammation of the diaphragm.

SYN *diaphragmatitis*.

di'aphragmodyn'ia [" + " + *odynē*, pain].

Pain in the diaphragm.

diaph'ysary [" + *phyein*, to grow]. Pert. to or affecting the shaft of a bone.

diaphyse'ctomy [" + " + *ektomē*, excision]. Removal of part of the shaft of a long bone.

diaphysis (di-af'i-sis) [" + *plassein*, to grow]. The shaft or middle part of a long cylindrical bone. SEE *apophysis*, *epiphysis*.

diaphysitis (di-ă-fi-si'tis) [" + " + *-itis*, inflammation]. Inflammation of shaft of a long bone.

diap'ysis (di-ap'la-sis) [" + *plassein*, to form]. Reduction of a fracture or dislocation. SYN *diorthosis*.

di'aplex [" + L *plexus*]. Choroid plexus of 3rd ventricle.

diaplex'al. Pert. to the diaplex.

diaplex'us [G. *dia*, through, + L *plexus*, braid]. Choroid plexus of 3rd ventricle.

diap'noic (di-ap-no'ik) [G. *dia*, through, + *pnein*, to breathe]. 1 Pert. to or causing perspiration, esp. insensible p. 2 A mild sudorific.

diapoph'ysis [" + *apophysis*, outgrowth]. An upper articular surface of transverse process of a vertebra.

diap'ysis (di-ap-i-e'sis) [" + *pyon*, pus]. Suppuration.

diap'ytic (di-ap-i-et'ik). Pert. to or causing suppuration.

diarr'hea (di-ă-re-ă) [G. *dia*, through, + *rein*, to flow]. Morbid frequency of bowel evacuation, the stools having a more or less fluid consistency. It is a frequent symptom of gastrointestinal disturbances and is primarily the result of increased peristalsis.

ETIOI. Diet, inflammation or irritation of the mucosa of the intestines, gastrointestinal infections, certain drugs, psychogenic factors.

d., acid. Green, broken stools with sour odor.

d., acufe. TREATMENT: Barley water, lime water, whey, albumin water, isin-glass, rice milk, arrowroot, corn flour, white of eggs; brandy or sherry. Gradual return to ordinary diet.

d., bilious. Bile in the stools.

d., catarrhal. D. caused by degeneration in the intestines.

d., choleraic. D. accompanying cholera in severe form with vomiting and collapse.

d., chronic. TREATMENT: (a) Light food; lean meat, white fish, white of eggs; tongue, scraped meat, potted meat, poultry; spinach, vegetable marrow, puree of potato; milk puddings, arrowroot, corn flour; jelly; cooked apples;

toast, cereals, but not whole wheat; cake; dry toast, rusk; whey, buttermilk, sour milk; tea, coffee, or cocoa (in moderation); red wine, whortleberry wine. Avoid oatmeal, all fibrous foods and causes of intestinal fermentation, meat extracts, strong soups, much sugar, and fat

(b) Pure milk diet; fresh milk, sour milk.

(c) If very persistent, try protein diet: Raw meat, sandwiches, eggs on toast, chicken, fish, sweetbread, custard, junket, jelly; with small allowance of zwieback, rusk, or toast, butter, sour milk, alum, whey, red wines.

(d) Any food which has been passed through a fine hair sieve.

d., colliquative. Variety causing collapse, due to frequency of evacuation

d., congestive. Form caused by congestion of alimentary tract

d., critical. D. causing a crisis, or occurring at the time of a crisis.

d., dry. Variety in which stools are exceptionally small, but can cause death.

d., dysenteric. D. with mucus and bloody discharge.

d., emotional. Form caused by emotional stress.

d., fatty. D. with stools containing undigested fat particles

d., infantile. In children under 2 years Dysentery, *q. v.* **Sym** Skin dry, temperature, high, thirst, pains, increase of stools with change of color and consistency **Treatment** Water, woolen clothing, no food, warm baths, hot applications or mustard plaster, emetic enemas, cleanliness, fresh air

d., inflammatory. Type caused by increased vascularity of intestinal mucosa.

d., intermittent. D. recurring, due possibly to malarial poisoning.

d., henteric. Watery stools with undigested food particles

d., membranous. D. with passage of pieces of intestinal mucosa

d., nervous. Nervous increase of peristalsis. **Treatment** In general, heat externally, rest, enemas and cathartics if resulting from constipation, sedatives if of nervous origin **Diet** Starvation diet of broth, and hot water for a day or 2.

d., mucous. D. with mucus in stools.

d., puerperal. Form occurring in puerperas, caused by septicemia or indigestion

d., purulent. Presence in stools of pus, due to intestinal ulceration.

d., serous. Water stools

d., simple. Variety in which stools contain only normal excreta

d., summer. D. occurring during summer heat and due usually to pathogenic bacteria present in contaminated food.

d., ulcerative. Severe d. with ulceration of mucosa of intestines.

diarthric (di-arth'rik). Pert. to 2 or more joints.

diarthrosis (di-arth'ro-sis) [G. *dia*, through, + *arthrōsis*, a joining]. An articulation in which opposing bones move freely, a hinge joint

diartic'ular [G. *dis*, two, + *L.* *articulus*, joint] Pert. to 2 joints

diaschisis (di-as'ki-sis) [G. *dia*, apart, + *schizein*, to split]. Disturbance or injury to 1 part of central nervous system may cause alteration in function of some distant part.

diascope (di-as-kōp) [+ *skopein*, to examine]. A glass held against the skin for ascertaining noncongestive changes.

diastal'sis [+ *stalsis*, contraction]. Ability to distinguish 1 thing from another.

diastal'tic. Denoting reflex action.

diastase (di-as-tas) [G. *diastanaí*, to separate]. A specific enzyme or ferment in plant cells, such as in sprouting grains and malt, and in the digestive juice which converts starch into sugar.

d. index. Normal index in urine bet. 6.6 and 30. Lower if kidney is diseased. In acute disease of pancreas may be 200 or more, due to pancreatic obstruction.

diastasis (di-as'ta-sis) [G. *a separation*].

1. In surgery, injury to a bone involving separation of an epiphysis. 2. In cardiac physiology, the last part of diastole.

It follows the period of most rapid diastolic filling of the ventricles, consists of a period of retarded inflow of blood from auricles into ventricles, lasts (in man under average conditions) about 0.2 seconds, and is immediately followed by auricular systole

d. recti. A separation lateralward of the 2 halves of the *m. rectus abdominis*.

diaste'ma [G. *an interval or space*]. 1. A fissure 2. A space bet 2 teeth.

diastematocrania (di-as'tem-at-o-kra'-ni-ā) [+ *kranion*, cranium] Congenital sagittal fissure of the skull

diastematomyelia (di-as'tem-at-o-mi-e'-li-ā) [+ *myelos*, marrow]. Congenital splitting of the spinal cord

diastematopy'elia [+ *pyelos*, pelvis]. Median slit of the pelvis, congenital.

diaster [G. *dis*, twice, + *astēr*, star].

Syn *amphaster*, *q. v.* In mitosis the achromatic figure consisting of two asters connected by spindle fibers

1. Daughter star. 2. Figure formed by 2 aster-shaped masses of chromatin in a maturing ovum

diastole [G. *diastellein*, to expand]. **Phys.** The normal period in the heart cycle during which the muscle fibers lengthen, the heart dilates, and the cavities fill with blood, the atria before the ventricles, roughly, the period of relaxation alternating with systole or contraction, thus constituting the pulsation of the heart **See** *heart*, *murmurs*, *pulse*, *systole*.

diastol'ic. Pert. to diastole

d. pressure. This is the point of the greatest cardiac relaxation

If the diastolic pressure does not drop in proportion to the systolic pressure this is known as a sign of danger.

RS' *blood pressure*, *diastole*, *pulse*, *pulse p.*, *systolic p.*

diastreph'ia (di-as-tref'i-ā) [G. *diastrephēin*, to pervert] Psychosis exhibiting extreme cruelty.

diataxia [G. *dis*, two, + *ataxia*, lack of order]. Ataxia of both sides of body.

d. cerebr'al'is Infant'il'is. Birth palsy **diatela**, *diatela* (di-ā-te'lā, -lē) [G. *dia*, between, + *L.* *tela*, web]. Membranous roof of 3rd ventricle

diater'ma [+ *terma*, end]. Portion of the floor of 3rd ventricle.

diathermal (di-a-ther'mal) [+ *thermē*, heat] Permeable by radiant heat.

diather'manous [+ *thermainein*, to heat] Diathermal*, permeable by heat.

diather'mia [+ *thermē*, heat]. An inferior term for diathermy. **See:** *diathermy*.

diather'mic. Of the nature of diathermy or of its results

diathermy (di-ā-ther'mi) [G. *dia*, through, + *thermē*, heat]. The therapeutic use

of a high frequency current to generate heat within some part of the body

The frequency is greater than the maximum frequency for neuromuscular response, and ranges from several hundred thousand to millions of cycles per second

d., medical. The generation of heat within the body by the application of high frequency oscillatory current for medical purposes.

d., short wave. Treatment by patient's being placed in the path of diathermic rays, but not in contact with either electrode

d., surgical. D of high degree for electrocoagulation, cauterization, etc.

diathesis (di-ath'e-sis) [G *diathēnāi*, to dispose]. Constitutional predisposition to disease

diathetic. Pert to diathesis, or predisposition

diatom [G *dis*, twice, + *atomos*, atom] One of a group of unicellular microscopical plants belonging to the Algae. They possess a siliceous cell wall

diatom'ic. 1. Containing 2 atoms, said of molecules. 2. Bivalent

diato'ric [G *dīatoros*, bored through] Artificial teeth attached with vulcanized rubber to their bases

diax'on, diax'one [G *dis*, twice, + *axōn*, axis] A neuron having 2 axons

diazo- A formative of names of compounds derived from 2 aromatic hydrocarbons, containing 2 atoms of nitrogen with phenyl

d. reaction. A deep red color in urine. SEE *Ehrlich's d. r.*

diba'sic [G *dis*, twice, + *basis*, base] Containing in each molecule 2 atoms of hydrogen replaceable by a base, said of acids

di'blas'tula [" + *blastos*, sprout] A blastule containing the ectoderm and endoderm.

Dibothriocephalus (di-both'ri-o-sef'al-us) [" + *bothrion*, pit, + *kephalē*, head] SYN *Diphylobothrium*, q. v.

dical'cic [" + *L. calx*, lime] Containing 2 atoms of calcium in a molecule

d. orthophosphate. CaHPO_4 A salt, often found in the urine

dicalcium.

d. orthophosphate. $2\text{H}_2\text{O}$ to formula. Used therapeutically for calcium and phosphorus deficiencies

dichloramine-T (di-klor'a-mēn) USP. White powder containing about 28% chlorine.

ACTION AND USES. Germicide and disinfectant.

dichloro-hexyl-resorcinol (dī-klē'rō-hek'-sil-rē-sor'sin-ōl) An antiseptic effective against streptococcus, staphylococcus and *B. pyocyaneus*.

dicho'tomy, dichotomiza'tion [G *dicha*, twofold, + *tomē*, a cut] 1. Division into 2 parts, as bifurcation of the embryo. 2. Sharing of fees between practitioner and consultant

dichroic (di-kro'ik). Pert to dichroism.

dichroism (di'kro-izm) [G *dis*, twice, + *chroa*, color] Property of a substance appearing to be 1 color by direct light and another by transmitted light

dichro'masy [" + *chrōma*, color] Able to see only 2 colors

dichromat'ic. Being able to see only 2 colors

dichromatopsia (di-kro-mat-op'si-ā) [G. *dis*, twice, + *chrōma*, color, + *opsis*, sight]. Ability to distinguish only 2 primary colors.

dichro'mic. 1. Containing 2 atoms of chromium. 2. Seeing only 2 colors.

dichro'mophil [G *dis*, twice, + *chrōma*, color, + *philein*, to love] Double staining with both acid and basic dyes.

dichromophilism (di-kro-mof'il-izm) [" + " + *ismos*, condition of] Having the capacity for double staining

Dick method. A toxin-antitoxin injection for the prevention of scarlet fever.

D. test. *Negative Reaction* Some slight inflammatory changes due to irritation by proteins in fluid administered. SEE *Schick method*, *Schick test*.

In a manner somewhat similar to the Schick testing for diphtheria, a person's susceptibility to scarlet fever may be ascertained by the injection of a standardized toxin of the *Streptococcus hemolyticus*. A positive reaction in the shape of erythema appears in about 12 to 24 hours. Patients convalescent from scarlet fever invariably give a negative reaction. Susceptible persons can subsequently be actively immunized by graded doses of a specific toxin, or passively immunized by the administration of scarlet fever antitoxic serum

dicliditis (dik-li'di'tis) [G *diktides*, valve, + *-itis*, inflammation] Inflammation of a cardiac or other valve

diclidostosis (di-kli'd-os-to'sis) [" + *osteon*, bone] Ossification of the venous valves

diclidot'omy [" + *tomē*, incision] Cutting a valve, esp. a rectal one

dico'ria [G *dis*, double, + *korē*, pupil] Double pupil in each eye

dicrotic (di-kro'tik) [G *dikrotos*, beating double] One heartbeat for 2 arterial pulsations, rel. to a double pulse

d. notch. In a pulse tracing, a notch on the descending limb

d. wave. A positive wave following the dicrotic notch

dicrotism (di'krot-izm) [" + *ismos*, condition of] The state of being dicrotic

dictyoma (dik-ti-ō-ma) [G *diktyon*, net, + *-ōma*, tumor] A retinal tumor.

dicumarol (di-cū'mā-iōl) A trade name for *bishydroxycoumarin* USP, an anti-coagulant that decreases activity of prothrombin in the blood plasma and hence increases prothrombin time

USES In prophylaxis and treatment of intravascular clotting, in postoperative thrombophlebitis, pulmonary embolism, acute peripheral embolism and thrombosis, and recurrent idiopathic thrombophlebitis. Used also in management of acute coronary thrombosis. Frequently an adjunct to heparin, q. v. *RS heparin*, *menadiolone sodium bisulfite*, *vitamin K*

CONTRAINDICATIONS Subacute bacterial endocarditis, recent brain and spinal surgery, purpura and blood dyscrasias, and in absence of prothrombin determination

DOSEAGE Original dose, 200-300 mg orally. Succeeding doses (with prothrombin activity over 25 per cent), 100-200 mg daily

didac'tylism [G. *dis*, twice, + *daktylos*, finger]. The congenital condition of having only 2 digits on a hand or foot

didial (di'di-āl) Proprietary hypnotic.

didymalgia (did-im-al'i-ā) [G *didymos*, testis, + *algos*, pain] Pain in a testicle

didymitis (did-i-mi'tis) [" + *-itis*, inflammation] Inflammation of a testicle. SYN *orchitis*.

didymodynia (did'i-mo-din'i-ā) [" + *odynē*, pain]. Pain in a testicle.

didymus (did'ī-mus) [G. *didymos*, twin, testis]. 1. A twin. 2. A double monstrosity. 3. A testicle

diachroscope (di-ek'o-skōp) [G. *dis*, twice, + *echo*, echo, + *skopein*, to examine]. A stethoscope that gives 2 sounds in 2 different parts at the same time

di'elec'tric [G. *dia*, through, + *elektron*, amber]. An insulating substance offering great resistance to passage of electricity by conduction through which electric force may act by induction.

dielectrolysis (di'ē-lek-trol'ī-sis) ["" + *lysis*, loosening]. The forcing of a drug or medicinal compound to a particular part of the body by osmosis brought about or accelerated with an electric current

diencephalon (di-en-sef'ā-lon) ["" + *egkephalos*, brain] SYN *thalamencephalon*, *interbetween brain*, *tween-brain* Second portion of the brain or that lying between the telencephalon and mesencephalon. It includes the epithalamus, thalamus, metathalamus and hypothalamus

Dientamoeba (di-ēn-tā-mē'bā) A genus of parasitic protozoa characterized by possession of two similar nuclei. They belong to the class *Sarcodina*, order *Amebidae*

D. fragilis. A species of parasitic amebae inhabiting the intestine of man. There is strong evidence that it may sometimes be pathogenic, producing symptoms such as intestinal colic, diarrhea, and lowered vitality

dieresis (di-er'es-is) [G. *dia*, apart, + *airein*, to take] 1. Breaking up or dispersion of things normally joined, as by an ulcer 2. Mechanical separation of parts by surgical means

dieret'ic. Dissolvable, or separable.

diet [G. *diata*] 1. Food substances, liquid and solid, regularly consumed in the course of normal living 2. A prescribed allowance of food adapted for a particular state of health, as a diabetic diet 3. To cause to eat or drink sparingly in accordance with prescribed rules

d. balanced. (a) One adequate in energy-providing substances (carbohydrates and fats), (b) Tissue-building substances (proteins), (c) Inorganic substances (water and mineral salts), (d) Regulating substances (vitamins), (e) Substances for certain physiological processes such as bulk for promoting peristaltic movements of the digestive tract

diet, words pert. To: acid ash d.; acid base d.; alkaline ash d.; basic d.; bland d.; calcium high and low d.; carbohydrate high d.; cardiac d.; caudiac d.; Smith; cellulose high d.; colostomy d.; elimination d.; Evans-Strang d.; fat low d.; feeding; fluid d.; general or house d.; iron high d.; Karrell d.; ketogenic d.; light d.; liquid full d.; liquid high caloric d.; liquid or fluid d.; without milk, liquid restricted d.; liquid surgical d.; residue d.; high and low, roughage d.; saltfree d.; salt low d.; salt poor d.; Schmidt's intestinal d.; Schmidt-Strassburger d.; Sippy d.; soft d.; tube feeding; Van Noordan's d.; vitamin d.; water balance d.

dietary (di'ē-ta-rī). A regulated diet.

dietetic (di-ē-tet'ik). Pert. to diet.

dietet'ics [G. *diatētikos*]. The science of the use of foods in health and disease. Some fundamental principles and facts of this science will be summarized here.

CONSERVATION OF ENERGY: There must be as much chemical energy in the food

as will equal the amt. of work done by the subject or patient plus the heat which he constantly loses. The number of calories in his daily food must in the long run equal his *basal metabolic rate* plus his additional metabolism due to muscular work and added heat losses. Thus a subject whose basal rate is 1700 calories per 24 hours may during the day do work and lose heat adding, say, 2000 calories to his output. he must, therefore, somehow get 3700 calories from his diet.

1 Gm. of fat gives about 9.3 cal.
1 Gm of carbohydrate 4.0 cal.
1 Gm of protein 4.0 cal.

CONSERVATION OF MATTER Everything that leaves the body, whether exhaled as carbon dioxide and water, or excreted as urea and minerals, must be replaced in the food and can be accounted for by chemical analysis. Thus if a man excretes 10 Gm of nitrogen daily he must receive 10 Gm of it in his diet, for the element can neither be created nor destroyed. Accordingly, he would receive 60 Gm of protein

DIFFICULTY OF SOME ORGANIC SYNTHESIS The power of the body to build tissue is limited, and for a given purpose only certain raw materials can be used. Thus proteins are "made up" of carbon, hydrogen, oxygen, and nitrogen, but eating charcoal and inhaling the gases would not enable one to make tissue protein. For instance, hemoglobin cannot be synthesized unless the body is supplied with proteins containing the pyrrole ring. This group occurs in the amino acids, tryptophane, prolin, and oxyprolin, proteins which do not contain these amino acids therefore are insufficient for needs of the body

SUMMARY A diet should contain (a) Water, (b) carbohydrates, (c) fats, (d) proteins, (e) minerals, (f) roughage (indigestible residue), (g) vitamins and other accessories

diethyl stilbestrol (di'eth'īl stil'bē'strōl) SYN *stilbestrol* A synthetic preparation possessing estrogenic properties. It is several times more effective than natural estrogens and may be given orally. It is used therapeutically in the treatment of menopausal disturbances and other disorders due to estrogen deficiencies

DOSAGE 1/10 to 1/2 mg., orally, per day.

dietitian (di-ē-tish'an) [G. *diata*, diet]. One scientifically trained in dietetics (which includes nutrition) and who is in charge of the diet of an institution

Dietl's crisis (de'tīz). Renal colic, accompanied by scanty, bloodstained urine.

Dieulafoy's triad. Tenderness, muscular contraction, and skin hyperesthesia in acute appendicitis at McBurney's point.

different'ial [L. *dis*, apart, + *ferre*, to bear]. Marked by differences.

d. blood count. Determination of the number of each variety of leukocytes in a cubic millimeter of blood.

d. diagnosis. Diagnosis based on comparison of symptoms of 2 or more similar diseases to determine which the patient is suffering from. SEE *blood count*, *diagnosis*.

different'iation ["" + *ferre*, to bear]. Acquisition of functions different from those of the original type.

diffrac'tion. The change which occurs in light when it passes through crystals, prisms, or parallel bars in a grating in which the rays appear to be turned aside

producing dark or colored bands or lines, or other phenomena. Term is also applied to similar phenomena in sound and electricity.

diffusate (dif-fu-sät) [“ + *fundere*, to pour] In the process of dialysis, that portion of a liquid which passes through a membrane and which contains crystalloid matter in solution. SYN. *dialysate*.

diffuse (dif-füs') [“ + *fundere*, to pour]. Spreading, scattered, spread.

d. inflammation. One not localized.

diffusible (dif-fu'zib-l). Capable of being diffused.

diffu'sion [L. *dis*, apart, + *fundere*, to pour] 1. Absorption of a liquid such as the absorption, by cells, of water from lymph when the percentage of salt is less in lymph than in the cells.

When the percentage is greater in the lymph than in the cells water is withdrawn from the latter. SEE *osmosis*.

DIFFUSION

The experiment begins in A with a thin layer of water, *w*, separating a large volume of ether, *e*, above from an equal volume of the much heavier carbon tetrachloride, *c*, below. B Three weeks later the layers are still distinct, but the lowest layer has visibly increased in volume at the expense of the uppermost layer. Ether has passed through the water into the carbon tetrachloride.

2. A process whereby different gases interpenetrate and become mixed, due to the incessant motion of their molecules. Similarly, if aqueous solutions of different materials stand in contact, mixing occurs on standing, even if the solutions be separated by thin membranes.

3. The tendency of molecules of a substance (gaseous, liquid, or solid) to move from a region of high concentration to one of lower concentration.

digastric (di-gas'trik) [G. *dis*, double, + *gaster*, belly] Having 2 bellies, said of certain muscles.

Digenea (di-jên-é'ä). An order of parasitic flatworms belonging to the class Trematoda and characterized by having an asexual generation, living usually in molluscs, alternating with a sexual generation living in vertebrates as their final host. It includes all the flukes parasitic in man. These include four groups of flukes, *q v*.

digen'esis [“ + *genesis*, production]. Reproduction in which alternate generations are asexual.

digest' [L. *dis*, apart, + *gerere*, to carry]. 1. To undergo digestion. 2. To make a condensation of a subject.

digest'ant [“ + *gerere*, to carry] 1. An agent that will digest food or aid in digestion. Ex. *pepsin, pancreatin*. 2. A preparation made from the digestive glands or lining membrane of the stomach, classified according to the foods it digests, such as *carbohydrate* or *protein*.

digestibility of foods. The following substances normally leave the stomach in from 1 to 2 hours

200 grams	1	Beer
100-200 "	2	Boiled milk
200 "	3	Broth, with no ingredients
200 "	4	Cocoa, plain
200 "	5	Coffee, plain
200 "	6	Eggs, (soft)
200 "	7	Light wines
200 "	8	Peptones, all kinds with water
200 "	9	Tea, plain
200 "	10	Water, carbonated
100-200 "	11	Water, pure (30 Gm — 1 ounce)

The following foods leave the stomach in 2 to 3 hours

150 grams	1	Asparagus
100 "	2	Beef sausage
300-500 "	3	Beer
300-500 "	4	Boiled milk
50 "	5	Cakes
200 "	6	Carp
150 "	7	Cauliflower, boiled or as a salad
150 "	8	Cherries, stewed or raw
200 "	9	Cocoa with milk
200 "	10	Coffee and cream
100 "	11	Eggs, raw or scrambled, hard boiled or omelette
200 "	12	Malaga wine
150 "	13	Potatoes, boiled or mashed
200 "	14	Sweetbreads (boiled)
200 "	15	Veal brains
300-500 "	16	Water
70 "	17	White bread, fresh or old, dry or with tea
70 "	18	Zwieback, fresh and old, dry or with tea

The following foods leave the stomach in 3 to 4 hours

150 grams	1	Apples
250 "	2	Beef, raw or boiled
100 "	3	Beefsteak, chopped
100 "	4	Beefsteak, roasted, warm or cold, lean
250 "	5	Calves' feet, boiled
150 "	6	Cakes
150 "	7	Carrots
150 "	8	Cucumber salad
160 "	9	Ham, boiled
150 "	10	Potatoes, boiled
150 "	11	Radishes (raw)
200 "	12	Salmon, boiled
200 "	13	Smoked fish
150 "	14	Spinach
230 "	15	Spring chicken, boiled
150 "	16	Turnips
100 "	17	Veal, roasted, warm or cold
150 "	18	Rye bread
260 "	19	Squab, boiled
195 "	20	Squab, roasted
150 "	21	White bread

The following foods leave the stomach in 4 to 5 hours.

250 grams	1 Duck, roasted
250 "	2 Goose, roasted
200 "	3 Herrings
240 "	4 Partridges, roasted
200 "	5 Peas (mashed)
210 "	6 Pigeon, roasted
100 "	7 Smoked meats
250 "	8 Smoked tongue
150 "	9 String beans (boiled)
250 "	10 Tenderloin beefsteak, roasted

Individual, pathological conditions, and the manner of cooking, the amt. of food ingested, must all be considered in reference to digestibility.

digestible. Pert to that which may be digested.

digestion [L. *digestio*, a taking apart]. The process by which food is broken down, mechanically and chemically, in the gastrointestinal tract and is converted into absorbable forms.

Salt, the simplest sugars (such as glucose), crystalloids in general, and water can be absorbed unchanged, but starches, fats, and proteins for the most part are not absorbable until disintegrated by the digestive fluids, and even the sugar sucrose (a disaccharose*) must first undergo inversion.

The chemical actions are chiefly hydrolytic, they are brought about by a variety of enzymes, each of which acts in an acid or alkaline or neutral juice according to its peculiar properties.

The higher carbohydrates are converted into monosaccharoses*, proteins (through successive stages of peptones and polypeptides) ultimately into amino acids, and fats into fatty acids and glycerine. In the stomach the soluble casein of milk is converted into insoluble paracasein resulting in its coagulation or clotting. This is brought about by the enzyme pepsin. The rennin and acid are responsible for the clotting of milk, which normally occurs

in the stomach. An enzyme lipase is able to attack fats in emulsified form. It liberates, for instance, butyric acid from the fats in milk, and thus causes the characteristic odor of vomitus. The chemical actions are facilitated by the churning, wavelike motions of the stomach walls. When the chyme is ready to leave the stomach, the pylorus opens from time to time and the chyme is spurted into the duodenum.

d., artificial. D outside the living organism by a ferment in fecum.

d., cecal. Digestive process in the **d., duodenal.** The acid chyme is now made alkaline, and the fats it contains are emulsified by the action of bile. A fresh set of enzymes adapted to these new conditions are supplied by the pancreatic juice which enters by 2 ducts and by the intestinal juice which comes from small glands in the wall of the intestine itself. The hydrolysis of starches, fats, and proteins is carried to its physiological completion here, and in the remainder of the small intestine.

d., extracellular. That occurring outside the body of the cell.

d., gastric. Portion of the digestive process taking place in the stomach.

d., intestinal. Hydrolytic processes continue here, and absorption of the products is active. *See absorption.* From the ileum the food residues pass in a nearly liquid state through a small opening into the ascending colon. A sphincter muscle prevents backflow. True digestive processes in the colon are slight, but there is normally much bacterial action (the products of which are mostly absorbed) and reabsorption of water. The remaining substances, now colored by pigments which entered with bile and changed to a firm consistency by the loss of water, pass on through the transverse colon, the descending colon, and the sigmoid flexure into the rectum. They are retained in the rectum by the action of sphincters until there is an opportunity for defecation.

DIGESTIVE JUICES: ACTION OF On Proteins, Fats, and Carbohydrates

Digestive Juice	Proteins	Fats	Carbohydrates
Saliva			Changes cooked starch into maltose
Gastric Juice	1. Curdles milk 2. Changes proteins into peptones		
Pancreatic Juice	Changes peptones to simpler substances	Changes fats to fatty acids and Glycerol	Changes sugars into simpler forms
Bile		Emulsifies fats	
Intestinal Juice	Complete the change of peptones into amino acids.		Completes the change of all sugars into the simplest form, glucose

On Foods

Food	Ferment or Enzyme	Digestive Juice	Where Juice Acts
Protein	{ Pepsin Trypsin.	Gastric juice, acid.	Stomach
		Pancreatic juice, alkaline.	Small intestine.
Fats	{ Erepsin Lipase.	Succus Entericus, alkaline.	Small intestine.
		Pancreatic juice.	Small intestine.
Carbohydrates	{ Ptyalin Amylopsin.	Saliva, alkaline.	Mouth and in stomach.
		Pancreatic juice, alkaline.	Small intestine.
		Succus Entericus.	Small intestine.
	{ Invertase.		

THE DIGESTIVE SYSTEM

1 Rectum 2. Appendix 3 Cecum 4 Ileocecal valve 5 Ascending colon. 6. Small intestines 7 Duodenum 8 Transverse colon 9 Pancreas 10 Liver 11 Gallbladder 12 Esophagus 13 Trachea 14 Aorta 15 Carotid artery 16 Subclavian artery 17 Aorta 18 Cardiac orifice 19 Stomach 20 Spleen 21 Pyloric orifice 22. Transverse colon 23 Jejunum 24 Ileum 25 Sigmoid flexure 26. Descending colon.

d., intracellular. Digestion within the cell body.

d., oral. Portion of the digestive process taking place in the mouth

d., pancreatic. Portion of digestive process influenced by pancreatic juice.

d., peptic. SEE *gastric d.*

d., primary. D. by gastrointestinal tract.

d., salivary. Digestive action by the saliva. SEE *salivary digestion.*

d., secondary. Cellular assimilation of nutritive material

d., tryptic. SEE *pancreatic d.*

digestion, words pert. to: absorption, achylia, achylous, achylous, albie, amyloid dyspepsia, aneilema, antialbumate, antialbumin, antialbumose, antipeptone, apepsia, apepsinia, assimilable, assimilate, -tion, autopepsia, bacterial d, bloat, bradypepsia, cacochylia, cascade, catastasis, cell-organ, chyle, chylification, chyme, chymification, colon, colypenic, dietetics, digestants, duodenal, dyspepsia, ereptic d., eructation, eupepsia, gastric, heart burn, indigestion, intestinal d., lipolytic, lysin, metabolism, "pept-" words, predigestion, regurgita-

tion, saliva, salivary d., salivary glands, succorrea, succus.

digestive (di-jes'tiv) Pert to digestion
d. juice. One of several secretions which aid in processes of digestion

dig'it (pl. dig'iti) [L. *digitus*, finger] A finger or toe

digital (di-jit'al) [L. *digitus*, finger] Pert to or resembling a finger or toe

d. reflex. Sudden flexion of terminal phalanx of a finger or thumb when nail is suddenly tapped

digitalis (di-jit-a'lis) [L. *digitus*, finger, because of its fingershaped corolla] USP Foxglove The dried leaves of *Digitalis purpurea*.

ACTION AND USES Heart stimulant. Indirectly diuretic

Dosage 1½ gr (0.1 Gm). Infusion of digitalis 1½ fluid diam (6 cc) Tincture digitalis 15 m (1 cc).

POISONING A valuable drug widely used in treatment of cardiac and other chronic diseases May be acute or chronic from its cumulative effect

SYM Digestive disturbances, as nausea, and vomiting Frequently distressing headache Cardiac irregularities are common, esp slowing of heart with ventricular extra systoles or partial heart block

F A TREATMENT Evacuate stomach, administer diffusible stimulants, cathartics and sedatives are desirable These patients are chronically ill or digitalis would not be used Esp care necessary in their management

digitalism (di-jit'al-izm) [' + G. *ismos*, condition of] The poisonous effects produced by digitalis

digitalization (di-jit'al-iz-a'shun). Subjection of an organism to the action of digitalis

dig'itate [L. *digitus*, finger]. Having fingerlike impressions or processes

digitation (di-jit-a'shun) [L. *digitus*, finger] A fingerlike process

dig'itus [L.] A finger or toe

diglossia (di-glos'si-ä) [G. *dis*, double, + *glossa*, tongue] Having a double tongue

dihydromorphine hydrochloride (di-hi-drö-morf'in-on). USP syn for *dilaudid hydrochloride*

dihydrostreptomycin (di-hi'drö-ströp-tö-mis'in) Derivative of streptomycin and originally thought to be less toxic Uses and dosage same as with parent drug

dihydrotachysterol (di-hi'diö-täk-i-ster'-öl). A hydrogenated tachysterol obtained by irradiation of ergosterol

In hypoparathyroidism aids absorption of calcium from digestive tract

dihydrotheelin (di-hi'drö-thé'l-in) Commercial hormone preparation obtained from hogs' ovaries and urine of pregnant mares or synthetically from estrone SYN *estradiol*.

dihysteria (di-his-ter'i-ä) [G. *dis*, double, + *ysteria*, the uterus]. State of having a double uterus.

diktyo'ma [G. *diktyon*, net, + *-ōma*, tumor]. A cellular epithelium tumor

dilaceration (di-las-er-a'shun) [L. *dilacerare*, to tear apart]. A tearing apart.

dilantin sodium (di-lan'tin). *Sodium diphenylhydantoinate* It is related to the barbiturates. A derivative of glyceryl urea An anticonvulsant used especially in the treatment of epilepsy

dila'tant [L. *dilatāre*, to enlarge]. Anything that causes dilation.

dilatation (di-la-ta'shun) [L. *dilatāre*, to expand]. 1. Expansion of an organ or

vessel 2 Expansion of an orifice with a dilator

d. digital. Dilatation of an opening or a cavity by use of the fingers

d. heart (of the). Abnormal increase in the size of the cavities of the heart, a common result of valvular disease or hypertension

d. stomach (of the). Condition in which the stomach is extremely dilated Acute d of the stomach or acute gastromesenteric ileus may occur as a post-operative or postpartum condition and usually results from obstruction of the duodenum

dilatation, words pert. to: capotement, cardiectasia, cardioidiosis, cecopachia, choledochectasia, ciliospinal, ciliospinal center, vasodilator and vasomotor center

dila'tion. 1. Expansion of an orifice with a dilator 2 Expansion of an organ or vessel SYN *dilatation*

dilator (di-lä'tor) [L. *dilatāre*, to expand] Instrument for dilating muscles, stretching cavities or openings

RS *anal, aural, esophageal, lacrimal, laryngeal, meatus, nasal, rectal, sinus, tracheotomy, urethral, uterine, vaginal*

d., Barnes. Rubber bag that is filled with fluid

d., Bossi. A multiple pronged instrument that dilates by separation of the prongs.

d., Goodell. Similar to the Bossi except that it has but 3 prongs

d., gyn. An instrument for dilating the cervix uteri

d., Hegar's. Graduated metal sounds that are inserted into the cervical canal and cause a graded dilatation

d., Ten's. Small cones made of seaweed, sponge, or tree roots which are inserted into the uterine canal dry and, on absorbing moisture, expand to cause a slow dilatation

dilaudid hydrochloride (di-law'did) (dihydromorphine hydrochloride) A white crystalline powder, odorless, and freely soluble in water USP SYN *dihydromorphine h.*

USES As a narcotic and sedative instead of morphine, over which it is claimed to have an advantage in producing less nausea, and in having less hypnotic properties

DOSAGE. As sedative or relief of pain, 1/24 gr (0.0025 Gm) orally, subcutaneously 1/32 gr (0.002 Gm.) being equivalent to 1/6 gr. (0.01 Gm.) morphine [dilutes]

dil'uent [L. *diluere*, to dilute] That which dilutes

dilution (di-lu'shun) [L. *diluere*, to dilute]. 1 Process of rendering a substance attenuated or diluted 2 A diluted substance

dimercaprol (di-mer-käp'röl). USP syn for *BAL*, q r

dimetria (di-me'tri-ä) [G. *dis*, double, + *metra*, uterus]. A double uterus.

dimorphous (di-mor'fus) [' + *morphē*, form]. Occurring in 2 different forms

dimp'ling. The formation of a dimple or dimples due to retraction of the subcutaneous tissue. Occurs in certain carcinomas

dineuric (di-nu'rik) [' + *neuron*, nerve] Having 2 axis-cylinder processes.

dinical (din'i-kal) [G. *dinos*, vertigo]. Pert. to giddiness or vertigo.

dioner (di-ön-er). An assistant to a mortician

dionin (di'o-nin) (ethylmorphine hydrochloride). USP. A white, slightly bitter powder.

Uses: As a sedative, analgesic, and antispasmodic; externally, in iritis and other affections of the eye.

Dosage Internally. $\frac{1}{4}$ gr. (0.015 Gm.).

diopsimeter (di-op-sim'et-er) [G. *diopsis*, vision, + *metron*, measure]. Device for exploring the visual field.

diop'ter [G. *dioptron*, something that can be seen through]. Refractive power of lens with focal distance of 1 meter, used as unit of measurement in refraction.

diop'tometer (di-op-tom'et-er) [+ *metron*, measure]. Device for measuring ocular refraction

diop'tometry [+ *metron*, measure]. The determination of refraction and accommodation of the eye.

diop'tral (di-op'tral) [G. *dioptron*, something that can be seen through]. Pert. to a diop'ter.

diop'tric (di-op'trik) 1. Diop'tral; pert. to refraction of light. 2. A diop'ter.

diop'trics [G. *dioptron*, something that can be seen through]. The science of refraction of light.

diorthosis (di-or-tho'sis) [G. *dia*, through, + *orthos*, straight]. Reduction of a fracture or dislocation SYN *diaplasia*.

diosmosis (di-oz-mo'sis) [+ *ōsmos*, a pushing]. Passage of a fluid through a membrane SEE *dialysis*, *osmosis*.

dioxide (di-oks'id) [G. *dis*, twice, + *oxys*, sharp] 1. A compound having 2 oxygen atoms to 1 of another element 2. A gas given off by the lungs Extraneous gases inhaled may be exhaled also

di-pep'tid(e) (di-pep'tid) [+ *peptem*, to digest] A derived protein obtained by hydrolysis of proteins or condensation of amino acids

di-pep'tidase (di-pēp'tid-ās) An enzyme that hydrolyzes dipeptides to amino acids

diphallus (di-fāl'ūs). A condition in which there is either a complete or incomplete doubling of the penis or clitoris

diph'a'sic [+ *phasis*, a phase]. Having 2 phases.

diphonia (di-fō'nī-ā) [+ *phōnē*, voice]. Simultaneous production of 2 different voice tones

diphtheria (dif-the'rī-a) [G. *diphthera*, a skin]. An acute infectious disease characterized by the formation of a false membrane on any mucous surface, and accompanied by great prostration

Etiol. Causative organism, the Klebs-Loeffler bacillus The disease is rare under 1 year of age. The vast majority of cases occur before the age of 10, but older children and adults are not exempt. Both sexes equally susceptible. Esp prevalent in fall and winter months. Transmission through direct contact with a human carrier, or as a result of exposure through contact with articles that have been contaminated by the diphtheria patient. **INCUBATION** Two to 8 days.

Sym Onset gradual Usually slight headache, often backache Temperature 100° F. to 103° F., and sore throat with presence of yellowish-white membrane adherent to tonsils or pharyngeal walls. Cervical adenitis may develop early in severe types. In nasal diphtheria, fever is a much more evident symptom. Adenitis often severe, serous discharge from nostrils which may be blood tinged; strong fetid odor common.

d. antitoxin. The antibody which counteracts the diphtheria toxin, the blood serum of a horse or some other

animal which has been immunized against diphtheria toxin.

d. carrier. A person harboring in his body the Klebs-Loeffler bacillus without manifest symptoms, thus acting as a distributor of the infection.

There are few things that have not been used for the treatment of diphtheria carriers. Various dyes, and antiseptics of all descriptions have been tried, as well as the application of ultraviolet rays. Complete removal of the tonsils and adenoids will afford more satisfactory results in freeing the individual of diphtheria organisms than any other procedure that may be undertaken. When dealing with a chronic carrier, it is sometimes well to determine through animal inoculation whether or not the organism is virulent, a nonvirulent organism making it unnecessary to restrain the patient by quarantine measures

d. laryngeal. In this type, croupy cough, aphonia, stridulous respiration due to narrowing of glottic opening are early evidences of the disease Restlessness, anxious expression, retractions of the supraclavicular and intercostal spaces evident on inspiration In this type of infection, the danger from asphyxiation due to mechanical obstruction is far greater than any serious results from toxemia Diphtheria of the conjunctiva, external auditory canal, lips, or genitalia is sometimes seen. Also, diphtheritic infections of postoperative wounds sometimes occur

COMPLICATIONS Postdiphtheritic paralysis, associated with loss of voice, regurgitation of fluids through the nostrils, as well as weakness of lower extremities Acute myocarditis very common Nephritis not rare Cervical adenitis, profuse epistaxis in nasal cases, otitis media, or mastoiditis may develop. In the laryngeal form, bronchopneumonia and chronic laryngeal stenosis are the chief complications seen when the membrane is found only below the glottis.

d. toxin. An exotoxin produced by the diphtheria bacillus A thermolabile substance capable of producing in susceptible animals the same symptoms brought about by inoculation with the living organism

d. toxin-antitoxin. A mixture of diphtheria toxin and antitoxin. Used in the treatment of diphtheria to produce active immunity. It has been replaced by d. toxoid

d. toxoid. Diphtheria toxin which has been detoxified Used to produce active immunity against diphtheria

DIFFERENTIAL DIAGNOSIS Tonsillitis, scarlet fever, acute pharyngitis, streptococcus sore throat, peritonsillar abscess, and Vincent's angina may frequently require consideration Examination of a smear from infected area is advisable, but cultures should be obtained in every instance for the purpose of confirming the diagnosis In the laryngeal type, edema of the glottis, foreign bodies, retropharyngeal abscess, and catarrhal croup may require consideration.

Progn. Favorable when antitoxin in sufficient amounts is administered within 3 days from time of onset If given on 1st day, death should hardly ever occur. In laryngeal diphtheria, intubation or, rarely, tracheotomy, is usually necessary, as well as an adequate dose of diphtheria antitoxin. Restless-

ness, abdominal pain, and vomiting are prognostic signs that commonly foretell a fatal end.

ACTIVE IMMUNIZATION. Since all individuals are not susceptible to diphtheria, and because this doubtful factor may be determined by means of the Schick test, it is usually advisable to make use of this test in adults before administering either toxin-antitoxin or toxoid. In children under 5 years, the Schick test may commonly be dispensed with on the assumption that a majority are susceptible. Toxin-antitoxin when used is administered in 1 cc doses, subcutaneously, at intervals of 1 week, from 3 to 4 months must elapse after such treatment in order to allow time for the required immunity to become established. Generally, there is less likely to be an unpleasant reaction when toxin-antitoxin is used in adults than if toxoid were chosen for those who have passed the age of 15. Toxoid, which is a detoxified diphtheria toxin, is especially advantageous for immunizing the very young. Usually given in 3 doses subcutaneously, the 1st injection consisting of ½ cc and 2nd and 3rd of 1 cc each. With this material, the interval between each of the 3 injections is 1 week, and immunity is established earlier than with the use of toxin-antitoxin and is also more enduring. Necessary arrangements must first be made for isolation. The second thought will concern diphtheria antitoxin. The quantity to be administered depends upon site of infection and duration of disease. According to Hoyne's table, the dosage below will serve as a guide.

It must be remembered that the cause of death in laryngeal diphtheria is usually asphyxiation or bronchopneumonia, and it is this type of the disease in which intubation is commonly essential to the saving of life. Concerning the foregoing, it should be borne in mind that more than 1 site of infection may exist. Consequently, a corresponding increase in dosage may be necessary, but more than 50,000 units of diphtheria antitoxin will seldom be a factor in bringing about recovery.

Having decided upon the dosage, it is usually well to administer the total amount determined upon at once. This may be given in a number of ways, the subcutaneous, intramuscular, and intravenous routes being those that are the most popular. For all practical purposes, the intramuscular route is the one for selection.

SITE OF INJECTION. The outer muscles of the thigh are preferable to administration in the buttock. If the antitoxin has been recently removed from an ice-box, it should be slightly warmed before administration. Under no circumstances, however, should the temperature be allowed to exceed 98°, otherwise, deterio-

ration, as well as conglutination, of the antitoxin may result. All customary aseptic precautions must be taken when antitoxin is administered.

In this type, surgical interference is generally a necessity. Intubation is always to be preferred to tracheotomy, provided an experienced operator is available, and furthermore, that the patient is safeguarded by hospitalization which will make possible any attention required within a moment's notice.

GENERAL MEASURES. Ten days should be minimum period for any diphtheria patient to remain in bed, regardless of the lightness of attack. In cases with myocardial involvement, prolonged rest in bed may be as important as the early administration of diphtheria antitoxin.

TREATMENT. No interference with the diphtheria membrane is advisable. Gargles should not be used, although cleansing mouthwashes are permissible. On the other hand, the use of suction in nasal cases is sometimes of distinct advantage. Early in an attack of the ordinary type of diphtheria, a liquid diet, consisting of plenty of water, fruit juices, and nourishing broths, may be required. Where the membrane is not extensive, a soft diet can soon be adopted, not neglecting the free use of vegetables. In the acute stage, stimulants of any description are rarely necessary. In fact, they are more likely to do harm than good. During convalescence, small doses of strychnine as a tonic may be of value, and at times epinephrine chloride 1.1000 in doses of 5 m subcutaneously is sometimes helpful. However, next to the use of diphtheria antitoxin, absolute rest in bed is the most valuable agent.

In laryngeal diphtheria, surgical interference is generally a necessity. Intubation is always to be preferred to tracheotomy, provided an experienced operator is available, and furthermore that the patient is safeguarded by hospitalization which will make possible any attention required within a moment's notice.

SEE *anatoxin, antitoxin, diphtheria carrier, Klebs-Loeffler bacillus, Schick test.*

d., surgical or wound. Diphtheric membrane formation on wounds.

diphtherial. Pert. to diphtheria.

diphtheriaphor (dif-the'r'i-ä-for) [G. *diphthera*, a skin, + *phorein*, to carry]. A diphtheria carrier or vector.

diphtheric (dif-the'rik). Pert. to diphtheria.

diphtherin (dif-the-rin) [G. *diphthera*, a skin]. The toxin of diphtheria, from *Corynebacterium*.

diphtheritic (dif-ther-it'ik). Pert. to diphtheria.

diphtheritis (dif-ther-it'is) [G. *diphthera*, a skin, + *-itis*, inflammation]. Another name for diphtheria.

Name	Description	Dosage in units
Tonsillar diphtheria	Membrane is limited to 1 or both tonsils	5,000-15,000
Pharyngeal diphtheria	Membrane has extended beyond the tonsils.	15,000-25,000
Nasal or nasopharyngeal diphtheria	Membrane extends into the nasal passages.	20,000-40,000
Laryngeal diphtheria	Membrane in larynx, causing dangerous stenosis.	15,000-30,000

diphtheroid (dif'the-roid) [“ + *eidōs*, appearance]. 1 Resembling diphtheria or the bacteria which cause diphtheria. 2 The formation of a false or pseudo-membrane not due to the diphtheria bacillus.

diphtherotoxin [“ + *toxikon*, poison] The specific toxin of the diphtheria bacillus.

diphthongia (dif-thon'jī-ā) [G *dis*, double, + *phthoggos*, voice]. The simultaneous utterance of 2 vocal sounds of different pitch in pathological conditions of the larynx.

Diphyllbothrium [“ + *phyllon*, leaf, + *bothrion*, pit]. A genus of tapeworms belonging to the order Pseudophyllidea and characterized by possession of a scolex possessing two slit-like grooves or bothria. Formerly called *Dibothriocephalus*.

D. cordatum. The heart-headed tapeworm, a small species infesting carnivores in Greenland, formerly known as *D. mansoni*. The plerocercoids are occasionally found in man.

D. erinacei. A species infesting dogs, cats, and other carnivores. Larval stages are occasionally found in man.

D. latum. The broad or “fish” tapeworm. The adult lives in the intestine of fish-eating mammals and man. It is the largest human tapeworm and may reach a length of 50 to 60 feet (ave. 20 ft). The eggs develop into ciliated larvae called *coracidia* which are eaten by certain species of copepods in which each becomes an *oncosphere* which develops into a *procercoid*. Further development occurs in a fish where it develops into a worm-like *plerocercoid* or *sparganum* larva. Infection of the final host occurs following eating improperly cooked fish. Pathological effects are abdominal pain, loss of weight, digestive disorders, progressive weakness, and a severe type of anemia.

diphyodont (dif'fō-dont) [“ + *phyein*, to produce, + *odus*, tooth]. Having 2 sets of teeth, as man.

dipacusis (dip-lā-ku'sis) [G *diploos*, double, + *akousis*, hearing]. Variety of disturbed perception of pitch characterized by hearing 2 tones for every sound produced.

diplegia (di-ple'jī-ā) [G *dis*, twice, + *plēgē*, a stroke]. Paralysis of similar parts on both sides of the body. *Syn*: double hemiplegia.

diplegic (dip-le'jīk). Pert to diplegia.

diploalbuminuria [G *diploos*, double, + *L. albumen*, white of egg, + *G ouron*, urine]. Coexistence of physiologic and pathologic albuminuria.

diplobacillus [“ + *L. bacillus*, a little stick]. A double bacillus, 2 being linked end to end.

diplobacterium [“ + *baktērion*, little rod]. An organism made up of 2 adherent bacteria.

diploblastic (dip-lō-blas'tik) [“ + *blastos*, germ]. The ectoderm and endoderm having 2 germ layers.

diplocardia [“ + *kardia*, heart]. Having a double heart.

diplococcemia (dip'lo-kok-se'mī-ā) [“ + *kokkos*, berry, + *aima*, blood]. Diplococci in the blood.

Diplococcus (dip-lō-kok'us) [“ + *kokkos*, berry]. A genus of bacteria belonging to the family Lactobacteriaceae. They are gram positive organisms occurring in pairs.

D. gonorrhoeae. *Neisseria gonorrhoeae* causative organism of gonorrhea.

D. pneumoniae. *Syn*: *pneumococcus*, *D. lanceolatus*, *Micrococcus pneumon-*

iae. *Micrococcus lanceolatus*, *Streptococcus pneumoniae*. A species of bacteria, oval or spherical in shape, gram-positive, nonmotile. They possess a capsule. The species is made up of a number of distinct strains of which some 33 different serological types have been isolated. Many others have been described. It is the causative agent of certain types of pneumonia esp. lobar pneumonia and is associated with other infectious diseases such as cerebrospinal meningitis, otitis media, and septicemia.

diploe (dip-lo-e) [G *diploē*, fold]. Cancellated tissue bet the tables of the skull.

diploetic, **diploic** [G *diploē*, fold]. Pert to the diploe or cancellated tissue bet cranial tables.

diplogenesis [G *diploos*, double, + *genesis*, production]. Having 2 parts or producing 2 substances.

diploid (dip'loyd). Having double the haploid number of chromosomes. Said of somatic cells which contain twice the number of chromosomes present in the egg or sperm.

diplokarion (dip-lō-kar'i-ōn) A nucleus containing twice the diploid number of chromosomes.

diploellifuria (dip-lō-mē'lī-tur'fī-ā) [“ + *melh*, honey, + *ouron*, urine]. Condition in which diabetic and nondiabetic glycosuria occur either simultaneously or alternately in the same individual.

diplomyelia (dip-lō-mī-ē'lī-ā) [“ + *myelos*, marrow]. Condition in certain types of spina bifida in which the spinal cord is doubled.

diploneurral [“ + *neurron*, nerve]. Having 2 nerves from different origins, as certain muscles.

diplophonia (dip-lo-fō'nī-ā) [“ + *phōnē*, voice]. Having 2 different voice tones at the same time. *Syn*: *diphonia*.

diplopia (dip-lō'pī-ā) [“ + *opsis*, sight]. Double vision, monocular (astigmatism, subluxated lens, incipient cataract), binocular (due to derangement of extraocular muscles).

d., binocular. Double vision occurs when both eyes are used but not in focus. Seen in disease of the eyeballs, cranial-nerve affections, disease of the cerebellum, cerebrum, and meninges. The more distantly appearing object is the true one.

d., crossed. Binocular vision in which the images are reversed.

d., direct. *See* *homonymous d.*

d., heteronymous. *See* *crossed d.*

d., homonymous. Double vision in which right-hand image appears on right side and left-hand image on left side. *Opp*: *crossed d.*

d., monocular. Double vision with 1 eye.

d., unocular. *See* *monocular d.*

d., vertical. D with 1 of 2 images higher than the other.

diplopiometer (dip-lō-pī-om'et-er) [“ + “ + *metron*, measure]. Device for estimating double vision.

diploscope [“ + *skopein*, to examine]. Device for study of binocular vision.

diplosoma'tia [“ + *sōma*, body]. Twins joined at 1 or more points. *Syn*: *diplosomia*.

diplosomia [“ + *sōma*, body]. Twins joined together. *Syn*: *diplosomatia*.

dipping. 1 Palpation of the liver by a quick depression of the abdomen. 2 The act of immersing an object in a solution; esp. applied to the dipping of cattle for the control of cattle ticks.

diprosopus (dip-rō-sōp'ūs). A fetal monster characterized by possession of a double face

dipsomania (dip-so-ma'nī-ā) [*G. dipsa*, thirst, + *mania*, mania] **PSY** A morbid and uncontrollable craving for alcoholic beverages **SEE** *alcoholism*

dipsopathy (dip-sop'ā-thī) [*+* + *pathos*, disease]. 1. Dipsomania. 2. Limitation of intoxicants for purposes of cure.

dipsophobia (dip-sō-fī-bī-ā). Morbid fear of drinking

dipsosis (dip-sō'sis) [*+* + *-ōsis*]. Abnormal thirst

dipsotherapy (dip-so-ther'ā-pl) [*+* + *therapeia*, treatment] Limitation of water to be drunk as a cure

Diptera (dip'ter-ā) An order of insects characterized by having sucking or piercing mouth parts, one pair of wings, and complete metamorphosis. It includes the flies, gnats, midges, and mosquitoes. It contains many species involved in the transmission of pathogenic organisms

dipterous (dip'ter-ūs) Having two wings, characteristic of the order Diptera

dipylidiasis (di-fil'id-i-ās-is) Infestation with the tapeworm, *Dipylidium caninum*

Dipylidium (di-fil'id-i-ūm) A genus of tapeworms belonging to the family *Dipylidae* which infests dogs and cats. *D. caninum*. A species of *Dipylidium*, a common parasite of dogs and cats. Occasionally human infestation may occur through the accidental ingestion of lice or fleas which serve as the intermediate host

direct. Immediate, uninterrupted

d. current. One flowing in 1 direction only **SEE** *current*

d. light reflex. One in which response occurs in same side as the stimulus

d. murmur. That due to stenosis of cardiac orifices

d. reflex. Prompt contraction of sphincter of iris when light entering through pupil strikes retina of eye

director (di-tek'tor) [*L. dirigere*, to lay straight] Grooved device for guiding a knife

directoscope [*+* + *G. skopein*, to examine] Device for examination of the larynx

dir'igomo'tor [*+* + *motor*, mover] Controlling or directing muscular activity

dis- [*L.*] Prefix. Free of, undo, as *disable*.

disaccharide (di-sak'ā-rīd) [*G. dis*, two, + *sakcharon*, sugar]. A member of the disaccharose* group of carbohydrates **SEE** *carbohydrates*.

disaccharose [*G. dis*, two, + *sakcharon*, sugar]. A complex sugar that may be split into 2 molecules of monosaccharids. The 2 monosaccharoses resulting from the decomposition may be different or identical. Thus the disaccharose *maltose*, $C_{12}H_{22}O_{11}$, for each molecule yields 2 molecules of glucose, $C_6H_{12}O_6$, while the disaccharose *sucrose*, $C_{12}H_{22}O_{11}$, yields a molecule each of glucose and fructose

The disaccharoses consist of the following.

LEVULOSE The same as *fructose*. In the body this is formed in the digestion of sucrose. It is found in fruits, plants, and in honey.

MALTOSE Malt sugar. This is found in malt and malt products, and in germinating seeds. It is acted upon in the intestines by maltase, resulting in dextrose as an end product. It is a reducing sugar

SUCROSE: Cane sugar or table sugar. A nonreducing sugar. It comes from sugar cane, sorghum, maple sugar, sugar beets, and honey. An increase in temperature while heating sucrose results in caramel. It is acted upon in the intestines by *sucrase*, an enzyme converting it into dextrose and levulose as end products.

Some sugars undergo fermentation by yeasts, or decomposition is brought about by bacteria or molds. They oxidize sugars into carbon dioxide and water. Alcohol is produced when dextrose ferments

Most of the sugar on the market consists of beet and cane sugar. Ripe fruits, and vegetables to a lesser degree, contain sucrose. The starch of green fruits is changed to a mixture of sucrose, glucose, and levulose. Sucrose gives the sweet flavor to ripe fruits. It has the following chemical characteristics

1. Extremely soluble. Cold water will hold in solution almost twice its weight of sucrose. Hot water will dissolve even more.

2. It crystallizes very easily

3. It melts at about 160° C., changing to an amber hue and growing darker, becoming less sweet and acquiring a bitter flavor called "caramel"

SEE *carbohydrates*, *monosaccharoses*, *polysaccharoses*

disarticulation [*L. dis*, apart, + *articulus*, joint] Amputation through a joint

disassimilation [*+* + *ad*, to, + *similare*, to make like] Changing assimilated material into less complex compounds, freeing potential energy

dis'asso'cia'tion [*+* + *associare*, to unite with]. A mental condition in which ideas are split from the consciousness and which are no longer amenable to objective control such as amnesiac somnambulism,* catalepsy,* dual personality,* fugues,* and trances.

disc [*G. diskos*, a flat dish] A round, flat, platelike structure **SEE** *disk*.

discharge (dis-charj') [*M.E. dischargen*, an 'oozing out'] 1. The escape (especially by violence) of pent up or accumulated energy or of explosive material. 2. The flowing away of a secretion or excretion of pus, feces, urine, etc. 3. The material ejected by discharge (2nd def.).

SEE *abscession* (2), *arrhea*, *cenosis*.

d., brush. That from a static machine having a disruptoconvective character.

d., cerebral cortical. The violent action of a diseased portion of the cerebral cortex that gives rise to an epileptic paroxysm

d., convective. One from a high potential source in the form of electrical energy passing through the air to the patient

d., disruptive. A passage of current through an insulating medium due to the breakdown of the medium under electrostatic stress

d., disruptoconvective. The static brush discharge simulating both the convective and the disruptive or spark discharge

d., electric. A slow or instantaneous bringing back to a neutral electric condition, by which every highly electrified body loses its surplus electricity, giving it up to surrounding bodies less highly electrified

d., lochial. Uterine excretion following childbirth **SEE** *lochia*.

- d., silent.** The gradual loss of electricity by even isolated bodies, owing to the conductivity of air and its contained vapors, together with that of the isolating bodies themselves
- discharge tube.** A vessel of insulating material (usually glass) provided with metal electrodes, which is exhausted to a low gas pressure and permits the passage of electricity through the residual gas when a moderately high voltage is applied to the electrodes
- discharge^{ing}.** The emission of or the flowing out of material as the discharge of pus from a lesion Excreting
- d. lesion.** A lesion of nerve center in brain suddenly discharging motor impulses
- dischronia^{tion}** [L *dis*, apart, + G *chronos*, time] Failure of relativity in the consciousness of time
- dissection** (di-sish'un) [“ + *scindere*, to cut] Rupture of the capsule of the crystalline lens in operation for cataract
- NP** Mild antiseptic or aseptic dressing, mydriatic, bandage, 2 inches wide, 5 to 7 yards long
- discitis** (dis-ki'tis) [G *diskos*, disk, + *-itis*, inflammation] Inflammation of any disk, esp., an interarticular cartilage
- Syn** *meniscitis*
- discoblastic** [“ + *blastos*, germ] Pert to discoid segmentation of yolk in an impregnated ovum
- discoblastula** (dis-kō-blāst-ū'lā). A modified blastula found in highly telolecithal eggs as in birds in which the blastomeres form a cellular cap (germinal disc or blastoderm) which is separated from the yolk by a space, the blastocoel
- discoid** [“ + *eidos*, form] Like a disc
- discoiplacenta** [“ + *plakous*, a flat cake]. A disklike placenta
- discrete** [L *discretus*, separated] Separate, opposed to *confluent* * Said of certain eruptions on the skin.
- discrimination.** The process of distinguishing or differentiating
- d. one-point.** The ability to locate specifically a point of pressure on the surface of the skin
- d. tonal.** The ability to distinguish one tone from another This is dependent upon the integrity of the transverse fibers of the basilar membrane of the organ of Corti
- d. two-point.** The ability to localize two points of pressure on the surface of the skin, and to identify them as discrete sensations Also called tactile discrimination
- discus.** A disk
- d. articularis.** An interarticular fibrocartilage, an articular disk
- d. proligerus.** The cumulus oophorus, *q v*
- discuss** [L *discutere*, to dissipate]. To disperse, scatter, or cause to disappear.
- discussion** (dis-kush'un) [L *discutere*, to dissipate]. Dispersal of a tumor or swelling
- discurrent** (dis-ku'shent) [L *discutere*, to dissipate]. Agent which disperses a lesion or tumor
- disdiacast** (dis-di'ā-klast) [G. *dis*, two, + *diaklan*, to break through]. A doubly refracting element in the tissues of striated muscles.
- disease** [L *dis*, apart, + Fr *aise*, ease]. Literally the lack of ease a pathological condition of the body that presents a group of symptoms peculiar to it and which sets the condition apart as an abnormal entity differing from other normal or pathological body states.

d. acute. D having a rapid onset and of relatively short duration

d. chronic. One having a slow onset and lasting for a long period of time.

d. communicable. D the causative organism of which is transmissible from one person to another, either directly or indirectly through a carrier or vector

d. congenital. D which is present at birth May be due to hereditary factors, or prenatal infection

d. constitutional. (1) D due to an individual's hereditary make-up (2) A disease involving the body as a whole in contrast to one involving specific organs

d. contagious. An infectious disease readily transmitted from one person to another

d. deficiency. A disease resulting from inadequate intake or absorption of essential dietary factors such as vitamins or minerals

d. degenerative. A disease resulting from degenerative changes that occur in tissues and organs, characteristic of old age

d. endemic. A disease which is present more or less continuously in a community

d. epidemic. D which attacks a large number of individuals in a community at the same time

d. familial. A d which occurs in several individuals of the same family

d. functional. A d in which no anatomical changes can be observed to account for the symptoms present

d. hereditary. D due to hereditary factors, transmitted from parent to offspring

d. idiopathic. D for which no causative factor can be recognized

d. infectious. D resulting from the presence in the body of a pathogenic organism

d. malignant. (1) Cancer, *q v* (2) D in which the progress is extremely rapid generally threatening or resulting in death within a short time

d. occupational. D resulting from factors associated with the occupation engaged in by the patient

d. organic. D resulting from recognizable anatomical changes in an organ, or tissue of the body

d. pandemic. An epidemic disease which is extremely widespread involving an entire country, continent, or possibly the entire world

d. parasitic. D resulting from the growth and development of parasitic organisms (plants or animals) in, or upon the body

d. periodic. Disease that occurs at more or less regular intervals or at the same time each year

d. psychosomatic. D which structural changes in or malfunctioning of organs are due to the mind, esp., the emotions

d. sporadic. D in which only occasional cases occur, not epidemic or endemic

d. subacute. D in which symptoms are less pronounced but more prolonged than in an acute disease, intermediate between acute and chronic disease

d. venereal. Abr. V D includes syphilis, gonorrhea, and chancroid Disease usually acquired through sexual relations.

disengagement [Fr. *désengagement*]. GYN: The displacement of the fetal head from within the maternal pelvis.

disequilibrium [*L. dis*, apart, + *aequus*, equal, + *libra*, balance]. On unequal and unstable equilibrium.

disinfect (dis-in-fekt') [*+* + *inficere*, to corrupt]. To free from infection by physical or chemical means.

disinfectant [*+* + *inficere*, to corrupt]. A chemical which kills bacteria. **Syn-** germicide, bactericide. Common disinfectants are (1) the halogens—chlorine, fluorine, iodine, (2) salts of heavy-metals—mercuric chloride (bichloride of mercury), silver nitrate, (3) acids—sulphurous acid, (4) alkalis—chloride of lime, (5) organic compounds—formaldehyde, alcohol 70%, iodoform, organic acids, phenol (carbolic acid), cresols, benzoic and salicylic acids and their sodium salts, (6) misc. substances—thymol, hydrogen peroxide, potassium permanganate, boric acid. An agent that frees from infection. Term is usually applied to a chemical agent which kills bacteria or other micro-organisms.

disinfecting agents. See alcohol, borax, boric acid, chlorine preparations, cresols, formaldehyde, hydrogen dioxide, kresol, mercuric chloride, nitric acid, phenol, potassium permanganate, sulfur, urotropin.

disinfection [*L. dis*, apart, + *inficere*, to corrupt]. The application of disinfectants. It is not possible to insure a 100% disinfection of a room. Disinfection, or the killing of vermin by chemicals and their vapors, however, is possible.

d. of blankets and woollens: May be steam disinfected, or soaked for 2 hours in 5% carbolic acid solution and then

washed. Cotton goods may also be so treated, or boiled before washing.

d. of excreta. Should be soaked in 5% carbolic acid solution for 1 hour before disposal. All infected excreta should be burned, but sputum may be treated as excreta if impossible to burn.

d. of field of operation. A safe rule is to make the disinfection, if anything, too extensive. Thus, in operations of any magnitude upon scalp and large wounds of this structure, and all operations on the skull and its contents the entire scalp must be shaved and disinfected.

In operations upon the breast, the axilla and half of the chest must be prepared, and if glands of neck are involved the entire neck must be included in field of operation.

In amputation of foot and lower third of leg the disinfection must extend as far as knee, and in all higher amputations it should include the whole limb and corresponding side of pelvis.

In all abdominal operations below the umbilicus the pubis must be shaved, and the surface disinfection must include the whole ant. surface and both sides as far as the breasts.

In operations on the stomach, liver, and bile ducts the field extends from the pubis to the breasts. A general warm bath, liberal use of tincture of green soap, must precede disinfection of the field of operation in all abdominal and pelvic operations, including hernia and varicocele.

In operations upon parts of the body difficult to disinfect, as scalp, palm of

DISINFECTANTS

Used For	Chemicals	Uses
Purifying the air and certain solutions.	Formaldehyde.	A 40 per cent solution of formaldehyde gas is called formalin. A 4 per cent solution preserves tissues, a 1 to 2 per cent solution disinfects instruments.
	Sulfur dioxide	Formed by burning sulfur. Disinfects but will bleach colored fabrics.
	Chlorine.	This gas in presence of moisture is a powerful disinfectant, used mostly as chlorinated lime to disinfect stools and urine, also to remove odors. Used commercially to purify drinking water.
Sinks, etc.	Phenol (carbolic acid).	Two to 5 per cent solutions fatal to all bacteria. Concentrated solutions are corrosive.
	Cresols.	Generally prepared as emulsions or soapy solutions under trade name of Lysol, more powerful than phenol.
Skin.	Iodine.	A 3 per cent solution of iodine in alcohol is used to disinfect the skin before an operation.
Wounds.	Mercurochrome.	Two per cent solution is used for surface wounds and infections.
Urethral irrigation. Cervix uteri.	Acetiflavine.	Maintains its high antiseptic power in the presence of serum. Used as a 1 per cent solution for painting the cervix, as a 1 in 2000 solution for urethral irrigation, or a 1 in 1000 solution as a lotion.
Bedpans and other articles.	Lysol.	Disinfectant and antiseptic. A 1 in 100 solution often used instead of 1 in 20 carbolic for disinfecting articles such as bedpans. A soapy preparation which cleanses as well as disinfects. Can be used as an antiseptic, half a dram to 1 pint for douching and swabbing.
Mouthwash.	Potassium permanganate	Antiseptic and disinfectant. Diluted with water to a pink color, it is useful as a mouthwash or gargle.

hand, and sole of foot, it is advisable to scrub with hot water and tincture of green soap, then rinse, then use 70 per cent solution of alcohol, benzalkonium chloride, hexachlorophene, or other disinfectant. Alcohol is universally useful in hand and surface disinfection.

The mucous membranes are active, absorbing surfaces so that the use of solutions of carbolic acid, mercuric bichloride, and other potent antiseptics is fraught with danger. The free use of any of these agents in the vagina, uterus, or rectum has frequently resulted in serious poisoning, and in some instances death.

Disinfection of the mouth should invariably precede the use of a general anesthetic, as in doing so the danger of inflammatory complications of the air passages following anesthetization is greatly diminished. For this purpose and to prepare the mouth for operation, cetyl pyridinium or benzalkonium chloride mouthwashes are especially effective.

In grave operations, such as excision of superior or inferior maxilla, and amputation of tongue, the employment of the solution is preceded by thorough cleansing of the teeth and the mucous membrane is swabbed with hydrogen peroxide.

In operations upon the rectum shaving, enemas, and rectal irrigation with a disinfectant such as benzalkonium chloride solution make up the procedure in common use.

Vaginal disinfection is more satisfactory. After a thorough cleansing with warm water and tincture of green soap, a douche of warm water with a solution of Lysol (0.2 to 0.5%) or other disinfectant is recommended. The vaginal disinfection is preceded by shaving and disinfection of the external genitals.

Catheterization should always be preceded by disinfection of the meatus with alcohol or 1:1000 solution of mercuric bichloride.

The ear should be mechanically cleansed of wax, dirt, blood clot, etc., and then be carefully disinfected by a low-pressure stream of warm sublimate solution, 1:2000 or hydrogen peroxide, till it is absolutely clean. Nose cleansed and thoroughly sprayed with boric acid solution.

disinfestation (dis-in-fes-ta'shun) [*" + infestare*, to strike at]. The process of killing infesting insects or parasites.

disintegration [*" + integer*, entire]. The product of catabolism, the falling apart of the constituents of a substance.

disjoint. To disarticulate or to separate bones from their natural positions in a joint.

disk [*G. diskos*, a disk]. A round, flat, platelike structure.

d., anisotropic. A dark, shining, highly refractive disk forming a part of the striation of the myofibril of a striated muscle fiber. Also called A or Q stripe.

d., articular. A disk of dense fibrous tissue or fibrocartilage found in the structure of certain joints, esp the temporomandibular joint.

d., blood. A red blood corpuscle.

d., Bowman's. Segment of a muscle fiber.

d., choked. Inflammation of the optic disk. *SYN papillitis*.

d., diameter. Optic disk diameter.

d., embryonic. An oval disk of cells in the blastocyst of a mammal from which the embryo proper develops. Its lower layer, the endoderm, forms the roof of the yolk sac, its upper layer, the ectoderm, forms the floor of the amniotic cavity. The primitive streak develops on the upper surface of the disk.

d., epiphyseal. Disklike epiphysis at vertebral centrum's ends.

d., germinal. A disk of cells on the surface of the yolk of the eggs of reptiles and birds from which the embryo develops, the blastoderm.

d., Hensen's. A pale disk occurring in the middle of a muscle fiber.

d., holder. Microscope joint to enable mobility in every direction.

d., intercalated. A highly refractive band which extends transversely across the fiber of cardiac muscle. It is bounded on each side by Z lines.

d., intermediate. Myofibrils. Also called Z line or Krause's membrane.

d., interpubic. Disk of cartilage bet. the pubic bones at their symphysis.

d., intervertebral. A fibrocartilage substance bet. vertebral surfaces.

It may rupture but it does not slip. It serves as a shock absorber. The gelatinous mass in the center is called the *nucleus pulposus*. When this slips out because of injury to the surrounding ring it is called herniation or a slipped disk. The cervical or the lower lumbar region may be injured causing pressure on nerve roots if in the lumbar region, with back and leg pains. Sneezing, spinal injury, and the ageing process may cause the trouble.

d., isotropic. A disk lying between the A disk of a striated muscle myofibril. Also called I or J disk. It extends across the entire muscle fiber.

d., M. A thin line lying in the center of Hensen's disk.

d., Merkel's. A disklike expansion found at the end of sensory nerve fibers in the epidermis. It is a touch receptor. Also called *tactile disk*.

d., optic. Area of the retina where optic nerve enters it.

d., proligerous. *SEE germinal d*

d., Q. The anisotropic or A disk of a striated muscle myofibril.

d., tactile. Merkel's disk, *q v*

d., Thurington's. Device used for retinoscopy.

d., Z. The intermediate disk of a striated muscle fiber, *q v*

dis'location [*L dis*, apart, + *locare*, to place]. The displacement of any part, more esp the removal temporarily of a bone from its normal position in a joint.

d., closed. Simple dislocation, *q v*.

d., complete. One which completely separates the surfaces of a joint.

d., complicated. One which is associated with other important injuries.

d., compound. One in which the joint communicates with the external air.

d., congenital. One which exists from or before birth.

d., consecutive. One in which the luxated bone has changed its position since its first displacement.

d., divergent. One in which the ulna and radius are dislocated separately.

- d., habitual.** One which often recurs after replacement [displacement]
- d., incomplete.** A subluxation; a slight *d., intrauterine.* One which occurs to the fetus in the uterus [finger]
- d., metacarpophalangeal joint.** *D. of* This is usually complicated by an interposition of tendons or other structures, and if reduced tends to slip out immediately. In many instances manipulating of this region only tends to make it more difficult for a subsequent reduction, therefore, immobilize* the disturbed area with well placed and padded splints of hand and wrist. Send patient to doctor, promptly
- d., Monteggia's.** Dislocation of hip joint in which head of femur is near anterosuperior spine of the ilium
- d., Nelaton's.** Dislocation of the ankle in which the astragalus is formed up bet the end of the tibia and the fibula
- d., old.** A dislocation in which no reduction has been accomplished, even after many days, weeks, or months
- d., partial.** Same as incomplete
- d., pathologic.** One which results from paralysis or disease of joint or supporting tissues.
- d., primitive.** One in which the bones remain as originally displaced
- d., recent.** One in which there is no complicating inflammation
- d., simple.** One in which the joint is not penetrated by a wound
- d., subastragalar.** Separation of the calcaneum and the scaphoid from the astragalus
- d., thyroid.** Displacement of the head of the femur into the thyroid foramen
- d., traumatic.** One due to injury or violence. SEE *Names of bones in alphabetical order.*
- dismember.** To remove an extremity or a portion of it
- disorganization** [' + G. *organon*, a unified organ] Alteration in an organic part, causing it to lose most or all of its distinctive characteristics
- disoma.** A monster possessing two trunks
- disorientation** (dis-o-ri-en-ta'shun) [' + Fr *orienter*, to face the east] Inability to estimate direction or location, or to be cognizant of time or of persons
- disparate points** (dis'par-at) [L. *disparare*, to separate] Points on the 2 retinas which are not corresponding or identical, causing objects to appear double
- dispareunia** (dis-par-ú-ni-á) [G. *dyspareunos*, badly mated] Pain in the female during coitus
- dispensary** [L. *dispensare*, to give out]. Place or clinic for free dispensation of medicines and treatment
- dispense** (dis-pens') [L. *dis*, out, + *pensare*, to weigh]. To prepare or deliver medicines
- dispereme** (dis-per-em') [G. *dis*, two, + *speréma*, coil] Stage that succeeds the diaster and precedes division of cell body, when threads of daughter cell are convoluted
- disperse** (dis-pers') [' + *spergere*, to scatter]. To scatter, esp applied to the scattering of light rays
- dispersion.** 1. Act of dispersing. 2. That which is dispersed
- d., coarse.** Mechanical suspension.
- d., colloidal.** Colloid solution.
- d. me'dium.** Liquid in which a colloid is dispersed.
- d., molec'ular.** A true solution.

- d. particles.** Colloid particles in a colloid system
- d. system.** A colloid solution.
- displacement** [Fr *deplacer*, to lay aside].
1. Removal from the normal or usual position or place. SEE *cardiastrophe*.
 2. Adding to a fluid one of greater density causing the first fluid to be dispersed.
 3. Attachment of emotion from repressed conflict to some apparently indifferent idea.
- Psy** The transfer of an emotion pert to 1 set of ideas to an inappropriate idea; although properly thus associated in the unconscious.
- disposition.** A natural tendency or aptitude exhibited by an individual or group of individuals. This may be manifested toward acquiring a certain disease, presumably due to hereditary factors
- dissect** (dis-sekt') [L. *dissecare*, to cut up] To separate tissues and parts of a cadaver for anatomical study
- dissection** (dis-sek'shun) [L. *dissecare*, to cut up] The cutting of parts for purpose of separation and studying of the same
- disseminated.** Scattered or disturbed over a considerable area, esp. applied to disease organisms, scattered throughout an organ or the body.
- d. sclerosis.** A degenerative disease of the nervous system, insular sclerosis
- dissipation** (dis-i-pa'shun) [L. *dissipare*, to scatter] Dispersion of matter. Act of being wasteful and living a dissolute life, esp. drinking to excess
- dissociation** (dis-so-si-a'shun) [L. *dis*, apart, + *sociatio*, union] Separation, as the separation by heat of a complex compound into simpler molecules
- d., microbic.** Substrains arising from pure strains
- d. of personality.** Split in consciousness resulting in 2 different phases of personality, neither being aware of the words, acts, and feelings of the other. SEE *dual personality, multiple personality.*
- d., psychological.** Disunion of mind of which the person is not aware. Dual personalities, fugues, somnambulism, are so classified. May be result of trying to find a solution or substitution for a repressed complex
- d. symptoms.** Anesthesia to heat, cold, and pain, without loss of muscular sense or tactile sensibility.
- dissolution** [L. *dissolvere*, to dissolve]. Death, pathological resolution or breaking up of the integrity of an anatomical element.
- dissolve** (di-zolv') [L. *dissolvere*, to dissolve] To cause absorption of a solid in and by a liquid
- dissolvent** (diz-ol'vent) [L. *dissolvens*, dissolving] 1. Having the power to dissolve. 2. That which is capable of dissolving.
- dissolving.** To cause to enter into a solution.
- distad** (dis'tad) [L. *distare*, to be distant, + *ad*, toward]. Away from the center
- distal** (dis'tal) [L. *distare*, to be distant]. Farthest from the center, from a medial line, or from the trunk. Opposite of *proximal*.
- distend'** [L. *distendere*, to stretch out]. 1. To stretch out. 2. To become inflated.
- distention** [L. *distendere*, to stretch out]. The state of being distended. SEE: *goblet cell, Wangensteen's method.*

distichiasis (dis-ti-ki'a-sis) [G. *dis*, two, + *stichos*, row]. Two rows of eyelashes, the post. of which is directed inward toward the eye.

distil' [L. *destillare*, to drop from]. To vaporize by heat, condensing and collecting the volatilized products.

distillate [L. *destillare*, to drop from]. The portion of a substance subject to distillation which passes in the form of a vapor and condenses.

distilla'tion [L. *destillare*, to drop from]. Condensation of a liquid, heated to a volatilization point, as the condensation of steam from boiling water.

It is used for the purification of water, and other purposes. Distilled water should not be exposed as it readily takes up impurities from the atmosphere.

d., destructive. The process of decomposing complex organic compounds by heat in the absence of air, and condensing the vapor of the liquid products.

d., dry. D of solids without liquids.

d., fractional. Separation of liquids based upon the difference in their boiling points.

distinctom'eter [L. *distinguere*, to mark out, + G. *metron*, measure]. Device for palpation of abdomen along its borders.

distobuccal (dis-to-buk'al) [L. *distare*, to be distant, + *bucca*, cheek]. Pert to the distal and buccal walls of bicuspid and molar teeth.

Dis'toma, Dis'tomum (dis'to-ma, -mum) [G. *distomos*, double mouthed]. Former name of genus of trematods worms. Its members have been placed in many new genera.

Dis'tomata. A suborder of the Class Trematoda (flukes).

dis'tome. A fluke with two suckers; an oral and a ventral sucker or *acetabulum*.

distomiasis (dis-tō-mī-ās'is). Infestation with flukes, which flukes may infest the intestine, liver, bile ducts, gall-bladder, blood vessels, or lungs.

distor'tion. 1 A twisting or bending out of regular shape. 2 A writhing or twisting movement as of the muscles of the face. 3 A deformity in which the part or structure is altered in shape. 4. In psychiatry, adapting an idea to conform with a patient's wishes.

distractibility [L. *dis*, apart, + *fractio*, a drawing]. Psy. A condition of mental wandering in which the thoughts are attracted by extraneous conditions or influenced by a disassociation of consciousness.

districhiasis (dis-trik-i'as-is) [G. *dis*, double, + *thrix*, hair]. Two hairs growing from the same hair follicle.

distrix (dis'triks). The splitting of ends of the hairs.

dito'cia, dito'kia [G. *dis*, double, + *tokos*, birth]. Twin birth.

ditokous (dit'o-kus). Giving birth to twins.

Dittrich's plugs (dit'triks). Small particles in fetid sputum composed of pus, detritus, bacteria, and fat crystals.

diuretic (di-u-re'tis) [G. *dia*, through, + *ouren*, to urinate]. Abnormal secretion of urine.

This occurs in diabetes mellitus, and also in hysteria, as an early symptom of chronic interstitial nephritis, as the result of fear or anxiety, from drinking large quantities of fluid, and in diabetes insipidus, when 200-300 oz. per day may be passed. **SYN:** polyuria. **SEE:** anti-diuresis, antidiuretic.

diuretic (di-u-ret'ik). Increasing or an agent which increases the secretion of urine.

Diuretics act in two ways (1) by increasing glomerular filtration or (2) by decreasing reabsorption from the tubules. An increase in blood flow in the renal vessels increases urine formation by increasing glomerular filtration-pressure and by increasing the number of glomeruli functioning.

Diuretics act on the kidney cells, increasing permeability, and also on the circulation to the kidneys. Alcohol dilates the blood vessels of the kidneys and thus increases circulation to them.

Cold applications have a diuretic action by contracting superficial vessels and raising blood pressure. **SEE:** diuresis.

d., alterative. One eliminated by the kidney which aids diseased urinary tract surfaces.

d., hydragogue. One increasing renal flow.

d., refrigerant. One which alleviates irritation from urine.

diuretin (di-u-re'tin) [G. *dia*, through, + *ouren*, to urinate]. A white, odorless powder, original soluble sodium salicylate salt of theobromine.

Uses. Diuretic, myocardial stimulant.

DOSAGE. Average, 15 gr (1 Gm.).

INCOMPATIBILITIES. Acids, ferric salts, lime water, etc.

diur'nal [L. *diēs*, day]. 1. Daily. 2. Happening in the daytime, or pert. to it; opposed to *nocturnal*.

divagation (div-a-ga'shun) [L. *divagari*, to wander about]. Disconnected and incoherent speech.

divergence (di-ver'jens) [L. *divergere*, to tend apart]. Separation from a common center, esp. that of the eyes.

div'er'gent [L. *divergere*, to tend apart]. Radiating in different directions.

diver's paralysis. Occupational disease due to returning too suddenly to normal atmosphere after working under high air pressure. **SYN:** bends, caisson disease, tunnel disease.

divertic'ula [L. *diverticulare*, to turn aside]. Plural of *diverticulum*, *q.v.*

MULTIPLE DIVERTICULA
OF THE COLON

d., hernia. Hernia containing part of the intestine.

diverticulotomy [' + G. *ektomē*, excision]. Surgical removal of a diverticulum.

diverticulitis [' + G. *-itis*, inflammation]. Inflammation of a diverticulum or of diverticula in the colon, causing stagnation of feces in little distended sacs of the colon (diverticula)

d., acute. **Sym** Similar to appendicitis; inflammation of peritoneum, formation of an abscess, and finally gangrene accompanied by perforation may ensue. Symptoms are felt on left side.

d., chronic. **Sym** Constipation growing worse, mucus in stools, gripping abdominal pains at intervals. Wall of bowels may thicken, which may produce chronic intestinal obstruction.

diverticulosis [' + G. *-ōsis*]. Diverticula of the colon.

diverticulum (di-ver-tik'u-lum) (pl *diverticula*) [L. *diverticulāre*, to turn aside]. A sac or pouch in the walls of a canal or organ, esp. the colon.

d., Meckel's. Vestiges of the vitelline duct sometimes appearing as an extended pouch at the lower portion of the ileum.

divulsor (di-vul'sor) [L. *dis*, apart, + *velere*, to pluck]. Device for dilatation of a part.

d., pterygium. Instrument for separating corneal portion of the pterygium.

d., tendon. Device for separating tendon from surrounding tissue.

dizygotic twins (di-zi-got'ik) [G. *dis*, two, + *zygon*, yoke]. Twins who are the product of 2 ova and who are dissimilar in most ways.

dir'ziness [A S *dyzig*, foolish] Giddiness, vertigo.

Dobell's solution (dō'belz) Carbolic acid, borax, sodium bicarbonate, glycerine, and water in solution.

Doble's globule (dō'bē's) A very tiny spherical body in a striated muscle fiber's light band.

DOCA. *Desoxycorticosterone* **See:** *STH*

dochmiasis, dochmiosis (dok-mi'as-is, -mī-ō'sis) [*Dochmus*, a nematode parasite]. Hookworm disease. **Syn.** *ankylostomiasis, uncinariasis*.

Dochmius (dok-mī-us). A species of parasite. **Syn:** *ankylostoma*.

Dock's test meal. Shredded wheat biscuit and 9-12 oz water. **See:** *Ewald's t. m.*

dodecadactylitis (do-dek-a-dak-til-'itis) [G. *dōdeka*, twelve, + *daktylos*, finger, + *-itis*, inflammation] Inflammation of duodenum.

dodecadactylon (do-dek-a-dak-til-on) [' + *daktylos*, finger]. The duodenum.

Doe's method (Orlando Witherspoon Doe, American physician, 1843-1890). To resuscitate a stillborn infant, enclosed in an air-tight box with only the mouth and nose exposed, inspiration is produced by exhausting the air in the box, expiration by forcing in warm air.

dog bite. Lacerated wound by a dog **See:** *rabies*

Preserve the dog alive if possible to determine the presence of rabies. Rabies may result from the bite of many animals, including man. The virus is unknown but it has an affinity for the central nervous system.

Incubation Period. Seven or 8 weeks, never less than 3 weeks, before the beginning symptoms appear. Rabies has

been known to develop a year after the bite.

Sym: (1) The incubation period; (2) a premonitory stage, (3) a phase of excitement, (4) a short terminal period. No symptoms are manifest during the incubation period, with possible exception of numbness about the wound. There may be a slight rise in temperature, malaise, and irritability.

The 3rd period brings dysphagia,* dysarthria* and dyspnea,* a husky voice, and excitement. The patient becomes increasingly restless with abnormal sensitivity to sounds, sights, odors, and all stimuli. Spasms of the diaphragm, larynx, and pharynx follow with inability to take water without localized convulsions. Temperature rises, but seldom exceeds 102° F. Vomiting, sweating, and pallor may be in evidence. The pupils sometimes are unequal and there is a spasm of the jaw causing a clicking sound, and a husky voice. Terror and delusion, and excitement may be followed by depression. The jaw relaxes, death occurs on 5th or 6th day following this period.

Treatment. Cauterize wound with strong tincture of iodine or silver nitrate, or, if the dog is known to be rabid, cauterize with strong nitric acid or use actual cautery. A saturated solution of sodium bicarbonate should be applied to wash off excess acid. If nitric acid is not available, a strong solution of phenol may be employed which should later be washed off with alcohol. The wound must be kept open and the flow of blood may be induced or maintained by suction. Pasteur treatment should be given as quickly as possible. With this treatment only 0.3% develop hydrophobia. This is esp. important if the bite is about the head or neck. **See:** *hydrophobia, rabies*.

dol. Symbol for degree of pain registered on the dolorimeter. Each degree covers 2 gradations on the 21 gradations of this device. A headache producing a 2-dol pain may cease after taking aspirin, but a 4-dol pain will not be reduced to a 2-dol pain by taking aspirin. Increasing dosage will not help.

dolichocephalic (dol'ik-o-se-fal'ik) [G. *dolichos*, long, + *kephalē*, head]. Having a skull with a long ant. post. diameter.

dolichohieric (dol-ik-o-hi-er'ik) [' + *ieros*, sacred]. Having a slender sacrum.

dolichopelvic, dolichopelvic (dol-ik-o-pel'ik, -pel'vik) [' + *pelvis*, pelvis]. Having an abnormally long or narrow pelvis.

dolichosigmoid (dol-ik-o-sig'moid) [' + *igma*, the letter S, + *eidos*, form]. Having an abnormally long sigmoid flexure.

doll's head anesthesia. Anesthesia affecting the head, neck, and upper thorax.

dolor (dō'lor) [L.] Physical or mental pain. **See:** *calor, rubor, tumor*.

d., cap'itis. Headache.

dolorific (dol-o-rif'ik) [L. *dolor*, pain]. Causing pain.

dolorimeter (dōl-ōr-im'er-et) [L. *dolor*, pain, + *meter*, measure]. **Sym:** *dol*. Device for measuring degree of pain that may be felt. Twenty-one gradations have been recorded. The threshold, or zero, represents 220 millicalories of heat; and the ceiling, 480 millicalories.

dolorogenic [' + G. *gennan*, to produce]. Causing pain.

domatophobia (do-mat-o-fō'bī-ă) [G. *dōma*, house, + *phobos*, fear] A form of claustrophobia. abnormal aversion to being in a house

domiciliary [L. *domis*, house]. Pert. to a house, as treatment

dominant [L. *dominans*, ruling] That which is inherited from 1 parent developing to the exclusion of a contrasting character from the opp. parent One who, or that which, gives something

d., hydrogen. A substance which gives up hydrogen to another substance SEE *hydrogen acceptor*

donee (dō-nē') [L. *donāre*, to give] One who receives blood transfused from another, the donor

Donné's corpuscles (don-nāz'). Bodies in colostrum having amoeboid movements

D.'s test. To determine pus in urine, mix with 10% solution of potassium hydrate. Pus is present if a lumpy hyaline mass with air bubbles rising slowly is formed when mixture is shaken

donor [L. *donāre*, to give] One who furnishes blood for transfusion

d., universal. One whose blood is of Group O, and whose blood is not agglutinated by the blood of anyone

Donovan body. Supposed causative agent of lymphogranuloma inguinale, *q v*

doraphobia (do-rā-fō'bī-ă) [G. *dōra*, hide, + *phobos*, fear] Abnormal aversion to touching the hair or fur of animals.

Dorel's canal. A bony canal in tip of temporal bone enclosing abducens nerve

Dorendorf's sign. A filling up or fullness of the supraclavicular groove in aneurysm of the aortic arch.

dormison (dor'mī-sōn) Trade name for *methylparalynol*, a sleep-inducing drug Said to be nontoxic, free of barbituric derivatives, or after-effects

dorsabdominal [L. *dorsum*, back, + *abdere*, to hide]. Pert. to the back and abdomen

dorsad (dor'sad) [" + *ad*, toward]. Toward the back

dorsal [L. *dorsum*, back]. Thoracic. Pert. to the back

d., elevated position. Patient is on the back, head and shoulders elevated at an angle of 30° or more Employed for digital examination of genitalia, and in bimanual examination

d., inertia posture. In which patient rests on the back showing tendency to turn to either side or to slip down in bed

This may be seen in great weakness, in acute infectious diseases such as typhoid, mental apathy, and in muscular weakness SEE *Illustration* below.

d., nerves. Nerves emerging from the dorsal vertebrae.*

d., recumbent position. Same as dorsal elevated, except extremities are moderately flexed and rotated outward, the soles of the feet resting upon bed or table, or legs may be extended With legs not flexed it is used for examination of chest, abdomen, and lower limbs With legs flexed, it is used in giving douches, for bathing, for catheterizing, and for applying abdominal compresses The patient may be placed in this position for bimanual palpation, or for vaginal examinations and repair of lesions following parturition

d., reflex. Irritation of the skin over the erector spinal muscles, causing contraction of muscles of the back

d., rigid posture. One in which both legs (or the right one) are drawn up; observed in peritonitis, meningitis, ascites, and tympanites The right leg is drawn up in appendicitis, in pelvic inflammation, renal calculus, in right ureter, in psoas abscess or in peritonitis on the right side SEE *ilius*, p D-44

d., vertebrae. Twelve bones of the spinal column bet the cervical and lumbar vertebrae SEE *position*, *posture*

dorsalgia (dor-sal'ji-ă) [" + G. *algos*, pain] Pain in the back SYN *notalgia*, *rachialgia*

dorsi-, dorso-, dors- [L] Combining form for *dorsum*, back

dorsiduct (dor'si-duk't) [L *dorsum*, back, + *ducere*, to lead] To draw toward the back or backward

dorsiduc'tion [" + *ducere*, to lead] Drawing toward the back

dorsiflect (dor'si-flekt) [" + *flectere*, to bend] Bending backward

dorsiflex'ion [" + *flectere*, to bend] The act of bending or flexion toward the dorsum or rear, opposite of plantarflexion Also applied to straightening or extending the toes

dorsim'esad [" + G. *mesos* middle, + L. *ad-*, toward] In the direction of the dorsimeson

dorsim'eson [" + G. *mesos*, middle]. The median plane of the back.

dorsispinal (dor'si-spi'nal) [" + *spina*, thorn] Pert. to the back and spine.

d., veins. Veins around the vertebrae

dorsoceph'alad [" + G. *kephalē*, head, + L. *ad* toward] Situated toward the back of the head

dorsodynia (dor-so-din'i-ă) [" + G. *odynē*, pain] Rheumatism in the muscles of upper part of back

dorsosa'cral [" + *sacrum*, sacred, "sacred bone"] Pert. to lower back

d., position. Patient lies upon the back, same as in the dorsal recumbent position,* excepting that thighs are flexed upon abdomen and legs upon thighs

DORSAL INERTIA POSTURE.
Showing weak patient slipping down into bed.

DORSAL RECUMBENT POSITION.

which are abducted. Leg holders are used to support legs in position.

Used for gynecological examinations and treatments, in plastic operations on genital tract, in vaginal hysterectomy, and in diagnosis and treatment of diseases of urethra and bladder. *Syn lithotomy position (illus., p. L-34)*

dorsum [L] The back or post surface of a part

dosage [G *dosís*, dose] The amt of medicine to be administered to a patient at one time

d. from tablets (usually hypodermic): Young's rule for children

FOR CHILDREN FROM 1-12 YEARS
Formula

Age in yr \times Adult dose = child's dose.
Age + 12

Example I The adult dose of sodium bicarbonate is gr. xx. How much should a 4-year-old child receive?

$$\frac{4}{4 + 12} \times 20 = 5$$

\therefore the child should receive gr. v.

FOR CHILDREN UNDER 1 YEAR
FREID'S RULE
Formula

Age in mo \times Adult dose = child's dose.
150

Example II The adult dose of morphine sulfate is gr. $\frac{1}{4}$. How much should an 8-month-old child receive?

$$\frac{8}{150} \times \frac{1}{4} = \frac{1}{75}$$

\therefore the child receives $1/75$ gr. of drug.

WHEN THE STRENGTH OF THE TABLET ON HAND IS GREATER THAN THAT DESIRED
Give

$$\frac{1/4 \text{ (D)}}{1/3 \text{ (H)}} = \frac{q}{1 \text{ tablet (Q)}} \quad q = \frac{3}{4}$$

or $1/4 : 1/3 \therefore Q : 1$

$$\frac{q}{3} = \frac{1}{4}, \quad q = \frac{3}{4}$$

Give $3/4$ of a $1/3$ gr. tablet. To prepare. Dissolve the $1/3$ gr. tablet in the number of m indicated by the denominator, give the number of m indicated by the numerator.

Note Dilutions must range bet 6 and 16. If the number indicated by the numerator or denominator is less than 6, multiply both numerator and denominator by the same number, then prepare the drug.

To prepare $3/4$ of a tablet $3/4 \times 3/3 = 9/12$. Dissolve tablet in 12 m of water and give 9 m .

WHEN THE TABLET ON HAND IS OF WEAKER STRENGTH THAN THE DOSE WANTED

Give morphine gr. $1/6$ from $1/8$ gr. tablets.

Since $1/6$ is greater than $1/8$ it will be necessary to take 2 tablets or $1/4$. Find relation bet. what is desired and what you have

$$\frac{1/6 \text{ (D)}}{2/8 \text{ (H)}} = \frac{q}{1 \text{ tablet (Q)}} \quad q = \frac{8}{12}$$

or $1/6 : 1/4 \therefore q : 1$

$$\frac{2}{8} : \frac{1}{6} \therefore q : 1$$

$$\frac{q}{8} = \frac{1}{6} \quad 6q = \frac{8}{12}$$

DORSAL RIGID POSTURE.
With right leg drawn up.

Dissolve two 1/8 gr. tablets in 12 m of water and give 8 m.

The proportionate dose for any age under 20 years may also be found by taking 1/20 of the full therapeutic dose, and multiplying the result by the age in years.

Old people often require smaller doses. When given per rectum the dose is usually rather larger than when given by the mouth, if given hypodermically the dose is generally smaller.

d. meter. An instrument designed to estimate the quantity of radiation, so as to determine the duration of exposure when using roentgen rays.

dosage, words pert. to: active principles, alkaloids, antidotes, autotherapy, drug action, drugs and their administration, drugs with 2 names, medical preparations, names of individual drugs in alphabetical order (over 400 in all), names of poisons, names of preparations, poison, poisoning, preparations usually given by rectum, prescription writing.

dose (dōs) [G *dosis*]. Amt of a medicinal preparation to be taken at 1 time.

d., divided. Fractional portions adm. at short intervals.

d., lethal. A fatal dose.

d., maximum. Largest dose it is safe to adm.

d., minimum. Smallest dose that will be effective.

dosimeter (do-sim'e-ter) [' + *metron*, measure] Device for measuring very small doses.

d., Mecapion. Instrument registering 180 roentgens to determine x-ray dosage.

d., Victoreen. Apparatus which registers 256 roentgens to measure x-ray dosage.

dosimetric (do-si-met'rik) Pert to dosage.

d. system. One of regular or determinate dosage.

dosimetry (do-sim'et-ri) [G *dosis*, dose, + *metron*, measure] Measurement of medicinal doses.

dossil (dos'il) [L. *docillus*, spigot]. A round lint pledget for cleansing wounds.

do'tage [ME *doten*, to doze] Senility, feeble-mindedness of very old age.

dothienteritis (doth-i-en-en-ter-i'tis) [G *dothien*, a boil, + *enteron*, intestine, + *-itis*, inflammation] Inflammation of Peyer's patches. SYN *typhoid fever*.

double (dūb'l) [L. *duplus*, twofold]. Combining 2 things or qualities.

d. consciousness. Expression of 2 phases of personality.

d. personality. A split in consciousness, neither personality being aware of acts and words of other. SEE *dual personality*, *multiple personality*.

d. touch. Exploration with a finger in 1 cavity and thumb in another.

d. uterus. State of having a double uterus. SYN *dihysteria*.

d. vision. Seeing 2 images of an object at the same time. SYN *diplopia*.

douche (doosh) [Fr *doucher*, to pour] A current of vapor or stream of water, hot or cold, directed against a part.

Douches may be made up of plain water or water that is medicated. The

douche may be for the purpose of personal hygiene or for the treatment of a local condition. In hemorrhage, temperature, 120° F., in inflammation, 115° F. Usual quantity, 4 qt.

d., air. Air current directed on body for therapeutic purposes.

d., alternating. SEE *Scotch d.*

d., astringent. One containing substances for shrinking the mucous membrane, such as alum or zinc sulfate.

d., circular. Needle spray or application of water to body through horizontal jets size of a needle from number of small rose sprays so placed that the water is projected against the skin of bather from 4 directions simultaneously.

d., cleansing. One used for purposes of personal cleanliness, usually contains an alkaline substance. Temperature, 105° F.

d., deodorizing. One to deodorize the vagina and vaginal secretions when they have an offensive odor. Used most often in cancer cases. Potassium permanganate is the most commonly used agent.

d., fan. A fan-shaped spray obtained by placing index finger upon the stream of water as it emerges from distal end of douche hose.

d., high. One where the bag is at least 4 feet above the hips of the patient.

d., intrauterine. This is sometimes given immediately postpartum or post-abortion when the cervix uteri is still patent. Hot water alone or water containing vinegar is used for the control of postpartum hemorrhage.

The intrauterine douche tube is a very useful, though dangerous, instrument in hands of an unskilled nurse. PREPARATION AND USE. Boil the tube 15 minutes in soda solution, expel air by allowing solution to run freely before inserting. Do not insert beyond the shield. Hold in position while using, use no force, attach a rubber tube to back flow, and provide a basin for the escaping fluid.

NP (1) It is essential that the patient's buttocks are not pulled down below edge of table. If this is done when legs are elevated in leg rests or stirrups, an undue strain is apt to result in sacroiliac trouble. There is at least 1 case on record where gangrene of the foot followed prolonged pressure by stirrups. (2) The exterior surfaces are either scrubbed and irrigated with sterile water or painted, using either iodine or mercuriochrome. The vaginal surfaces are included, as is also the cervix. The patient has already been placed on a Kelly pad, on which a sterile towel has been placed. A sterile towel is now placed across the pubes. Another is now placed crosswise across the buttocks. The "floating" nurse takes a strip of narrow adhesive plaster, about 18 in. long, holding it by the ends, well away from her. The "sterile" nurse then throws over the middle of the tape a sterile towel so that tape holds towel in middle fold. The "floating" nurse places edges of tape around patient's hips so that sterile towel is stretched tightly across rectum. Sterile leggings are now pulled over patient's legs and a lithot-

omy sheet draped down on the perineum. (3) Uterine packing should be ready. This form of packing is usually of gauze $1\frac{1}{2}$ in wide and 18 in long.

d., jet. A solid stream from the douche hose.

d., low. One where the bag is 1-1½ feet above the hips of the patient

d., medicated. One containing a medicinal substance for the treatment of local conditions. Lysol, tincture of iodine, and bichloride of mercury are the most commonly used

d., neutral. Douche given at average surface temperature of body—90°-97° F.

d., pail. General affusion with pails of water at 3 temperatures, dashed over the patient in quick succession. Temperatures of 1st bath, 100°, 96° and 90° F., reduced 2 degrees each, given once or twice weekly

d., perineal. One projected upward from a bidet* placed just above floor; patient sits in armchair, crescent-shaped seat, and receives douche upon perineum.

d., rain. Overhead shower

d., Scotch. Alternating of hot and cold jets of water against local area of skin

d. solutions. Alum $\frac{1}{2}$ to 1% Bichloride of Mercury 1/3000-1/10,000 Boracic Acid 2% Carbolic Acid $\frac{1}{4}$ to 1% Green Soap 1% Lysol $\frac{1}{4}$ to $\frac{1}{2}$ % Potassium Permanganate 1/10 to 1% Silver Nitrate 1/10% Sodium Bicarbonate 2%

d., stimulating. The use of copious amt of hot or cold water in case of pelvic congestion

d. temperatures. For a cleansing douche, 105° F. For a hemorrhage douche, 120° F. For an inflammation douche, 115° F. For a neutral douche, 92° to 97° F. For a vaginal douche, 98° to 115° F.

d., vaginal. Long warm douche, 20 to 30 minutes, flowing slowly from height not greater than 15 in above patient's pelvis, temperature from 98° to 115° F., from 3 qt to 5 gal daily.

SEE *Elliott's treatment*.

d., vapor. Stream of vapor projected from the douche hose, given with or without intervening flannel clothes.

Douglas' cul-de-sac. Peritoneal sac which lies behind uterus and in front of rectum

D.'s pouch. Same as D's cul-de-sac.
douglasitis (dug-las-'tis) [G. -itis, inflammation] Inflammation of the cul-de-sac of Douglas

dowel [Fr. *douille*, socket, from L. *ductus*, leading] Metal pin for fastening an artificial crown to a tooth root

Dowell test. Injection of ant pituitary in flexor surface of arm, which causes an erythema at point of injection in a pregnant woman

Doyère's eminence (dwah-yair'). Elevation where a nerve filament enters a muscle

D. P. Abbr for Doctor of Pharmacy

dr. Abbr for dram or drachm

D. R. Abbr for reaction of degeneration

drachm (dram) [G. *drachmē*, a weight]. A unit of weight in apothecaries' system. **SYMS** 3. **SYN.** *dram*.

dracontiasis (drä-kön-ti-äs-sis) [G. *dracontian*, little dragon]. **SYN.** *dracunculosis*, *q v*

dracunculiasis (dra-kün-kü-li-äs-sis). Infestation with the nematode, *Dracunculus medinensis*

dracunculosis (drä-kün-kü-lö-sis) The condition of being infested with the guinea worm

Dracunculus (drä-kün-kül'üs) A genus of parasitic nematodes belonging to the suborder *Camallanata*

D. medinensis. The guinea worm or "fery serpent". A species of nematode which is a common human parasite esp., in parts of Asia and Africa. The adult gravid female lives in subcutaneous tissues and may reach a length of 3 or 4 ft. Embryos are deposited in a blister formed on the skin which breaks liberating embryos into water. Intermediate host is a species of Cyclops. Human infestation results from drinking water containing infested Cyclops.

drain (drain) [AS *drehnigean*, to draw off] 1. Exit or tube for discharge of morbid matter 2. To draw off a fluid.

d., absorbable. One taken up by lymphatic and venous system.

d., capillary. Drawing off by capillary attraction. Never use in suppurating, etc.

d., nonabsorbable. One made from horsehair, gauze, rubber, glass, or metal. **TYPES** abdominal, antrum, perineal, suprapubic, etc

d., tubular. One prepared from bone. Absorbed 8-10 days.

drainage (dra'nä) [AS *drehnigean*, to draw off] The free flow or withdrawal of fluids, as pus from a cavity or wound
SEE *autodrainage*, *drain*

d., capillary. D by method of capillary attraction

d., funnel. D with glass funnels

d., postural. D for draining nasal area and the sinuses

The patient lies on his back on a bed with shoulders over the side and head hanging down.

d. tube. Device for allowing escape of pus, serum, blood, or other fluids from a wound, abscess, etc.

d. t. carrier. Device for placing drainage tube in position.

d. t. trocar. Device to introduce drainage tube without making a large incision

dram [G. *drachmē*, a weight]. Sixty gr. or $\frac{1}{2}$ oz apothecary weight, 3.888 Gm., 27.34 gr or 1/16 oz., *avoirdupois*.

d., fluid. A teaspoonful or $\frac{1}{4}$ of a fluid ounce or 57.1 gr of distilled water, the equivalent of 3.70 cc. In Great Britain 54.8 gr. of distilled water or 3.50 cc.

dram'atism [G. *drama*, acting, + *ismos*, state of]. Dramatic behavior and lofty speech in insanity

drapetomania (drap-et-o-ma'n-i-ä) [G. *drapetēs*, runaway, + *mania*, madness]. Insane impulse to wander from home.

dras'tic [G. *drastikos*, effective]. 1. Acting strongly. 2. A very active purgative,

usually producing many evacuations, and accompanied by pain and tenesmus. Ex: *croton oil, elaterin*.

draught (draft) [A.S. *dragan*, to draw]. 1. A drink. 2. Drawing liquid into the mouth.

draw sheet. Historically, the term "draw sheet" was given to a long roll or bolt of muslin with the free end placed under the patient's buttocks. When this became soiled, it was drawn from under the patient and rolled up on the opposite side of the cot or bed, allowing the patient to lie on a clean section of the roll of muslin.

The draw sheet is now used to cover a rubber sheet which protects the mattress from soiling and drainage. A crib sheet or one-half a regular sheet is the usual size but it must be wide enough to extend from the patient's shoulders to below the knees and long enough to tuck under both sides of mattress (See *Bed, Making an Occupied*, for method of changing).

drepanocyte (dre-pan'o-sit) [G. *drepanē*, sickle, + *kytos*, cell]. Sickle or crescent cell.

drepanocytemia (dre-pan-o-si-te'mi-ā) [“ + *ama*, blood]. Sickle cell anemia.

drepanocytic (dre-pan-o-sit'ik) [“ + *kytos*, cell]. Pert. to or resembling a sickle cell.

dress [Fr. *dresser*, to treat a wound]. Covering, protective, or support for diseased or injured parts.

NP. These rules should be followed when preparing to dress any type of wound.

1. Assemble all necessary articles either on a tray or surgical dressing cart.
2. Scrub hands thoroughly with soap under hot running water. Use sterile rubber gloves for procedure, if doctor so advises.
3. Tell the patient what is going to be done, then drape with a sheet or bath blanket, exposing only the area necessary to be dressed.
4. Place sterile towel beside the wound and, using sterile forceps, place upon it the sterile instruments, gauze, etc., from their sterile containers immediately.
5. Using clean forceps, remove soiled dressings and place in paper bag for burning. Follow doctor's instructions as to use of antiseptics, powders, petroleum gauze, etc.
6. If drainage is profuse, reinforce the dressing with absorbent cellulose pads.
7. Make the patient comfortable; remove all articles from room, take tray or cart to area for cleaning and replenishing supplies.

RS *adhesive plaster, bandages, compresses, cravats, protectives*.

d., absorbent. Gauze, sterilized gauze, absorbent cotton, lint, lint cloth, paper lint, absorbent wool, wood wool, moose pappe, spongipilin.

d., antiseptic. Dressing consisting of gauze permeated with an antiseptic solution.

d., dry. Dressing consisting of dry gauze, absorbent cotton, or other dry material.

d., fixed. Dressing permeated with starch, silicate of soda, or plaster of Paris. When this dressing dries it provides fixation of the part so treated.

d., hot moist. Most common form is saturated hot boric solution, heated to as hot as can be borne by bare forearm of nurse. Sterile towel unfolded, gauze dressings dropped into it, immersed in solution at middle, wrung out by turning dry ends in opposite directions. Dressing is then applied, with sterile forceps, directly to the wound and a dry, sterile towel is sometimes used over it, to keep dressing in place. Heat is best maintained by infrared generator.

d., occlusive. Dressing that seals a wound completely to prevent infection from without.

d., protective. Dressing applied for purpose of preventing injury or infection to the part so treated.

d., water. Dressing consisting of gauze, cotton, or similar dressing material which is kept wet by the application of sterilized water.

Dreyer's tuberculin or vaccine (dri'erz). A tuberculosis vaccine prepared by removing the lipid material from tubercle germs.

Drinker respirator. Apparatus in which alternating positive and negative air pressure upon the patient creates artificial respiration. Commonly called the "Iron lung".

drip [A.S. *dryppan*, to drip]. 1 To fall in drops. 2 To instill drop by drop.

d., intravenous. Slow injection of glucose and saline solution, a drop at a time, intravenously.

d., Murphy. Slow rectal instillation of a fluid drop by drop.

d., nasal. Method of administering fluid slowly to dehydrated babies by means of a catheter placed through the nose with one end in the esophagus.

d., postnasal. A condition due to chronic sinusitis in which a discharge drips from the postnasal region into the pharynx.

drip sheet. Modified sheet bath.

drisdol (dri-sol') Proprietary name for pure crystalline vitamin D₂.

Uses In vitamin D deficiency, as rickets, tetany, etc.

dromomania (dro-mo-ma'ni-ā) [G. *dromos*, a running, + *mania*, madness]. Insane impulse to wander.

dromotrop'ic [“ + *trepein*, to turn]. Pert. to supposed fibers in cardiac nerves which influence conductivity of muscles.

drop [A.S. *dropa*] [L. *gutta*]. 1 A minute spherical mass of liquid. 2. Falling of a part from paralysis or injury.

d., ague. Fowler's solution.

d., black. Vinegar of opium.

d., culture. A bacterial culture in a drop of culture media.

d., finger. Baseball finger.

d., foot. Toes dragging in walking with falling of foot due to paralysis of dorsal flexor muscles.

d., knockout. A drug to cause unconsciousness; usually adm. for criminal purposes.

d. wrist. Paralysis of extensor muscles causing hand to hang down from forearm.

droplet. Very small drop.

d. infection. That conveyed by means of infective particles, as when carried in a spray from the nose or mouth. Usual mode of infection from common cold.

dropsy (drop's) [contraction *L. hydrops*, dropsy, from *G. ydōr*, water]. A condition rather than a disease. Morbid accumulation of water in the tissues and cavities, hydrops.

Etiol. Heart disease, kidney disease, cirrhosis of the liver, and other causes. The kidneys have little to do with retention of tissue fluids, but the body chemistry is more at fault in Bright's disease.

Diet. Sufficient proteins, carbohydrates, fats, vitamins, and iron, reducing the sodium intake a salt free diet with an acid base. Potassium or other salt substitutes may be used.

d. of amnion. Os. Abnormal increase in amt. of amniotic fluid. SYN. *polyhydramnios*.

d. of the belly. Ascites.

d. of brain. Hydrocephalus. [ease.

d., cardiac. That due to cardiac dis-

d. of chest. Hydrothorax.

d. of peritoneum. Hydroperitoneum.

d., ovarian. A collection of fluid in the ovary forming a crust.

d., tubal. A collection of fluid in the fallopian tube. SYN. *hydrosalpinx*.

d., uterine. A collection of fluid in the uterine cavity. SYN. *hydrometra*.

Drosophila. A genus of flies belonging to the order Diptera. Includes the common fruit flies.

D. melanogaster. A genus of fruit flies used extensively in the study of genetics. The development of the chromosome theory of heredity was largely the outcome of research on this species.

drowning [*A.S. druncian*, to drown]. A special type of asphyxia resulting from the body being submerged in water or some other fluid. External respiration is blocked by a spasm of the larynx or the filling of the lungs with fluid.

SYM. Unconsciousness, cessation of respiration, cyanosis, etc., depending upon duration of submersion. Due to action of the epiglottis, there is very little, if any, water in the lung.

F. A. TREATMENT. Artificial respiration at once. Do not waste time trying to get water out of lungs. Apply external heat, massage extremities, use oxygen or oxygen-carbon dioxide mixtures with resuscitation. May have to be kept up for several hours.

RS: Artificial respiration, asphyxia, shock, syncope, unconsciousness.

drug [*Fr. drogue*]. A medicinal substance, used in the treatment of disease.

drug action. LOCAL. When the drug is applied locally or direct to a tissue or organ it combines to form an albuminate with the cells' albumins. This action may be: 1. *Astringent* a.: When the drug

cannot act because the albuminate does not dissolve. 2. *Corrosive* a.: When the drug is strong enough to destroy cells. 3. *Irritating* a.: When too much of the drug combines with cells to impair them.

GENERAL OR SYSTEMIC ACTION. When the drug enters the blood stream by absorption or direct injection affecting tissues and organs not near the site of entry. Systemic action may be: 1. *Specific*. When specific in the cure of a certain disease. 2. *Substitutive*. When it supplies substances deficient in the body. 3. *Physical*. When some of the constituents of a cell are dissolved by the action of the drug in the blood stream. 4. *Chemical*. When the drug or some of its principles combine with the constituents of cells or organs to form a new chemical combination. 5. *Salt Action*. Osmosis* caused by dilution of salt (also acids, sugars, and alkalies) in the stomach or intestines by fluid withdrawn from the blood and tissues, or diffusion* when water is absorbed by cells from the lymph. 6. *Selective*. Action produced by drugs which only affect certain tissues or organs. 7. *Synergistic*. The stimulating of the action of one drug by another drug. 8. *Antagonistic*. Counteraction of one drug by another one. 9. *Physiological*. The effect of a drug on a normal animal body. 10. *Therapeutic*. The effect upon diseased organs or tissues. 11. *Side Action*. Creating an effect not desired. 12. *Empiric*. An effect produced but not proved by laboratory experiment. 13. *Toxicological*. A poisonous effect generally from result of an overdose.

CUMULATIVE. The effect of drugs too slowly excreted or absorbed so that an accumulation of the drug in the body produces a poisonous effect. Such drugs should not be administered continuously.

d. a., incompatible. Ill effects produced by 2 or more drugs antagonistic to each other.

drug action, words pert. to: active principles, alkaloids, antidotes, dosage, drugs and their administration, drugs with 2 names, medical preparations, names of individual drugs in alphabetical order (over 400 in all), names of poisons, names of preparations, poison, poisoning, preparations usually given by rectum, prescription writing.

drug addiction. A condition caused by excessive or continued use of habit-forming drugs. **SYM.** The symptom-pattern may be changed according to the drug used. In general there may be a change in personality, loss of appetite, or the appetite is dulled, disturbance in normal sleep-rhythm, generally a weight loss. The addict may be dull, sleepy, and incoordinated in movement having the appearance of intoxication. The eyes often tearing, and bloodshot; a watery fluid at times dripping from the nose. When intramuscular or intravenous injection is used there may be scars, hardening and swelling of the arm tissues.

drug rashes: Drugs of which large doses are liable to produce a rash are Arsenic, belladonna, bromides, chloral, iodides, opium, phenacetin, quinine, sera, sodium salicylate, turpentine (the nurse may notice the rash on the buttocks after a

turpentine enema has been given), and the application of cyanide gauze to a wound (in this latter case the rash is confined to the area of the wound, which is surrounded by "sores").

Antipyrin Papular, erythematous rash, sometimes accompanied by edema and much irritation.

Arsenic Papular or erythematous rash, sometimes urticarial. Prolonged use may produce pigmentation of skin.

Belladonna Erythematous rash, usually accompanied by intense itching.

Bromides Usually like acne vulgaris. Sometimes erythema

Chloral Papular erythema

Enemata (soap) may cause erythema or urticaria if hard soap is used

Iodides Usually papular erythema, sometimes with acnelike pustules

Phenolphthalein Macular rash, sometimes purpuric.

Quinine Very irritable erythema or urticaria

Salicylate Erythematous rash, possibly morbilliform.

Serum Usually urticaria.

Sulfonal Erythematous or urticarial rash

drugs (special) and their administration.

ACIDS When acids are administered they should be given well diluted through a glass tube, because they are corrosive to the enamel and the dentine of the teeth. They should be given with much water and the drinking tube should be placed well back in the mouth to prevent the fluid coming in contact with the teeth before passing into the throat. Hydrochloric acid is one preparation that should always be given with the above thought in mind.

ARTIFICIAL TEETH A solution for artificial teeth. Plain normal salt solution or boric acid solution diluted one-half may be used.

BARBITAL DERIVATIVES All such preparations should be given from one-half to one hour before sleep is desired. All procedures should be taken care of before the medicament is given in order that nothing shall disturb the patient after the drug is administered.

CALOMEL This drug should always be followed by a saline purgative. Unless the intestine is emptied of calomel within a reasonable time it may continue to be absorbed and produce poisonous symptoms.

ELIXIR OF IRON, QUININE AND STRYCHNINE When administering these drugs they should be given well diluted with much water, through a glass tube. A bitter effect will be produced if given before meals.

FOWLER'S SOLUTION When a nurse is giving a patient Fowler's solution or *Liquor potassii arsenitis* the dosage must be started at the minimum and increased gradually until the maximum is reached, then decreased in the same manner. This is to prevent cumulative action.

HABIT-FORMING DRUGS Whenever the use of habit-forming remedies is indicated, the nurse should use them only after exhausting every art of her profession to relieve pain, discomfort, or insomnia. If these efforts fail, she may then give the dose ordered, but the patient should never be informed of the nature of the remedy given.

INSULIN: When this is administered, it should be given hypodermically according to the instructions of the attending physician. The type of insulin, dosage, and frequency of dosage vary greatly.

IODINE: When iodine is applied to the skin and there is a burning from the application, alcohol should be used to wash away the accumulation and prevent further burning, or any caustic effect.

LAXATIVES These are best given in the evening, because it usually takes 6 or 8 hours for them to produce an effect. The saline purgatives are usually given well diluted on an empty stomach, in the morning. The other purgatives are usually given as ordered and needed.

MOUTHWASH Stock solutions used for mouthwash should be diluted one-half or more before being given to the patient. The special solutions, such as S.T. 37, or Dobell's solution, should be diluted according to instructions from the attending physician. Only enough for the immediate mouth washing should be used at a particular time. To take into the patient's room a glass or cupful, when the patient will only use about one-half of the amt., is not an economic procedure.

HORSE SERUM: When it is to be administered, information should be obtained as to whether the patient has had serum recently, as a reaction is liable to occur if not sufficient time has elapsed between the inoculations or if the patient is allergic to horse serum. If uncertain, a test should be made by injecting a few drops of the horse serum hypodermically, and within a short time a reaction will occur. A small spot appears at the site of the injection if the patient has a tendency toward an unfavorable reaction.

OXYGEN The most commonly used method for the administration of oxygen consists of inserting a catheter into a nostril, or into each nostril. Oxygen may also be given from a tank by means of a mask over the patient's nose and mouth, or the patient may be placed in an oxygen tent, or an oxygen chamber or room. The last two methods are extremely dangerous and must be used cautiously, as the danger from fire hazard is very great. These two methods are also expensive.

SALINE PURGATIVES Should always be given to the patient when the stomach is empty, preferably in the morning.

SEIDLITZ POWDERS: These should be mixed or dissolved in about one-fourth glass of water, a separate glass for each powder, the white and the blue. At the bedside, the mixture in one glass is poured into the other and the patient drinks this mixture before it effervesces.

TYPHOID VACCINE This should be administered intracutaneously or subcutaneously. The intracutaneous dosage for adults consists of 0.1 cc., 0.15 cc., and 0.2 cc. of triple typhoid vaccine administered at weekly intervals.

drugs and their administration, words pert.
to: active principles, alkaloids, antidotes, dosage, drug action, drugs with 2 names, medical preparations, names of individual drugs in alphabetical order

Drugs and Their Common Names

CHEMICAL NAMES	COMMON NAMES
Nitric Acid	Aqua Fortis
Nitro-Hydrochloric Acid	Aqua Regia
Copper Sulfate	Blue Vitriol
Potassium Bitartrate	Cream of Tartar
Mercury Subchloride	Calomel
Calcium Carbonate	Chalk
Potassium Carbonate	Salt of Tartar
Potassium Hydroxide	Caustic Potash
Sodium Chloride	Common Salt
Iron Sulfate	Copperas, or Green Vitriol
Mercury Perchloride	Corrosive Sublimate
Aluminum and Potassium Sulfate	Dry Alum
Magnesium Sulfate	Epsom Salts
Light Carburetted Hydrogen	Fire Damp
Lead Sulfide	Galena
Sodium Sulfate	Glauber's Salts
Glucose	Grape Sugar
Lead Lotion	Goulard Water
Iron Bisulfide	Iron Pyrites
Tin Oxide	Jewelers' Putty
Nitrogen Protoxide	Laughing Gas
Calcium Oxide	Lime
Silver Nitrate	Lunar Caustic
Calcium Chloride	Muriate of Lime
Potassium Nitrate	Niter or Saltpeter
Sulfuric Acid	Oil of Vitriol
Arsenic Sulfide	Realgar
Lead Oxide	Red Lead
Iron Oxide	Rust of Iron
Ammonium Chloride	Salt Ammoniac
Calcium Hydroxide	Slaked Lime
Sodium Carbonate	Soda
Ammonia	Spirits of Hartshorn
Hydrochloric Acid	Spirits of Salt
Calcium Sulfate	Stucco, or Plaster of Paris
Lead Acetate	Sugar of Lead
Basic Copper Acetate	Verdigris
Mercury Sulfide	Vermilion
Acetic Acid (Diluted)	Vinegar
Ammonia	Volatile Alkali
Hydrogen Oxide	Water
Ammoniated Mercury	White Precipitate
Zinc Sulfate	White Vitriol

(over 500), names of poisons, names of preparations, poison, poisoning, preparations usually given by rectum, prescription writing

drugs, handling of. Read the label or other printed instruction issued with medicine carefully, measure out accurately the doses (quantities) ordered, and never guess

A measuring glass or spoon should be employed, marked either in drams and ounces only, or with the words teaspoon, dessertspoon, and tablespoon also.

One drop equals 1 minim Symbol, η . One teaspoonful equals 1 dram Symbol, 3. Two teaspoonfuls equal 2 drams or 1 dessertspoonful Four teaspoonfuls equal $\frac{1}{2}$ ounce or 1 tablespoonful Two tablespoonfuls equal 1 ounce. Symbol, 5.

Important Points (1) The cork must never be left out of the bottle, as a necessary property may evaporate or the drug may become a dangerous concentration. (2) The drug compartment must be kept locked.

To Give a Dose of Medicine: Make quite sure: (a) To whom it has to be given; (b) what has to be given; (c) when it has to be given; (d) the amt to be given

Shake the bottle, measure the dose, again note label. Give to patient and see that it is swallowed. A small drink of water will take away unpleasant taste or medicine may be taken through a straw. As in feeding, the patient's head

and shoulders should be well raised before the dose of mixture is given to him

drugs, words pert. to: absorbent, alkaloids, alternative, ampule, analeptic, analgesic, anesthetic, anodyne, antacid, antagonistic action, anthelmintic, antiarthritic, antidiuretic, antiemetic, antilithic, antiperiodic, antipyretic, antiseptic, antisialagogue, antispasmodic, antizymotic, aperient, aromatic, astringent, a. action, balsam, biochemophlic, bitters, cachet, calmant, capsule, cardiac depressant or stimulant, carminative, cathartic, caustic, cerate, cerebral depressant or stimulant, chologogue, confection, convulsant, correctant, corrosive, counterirritant, decoction, delirifacient, demulcent, deodorant, depulvory, depressant, depressomotor, depurant, detergent, diaphoretic, digestant, disinfectant, diuretic, drug administration, erobolic, elixir, emetic, emmenagogue, emollient, emulsion, enzyme, epispastic, errhines, escharotic, evacuant, excitomotor, expectorant, extract, febrifuge, ferment, fluid-extract, galactagogue, glandular therapy, glucosides, glycerite, hematonic, hemostatic, hormone, hydragogue, hypnotic, idiosyncrasy, infusion, irritation, lamella, laxative, liniment, local remedy, lozenge, mixture, motor depressant or stimulant, mucilage, mydriatic, myotic, oil, ointment, oleate, oleoresin, organotherapy, oxytocics, paper, pharmacognosy, pharmacology, pill, plant acids, plaster, poisonous action, powder, prophylactic,

protein shock therapy, purgative, refrigerant, resins, respiratory depressant or stimulant, revulsant, rubefacient, saline purgative, saponins, secretory depressant or stimulant, sedative, sensitization, serum therapy, snailagogue, solution, somnifacient, soporific, specific, spirit, sterule, stimulant, stomachic, styptic, sudorific, suppository, synergistic action, systemic remedies, tablet, tannins, tennacide, tincture, tonic, toxicological action, vaccine therapy, vasoconstrictor, vasodilator, vermicide, vermifuge, vesicette, vesicant, vinegar, vulneraries, water, wine. *See names of drugs (over 500) in alphabetical order.*

drum [AS *drumme*]. The ear drum or tympanic cavity, the tympanum or cavity of the middle ear

drunkenness [AS *druncan*, to drink]. Alcoholic intoxication

druse (drús) [Ger "a rock cavity lined with crystals"]. 1 Rupture of tissues with no lesion of surface 2 Small, hyaline, globular pathological growths formed on optic papilla

dry cells. A zinc container lined with thin blotting paper which serves as the negative electrode, carbon rod in center as positive electrode, a paste of ammonium chloride, zinc chloride, manganese dioxide, and granulated carbon fills space bet electrodes, preventing polarization.

dry diet. A temporary high carbohydrate diet with measured liquid given bet meals only

dry ice. Solidified carbon dioxide used for commercial refrigeration.

dry measure. A measure of volume for dry commodities, as follows

2 pints (pt) = 1 quart (qt)
8 quarts = 1 peck (pk)
4 pecks = 1 bushel (bu)

Drysdale's corpuscles. Non-nucleated, granular cells present in the fluid of certain ovarian cysts

du'alism [L *duālis*, pert. to two]. 1 The condition of being double or two-fold 2 The theory that the human body consists of two entities, mind and matter, which are independent of each other 3 The theory that blood corpuscles arise from two types of stem cells, myeloblasts giving rise to the myeloid elements and lymphoblasts giving rise to the lymphoid elements

dual personality. A split in consciousness which results in the expression of 2 different phases of personality at various intervals, neither personality, as a rule, being aware of the words, acts, and feelings of the other. When this does rarely occur it has been called "co-consciousness."

See co-consciousness, dissociation of personality, multiple personality, vigilambulism.

Dubini's disease (doo-be'néz) Rhythmic, rapid contractions of a group or groups of muscles *Syn* electric chorea, *spasmus Dubini*.

duboisine (du-bof'sin). Alkaloid derivative of plant *Duboisia myoporioides*.

Uses Its sulfate is used as a hypnotic, and to treat paralysis agitans.

Dosage 0.0008-0.0015 Gm. (1/80-1/40 gr.).

d., poisoning from. Resembles atropine, *q.v.*

Duchenne's disease (du-shen'). 1 Bulbar paralysis. 2 Tabes dorsalis.

Ducrey's bacillus (du-kray') *Hemophilus ducreyi*. The cause of soft sore, or chancroid, small, rod-shaped organism found in pairs

duct [L *ducere*, to lead] 1. A narrow tubular vessel or channel, especially one serving to convey secretions from a gland 2 A narrow enclosed channel containing a fluid, as the semicircular duct of the ear

d., accessory pancreatic. D of the pancreas, leading into pancreatic d. or the duodenum near the mouth of the common bile d.

d., alimentary. *See thoracic d.*

d., alveolar. A branch of a respiratory bronchiole which leads to the alveolar sacs of the lungs

d., Bartholin's. The major duct of the sublingual gland proper

d's biliary. The canals which carry bile The intrahepatic ducts include the bile canaliculi and interlobular ducts, the extrahepatic ducts include the hepatic duct, cystic duct, and common bile duct

d., Botallo's. Fetal blood vessel connecting the pulmonary artery and aorta. The *ductus arteriosus*

d., cochlear. Canal of the cochlea

d., common bile. Duct formed by the confluence of the hepatic and cystic ducts. It conveys bile to the duodenum opening at the ampulla of Vater

d., Cuvier's. One of a pair of fetal veins (the common cardinal veins) which convey blood from the pre- and posterior cardinal veins to the sinus-venosus of the heart. The right one becomes the sup vena cava

d., cystic (d. *cysticus*) Excretory d. of gallbladder *See gallduct*

d., efferent. Any duct conveying secretion from a gland

d., ejaculatory (d. *ejaculatorius*) Conveys semen into urethra

d., endolymph. In the embryo a tubular projection of the otocyst ending in a blind extremity, the endolymph sac, in the adult it connects the endolymphatic sac with the utricle and saccule

d., excretory. Any duct which conveys a product from an organ, as the excretory duct of a salivary gland

d., galactophorous. Duct carrying milk in mammary glands' lobes

d., Gartner's. A remnant of the Wolffian duct extending from the parovarium through the broad ligament into the vagina

d., hepatic (d. *hepaticus*). Receives bile from liver *See gallduct*.

d's., intralobular bile. *See biliary d.*

d., lacrimal. One of two short ducts, inferior and superior, which convey tears from the lacrimal lake to the lacrimal sac. Their openings are on the margins of the upper and lower eyelids

d., lactiferous. One of fifteen to twenty ducts which drain the lobes of the mammary gland Each opens in a slight depression on the tip of the nipple

d., Leydig's. *See wolffian d.*

d., lymphatic. One of two main ducts conveying lymph to the blood stream The left lymphatic duct (thoracic duct) drains the left side of the body above the diaphragm and all of the body below the diaphragm the right is a smaller duct draining the right side of the body above the diaphragm Both enter into the subclavian veins near their junctions with the int. jugular veins

d., mammary. *See lactiferous duct*

d., mesonephric. *See wolffian d.*

d., mesonephric. The cut which in the embryo connects the mesonephros with the cloaca In the male it develops into the ductus deferens. Also called Wolffian duct.

d., metanephric. Ureter.
d., milk (*d. lactiferus*). A mammary duct entering the nipple.
d., Muller's. Bilateral ducts in the embryo that go to form the uterus, vagina, and fallopian tubes
d., nasolacrimal. The duct which conveys tears from the lacrimal sac to the nasal cavity. It opens beneath the inferior nasal concha
d., omphalomesenteric. The vitelline duct, *q.v.*
d., pancreatic (*d. pancreaticus*). Conveys pancreatic juice to the duodenum. Also called the *d. of Wirsung*
d., paraurethral. Skene's duct, *q.v.*
d., parotid (*d. parotideus*). Discharges parotid secretions into mouth
d., prostatic (*d. prostatice*). One of 20 ducts which discharge prostatic secretion into the urethra
d., right lymphatic. *d.* carrying lymph near liver on right side of body
d. s of Rivinus. Five to fifteen ducts (the minor sublingual ducts) which drain the posterior portion of the sublingual gland
d., salivary. Any of the ducts which drain a salivary gland
d. of Santorini. The accessory pancreatic duct
d., secretory. A gland's smaller canals
d., segmental. A pair of embryonic tubes, located bet. visceral and parietal layers of mesoblast on each side of the body
d. s semicircular. Three membranous tubes forming a part of the membranous labyrinth of the inner ear. They lie within the semicircular canals and bear corresponding names, superior, posterior, and lateral
d., seminal. Any of the ducts which convey semen, specifically the ductus deferens and the ejaculatory duct
d., Skene's. Paraurethral duct. One of two slender ducts which open on either side of the urethral orifice in the female
d., spermatic. Vas deferens
d., Stenson's, Steno's. Parotid gland *d.*
d., sublingual. SEE *Rivini's and Bartholin's d's*
d., submaxillary. SEE *Wharton's d.*
d., sudoriferous. Sweat duct
d., tear. Any that convey tears, inc. excretory ducts of lacrimal glands, lacrimal ducts, and nasolacrimal ducts
d., testicular. Vas deferens
d., thoracic (*d. thoracicus*). Discharging into subclavian vein
d., umbilical. Embryonic *d.* bet. cavity of intestines and umbilical vesicle. The vitelline duct, *q.v.*
d., utriculosaccular. A short one connecting the utricle and sacculus of inner ear
d., vitelline. The narrow duct which in the embryo connects the yolk sac (umbilical vesicle) with the mid gut. Also called yolk stalk, umbilical *d.*
d. (of) Wirsung. The major pancreatic *d.*
d., Wolfian. The mesonephric duct.
ductless [' + A.S. *læssa*]. Having no duct, secreting only internally.
d., glands. Ductless glands secrete internally one or more hormones which have a specific action upon the body. SEE: *endocrine, endocrinology, exocrine.*
ductile (duk'tūl) [*L. ducere, to lead*]. A very small duct.
d., aberrant. One of a group of small tubules associated with the epididymis. They are blindly ending, representing

the vestigial remains of the caudal group of mesonephric tubules.
ductus. Latin for duct. Used in BNA.

d., arteriosus. A channel of communication bet. main pulmonary artery of the fetus and aorta

d., choledochus. The common bile duct

d., cochlearis. The cochlear duct *q.v.* Also called *scala media*

d., communis. One about 3 in long formed by union of cystic and hepatic *d.'s*, carries the bile to the intestine

d., deferens. Excretory duct of the testicle. Conveys sperm from the epididymis to the ejaculatory duct. SYN *vas deferens*

d., efferent. One of a group of 12-14 small tubes which constitute the efferent ducts of the testis. They lie within the epididymis and connect the rete testis with the ductus epididymis. Their coiled portions constitute the lobulus epididymis

d., hemithoracicus. Ascending branch of thoracic opening either into right lymphatic duct or close to angle of union of right subclavian and right internal jugular veins

d., hepaticus dexter. One issuing from the right lobe of the liver, uniting with the *d. hepaticus sinister* and forming the hepatic duct

d., hepaticus medius. An occasional branch of the hepatic duct conveying bile from the quadrate lobe

d., hepaticus sinister. One issuing with *d. hepaticus dexter* to form hepatic duct.

d., prostatici. Ducts for secretion of prostate into the urethra

d., sacculo-utricularis. Small tube connecting sacculus of internal ear with utricle

d., venosus. Smaller, shorter, and post. of 2 branches into which umbilical vein divides after entering the abdomen, empties into the inf. vena cava

Dührssen's incisions of the cervix uteri. Incisions made in the undilated cervix in order to allow for completion of the delivery of the fetus

They are made at 4-hour intervals in order that if there is any extension of the incision at the time of the passage of the fetus, this extension will not go into the broad ligaments and the uterine arteries

duipara (dū-ip'ār-ā) [*L. duo, two, + parere, to bear*]. A female pregnant for the 2nd time

dulcin (dul'sin) [*L. dulcis, sweet*] A toxic substance, 200 times sweeter than sugar. SYN *sucrol, dulcite*

dulcite. A sugar ($C_6H_{12}O_6$) found in certain plants. Also called *dulcitol* or *dulcose*

dull [*A.S. dol*]. 1. Not resonant on percussion. 2. Not mentally alert.

dullness, dulness (dul'nes) [*A.S. dol*]. 1. Lack of normal resonance on percussion. 2. State of being dull

dumb [*A.S.*]. Mute. Unable to speak.

d., ague. Latent malaria not expressed by ordinary signs

dumb/bell crystals. Crystals shaped like a dumbbell

dumb/ness [*A.S.*] Muteness

duode'nal [*L. duodeni, twelve*]. Pert. to the duodenum.

d., activities. The entry of acid chyme into the duodenum brings about discharge of bile from the gallbladder and the secretion of pancreatic juice by the pancreas. These enter through the

common bile duct. Bile salts alkalize the chyme and emulsify the fats. Through the action of pancreatic enzymes, the following changes occur: *steapsin* (pancreatic lipase), hydrolyzes neutral fats to fatty acids and glycerol, *amylopsin* (pancreatic amylase) hydrolyzes starch to maltose, *maltase* hydrolyzes maltose to glucose. Three proteolytic enzymes, *trypsin*, *chymotrypsin*, and *carboxypeptidase* act on proteins hydrolyzing them to proteoses, peptones, and amino acids.

d. bulb. Area of duodenum just beyond the pylorus.

SECRETORY PHENOMENA One of these substances, *secretin*,* excites the pancreas to increased production of its juice, the other, *cholecystokinin*, causes the gallbladder to contract and force its contents through the ductus choledochus into the duodenum. In addition, nervous mechanisms contribute to the co-ordination which exists here, regulating the rate of discharge of chyme from the stomach, varying both quantity and quantity of the various secretions, and determining the rate of passage through the duodenum. For the action of particular juices SEE *bile*, *digestion*, *enzyme*, *functions of pancreas*, *juice gastric*, *juice*, *pancreas*, *succus entericus*.

MOTOR PHENOMENA (a) First part of duodenum (*pars superior*, *duodenal cap*, *d. bulb*) is the small portion immediately following the pylorus. It is regularly full of material and consequently visible in roentgenograms as a spade-shaped shadow. (b) The next part (*pars descendens*) is that into which the common bile duct (*ductus choledochus*) and pancreatic ducts open. Movement through it and through (c) the *pars inferior* and (d) the *pars ascendens* is rapid, so that they are normally inconspicuous by x-ray. Throughout the duodenum the mucosa is thrown into folds (*plicae circulares*) and shows the active projections called villi. The folds are permanent and inactive. The villi, which stud the surface of the folds as well as the spaces bet. them, exhibit waving and thrusting movements.

d. delay. Delay in the movement of food through the duodenum due to conditions such as inflammation of lower portion on the intestine which reflexly inhibits duodenal movements, *d. papilla major*. Slight elevation in descending portion of the duodenum bearing openings of the common bile duct and main pancreatic duct. *d. papilla minor*. Slight elevation about 2 cm above the *p. major* bearing opening of the accessory pancreatic duct.

d. ulcer. Broken mucous membrane, usually accompanied by suppuration and perhaps a sore is present which bleeds with more or less danger of perforation.

It heals slowly due to constant passage of irritating fluids and food over it, distention of stomach and contraction and relaxation of gastric muscles, acids of foods, bile and gastric juice, condiments and concentrated sugar solution.

TREATMENT Mucin, metapen* used successfully, 1:500 solution, a teaspoonful after each meal.

Diet Same as for peptic ulcer. SEE: *peptic ulcer*.

d. papilla. Raised surface near entrance of ductus choledochus communis into duodenum.

duodenectasis (dū-ō-dēn-ēk'tā-sis). Chronic dilatation of the duodenum.

duodenectomy (du-ō-den-ek'tō-mī) [' + G. *ektome*, excision]. Excision of part or all of the duodenum.

duodenitis [L. *duodeni*, twelve, + G. *-itis*, inflammation]. Inflammation of the duodenum.

duodenocholecystostomy (dū-od-en'o-kol-e-sis-tōs'tō-mī) [' + G. *chole*, bile, + *kystis*, bladder, + *stōma*, mouth]. Formation by surgical means of a fistula bet. duodenum and gallbladder.

duodenocholedochotomy (du-od-en'o-kol-ed-o-kot'o-mī) [' + G. *choledochos*, bile duct, + *tome*, incision]. Surgical incision of the duodenum to reach the gallbladder.

duodenocystostomy (du-od-en'o-sist-os'tō-mī) [' + G. *kystis*, bladder, + *tōmē*, incision]. Formation of a passage bet. the duodenum and the bladder.

duodenoenterostomy (du-od-en'o-en-ter-os'tō-mī) [' + G. *enteron*, intestine, + *stōma*, opening]. Formation of passage bet. the duodenum and intestine.

duodenogram (du-ō-de'no-gram) [' + G. *gramma*, a writing]. A roentgenogram of the duodenum.

duodenohepatic (du-ō-den-o-he-pat'ik) [' + G. *hepar*, *hepat-*, liver]. Pert. to duodenum and liver.

duodenojejunoscopy (du-ō-den-o-jej-u-nos'tō-mī) [' + G. *jejunum*, empty, + G. *stōma*, opening]. Making a passage bet. the duodenum and jejunum.

duodenoscopy [' + G. *skopein*, to examine]. Inspection of the duodenum with an endoscope.

duodenostenostomy (du-ō-den-o-sten-os'tō-mī) [' + G. *stenos*, narrow, + *stōma*, opening]. The making of an opening through the abdomen into the duodenum.

duodenostomy (du-ō-den-os'tō-me) [' + G. *stoma*, opening]. Operation of making a permanent opening into the duodenum through the wall of the abdomen.

duodenotomy (du-ō-den-ot'o-me) [' + G. *tōmē*, incision]. An incision into the duodenum.

duodenum (du-ō-dē'nūm) [L. *duodeni*, twelve]. The first part of the small intestines connecting with the pylorus of the stomach and extending to the jejunum.

It receives the hepatic and pancreatic secretions through the same duct. It is 8 to 11 inches long. Brunner's glands

THE DUODENUM

1. Pyloric end of the stomach. 2. Pyloric valve. 3. Upper transverse part. 4. Descending part. 5. Lower transverse part. 6. Choledochus duct. 7. Pancreatic duct.

are found in the duodenum, and the chyle is formed here. Lieberkühn's glands are also found here

It is a crucial section of the alimentary canal, since in it occurs the mixing of (1) the acid chyme from the stomach, (2) the bile from the liver and gallbladder, (3) the pancreatic juice entering by way of 2 ducts, and (4) the intestinal juices secreted by the glands of Brunner and the crypts of Lieberkühn

NERVE SUPPLY: Pancreatico-duodenal plexus and the vagus

BLOOD SUPPLY: Pancreatico-duodenal and gastroduodenal arteries

RS Brunner's glands, choledochoduodenostomy, duodenal digestion, duodenal ulcer, gallbladder, glands, intestines, Lieberkühn's glands, liver, pancreas

duplication, duplicature [L. *duplicare*, to double] A doubling or folding, or state of being folded

duplicatus. Fetal monstrosity in which the cephalic or the pelvic end is doubled or both

dupp (dūp) [imitative origin] Word denoting 2nd sound at cardiac apex heard in auscultation. It is due to the closing of the pulmonary and aortic semilunar valves

The 1st sound is longer and pitched lower **Sff** heart, auscultation of, lubb, lubb-dupp

Dupuytren's contraction (du-pwē-trānz') Contraction of palmar fascia causing ring and little fingers to bend into palm so that they cannot be extended

du'ra [L. *durus*, hard] Dura mater
d. mater [L. hard mother] The outer membrane covering the spinal cord (*d. m. spinalis*) and brain (*d. m. cerebri* or *encephali*). SEE *pia mater*, *tentorium*.

dural (du'ral) [L. *durus*, hard] Pert to the dura

durama'tral [' + *mater*, mother]. Pert. to the dura **SYN** *dural*.*

duraplasty [' + G. *plassein*, to form]. Plastic repair of the dura mater

durematoma (dū-rem-at-o-mā) [' + G. *aima*, blood, + *-ōma*, tumor]. Accumulation of blood bet. arachnoid and dura

duritis (du-rī'tis) [' + G. *-itis*, inflammation] Inflammation of the dura. **SYN** *pachymeningitis*.

duroarachnitis (dū-ro-ar-ak-nī'tis) [' + G. *arachnē*, cobweb, + *-itis*, inflammation] Inflammation of dura and arachnoid membrane

durocaine (du'ro-kān) Spinal anesthetic. Procaine hydrochloride in pseudohypobaric solution

Duroziez's murmur (du-ro-zī-ze'). Double murmur over femoral artery on pressure

dust. Minute, fine particles of earth; any powder

d. blood. Hemoconia

d. cells. Reticulo-endothelial cells in the walls of the alveoli of the lungs which ingest or destroy dust particles

d. ear. Fine calcareous bodies found in the gelatinous substance of the otolithic membrane of the ear; otoconia, or otoliths

dusting powder. Any fine powder for dusting on skin [vovaginal gland]

Duvernoy's gland (doo-vei-nas'). The vulvawarf. An abnormally short or undersized person, a pigmy

d. achodroplastic. One with normal trunk but possessing shortened extrem-

ities, with a large head, and protruding buttocks

d. asexual. One with deficient sexual development.

d. cretin. One resulting from deficient development of the thyroid gland

d., diabetic. One due to diabetes

d., hypophyseal. One due to hypofunction of ant lobe of the hypophysis

d. infantile. One showing marked physical, mental and sexual underdevelopment

d., micromelic. One with very small limbs

d., ovarian. An undersized female due to absence or underdevelopment of the ovaries

d., phocomelic. One with abnormally short diaphyses

d., physiologic. A normal dwarf

d., pituitary. A hypophyseal one

d., rachitic. One due to rickets

d., renal. One due to renal osteodystrophy

d., sexual. One showing normal sexual development

dwarfism. Condition of being abnormally small. May be hereditary, or a result of endocrine dysfunction, deficiency diseases, renal insufficiency, diseases of the skeleton or other causes.

dy'ad. 1 A pair. 2 A pair of chromosomes formed by the division of a tetrad in mitosis. A dyad represents a single chromosome split precociously for a subsequent division. 3 In *Chem* A bivalent element or radical

dynamia (di-nam'i-ā) [G. *dynamis*, power] Vital energy or ability to combat disease

dynamic (di-nam'ik) [G. *dynamis*, power]. Pert to vital force or inherent power, opp of *static* [is inherent in mind].

d. psychology. A theory that energy

dynam'ics [G. *dynamis*, power]. The science of bodies in motion and their forces

dynamization (di-nam-iz-a'shun) [G. *dynamis*, power] The attempt to add to the potency of medicine by agitation or commutation. * SEE *attenuation*.

dynamo [G. *dynamis*, power] Apparatus for conversion of mechanical energy into electrical power

Chief parts are (1) magnetic field produced by electromagnets, (2) armature which is coil of insulated wire mounted around a soft iron core, (3) collecting device, (4) mechanical power which keeps either the armature or electromagnet moving in relation to another

dynamogen'esis [' + *genesis*, growth]. The capacity to call forth increased energy.

dynamogen'ic [' + *gennan*, to produce] Pert to, or caused by, an increase of energy

dynamograph (di-nam'o-graf) [' + *graphēin*, to write] Device for recording muscular strength

dynamometer (di-nam-om'e-ter) [' + *metron*, measure] 1. A device for measuring muscular strength. Simple dynamometer is spring scales bet segment to be examined and examiner's hand. 2. A device for giving the magnifying power of a lens

dynamoneure (di-nam'o-nūr) [' + *neuron*, nerve]. A motor, spinal nerve cell.

dynamoscope (di-nam'o-skōp) [' + *skopēin*, to examine] Instrument for auscultation of muscles

dynamoscopy (di-nam-os'ko-pl) [' + *skopēin*, to examine]. Auscultation of muscles.

dyne (dīn) [G. *dynamis*, power]. A unit of force which would propel a mass of weight of 1 gram with a velocity of 1 cm in a second [painful]

dys- [G] Prefix meaning bad, difficult, **dysacous'ia**, **dysacus'ia** [G. *dys*, bad, + *akousis*, hearing] Discomfort caused by loud noises

dysacus'ia (dis-a-ku'si-a) [+ *akousis*, hearing] Abnormal discomfort from noises, **dysacus'ia**

dysadrenia (dis-ā-dren'i-ā) [+ L. *ad-* toward, + *rēn*, kidney] Functional disorder of the kidneys [terioration]

dyse'mia [+ *ama*, blood] Blood de-
dysalbumose (dis-al'bū-mās) [+ L. *albumen*, white of egg] A variety of albumose insoluble in water or hydrochloric acid

dysantigraphia (dis-an-ti-gra'fi-ā) [+ *anti*, against, + *graphein*, to write] Inability to copy writing or printed letters

dysaphia (dis-af'i-ā) [+ *aphē*, touch] Dullness of the sense of touch

dysarrhythmia (dis-a-rith'mi-ā) Abnormal rhythm

d. cerebral. Abnormal rhythm in brain waves indicated by the electroencephalogram Characteristic of epilepsy

dysarteriotomy (dis'ar-te-i-ol'o nī) [+ *arteria*, artery, + *tonos*, tension] Abnormal blood pressure, either too low or too high

dysarthria (dis-ar'thri-ā) [+ *arthron*, articulation] 1 Difficulty in articulation of joints, as in amyotasia 2 Incorrectly applied to imperfect speech, stammering

dysarthrosis [+ *arthrosis*, joint] Joint malformation

dysbasis (dis-ba'zi-ā) [+ *basis*, a step] Difficulty in walking, esp when due to disease of the brain or spinal cord

dys'bolism [+ *bolē*, a throwing]. Disordered metabolism

dysbulia (dis-bu'li-ā) [+ *boulē*, will]. 1 Inability to fix the attention, difficulty experienced in thinking, mind weariness 2 Weak and uncertain will power

dyschezia (dis-ke'zi-ā) [+ *chezēn*, go to defecate] Constipation due to habitual neglect to respond to stimulus to defecate

dyschiria (dis-ki'ri-ā) [+ *cheir*, hand] Inability to tell which side of the body has been touched

If referred to the wrong side it is called *allochiria*, * to both sides, *synchiria* * *syn achiria*.

dyscholia (dis-ko'li-ā) [G. *dys*, bad, + *cholē*, bile]. Morbid condition of the bile.

dyschondroplasia (dis-kōn-drō-plā'zi-a) Disease, usually hereditary, resulting in disordered growth Characterized by multiple exostoses of growth of the epiphyses, esp of the long bones, metacarpals, and phalanges Also called multiple cartilaginous exostoses, diaphyseal acclasis, etc

dyschroa, **dyschro'ia** (dis-kro-ā, dis-kro'i-ā). Discolored skin, esp of the face, poor or bad complexion

dyschromatopsia (dis-kro-mat-op'si-ā) [+ *chrōma*, color, + *opsis*, vision]. Imperfect color vision

dyschro'mia [+ *chrōma*, color]. Discoloration, as of the skin.

dyscinesia (dis-sin-e'zi ā) [+ *kinēsis*, movement]. Impairment of voluntary movements.

dyscolmesis (dis-koy-me'sis) [+ *kōmēsis*, a sleeping] Delay in falling asleep

dysco'ria [+ *korē*, pupil]. Abnormal form of the pupil.

dyscrasia (dis-kra'si-ā) [+ *krasis*, mixture]. Morbid condition supposed to be caused by toxins in the blood

dyscrasic (dis-kra'sik) [+ *krasis*, mixture]. Pert. to dyscrasia

dyscrinism [+ *krinein*, to secrete, + *ismos*, condition of]. Any disorder of secretions, esp of an endocrine gland

dysdiadochokinesia (dis'di-ā-do'ko-kine'si-a) [+ *diadochos*, succeeding, + *kinēsis*, movement] Inability to quickly substitute antagonistic motor impulses

dysdiemorrhysis (dis-di-em-or'i-sis) [+ *dia* through, + *ama*, blood, + *rusis* a flowing]. Sluggish circulation of capillaries [disease]

dyse'mia [+ *ama*, blood] Any blood

dysendocriniasis (dis-en-do-kiin-i'a-sis) [+ *endon*, within, + *krinein*, to secrete]. Faulty function of the endocrine glands

dysendoc'rinism [+ " + " + *ismos*, state of] Faulty function of the endocrine glands, dysendocriniasis

dysendocri'siasis [+ " + *krinein*, to secrete] Faulty function of the endocrine glands, dysendocriniasis

dysenteric (dis-en-ler'ik) [+ *enteron*, intestine] Pert. to dysentery

dysentery (dis-en-ler'ik) [+ *enteron*, intestine] A term applied to a number of intestinal disorders, esp the colon, characterized by inflammation of the mucous membrane

ETIOLOGY Bacterial or viral infection, infestation by protozoa or parasitic worms, or chemical irritants

SYM Abdominal pain, tenesmus, diarrhea with passage of mucus or blood

d., amebic. Due to amebas SYM Similar to catarrhal d with intermissions

TREATMENT SEE Amebiasis

d. bacillary. An acute infectious disease caused by bacteria of the genus *Shigella*, esp *Sh dysenteriae* *Sh paradyenteriae* and *Sh sonnei* It may occur sporadically or in epidemics. In addition to intestinal symptoms, a severe toxemia may occur due to exo- and endotoxins produced by the organisms In epidemics the fatality rate may be 20% or more

d. balantidial. B caused by ciliate protozoan, *Balantidium coli*

d., catarrhal. Due to change of weather, diet, or water SYM Diarrhea, vomiting, abdominal pain, desire to stool, and fever Increasing stool: bloody TREATMENT Liquid diet Rest in bed Irrigation of colon

d., diphteric. Epidemic intestinal affection, caused by vegetable organism in drinking water SYM Intensified catarrhal d symptoms TREATMENT Dietetic, same as other forms of the disease. Milk alone, 4 to 5 pt., lean meat, only.

d., malignant. A form in which symptoms are very pronounced and progress rapidly, usually terminating fatally

d. viral. D caused by virus

dysergasia (dis-er-ga'si-ā) [+ *ergon*, work]. Inability to function properly SYN *neurasthenia* In Psy, a behavior disorder characterized by disorientation, hallucinations, dreamstates, and delirium Possibly due to toxic conditions such as uremia, or alcohol intoxication

dysergastic (dis-er-gas'tik). Pert. to dysergasia

d. reaction. Hallucinations, fears, disorientation, dream states, and other mental disorders resulting from poor circulation and nutrition of the brain

dysergia (dis-er'jī-ā) [G. *dys*, bad, + *ergon*, work] Lack of co-ordination in muscular voluntary movements.

dysesthesia (dis-es-the'zī-ā) [' + *aisthēsis*, sensation] 1 Sensations, as of the pricks of pins and needles, or of crawling. SYN *formication*. 2 Failing sensitivity, esp. of touch. 3 Painfulness of any sensation which is not normally painful.

d., auditory. Abnormal discomfort from loud noises. SYN *dysacusia*.

dysfunction (dis-funk'shun) [' + L *fungi*, to be busy] Absence of complete normal function.

dysgalactia [' + *gala*, milk] Defective milk secretion.

dysgenesis, dysgenesis (dis-jen-e'sī-ā, -sis) [' + *genesis*, procreation] Impairment or loss of procreative powers. SYN *sterility*.

dysgenic [' + *gennan*, to produce] Causing racial deterioration.

dysgenitalism [' + L *genitalis*, pert to genitals, + G *ismos*, state of] Condition caused by abnormal genital development.

dysgerminoma (dis-ger-min-o'mā) [' + L *germen*, a sprout, + G *-oma*, tumor]. A neoplasm in sex cells in hermaphrodites and in undeveloped testicles or undeveloped ovaries.

dysgeusia (dis-gu'sī-ā) [' + *geusis*, taste] Perversion or impairment of sense of taste.

dysglan'dular [' + L *glans gland-*, acorn] Abnormal functioning of glands, esp. those of internal secretion.

dysglycemia (dis-gli-se'mī-ā) [' + *glykus*, sweet, + *aima*, blood] Faulty blood sugar metabolism.

dysgnos'ia [' + *gnōsis*, knowledge] Any anomaly of intellect. SYN *dysrhymia*.

dysgone'sis [' + *gonē*, seed] 1 Functional disorder of the genital organs. 2. Poor growth of bacterial culture.

dysgon'ic [' + *gonē*, seed] Bacterial cultures of sparse growth.

dysgraph'ia (dis-grāf'ī-ā) [' + *graphein*, to write] 1 Inability to write properly. Usually the result of a brain lesion. 2 Writer's cramp.

dyshematopoiesia (dis-hem"ā-to-poy-e'sī-ā) [' + *aima*, blood, + *poiesis*, making] Imperfect blood formation.

dyshidria (dis-hīd'ri-ā) [' + *idrōs*, sweat] 1 Retention of contents of the sweat follicles. 2 Milk perspiration.

dys'hormonal [' + *orman*, to excite]. Caused by endocrine disturbance.

dys'hormonism [' + + *ismos*, state of]. Deficiency or excessive production of hormones or any internal secretions.

dysidrosis (dis-id-ro'sis) [' + *idrōs*, sweat, + *-ōsis*] Disorder of the perspiratory apparatus. Never appears in the aged or children. SYN *dysidria*. SEE: *pompholyx*.

dysin'sulinism [' + L *insula*, island, + G. *ismos*, state of] Imperfect secretion of insulin.

dyskerato'sis [' + *keras*, horn, + *-ōsis*]. Epithelial alterations in which a certain number of isolated malpighian cells become differentiated. Any alteration in the keratinization of the epithelial cells of the epidermis. Characteristic of many skin disorders.

dyskine'sia [' + *kinēsis*, movement]. Defect in voluntary movement.

d. al'gera. Condition in which active movement is painful.

d. intermittent. Limb disability occurring intermittently.

d., uterine. Pain in the uterus on movement.

dyskinet'ic [G. *dys*, bad, + *kinēsis*, movement]. Having disordered normal movement.

dyskoimesis (dis-koy-me'sis) [' + *koimēsis*, sleeping] Difficulty in going to sleep.

dyslalia (dis-lal'ī-ā) [' + *lalein*, to talk] Impairment of speech due to defect of speech organs.

dyslexia (dis-leks'ī-ā) [' + *lexis*, diction]. Difficulty in reading as result of brain lesion. Visual confusion by which similarly shaped letters, such as o, e, c, b, p, h, or n, cause the victim to transpose letters in reading, seeing such a word as 'pot' for 'top'. The number so afflicted are more than those who are blind. Eight to 25% of all children have such reading difficulties, boys being affected more than girls by four to one.

dyslochia (dis-lo'kl-ā) [' + *lochia*, lochia] Disordered lochial discharge, or premature cessation.

dyslogia (dis-lo'jī-ā) [' + *logos*, understanding] Difficulty in expression of ideas.

dysmasesis (dis-mas-e'sis) [' + *masēsis*, mastication] Difficulty in masticating. SYN *dysmastesis*.

dysmegalop'sia [' + *meqat*, size, + *opsis*, vision] Inability to visualize correctly the size and shape of things.

dysmenorrhea (dis-men-or-ē-ā) [' + *mēn*, month, + *rein*, to flow]. Painful or difficult menstruation, either primary or secondary.

Adm. of testosterone propionate has proved effective in a number of cases. Vaginal smears should be taken twice a week to indicate overdosage, the average tolerance level being 500 mg.

d., congestive. Condition caused by pelvic congestion.

d., inflammatory. Condition caused by pelvic inflammation.

d., mechanic. SEE *obstructive d.*

d., membranous. A severe spasmodic dysmenorrhea which is accompanied by the passage of a cast of the uterine cavity. Treated by curettage, and if not relieved, hysterectomy.

d., neurotic. Form caused by neurosis.

d., obstructive. D caused by obstruction of menstrual flow.

d., primary. Difficult menstruation starting from the first period and usually a result of maldevelopment of the uterus.

Etiol. Malposition of uterus, infantile uterus, sharply anteverted uterus; pinpoint external os of the cervix; individuals with a low threshold for pain.

OPERATIVE TREATMENT: Dilatation or cervical hysterotomy.

d., secondary. When periods were, at the outset, normal, but, because of the development of some pathological state in the pelvis, there is a disturbance of menstruation.

Etiol. Cervix: Diseases of the cervix, lacerations with scar formation; acute, subacute, and chronic endocervicitis.

Body of the Uterus: Chronic endometritis; hyperplastic endometrium; fibroids, particularly the submucous and intramural types of fibroids; chronic metritis, acquired malposition of the uterus. **Tubal Conditions:** Acute, subacute, and chronic salpingitis. **Ovarian Conditions:** Cystic oophoritis, endo-

metrial cysts of the ovary, ovarian tumors of marked size *Parametrium*: Uterosacral and broad ligament parametritis.

GENERAL HYGIENE: A healthy outdoor life, correct action of the bowels, and adequate sleep and relaxation.

OPERATIVE TREATMENT: Correction of any pathology in the pelvis.

MEDICAL TREATMENT: In general, this consists in a free use of anodyne coal tar products accompanied by antispasmodics (tincture of belladonna, nux vomica, cannabis indica), and depressants (bromides, barbituric acid derivatives).

d., spasmodic. D caused by uterine contractions of spasmodic form

dysmetria (dis-me'trī-ā) [“ + *metron*, measure] An inability to fix the range of a movement.

Rapid and brusque movements made with more force than necessary. Seen in cerebellar affections. *RS adiadochokinesis, asynergia, gait.*

dysmetropsia [“ + “ + *opsis*, vision] Inability to visualize correctly the size and shape of things. *SYN dysmegalopsia*

dysmimia (dis-mim'ī-ā) [“ + *mimēsthai*, to imitate] 1 Inability to express oneself by gestures or signs 2 Inability to imitate.

dysmnēsia (dis-ne'zī-ā) [G. *dys*, bad, + *mnēmē*, memory]. Any impairment of memory

dysmorphophobia (dis-mor'fō-fo'bl-ā) [“ + *morphē*, form, + *phobos*, fear]. Morbid fear of deformity, a form of paranoia

dysmorphosis (dis-mor'fō-sis) [“ + “ + *-osis*]. Not normal in form

dysmyotonia [“ + *mys* muscle, + *tonos*, tone]. 1 Muscle atony 2 Excessive muscle tonicity. *SYN myotonia.*

dysneuria (dis-nu'ri-ā) [“ + *neuron*, nerve]. Impairment of the nervous function.

dysodontiasis (dis-o-don-tī'as-sis) [“ + *odus*, tooth]. Painful or difficult dentition

dysontogenesis (dis-ōn-tō-jēn'ē-sis) [“ + *on*, being, + *genesis*, development] Defective development of an organism.

dysontogenetic [“ + “ + *gennan*, to produce]. Pert. to defective development.

dysopia (dis-o'pī-ā) [“ + *opsis*, vision]. Defective or painful vision.

dysop'sia [“ + *opsis*, vision]. Defective vision *SYN dysopia.*

dysorexia (dis-o-rek'sī-ā) [“ + *orēxis*, appetite]. Perverted or lessened appetite

dysosmia (dis-oz'mī-ā) [“ + *osmē*, smell]. Impairment of the sense of smell.

dysostosis (dis-os-to'sis) [“ + *osteon*, bone]. Defective bone formation.

d., cleidocranial. A congenital ossification of the skull with partial atrophy of clavicles.

dysovarism (dis-o'var-izm) [“ + *L ovarium*, ovary, + *G. ismos*, condition]. An abnormality due to disturbance in the ovarian internal secretion.

dysoxidizable [“ + *oxys*, sour]. Not easy to oxidize.

dyspancreatism [“ + *pagkreas*, pancreas, + *ismos*, condition of]. Impaired pancreatic function.

dyspareunia (dis-pa-ru'nī-ā) [G. *dyspareunos*, unhappily mated as bedfellows]. Painful coitus.

Error: Most often brought about by a resistant hymen, ulceration of the fourchette, urethritis, vaginitis, and inflammatory conditions in the pelvis; often the result of psychoneurotic rather than a physical condition.

dyspepsia (dis-pep'sī-ā) [G. *dys*, bad, + *peptein*, to digest]. Imperfect digestion. Not a disease in itself, but symptomatic of other diseases or disorders

d., acid. With excessive acid.

d., alcoholic. Caused by excessive use of alcoholic beverages

d. atonic. Due to lack of muscular tone in the digestive organs

d., biliary, billous. Form in which there is insufficient quantity or quality of bile secretion

d., cardiac. Form occurring during heart disease

d., catarrhal. Due to inflammation of the stomach

d. fermentative. D caused by excessive fermentation of food and characterized by frequent eructation of gas; also called “gaseous” or “flatulent” d

d., gastric. D caused by faulty stomach function

d., gastrointestinal. D caused by faulty function of stomach and intestines

d., hepatic. D. caused by liver disease.

d., hysterical. D present during hysterical attacks.

d., intestinal. Due to abnormal state of pancreatic, biliary, and intestinal secretions

d., nervous. Indicated by gastric pain and palpitation due to a lesion of nerves innervating the digestive tract, or to emotional states

dyspeptic (dis-pep'tik) [“ + *peptein*, to digest] 1 Affected with or pert. to dyspepsia. 2. One afflicted with dyspepsia

dyspeptone (dis-pep'tōn) [“ + *peptein*, to digest] An insoluble product of gastric digestion.

dysperma'sia [“ + *sperma*, seed] Difficult or painful orgasm during coitus

dyspermatisim [“ + “ + *ismos*, condition] Difficult or painful orgasm during coitus *SYN dyspermasia.*

dyspermia [“ + *sperma*, seed]. Difficult or painful orgasm during coitus. *SYN: dyspermasia*

dysphagia, dysphagy (dis-fa'jī-ā, -jī) [“ + *phagēin*, to eat]. Inability to swallow as a result of spasm of the esophagus, seen in hysteria

d. constrictricta. D due to narrowing of the pharynx or esophagus

d. globosa. Globus hystericus, *q v*

d. lusoria. D caused by pressure exerted on the esophagus by an anomalous right subclavian artery

d. paralytica. D due to paralysis of muscles of deglutition

d. spastica. D resulting from a spasm of pharyngeal or esophageal muscles

dysphasia (dis-fa'zī-ā) [“ + *phasis*, speech]. Impairment of speech.

dysphemia (dis-fe'mī-ā) [“ + *phēmē*, speech]. Stammering.

dysphonia (dis-fō'nī-ā) [“ + *phōnē*, voice]. Difficulty in speaking, hoarseness.

d. clerico'rum. Clergyman's sore throat

d. pu'berum. Change of voice in boys during puberty.

dysphoria (dis-for'i-ä) [+ pherein, to bear]. Exaggerated feeling of depression and unrest without apparent cause.

dysphrasia (dis-fra'zi-ä) [+ phrasia, a speech. Impairment of speech. **SYN:** dysphasia.

dysphrenia (dis-fre'ni-ä) [+ phrên, mind]. Functional or constitutional psychosis; the opp. of the organic type

dysphyllaxia (dis-n-laks'i-ä) [+ phyllaxis, watching]. Waking too early from sleep

dyspinealism (dis-pin'e-al-izm) [+ L. *pinealis*, pert to a pine cone, + G *ismos*, condition of] Functional impairment of pineal gland.

dyspituitarism [+ L. *pituita*, mucus]. Condition due to disorder of the pituitary body in which both hyperpituitarism and hypopituitarism are present at the same time

dysplasia [+ *plassein*, to form]. Abnormal development of tissue. **SYN:** *alloplasia heteroplasia*

dyspnea (disp-ne'a) [+ *pnoë*, breathing] Labored or difficult breathing usually accompanied by pain.

Etiol. Insufficient oxygenation of the blood resulting from disturbances in the lungs, low oxygen pressure of air, circulatory disturbances, hemoglobin deficiency, and other causes may be acidosis, excessive CO. content of blood, excessive muscular activity, lesions of the respiratory center, emotional excitation, hyperexcitability of Hering-Breuer reflex, cardiac asthma, and orthopnea

SYM. Audible, labored breathing, distressed, anxious expression, dilated nostrils, protrusion of abdomen and expanded chest, gasping, marked cyanosis.

d. cardia. D due to cardiac insufficiency

d. expiratory. As in asthma and bronchitis, wheezing and painful expiration

Secretions in respiratory tract cause of sound

Poisons May be induced by cyanides, carbon monoxide, stichuine during convulsions

d. inspiratory. D due to interference in passage of air to the lungs

d. renal. D due to kidney disorder.

dyspneic (disp-ne'ik) [G *dys*, bad, + *pnoë*, breathing] Affected with or due to dyspnea

dyspraxia [+ *pragtein*, to do] Difficulty in functioning

dysraphism (dis-ruf'izm) In the embryo, failure of raphe-formation, or failure of fusion of parts, which normally fuse

d. spinal. A general term applied to failure of fusion of parts along the dorsal midline May involve any of the following structures. skin, vertebrae, skull, meninges, brain and spinal cord

dyspraxia [+ *prassein*, to perform]. Painful functioning

dysstasia [+ *stasis*, standing]. Difficulty in standing

dysstafic [+ *stasis*, standing]. Showing difficulty in standing

dysssynergia [+ *syn*, with, + *ergon*, work]. Failure of muscular co-ordination **SYN** *ataxia*.

dysystole (dis-sis-to-li) [+ *systolë*, contraction] Dilatation with cardiac insufficiency. Asystole, incomplete systole

dystasia [+ *stasis*, a standing]. Difficulty in standing

dystaxia (dis-tax'i-ä) [+ *taxis*, arrangement]. Partial ataxia.

dysteleology (dis-te-le-o'-ji) [+ *teleos*, complete, + *logos*, knowledge]. The study of rudimentary organs.

dysthymia (dis-thim'i-ä) [+ *thymos*, mind]. 1. Mental perversion; melancholia. 2. Condition resulting from malfunctioning of the thymus gland during childhood

dysthyreosis (dis-thi-re-o'sis) [+ *thyreos*, shield, + *-osis*]. Impaired functional activity of thyroid gland. **SYN:** *dysthyroidism*.

dysthyroidism (dis-thi'roi-dizm) [+ " + *eidos*, form, + *ismos*, state of]. Imperfect development and function of the thyroid gland

dystithia [+ *tithënia*, nursing]. Difficulty or inability to nurse at breast.

dystocia (dis-to'si-ä) [+ *tokos*, birth]. Difficult labor May be produced by either the passenger (the fetus) or the passage (the pelvis of the mother).

FETAL CAUSES (a) Usually large babies, (b) malpositions of the fetus (transverse presentation, face, brow, breech, or compound presentations), (c) abnormalities of the fetus (hydrocephalus, tumors of the neck or abdomen, hydrops of the fetus), (d) multiple pregnancy (interlocked twins)

MATERNAL CAUSES **Uterus** (a) Primary and secondary uterine inertia, (b) congenital anomalies of the uterus (bicornuate uterus), (c) tumors of the uterus (fibroids, carcinoma of the cervix), (d) abnormal fixation of the uterus by previous operation

Bony Pelvis Contracted pelvis, the commoner clinical types of which are (a) flat pelvis, rachitic and nonrachitic, (b) generally contracted pelvis, (c) flat and generally contracted pelvis; (d) funnel pelvis, (e) exostoses of the pelvic bones, (f) tumors of the pelvic bones

Cervix Uteri. (a) Bandl's contraction ring, (b) rigid cervix that will not dilate, (c) stenosis and stricture preventing dilatation.

Ovary Ovarian cysts that block the pelvis

Vagina and Vulva: (a) Cysts; (b) tumors, (c) atresias and stenoses.

DIAG. Can generally be made before the patient goes into labor by vaginal examination and external pelvimetry.

TREATMENT Varies according to the condition present that causes the dystocia. In general it aims toward the correction of the abnormality in order to allow the fetus to pass. If this is not possible, operative delivery must be resorted to. **SEE.** *cephalotripsy*.

dystonia (dis-to'ni-ä) [G *dys*, bad, + *tonos*, tone]. Impairment of tonicity.

dystonic [+ *tonos*, tone]. Pert. to dystonia or hyper- or hypotonicity of tissues

dystopia [+ *topos*, place]. Malposition; displacement of any organ

dystopic (dis-top'ik) [+ *topos*, place]. Not in place.

dystopy [+ *topos*, place]. Malposition of an organ. **SYN** *dystopia*.

dystrophia [+ *trephein*, to nourish]. Progressive weakening of a muscle **SYN:** *dystrophy*.

d. adiposogenitalis. Disease of the anterior pituitary gland showing genital atrophy and obesity, Frohlich's syndrome

d. Landousy-Djerine. A form of d, in which there is marked atrophy of facial muscles, shoulder girdle and arm. Facial atrophy produces a peculiar expression called *myopathic facies*

d., progressive muscular. Progressive atrophy of muscles beginning in terminals of motor nerves. *Etiol.* Nutritional disorder.

d. pseudohypertrophic muscular. An hereditary disease usually beginning in childhood in which muscular ability is lost. At first certain muscles atrophy followed by atrophy. Also called Erb's paralysis.

dystrophic (dis-trof'ik) [“ + *trephein*, to nourish]. Pert. to dystrophia.

dystrophodex'trin [“ + “ + *L. dexter*, right]. A starchy material in normal blood but slightly soluble.

dystrophoneurosis (dis-trof'o-nu-ro'sis) [“ + “ + *neuron*, nerve, + *-ōsis*]. Defective nutrition accompanied by a nervous disease.

dystrophy (dis'tro-fi) Dystrophia, *q v*

dystripsyia (dis-trip'si-ā) [“ + *tripsis*, digestion]. Impaired secretion of pancreas.

dysuria (dis-u'ri-ā) [“ + *ouron*, urine]. Painful or difficult urination, symptomatic of numerous conditions. Vesical tenesmus.

There is a persistent desire to urinate, and there may be a condition of strangury, the urine being passed drop by drop accompanied by pain. This may be indicative of cystitis, neuralgia of the bladder, urethritis, urethral stricture; hypertrophied, cancerous, ulcerated prostate in the male, prolapsus of uterus in the female, pelvic peritonitis and abscess, metritis, cancer of the cervix, or dysmenorrhea. Pain and burning may also be caused by concentrated acid urine.

dysu'riac [“ + *ouron*, urine] One affected with dysuria.

dyszooamyilia (dis-zo'o-am-il'i-ā) [“ + *zoon*, animal, + *amylon*, starch] Failure to transform dextrose into glycogen.

dyszoosper'mia [“ + “ + *sperma*, seed] Imperfect formation of spermatozoa.

E

E. Abbr. for *electromotive force, emmetro-
pid, energy, Escherichia, experimenter,*
and *eye*, also symb for *voltage* and
chemical symbol for *einsteinium*

e. Abbr for *electric charge, electron,*
and *ex* (L from).

E 107. Avertin, an anesthetic.

ea. Abbr for *each*

ead. Abbr for *eadem* (L the same)

EAHF. Abbr for *eczema, asthma, and
hay fever*

Eales' disease (ēlz) Repeated hemorrhages
into the retina and vitreous

ear [A.S *eare*]. Organ of hearing. Con-
sisting of external, middle, and internal
ear.

e., blood supply of. Ant. and post
auricular, stylomastoid, petrosal, and
int auricular arteries

e. bones. Bonelets of tympanic cavi-
ty *SYN ossicles*

e. cauliflower. A deformity consist-
ing of a thickening of the external ear
resulting from repeated blows. Com-
monly seen in prize-fighters

e. drum. The tympanum, or cavity in
middle ear

e. dust. Calcareous concretions in
membranous labyrinth *SYN otoconia,*
otolith

e., examination of. Watch test for
hearing, color, size, and shape, dis-
charge from middle or inner ear, ten-
derness upon pressure in front or back
of ear, inflammation or bulging, perfora-
tions, or scars of or in drum.

Acute hearing sometimes precedes de-
lirium *Deafness* indicates want of at-

tention, wax in external ear passage,
paralysis of auditory nerve or effect of
quinine or other drugs. *Pallor of ears,*
tongue, and gums indicates loss of blood
or poverty of blood *Ringings in ears*
is noted in nervous debility, cerebral
hyperemia and anemia, in disease of
ear, Ménière's disease, and after use of
certain drugs like quinine and salicylic
acid

e., external. Comprises auricle and
external auditory canal, is separated
from middle ear by tympanic* mem-
brane or drum

e., foreign bodies in. These are usually
insects, pebbles, beans, or peas. In-
sects in the ear cannot be attracted from
the ear by a bright light inasmuch as
they crawl in head first and usually do
not see the light

SYM Pain, ringing or buzzing in the
ear, and, if an insect, there is a great
noise.

TREATMENT Drop in bland oil and so
float insect out of ear. In case of a
solid foreign body, oil or water should
not be used, inasmuch as it may cause
the body to be pushed further in the
ear or may cause it to swell and be-
come firmly embedded. Such foreign
bodies in the ear do not constitute an
emergency and should be left untreated
until seen by a physician

Swimmers sometimes find that water
enters the ear and will not flow out spon-
taneously. This may occasionally be dis-
lodged by a sudden tap on the side of
the head above the ear, or by intro-
ducing a long wisp of cotton which will
draw out the water by capillarity*. Occa-
sionally this sensation of water in the
ear is not due to water, but to the
swelling of the cerumen* that is usu-
ally present. In such instances a physi-
cian should be consulted

e., internal. Consists of the cochlea
containing the sensory receptors for
hearing and the vestibule and semicir-
cular canals which contain the receptors
for equilibrium and the sense of position.
Innervated by the cochlear and vestibular
branches of the auditory nerve

e., middle. An irregular cavity in
temporal bone. In front it communi-
cates with eustachian tube which forms
an open channel bet. middle ear and
cavity of nasopharynx. Behind, middle
ear opens into mastoid antrum, and this
in turn communicates with the mastoid
cells. There are two openings into the
inner ear, both of which are covered
with membrane. A string of tiny bones,
joined together, extends from the tym-
panum to the *foramen ovale* of the in-
ternal ear. These are (1) malleus, (2)
incus, (3) stapes.

e. nerve supply of. *External* 5th,
7th, 10th cranial nerves and branches
from cervical plexus. *Middle* 7th and
9th cranial nerves and sympathetic
fibers. *Internal* 8th cranial nerve.

e., swelling in front or behind. *ETIOI.*
Mumps, mastoid disease, scurvy, an-
thrax, or gangrenous stomatitis.

THE EAR

1. External ear; 2. Middle ear; 3. Internal ear; 4. Pinna; 5. Helix; 6. Antihelix; 7. Scaphoid fossa; 8. Fossa helicis; 9. Tragus; 10. Antitragus; 11. Concha; 12. Lobe; 13. External Auditory meatus; 14. Tympanic membrane; 15. Tympanic promontory; 16. Foramen rotundum; 17. Posterior wall of the tympanum; 18. Auditory ossicles; 19. Eustachian tube; 20. Facial canal; 21. Vestibule; 22. Semicircular canals; superior, inferior, horizontal; 23. Ampulla; 24. Cochlea; 25. Prominentia spiralis; 26. Scala tympani.

e-wax. Wax in the ear. SYN: cerumen.

ear, words pert. to: acoustic meatus, aditus, angiotitis, ankylotia, annulus, antihelix, antilobium, antitragicus, antitragus, antrotympanitis, asylum ear, auricle, auriculare, "auris-" words, bin-aural, blennorrhoea, bulla ossea, cavum tympani, cerumen, cochlea, concha, crista ampullaris, cupola, deafness, endolymph, epitympanum, eustachian, foreign bodies, helix, hydrotis, incus, labyrinth, labyrinthitis, macrotia, malleus, microtia, ossicles, "ot-" words, pinna, politization, scala tympani, suprameatal, tinnitis aurium, tympanum, "utri-" words, vestibule, vitreous, wax.

earache. Aural pain. SYN *otalgia*.

earth eating. Eating clay or dirt. Sometimes done by children who lack lime, also by the insane. SYN *chthonophagia*, *geophagism*, *geotragia*.

ear trumpet. A tubular device to aid the deaf in hearing.

eat [A.S. *etan*]. 1 To devour as food. 2 To take solid food. 3 To corrode.

eating, words pert. to: abrosia, acataposis, acoria, allotriophagy, amasesis, apastia, appetite, bradyphagia, bulimia, chthonophagia, dysphagia, esculent, fastidium, fasting, geophagia, hunger, hyperorexia, mastication, parorexia, pica, polyphagia.

Eberthella. A genus of *Bacteriaceae* causing intestinal inflammation.

E. typhosa. SYN *E. typhosi*. *Salmonella typhosa*.

eberthemia [Eberth + G. *aima*, blood]. The presence of typhoid bacilli (*Bacillus typhi abdominalis*, or Eberth's bacilli) in the blood.

eberthian. Pert. to or caused by Eberth's bacillus.

Ebner's glands. Serous glands of the tongue usually found in the vicinity of the circumvallate papillae.

ebonation [L *ē*, out, + A.S. *ban*, bone]. Removal of bony fragments from a wound.

Ebstein's diet. One used in the treatment of obesity. Very little carbohydrate is permitted.

Breakfast. Tea ½ pint, no milk or sugar, bread or toast 3 ounces, plenty of butter. **Dinner.** Clear soup, meat 4 or 6 ounces, fat gravy, boiled vegetables, fresh fruit. **Afternoon.** Like breakfast. **Supper.** One egg, fat roast meat, ham, or fish, bread 1 ounce, butter, cheese, and fruit.

E's disease or lesion. Epithelial necrosis and hyaline degeneration of the renal tubules in diabetes mellitus.

E's leukemia. A rapidly progressing form of leukemia.

ebullition (ēb-u-lish'yun) [L *ebullire*, to boil]. 1 Boiling. 2 Effervescence.

eburnation (ē-bur-nā'shun) [L *eburnus*, made of ivory]. Changes in bone causing them to become dense like ivory and hardened.

eburneous (ē-bur-ne-us) [L *eburnus*, made of ivory]. Resembling ivory; ivory-colored.

ecaudate (ē-kaw'dāt) [L *ē*, without, + *cauda*, tail]. Without a tail.

ecbolic (ēk-bol'ik) [G. *ekbolikos*, throwing out]. 1 Hastening labor by toning up uterine muscles. 2 Causing abortion. 3. Any agent producing or hastening labor or abortion. Ex *cotton root*, *ergot*, *tansy*. SYN *abortifacient*.

eccentric (ēk-sen'trik) [G. *ekkentros*, from the center]. 1 Peculiar, abnormal in action or ideas. 2 Proceeding away from a center. 3 Peripheral.

e. atrophy. Atrophy with dilatation.

e. convulsion. One caused by peripheral irritation.

e. hypertrophy. Hypertrophy of a hollow organ with dilatation.

e. limitation. Having smaller visual field than normal.

eccentro-osteochondrodysplasia. A pathological condition of bones due to imperfect bone formation. Ossification occurs in several centers instead of one common center. Also called *Morquio's disease*.

eccentropiesis (ēk-sen'tro-pi-e'sis) ['' + *pie-sis*, pressure]. Pressure from within exerted outward for treatment of anal fistula.

echchondroma, echchondrosis (ēk-on-dro'mā, -dro'sis) [G *ek*, out, + *chondros*, cartilage, + *-oma*, tumor]. A chondroma or cartilaginous tumor.

echchondrotome (ēk-on-dro-tōm) ['' + *tome*, incision]. Knife for excision of cartilage.

echchymoma (ēk-i-mo'mā) ['' + *chymos*, juice, + *ōma*, tumor]. An extravasated blood tumor. A swelling due to the accumulation of blood in subcutaneous tissues such as occurs following a bruise.

echchymosis (ēk-i-mo'sis) (pl. -ses) ['' + *-osis*]. A form of macula appearing in large irregularly-formed hemorrhagic areas of the skin. The color is red, changing to blue, greenish brown, or yellow.

Ectoi. Extravasation of blood into areolar tissue.

echchymotic (ēk-i-mot'ik) ['' + *chymos*, juice]. Resembling or rel. to an echchymosis.

eccrinology (ēk-rin-ol'o-jī) ['' + *krinein*, to secrete, + *logos*, study of]. The science of secretions.

eccrisis (ēk'kris-is) ['' + *krisis*, separation]. The expulsion of morbid or waste products. SYN *excretion*.

eccrific ['' + *krinein*, to secrete]. Promoting or that which promotes excretion.

eccyclomastopathy (ēk-si'clo-mas-top'ā-thi) ['' + *kyklos*, circle, + *mastos*, breast, + *pathos*, disease]. A mass of lesions of the breast made up of connective tissue and/or epithelial cells. SYN *cyclomastopathy*.

eccyesis (ēk-si-e'sis) ['' + *kyēsis*, pregnancy]. Extruterine or ectopic pregnancy.

ecdem'ic [G *ekdēmos*, foreign]. Not endemic nor epidemic, as a disease carried to a region from without.

ecdemomania (ēk-de-mo-mā-ni-ā) ['' + *mania*, madness]. Wanderlust, abnormal desire to wander. SYN *drapetomania*, *dromomania*, *vagabondage*.

ecderon (ēk'dē-ron) [G. *ek*, out, + *deros*, skin]. Epidermis, or outer portion of skin, as distinguished from *enderon*,* or inner portion.

ecdysis (ēk-dis'is) 1. The shedding or sloughing off of the epidermis of the skin, desquamation. 2. The shedding of the outer covering of the body as occurs in certain animals, such as insects, crustaceans, and snakes: molting.

ECG. (ecg). Abv for electrocardiogram.

echidnase. An enzyme present in snake venom which produces inflammation.

echidnin (ēk-id'nin). 1. The venom of poisonous snakes. 2. The active principle present in snake venom.

Echidnophaga (ēk-id'nō-fā-jā). A genus of fleas belonging to the family Pulicidae.

E. gallinacea. The sticktight flea which is the most important flea pest of poultry. It collects in clusters on the heads of poultry and in the ears of mammals it may infest humans, esp. children.

echinate (ek'ī-nāt) [G. *echinos*, hedgehog]. 1. Spiny. 2 In agar streak, a growth with pitted or toothed margins along the inoculation line; in stab cultures, coiled growth with pointed outgrowths

echinococcosis (ē-kin-o-kok-ko'sis) [" + *kokkos*, berry]. Infestation with echinococcus.

echinococcotomy (ē-kin-o-kok-o'to-mī) [" + " + *tomē*, incision]. Operation for evacuation of an echinococcus cyst.

Echinococcus (e-kin-o-kok'us) (pl. *Echinococci*) [" + *kokkos*, berry] A genus of tapeworms. They are minute forms consisting of a scolex and three or four proglottids

e. cyst. A cyst resulting from the development of the larva of the dog tapeworm.

e. cysticus. Disease resulting from a single hydatid cyst occurring in the liver.

e. disease. Infestation with the larva of *Echinococcus* which causes the formation of hydatid cysts

e. granulosus. A species of tapeworms which infests dogs and other carnivores. Its larva called a hydatid develops in other mammals including man and causes the formation of hydatid cysts

e. hydatidosus. Variety of *E* characterized by development of daughter cysts from the mother cyst

Echinorhynchus (ē-kin-o-rin'kus) [" + *rychos*, beak] Formerly considered a genus of parasitic worms belonging to the Acanthocephala. It has been divided into many sub-groups

E. gigas. Macracanthorhynchus hirudinaceus, a worm commonly parasitic in pigs, but occasionally found in man

echinosis (ē-kin-o'sis) [" + -osis]. Blood corpuscles appearing like a sea urchin, having lost their smooth outlines. Crenation of red blood cells

Echinostoma (ē-ken-ōs'tō-mā) A genus of flukes characterized by a spiny body and the presence of a collar of spines near the anterior end. They are found in the intestines of many vertebrates, esp. aquatic birds. They occasionally occur as accidental parasites in man.

echinulate (ē-kin'u-lāt) [G. *echinos*, hedgehog]. A bacterial growth having lateral spines. Seen along line of inoculation.

echo (ēk'ō) [G. *ēchō*, echo]. A reverberating sound

e. acou'sia. Subjective echoes of sounds just normally heard.

e., amphor'ic. Amphoric sound sometimes heard in auscultation of chest. **See chest, percussion of.**

e. sign. Repetition of closing word of a sentence, a sign of epilepsy or other brain conditions

e. speech. Echolalia

ECHO virus. A virus belonging to the group known as Enteric Cytopathogenic Human Orphan group

echokinesia (ek-o-kin-e'sī-ā) [" + *kinēsis*, movement]. Involuntary repetition of another's gestures.

echolalia (ek-o-lā'li-ā) [" + *lalia*, babble] An involuntary, parrotlike repetition of words spoken by others, often accompanied by twitching of muscles, as seen in schizophrenia

echomatism (ē-ko'mā-tizm) [" + *ismos*, condition of]. Automatic repetition of another's actions.

echomimia (ē-ko-mim'ī-ā) [" + *mimēsis*, imitation]. The imitation of the actions of others without meaning as seen in dementia precox

echomotism (ē-ko-mo'tizm) [" + *L. motus*, moving] Imitation of movements.

echopathy (ē-kop'ā-thī) [" + *pathos*, disease]. Imitation of another's actions and repetitions of his words, a neurosis.

echophotony (ē-ko-fu'to-nī) [" + *phos*, light, + *tonos*, tone]. Production of color sensations by stimulus of sounds heard.

echophrasia [" + *phrasis*, speech]. Patient's meaningless repeating of words spoken to him. May be accompanied by muscle twitching; seen in dementia precox

echopraxia (ē-ko-praks'ī-ā) [" + *praxein*, to perform] Imitation, without meaning, of motions made by others. **SYN:**

echoprax'is [" + *praxein*, to perform]. Senseless repetition by the patient of movements made by the physician in treatment.

eclabium (ek-lā'bl-um) [G. *ek*, out, + *L. labium*, lip]. Eversion of a lip

eclampsia (ē-klamp'sī-ā) [" + *lampein*, to flash]. 1 A sudden attack of convulsions or an epileptiform seizure not of central origin. 2 A major toxemia of pregnancy accompanied by high blood pressure, albuminuria, oliguria, tonic and clonic convulsions, and coma. May occur pre-, intra-, or postpartum

Error. Unknown eclampsus more often in primiparae, in multiple pregnancy, in hydramnios, in hydatidiform mole, in patients with severe anemia, and in the undernourished

PATH. Seen most frequently in the kidney, liver, brain, heart, and placenta. The kidney shows degenerated tubal nephritis, the tubal epithelium showing cloudy swelling, fatty degeneration, and coagulation necrosis. The liver is enlarged and mottled, there are periportal thrombosis and degeneration of the periphery of the lobules with subcapsular hemorrhages. The brain shows edema, hyperemia, thrombosis, and hemorrhages. The heart shows cloudy swelling and degenerative myocarditis. The placenta shows infarcts, thromboses, and hemorrhages

SYM. Edema of the legs and feet, puffiness of the face, hyperplecia, and albuminuria. Severe headaches, dizziness, spots before the eyes, epigastric pain, convulsions (beginning with fixation of the eyeballs, rolling of the eyes, twitchings of the face, arms, and hands; the paroxysms then involve the entire body), blueness of face, protrusion of the tongue, frothing at the mouth, and coma. There may be one or many convulsions. The pulse is rapid and bounding, the temperature usually rises to 103° or 104° F., and the blood pressure varies bet 140 and 200 mm Hg systolic. The patient may continue in coma until death.

TREATMENT. *Prophylactic:* The most important. Good prenatal care, with careful watching of the patient's blood pressure, urine, and weight, instituting medical management as soon as any abnormal findings are presented, and terminating labor if unsuccessful in reducing the signs of danger

The Attack. Prevent the patient from doing herself bodily harm (tie her in bed, protect the tongue by keeping the teeth separated). In general, promote elimination by subcutaneous injection of

salt solution, lavage of the stomach, saline catharsis, and the use of hypertonic glucose solution intravenously. Reduce the irritation of the nervous system by Stroganoff treatment with morphine and scopolamine, by the use of large doses of chloral hydrate and bromides by rectal instillation, or by the use of any of the barbiturates. If necessary to control a long sustained convulsion, ether may be used. The blood pressure may be reduced by venesection, or by the use of veraltrone.

Delivery. This should not be instituted until the general condition of the patient has improved unless the patient is in active labor, in which case the labor should be aided by the use of forceps as soon as is possible. Cesarean section should not be done unless there is some other obstetrical reason. If medical management shows no improvement, then labor must be instituted by one of the recognized methods, because only the removal of the pregnancy will allow for improvement in the condition of the mother.

PRECAUTIONS IN (during a convulsion)

(a) The patient must *not* be left alone.
(b) Restrain only enough to keep her in bed. Side boards or some type of restraint must be used after the convulsion to make certain the patient will not fall out of bed during the coma, delirium, and restless stage.
(c) Use mouth gag to keep patient from biting her tongue.
(d) See that the physician is notified immediately.
(e) See that the physician's orders are carried out. (When a nurse is cognizant of a physician's routine in these cases she will be given more authority and responsibility in anticipating his desires before his arrival.)
(f) Have the fetal heart checked frequently, in cases of convulsion before delivery, because the fetal circulation is interfered with and the infant may register signs of distress.

e., albuminuric. E. caused by presence of albuminuria.

e. gravidum. E in women during pregnancy.

e. infantile. A convulsion occurring in children. It is of reflex origin being associated with teething, acute digestive disorders, worm infestation, or cerebral congestion.

e. nutans. SYN *nodding spasm, salam convulsion*. E characterized by nodding movements.

e. puerperal. A convulsion occurring near the end of pregnancy, during labor, or immediately following labor.

e. uremic. E resulting from uremia due to suppressed urine formation.

ecclampsism (e-klamp'sizm) [" + *ismos*, condition of]. Puerperal eclampsia without convulsive seizures.

ecclamp'tic [" + *lamptein*, to flash]. Rel. to, or of the nature of, eclampsia.

ecclampsism (ek-klamp'tizm) [" + *ismos*, state of]. Condition due to auto-intoxication incident to pregnancy.

ecclamp'togenic [" + *gennan*, to produce]. Causing convulsions.

ecclamp'togenus (ek-lamp-toj'en-us) [" + *gennan*, to produce]. Producing convulsions. SYN: *ecclamp'togenic*.

eclectic (ek-lek'tik) [G. *eklektikos*, selecting]. Selecting from various sources what seems to be the best.

e. school of medicine. One employing indigenous plants or "specifics" according to patient's symptoms.

eclecticism (ek-lek'ti-sizm) [" + *ismos*,

state of]. A system of medicine treating disease through specific remedies for individual pathological conditions, rather than by treating body as a whole. Remedies, principally botanical.

eclysis (ek-li'sis) A mild syncope.

ecnesia (ek-ne'zi-ä) [G. *ek*, out, + *mnēsis*, memory]. Inability to remember recent events as seen in senility. The memory of before and after events not affected.

ecoid (e'koid) [G. *oikos*, house, + *eidōs*, resemblance]. The framework of a red blood corpuscle.

ecology (e-kol'o-jī) [" + *logos*, study of]. The physiology of organisms as affected by their environment. SYN: *bionomics*.

ecomania (e-ko-ma'ni-ä) [" + *manía*, madness]. An extreme humbleness manifested before those in authority but a dominating, irritable attitude towards members of the family. Manifested in chronic alcoholism.

écouvillonage (a-koo-vi-von-ahzh') [Fr.]. The cleansing and application of remedies to a cavity by means of a brush or swab.

ecphoria (ek-fō'rī-ä) An engram, or the reestablishment of a memory trace or engram.

ecphyadectomy (ek-fī-ä-dek'to-mī) [G. *ek-phyas*, appendix, + *ektomē*, excision]. Removal of vermiform appendix. SEE *appendectomy*.

ecphyaditis (ek-fī-ad'ī-tis) [" + *-itis*, inflammation]. Inflammation of vermiform appendix. SYN: *appendicitis*.

ecphyllactic (ek-fī-lak'tik) [G. *ek*, out, + *phylaxis*, guarding]. Pert. to ecphyllaxis.

ecphyllaxis [" + *phylaxis*, protection]. Impotent antibodies or phylactic agents in the blood.

ecphyra (ek-fī-mā) [" + *phyma*, growth]. An outgrowth or excrescence, as a wart.

écrasement (ä-kräz-mon') [Fr. *écraser*, to crush]. Excision by means of an écraseur.

écraseur (ä-krä-zer') [Fr. *écraser*, to crush]. A wire loop used for excisions.

ectasy (ek'ta-sī) [G. *ekstasis*, a standing out]. An exhilarated, trance-like, or exalted state.

ectstrophy (ek'stro-fī) [G. *ekstrophe*, a turning out]. Turning an organ inside out. SYN: *ectstrophy*.

ec'tad [G. *ektos*, without]. Toward the surface, outward, externally.

ec'tal [G. *ektos*, without]. External, outer, on the surface.

ectasia, **ectasis** (ek-ta'sī-ä, -sis) [G. *ek*, out, + *teinein*, to stretch]. Dilatation of any tubular vessel.

e. ventriculi paradoxa. Hourglass stomach.

ectasin (ek'tas-in) [" + *teinein*, to stretch]. A tuberculin-derived substance causing vasomotor dilation.

ectatic [" + *teinein*, to stretch]. Distensible or capable of being stretched.

ecten'tal [G. *ektos*, without, + *entos*, within]. Pert. to entoderm and ectoderm.

e. line. Point of entodermal and ectodermal junction.

ectethmoid (ekt-eth'moid) [" + *ethmos*, sieve, + *eidōs*, form]. Lateral mass of the ethmoid bone.

ecthyma (ek-thi'mā) [G. *ek*, out, + *thyein*, to rush]. An acute, noncontagious, inflammatory, pustular, cutaneous eruption on a hardened base which may be followed by slight scarring or temporary pigmentation.

ETIOI. Lowered resistance to common pathogenic organisms (particularly *Staphylococcus aureus*), uncleanness, poor hygienic surroundings, general debility. Slightly infectious and auto-inoculable.

SYM. Circular or irregularly oval lesions, the bases excoriated, raw and sensitive to pressure, until the crusts drop off, leaving scars or pigmented spots.

PATH. Epidermal, originating in upper prickle-cell layer.

PROG. As a rule favorable, but depending to some extent upon patient's general condition.

TREATMENT. Tonics and simple nourishing diet. Crusts to be removed by starch poultices, etc., lesions cleansed, and mild antiseptic applied. If sluggish, paint with silver nitrate, balsam of Peru, gentian violet, or mercurochrome.

e. scrofulosum. Form seen in scrofula.

e. syphiliticum. Pustular eruption occurring in tertiary syphilis.

ecthyreosis (ek-thī-rē-o'sis) [" + *thyreos*, shield, + -ōsis]. Loss of thyroid gland function.

ectiris (ek-tī-ris) [G *ektos*, without, + *iris*, iris]. The external portion of the iris.

ecto- [G *ektō*]. Prefix. Outside.

ectoaantigen [G *ektos*, out, + *anti*, against, + *gennan*, to produce]. 1. Any toxin or stimulator of antibody formation. 2. An antigen assumed to have its origin in ectoplasm of bacterial cells or one loosely attached to the surface of bacteria and capable of being separated from the bacterial cell.

ectoblast [" + *blastos*, germ]. Old term for the ectoderm or epiblast of an embryo.

ectocardia (ek-to-kar'dī-ā) [" + *kardia*, heart]. Having the heart out of normal position.

ectochoroidea (ek'tō-ko-ro'yē-de-ā) [" + *chorioidēs*, choroid]. Outer layer of choroid coat of the eye.

ectocinerea (ek-to-sin-c're-ā) [" + L. *cinereus*, ash]. The outer gray matter of the brain.

ectocolostomy [G *ektos*, outside, + *kōlon*, colon, + *stōma*, opening]. Formation through the abdominal wall of an opening into the colon.

ectocondyle [" + *kondylos*, knuckle]. The outer condyle of the bone.

ectocornea (ek-to-kor'ne-ā) [" + L. *corneus*, horny]. External layer of the cornea.

ectocuneiform [" + L. *cuneus*, wedge, + *forma*, form]. External cuneiform bone.

ectocyctic (ek-to-sī'tik) [" + *kytos*, cell]. Outside of the cell.

ectodactylism [" + *daktylos*, finger, + *ismos*, state of]. Lack of a digit or digits.

ectoderm (ek'to-derm) [" + *derma*, skin]. The outer layer of cells in a developing embryo.

From it are developed skin structures, the nervous system, organs of special sense, the pineal and part of pituitary and suprarenal glands. **SYN:** *epiblast*.^{*} **SEE:** *ectoderm*.

ectodermal [" + *derma*, skin]. Rel. to the ectoderm.

ectodermatosis (ek-to-der-mā-to'sis) [" + -ōsis]. Disorder due to faulty development of the ectoderm.

ectodermic [" + *derma*, skin]. Pert. to the ectoderm. **SYN:** *ectodermal*.

ectodermoid [" + " + *eidōs*, resemblance]. Pert. to or resembling the ectoderm.

ectodermosis [" + " + -ōsis]. Illness resulting from congenital maldevelopment of ectodermal structures. **SYN:** *ectodermatosis*.

e. erosiva pluriorificialis. **SYN:** *dermatostomatitis*. A form of erythema multiforme characterized by fever, chills, profuse salivation, and the development of vesicles on the lips, tongue, and cheeks and later erythematous lesions on the hands. The disease is rare, occurring in children and young persons.

ectoentad [" + *entos*, within]. From without inward.

ectoenzyme [" + *en*, in, + *zymē*, leaven]. An extra-cellular enzyme or one that acts outside of the cell that secretes it.

ectogenous (ek-toj'en-us) [" + *gennan*, to produce]. Having its origin outside of a body or structure, as infection.

ectoglia (ek-tog'li-ā) [G *ektos*, outside, + *glia*, glue]. Superficial embryonic layer in beginning of stratification of the medullary tube.

ectoglobular [" + L. *globulus*, globule]. Not within blood cells or globular bodies.

ectogony [" + *gonos*, seed]. Influences on the mother's body and metabolism from the developing zygote.

ectokelostomy (ek-to-ke-los'to-mi) [" + *kēlē*, hernia, + *stōma*, opening]. Making an external opening into a hernial sac to prepare for a radical operation.

ectolecithal (ek-to-les'ith-al) [" + *lekithos*, yolk]. Pert. to ovum having food yolk placed near the surface.

ectolysis [" + *lysis*, dissolution]. Ectoplasmic lysis.

ectomere (ek'to-mēr) [" + *meros*, part]. One of the blastomeres forming the ectoderm.

ectome'soblast [" + " + *blastos*, germ]. Cells from which will be developed the ectoblast and mesoblast.

ectomy (ek'to-mi) [G. *ektomē*]. Excision of any organ or gland.

ectonuclear [G. *ektos*, outside, + L. *nucleus*, kernel]. Occurring outside a cell nucleus.

ectopagus (ek-tō-fāg'ūs). An abnormal detus consisting of twins fused at the thorax.

ectoparasite. A parasite that lives on the outer surface of the body.

ectoperitonitis [" + *peritonion*, peritoneum, + *-itis*, inflammation]. Inflammation of the parietal layer of peritoneum (layer lining the abdominal wall).

ectopia (ek-to'pi-ā) [G. *ek*, out, + *topos*, place]. Malposition or displacement of an organ or structure esp. if congenital.

e. cordis. Malposition of the heart in which heart lies outside the thoracic cavity.

e. lentis. Displacement of the crystalline lens of the eye.

e. pupillae. **SYN:** *corectopia*. Displacement of the pupil. [ney]

e. renis. Displacement of the kidney.

e. testis. Displacement of the testis.

e. vesicae. Displacement of the bladder, esp. extrophy of the bladder.

e. visceral. An umbilical hernia.

ectopic (ek-top'ik) [" + *topos*, place]. In an abnormal position; said of a fetus.

e. beat. Cardiac beat beginning at a point other than sinoauricular node.

e. gestation or pregnancy. Implantation of the fertilized ovum outside of the uterine cavity. There is usually a de-

cidual reaction in the uterus, but the decidua is poorly developed and the decidua reflex is absent. The tubal decidua reaction is meager.

LOCATIONS. *Abdominal:* In the free abdominal cavity and attached to one of the abdominal viscera, usually secondary to tubal. *Interstitial:* In the interstitial portion of the tube. *Ovarian:* In the ovary. The ovarian and primary abdominal types are very rare. *Tubal:* In the fallopian tube, the most frequently encountered. The pregnancy may be situated in the interstitial, ampullar, or isthmic portion of the tube, the isthmic type being the most common.

ETIO. Most commonly associated with inflammatory conditions of the tube and other conditions which mechanically interfere with the downward passage of the ovum, such as diverticula, polyps in the tubal lumen, peritoneal adhesions, and a large migrating ovum. Any variety of pregnancy or any combination of varieties may occur (uterine plus ectopic, bilateral ectopic, etc.).

SYM. (a) Missed menstruation; (b) tenderness, soreness, pain on affected side, (c) pallor, weak pulse, signs of shock or hemorrhage, (d) pain may be reflected to shoulder, (e) perhaps bluish discoloration of umbilicus.

Unruptured. Amenorrhea may or may not be present, vague pains in the abdomen usually on one side; irregular hemorrhage. The diagnosis at this stage can be made only by the absence of definite signs of uterine pregnancy, and colpotomy incision with an inspection of the internal genitalia.

Ruptured. Without a severe hemorrhage. Severe pain in the lower abdomen with fainting spells which occur repeatedly. Diagnosis made by puncture which reveals the free blood in the abdominal cavity.

Tragic, with overwhelming hemorrhage. Sudden collapse with cold, clammy sweat, rapid pulse, Cullen's sign in women with thin abdominal walls, lowering blood pressure, gaseous distention of the abdomen, desire to defecate with no relief of the pressure on defecation (due to bloody distention of the cul-de-sac), shock, air hunger, and other signs of severe hemorrhage. Diagnosis is confirmed by the return of free blood on post puncture. After several attacks there is a leukocytosis of 12 to 15,000, and the hemoglobin is lowered.

DIFFERENTIAL DIAGNOSIS: Ectopic must be differentiated from uterine pregnancy, acute salpingitis, twisting of the pedicle of an ovarian cyst or pedunculated fibroid tumor, and hemorrhage from a ruptured graafian follicle or corpus luteum cyst.

TREATMENT. Once the diagnosis of ectopic pregnancy is made, operative treatment is indicated. In those cases where there is profound shock from hemorrhage the patient should be supported by blood transfusion and saline infusions before major surgery is attempted. See: *celiocolpotomy*.

e. rhythm. Any cardiac rhythm that is abnormal or irregular.

ectoplasm (Ē. *ektos*, outer, + *plasma*, a thing formed). The outermost layer of cell protoplasm.

ectoplasmic (Ē + *plasma*, a thing formed). Pert. to ectoplasm.

ectoplastic (Ē + *plastēin*, to form). Formed at the periphery; ectoplasmic.

ectopotomy (Ēk-to-pot'o-mī) [G. *ek*, out, + *topos*, place, + *tomē*, incision]. Removal of the fetus in ectopic pregnancy.

ectopterygoid (Ēk'to-ter'i-goyd) [G. *ektos*, outside, + *pteryx*, wing, + *eidōs*, form]. *Musculus pterygoideus externus*.

ectopy (Ēk'to-pl) [G. *ek*, out, + *topos*, place]. Displacement. **SYN:** *ectopia*.

ectoretina [G. *ektos*, outside, + *L. rete*, net]. Outer layer of retina.

ectoscopy (Ē + *skopein*, to examine). Diagnosis by study of thoracic movements when patient speaks, or by abdominal movements.

ectostosis (Ēkt-os-to'sis) (Ē + *osteon*, bone, + *-ōsis*). Formation of bone beneath the periosteum.

ectotoxemia (Ē + *toxikon*, poison, + *aima*, blood). Toxemia from introduction of a toxin into the body.

Ectotrichophyton (Ēk-tō-tri-kōf'i-tōn). Term applied to Trichophyton ectothrix, a genus of parasitic fungi, attaching hair follicles and hair.

ectozoon (Ēk-to-zōon) (Ē + *zōon*, animal). Parasitic animal that infests the outer integument of the body.

ectrodactylism (Ēk-tro-dak'til-izm) [G. *ektroma*, abortion, + *daktylos*, finger, + *ismos*, state of]. Congenital absence of 1 or more fingers or toes.

ectropic (Ēk-tro'plk) [G. *ek*, out, + *trepein*, to turn]. Pert. to complete or partial eversion of a part, generally the eyelid.

ectropion (Ēk-tro'pl-on) (Ē + *trepein*, to turn). **OPHTH:** Eversion, as the edge of an eyelid.

ETIO. Old age; relaxation of skin; cicatrix following trauma; infection; palsy of facial nerve.

e. of the cervix uteri. **GYN:** A turning out of the edges of the cervix following laceration.

ectropionize (Ē + *trepein*, to turn). To evert, or cause an eversion.

eczema (Ēk'zē-mā) [G. *ekzein*, to boil out]. Cutaneous inflammatory condition, acute or chronic, with erythema, papules, vesicles, pustules, scales, crusts, or scabs alone or in combination, dry, or with watery discharge, and with thickening or infiltration and more or less itching or burning. More a symptom than a disease. **SYN:** *dermatitis*.

ETIO. Essential cause unknown. No class, age, or sex is exempt, but those with thin, dry skins are more susceptible. Not infectious. Two classes of causes. (1) External or exciting (parasitic, irritation, occupational and non-occupational, chemicals, etc.). (2) Constitutional or predisposing (nerve strain and reflex irritation, anaphylactic reactions, hyperglycemia, etc.).

SYM. Primary type characterized by erythematous, papular, vesicular, or pustular lesions. In secondary type, the lesions evolve from primary variety. Invasion by pathogenic organisms may cause suppuration.

e. capitis. That on the head. Oozing dermatitis seborrheica.

e., erythematous. Dry, pinkish, ill-defined patches with itching and burning, slight swelling with tendency to spread and coalesce, branny scaling, roughness and dryness of skin. May become generalized.

e. fissum. Form of e. with painful openings in the joint regions.

e., hypertrophicum. E. with a permanent enlargement of papillae of the skin, or skin growths.

e., lichenoid. E. with a thickened condition of the skin.

e. madidans. Variety with raw, erythematous points exuding moisture.

e., Marginum, tinea cruris. E. caused by ringworm.

e., papular. Pin-point to pinhead-sized reddish, pinkish, or violaceous papules with rounded or acuminate thin-walled vesicles which, when ruptured, become covered with thin yellowish crust of dried sebum or inspissated pus interspersed with raw areas of denuded epithelium. Skin as a result of irritation and chronic congestion becomes thick and infiltrated and dark red.

e., pustular. Includes many forms: Follicular, impetiginous or consecutive types, including *eczema rubrum* (red, glazed surface with little oozing); *eczema madidans* (raw, red, and covered with moisture); *eczema crustosum* (more or less crusting with exudate); *eczema fissum* (thick, dry, inelastic skin with cracks and fissures); *squamous eczema* (chronic, on soles, legs, scalp, multiple, circumscribed infiltrated patches with thin, dry scales); *eczema sclerosum* (marked thickening, elephantiasislike papillary hypertrophy resulting in rough, horny, verrucose patches on legs, soles, and palms with fissuring); *furrowed eczema* (slightly erythematous skin, harsh and dry, with innumerable cracks on outer epidermal layer).

Prog. Chronic, amenable to treatment but prone to relapse and recurrence.

TREATMENT *Internal* Simple diet, elimination of highly seasoned foods and pastries, condiments and stimulants. Free elimination and water drinking. Opium to be avoided as it increases itching. In gouty and rheumatic, colchicum, salicylate and salines. Filocarpine, particularly in the dry skin. X-rays and light exposures. Counterirritation to spinal areas. Removal of focal infections. Avoidance of foreign proteins. *External* No soap and water. Removal of crusts and scales by oils or cold cream. In acute stage, in moist types, lotions by day and carbolized zinc oxide ointment at night. Carbolic acid for itching or in dry types, boric acid bath or compress, 10 to 15 minutes a day to relieve itching if there is much secretion, or cupful of baking soda in bathtub of water at 98°. Put 3 cups of boiled oatmeal in cheesecloth bag and squeeze in water until cloudy.

Skin tests should be made to find cause of any irritation. Salves alone or alternated with lotions. In advanced and subacute stage with infiltration use stimulating applications with calamine lotion and zinc oil. Tar in subacute and chronic types. In circumscribed types with thickening, salicylic acid in ointment or plaster together with green soap shampoo. Potassium permanganate for pruritus and healing. **Sx.** *allergy, patch-test, tetter.*

e. rubrum. **See:** *e. madidans.*

e., seborrheic. Form marked by excessive secretion from the sebaceous glands. **Syn** *seborrhea.*

e. squamosum. E. with scaly formation.

e., vesicular. Formation of vesicles on the scalp in *eczema.*

eczematous [G. *ekzein*, to boil out]. Marked by or resembling *eczema.*

Edebohl's position (ed'e-böl). The dorsal recumbent position with the buttocks

resting upon end of table, the lower limbs flexed backward toward the abdomen sufficiently to permit holding the position with legs supported from ankles in a support attached to 2 straight uprights extending 1 on each side at end of table.

edema [G. *oîdēma*, swelling]. A condition in which the body tissues contain an excessive amount of tissue fluid. It may be local or general. Generalized edema is called dropsy, or anasarca.

Error. Edema may result from increased permeability of the capillary walls; increased capillary pressure due to venous obstruction or heart failure; lymphatic obstruction; disturbances in renal functioning, reduction of plasma proteins, inflammatory conditions; chemical substances such as bacterial toxins, venoms, caustic substances, and histamine.

May occur by diffusion,* osmosis,* or dialysis.* Acid in the tissue, such as resulting from a sting, produces absorption of water which causes local edema.

TREATMENT OF GENERAL EDEMA Bed rest desirable. Salt intake restricted. This may be moderate or severe restriction, depending upon degree of edema. Fluid intake restricted, may be as low as 600 cc. in 24 hours. This proscription may be relaxed when free diuresis has been attained. Diuretics are effective when renal function is good, edema mild, and when underlying abnormality of cardiac function, capillary pressure, or colloid osmotic pressure are being corrected, simultaneously. Diuretics contraindicated in the true nephritic edema of acute diffuse glomerulonephritis. They are often useless in cardiac edema associated with advanced renal insufficiency. Useful diuretics are urea, theobromine, theophylline, potassium nitrate, chloride, or acetate, ammonium chloride, or nitrate, and the mercurial diuretics, salyrgan, mercupurin (both given intravenously), and mercurin suppositories. The diet in edema should be adequate in protein, high in calories, rich in vitamins, and low in salt. When diuresis appears, the diet may become normal.

e., acute circumscribed. Form with separated swellings on the body, but usually on the face. [motor disorder.]

e., angioneurotic. E. caused by vaso-

e., blue. Hysterical paralysis inducing a swollen, bluish condition of a limb.

e. bullousum vesicae. Form affecting the bladder.

e. of glottis. An infiltration of the submucosa of the larynx, with cough, loss of voice and feeling of suffocation.

e., inflammatory. E. of inflamed tissues.

e., malignant. E. characterized by a rapid course, and speedy destruction of tissue [infiltration.]

e., purulent. E. caused by purulent

e., salt. Form caused by increase of salt in the diet.

edema, words pert. to: angioneuroedema, cephaloedema, chemosis, lung, nephritis, phlegmasia alba dolens.

edematous (e-dem'at-us) [G. *oîdēma*, swelling]. Pert. to, or affected with, edema.

edible (éd't-bl) [L. *edere*, to eat]. Suitable for food. [sweeten.] Sweetening

edulcorant [L. *ē*, out, + *dulcorāre*, to edulcorate (e-dul'ko-rāt)] '+' + *dulcorāre*, to sweeten]. 1. To sweeten. 2. To wash out salts or acids.

EEG. Abbr. for *electroencephalogram.*

effector [L. *effectus*, accomplishing, from *efficere*]. One of the nerve endings having the efferent process end in a gland or muscle cell. The terminal arborizations of efferent or motor nerves. Also applied to effector organs (muscles and glands).

e. organ. A structure which when stimulated produces an effect, specifically muscles and glands.

effluent [L. *ex*, out, + *ferre*, to carry]. Carrying away from as efferent nerves which conduct impulses from the brain or spinal cord to the periphery, efferent lymph vessels which convey lymph from lymph nodes, and efferent arterioles which carry blood from glomeruli of the kidney.

e. nerves. Motor nerves. They can carry impulses having the following effects. (1) Motor, causing contraction of muscles, (2) secretory, causing glands to secrete, and (3) inhibitory, causing some organ to become quiescent.

effervesce (ef-er-ves') [L. *effervescere*, to boil up]. To boil, or form bubbles on the surface of a liquid.

effervescence (ef-er-ves'ense) [L. *effervescere*, to boil up]. Formation of bubbles of gas coming up to surface of fluid.

effervescent. Bubbling. Rising in little bubbles of gas.

effleurage (ef-flür-ahzh') [Fr. *effleurer*, to touch lightly]. In massage, deep or superficial stroking.

efflorescence (ef-flor-es'ens) [L. *efflorescere*, to bloom]. A rash, a redness of the skin. SYN *ezanthem*.

efflorescent (ef-flor-es'ent) [L. *efflorescere*, to bloom]. Becoming powdery or drying from loss of water of crystallization.

effluve [L. *ē*, out, + *fluere*, to flow]. A conductive discharge of a high potential current through a dielectric.

effluvium (ef-lu'vium) (pl *effluvia*) [L. a flowing out]. An invisible emanation or exhalation. SYN *odor*, *vapor*.

effuse [L. *ex*, out, + *fundere*, to pour]. Thin, widely spreading. Applied to a bacterial growth which forms a very delicate film over a surface.

effusion [" + *fundere*, to pour]. Escape of fluid into a part, as the pleural cavity, such as empyema, or pyothorax (pus), hydrothorax (serum), hemothorax (blood), chylothorax (lymph), pneumothorax (air), hydropneumothorax (serum and air), and pyopneumothorax (pus and air).

egersis (e-ger'sis). Extreme or abnormal wakefulness, extremely alert.

egesta (e-jes'tā) [" + *gerere*, to bear]. Waste matter eliminated from the body.

egg [AS *aeg*]. 1. The female sex cell or ovum applied especially to an ovum which after fertilization is passed from the body and develops outside as in fowls. 2. The mammalian ovum.

e. albumen. The white of an egg. SEE: *vitellin*, *vitellus*, *yellow sac*.

egg plant [AS. *aeg*, + L. *planta*, sprout]. COMP. NUTRIENTS 250 Gm. Pro 3.00, Fat 0.8, Carbo. 10.8 per av serving. Vit. A+, B+, C+, G+++. Ca 0.011, Mg 0.015, K 0.140, Na 0.010, P 0.034, Cl 0.024, S 0.016, Fe 0.0005

ego (e'go) [G. *egō*, I]. PSY: That part of the unconscious that has been influenced by the senses and which has taken on consciousness in its contacts with reality. A sum total of the innate endowments, environmental impressions, and the reactive tendencies arising out of the conflict between them.

NUTRITIVE VALUE OF CHICKEN EGG

		Whole Egg	Egg White	Egg Yolk

e. ideal. The unconscious perfection of an individual's pattern or standard of character, usually identified with one greatly admired.

The social standards of the individual in contrast to his instinctive unsocial desires. While undoubtedly there is an inherent difference in the child's capacity to attain an ego ideal as definitely as to attain mature intelligence, much of its formulation depends upon teaching and example in the early years.

Organic disease modifies its evolution, and even more definitely may effect its involution. The later experiences of life, each in turn, add some little modification. It constitutes one phase of "conflict." Overdevelopment or compensatory overemphasis may lead to manifestations neither desirable from the social nor personal viewpoints.

e. instincts. All instincts not of a sexual nature.

e. libido. One concentrated in and upon the ego and not manifested toward external objects. Manifested in narcissistic disorders.

e., super. An inner censor (outside of the field of consciousness) of the ego.

egobronchophony (e'go-bron-kof'o-ni) [G. *aiz*, *aig-*, goat, + *brochos* + *phōnē*, voice]. A bleating sound with bronchophony. SEE *egophony*.

egocentric [G. *ego*, I, + *kentron*, center]. Pert. to a withdrawal from external world with concentration upon inner self.

egomania [" + *mania*, madness]. Abnormal self-esteem and self-interest.

egophony (eg-of'o-ni) [G. *aiz*, *aig-*, goat, + *phōnē*, voice]. A nasal sound somewhat like the bleat of a goat heard in auscultation when the subject speaks in a normal tone.

egotropic [G. *ego*, I, + *tropos*, a turning]. Interested chiefly in oneself; self-centered. [glon.]

Eh'renritter's ganglion. The jugular ganglion. Ehrlich's side-chain theory (air'lik). So named because the protoplasmic cell is said to possess the certain receptors or "side-chains" which are capable of becoming fixed to certain protein groups with which they have a chemical affinity. This "fixation" is of value to the cell in that it enables it to attach the various food substances which it needs for nourishment. The molecules of a toxin, according to this theory, contain 2 groups for attachment to the cell.

HAPTOPHORE GROUP. It becomes fixed to a suitable cell receptor. When this

happens, the receptor detaches from the cell and floats off in the blood stream. The cell responds to this loss by producing more effectors, which are again liberated into the blood, where they combine with toxins and thereby render them inert, and so form free antitoxin.

Toxophore Group. Toxicity results when this becomes attached to certain receptors of the cell called toxiphiles, and this union is prevented by rendering the haptophore group inert. SEE. *immunity*.

E's theory of immunity. A theory which attempts to explain the formation of antitoxin in the blood. Also known as E's side-chain theory, *q.v.*

Ehrlich-Hata "606." A specific for syphilis. SYN *salvarsan*.

Eichhorst's corpuscles (ik'horst). Spherical, small blood corpuscles found in pernicious anemia.

E's neuritis. Neuritis involving nerve sheath and interstitial muscular tissues.

eidopometry (i-dop-tom'et-ri) [G *eidos*, form, + *optein*, to see, + *metron*, measure] Determination of visual acuteness.

eighth cranial nerve. Acoustic nerve, *q.v.*

eikonom'etry [G *eikon*, image, + *metron*, measure] Determination of distance of an object by measuring the image produced by a lens of known focus.

eloid (i'loid) [G *elein*, to coil, + *eidos*, appearance] Having a coil-like structure.

Eimeria (i-me-ri'-ä) A genus of sporozoan parasites belonging to the class Telosporidea, subclass Coccidida. They are intracellular parasites living in the epithelial cells of vertebrates and invertebrates. They rarely are parasitic to man.

E. hominis. A species in the pleural exudate of man.

eisodic (i-sod'ik) [G *eis*, into, + *odos*, way] Centripetal or afferent, as nerve fibers of a reflex arc.

eisweismilch (i'vis-milk). Milk with curd broken up and whey removed, mixed with malt sugar, and boiled buttermilk for infant feeding.

ejaculatio (e-jak-u-lä'she-o) [L]. Sudden expelling, as of semen.

e. precox (pre'kox) [L.] Premature ejaculation. Inability to prevent ejaculation of semen at the beginning of copulation, or prior to it.

ejaculation (e-jak-u-lä'shun) [L. *ejaculari*, to throw out]. Ejection of the seminal fluids from the male urethra, or of the secretions of the vaginal glands, esp Bartholin's glands, in the female.

e. mechanism of. Ejaculation consists of two phases, (1) the passage of spermatozoa and the secretions of the accessory organs (*bulbo-urethral* and prostate glands and seminal vesicles) into the urethra and (2) the expulsion of the seminal fluid from the urethra. The former is brought about by contraction of the smooth muscle of the vas deferens, and the increased secretory activity of the glands, the latter by the rhythmical contractions of the bulbocavernosus and ischio cavernosus muscles and the levator ani.

Ejaculation is a reflex phenomenon. Afferent impulses arising principally from stimulation of the glans penis pass to the spinal cord by way of the internal pudendal nerves. Efferent impulses arising from a reflex center located in the upper lumbar region of the cord pass through sympathetic fibers in the hypogastric nerves and plexus to the

vas deferens and seminal vesicles. Other impulses arising from the 3rd and 4th sacral segments pass through the internal pudendal nerves to the ischio cavernosus and bulbocavernosus muscles.

Erection of the penis usually precedes ejaculation. Ejaculation occurs normally during copulation or it may occur as a nocturnal emission. The amount of seminal fluid discharged contains up to 300,000,000 spermatozoa.

RS *coitus, coitus interruptus, excitation, orgasm, semen*.

ejaculatory. Pert. to ejaculation.

e. duct. The terminal portion of the seminal duct formed by the union of the ductus deferens and the excretory duct of the seminal vesicle.

ejecta (e-jek'tä) [L. *ejaculari*, to throw out] Matter thrown off by the body. SYN *dejecta, egesta*.

EK, EKG. Abbr for electrocardiogram.

ekphorize (ek'to-riz) [G *ek*, out, + *pherein*, to bear] Psy A bringing back of the effect of a psychic experience in an attempt to reexperience it in memory. SYN *engram*.

elaiop'athy [G *elaion*, oil, + *pathos*, disease] Swelling of joints due to contusion, followed by fatty deposits. SYN *eleopathy*.

elastic (e-las'tik) [G. *elastikos*, elastic]. Capable of being stretched and returning to its original state, having elasticity. [stretched]

e. bandage. One which can be e. cartilage. Yellow cartilage such as is found in the epiglottis, pharynx, external ears, and auditory tube.

e. lamina. Descemet's membrane.

e. skin. Rare condition in which there is unusual elastic state of the skin.

e. stocking. One worn to place pressure on surface of the foot, or portion of the leg.

e. tissue. Connective tissue supplied with elastic fibers as found in the middle coat of arteries.

elasticity (e-las-tis-i-ti) [G *elastikos*, elastic] The quality of returning to original size and shape after compression or stretching.

elastin (e-las'tin) [G *elastikos*, elastic]. 1. An albuminoid substance forming the principal constituent of yellow elastic tissue, comprising about 30% of this tissue. 2. A protein which can be prepared from various connective tissues. SEE *albumoid*.

elas'tinase [G *elastikos*, elastic]. A ferment that dissolves elastin.

elas'toid [G *elastikos*, elastic, + *eidos*, form] Pert to a substance formed by hyaline degeneration.

e. degeneration. Hyaline d of elastic fibers of an artery.

elasto'ma [' + -oma, tumor]. A chronic disease of the skin, pseudoxanthoma.

elastometer (e-las-töm-et-er) [' + *metron*, measure]. Device for measuring elasticity.

elastom'etry [' + *metron*, measure]. The measurement of elasticity of tissues.

elas'tose. A peptone resulting from gastric digestion of elastin.

elaterin (e-lä'ter-in) [G *elatērios*, driving]. The neutral principle obtained from *elaterium*, a plant grown in the Mediterranean region. [lit.

Action and Uses Hydragogue cathartic. Dosage: 1/20 gr.

ela'tion [L. *elatus*, borne out of]. Psy. Joyful emotion. It is pathologic when out of accord with patient's actual circumstances.

el'bow [A.S. *eln*, forearm, + *boga*, bend].
Joint of arm and forearm

e., dislocation, ant. TREATMENT Reduction by direct pressure with moderate extension.

e. jerk. Striking tendon of biceps or triceps muscle causes involuntary bending or jerk of elbow

e. joint. Joint between arm and the forearm. Includes the humero-ulnar, humero-radial, and proximal radioulnar articulations.

e., d., lateral. Frequently accompanied with fracture of condyle. TREATMENT Reduction under anesthesia; hyperextension, lateral pressure, traction, and flexion. Arthrotomy if irreducible. Dressing, bandage, and sling, or 2 lateral angular splints.

e., d., post. SYM Olecranon projects. Arm flexed. Lower end of humerus felt at bend. Elastic fixation of elbow. Distance increased bet olecranon and condyles. TREATMENT Reduce by hyperextension of forearm. Ant angular splint for 2 weeks. Frequent dressings, massage, and movements.

ELBOW JOINT

e. reflex. Sharp extension of forearm resulting from tapping of triceps tendon while arm is held loosely in bent position.

elbow, words pert. to: anconad, anconagra, anconal, anconeal, anconeus, anconitis, tennis elbow.

elcosis (el-ko'sis) [G *elkōsis*, ulceration].
Fetid ulceration

Electra complex [G *Elektra*, Agamemnon's daughter, who helped assassinate her mother, because of love for her father, whom the former had slain] PSY. A group of symptoms due to suppressed sexual love of daughter for father. OPP: *Oedipus complex*, *q.v.*

electric [G *ēlektron*, amber] Pert to, caused by, or resembling electricity

e. baker. Device for placing intense heat on a part, as in arthritis. SEE: *baker*

e. contacts and injuries. Injuries from electricity vary with type and strength of current, length of contact, location of contact, such as legs, arms, etc., and hence vary from trivial burns to complete charring or unconsciousness from either paralysis of the respiratory center, fibrillation of the heart, or both.

Direct currents of less than 300 volts are seldom fatal, but alternating currents of 15 to 60 cycles may be fatal, even when below 100 volts. Ordinary household or office currents vary from 30 to 220 volts.

INSULATION: Protection against such currents may be made with dry non-conductors, such as folded newspapers, magazines, cardboard, wood, rubber, clothing, etc. These may be used to move patient from the contact or to remove wire from patient. It is always preferable to turn off the current if possible. If patient is in water, remember that it is electrically charged and special precautions must be taken. On a humid or rainy day ordinary insulators may contain sufficient moisture to conduct electricity. Make sure insulators are dry.

High tension currents, such as those used about the x-ray or in conducting currents for long distances or for special industrial locations cannot be insulated by such means. Such currents may jump through rubber, paper, or strips of wood. A safe procedure is to ascertain the source of current and have it shut off, otherwise multiple tragedies result. TREATMENT SEE *electric shock*.

e. field. Field exerting force of one dyne on unit positive charge. SEE *intensity of electric field*.

e. muscle stimulation. Two types of current, faradic used for stimulation of nerve to the muscle, and galvanic used for stimulation of nerve and muscle. Contraction of muscle with galvanic occurs only at *make* or if strong enough at *break*. Used for diagnosis and treatment in neuromuscular diseases.

e. shock. SYM Burns, with loss of consciousness, contact or proximity to source of current are principal symptoms.

F A TREATMENT Carefully free victim from source of current with nonconductors such as dry wood, paper, rubber, etc., or shut off current. Prolonged artificial respiration may be necessary. SEE *shock*.

e. valve. A vacuum tube having for one electrode a hot filament. Often used in rectifying alternating to direct current, as in roentgen generators.

electricity [G *ēlektron*, amber] "A form of energy which, when in motion, exhibits magnetic, chemical, mechanical and thermal effects, and when at rest or in motion exerts a force on other electricity. Recent investigations indicate that it is discrete or granular in nature. Electricity may be of 2 kinds, namely, positive and negative"—Sheldon

e., atmospheric. E existing in the atmosphere

e., faradic. SEE *induced e.*

e., franklinic. SEE *static e.*

e., frictional. Generation of static e. by rubbing 2 articles together

e., galvanic. E generated by chemical action

e., induced. E generated in a body from another body close by, without contact

e., magnetic. E induced by means of a magnetic device

e., medical. Generation of e. by a device which can be adjusted for treating medical cases.

e., negative. Electric charge caused by an excess of electrons negatively charged

e., positive. Electric charge caused by loss of negative electrons

e., static. E generated by friction.

e., unit of. SEE. *ampere, coulomb, farad, ohm, volt, watt.*

elec'trify [' + *L. facere*, to make]. To charge a body with electricity.

electriza'tion [G *elektron*, amber]. The act of charging the body with electricity.

electroanesthesia [' + *a-*, priv., + *aisthēsis*, sensation]. Local anesthesia induced by an anesthetizing substance injected into tissues by electricity.

electrobiol'ogy [' + *bios*, life, + *logos*, study of]. Science of electric phenomena in the living body.

electrobios'copy [' + " + *skopein*, to examine]. Electric test to determine if life is extinct.

electro'car'diogram [' + *kardia*, heart, + *gramma*, writing]. A typical record of normal heart action shows certain waves called P, Q, R, S, and T waves. Sometimes a U wave is seen. The first or P wave is caused by contraction of the atria. The Q, R, S, and T waves are related to contraction of the ventricles. The cause of the U wave is unknown. The electrocardiogram gives important information concerning the spread of excitation to the different chambers of the heart and it is of value in the diagnosis of cases of abnormal cardiac rhythm and myocardial damage.

electrocar'diograph [' + " + *graphein*, to write]. Device for recording variations in action of heart muscles.

electro'car'diography [' + " + *graphein*, to write]. The making of and study of graphic records electrocardiograms produced by electrical currents originating in the heart.

elec'trocar'dioph'nograph [' + " + *phone*, voice, + *graphein*, to write]. Device for recording heart sounds.

elec'trocatal'ysis [' + *kata*, down, + *lysis*, loosening]. Chemical decomposition produced by electricity.

electro'cau'tery [' + *kauter*, burner]. Cauterization by means of an apparatus consisting of a holder containing a wire, which may be heated to a red or white heat by a current of electricity, either direct or alternating.

electrochem'istry [' + *chemēia*, chemistry]. Science of chemical changes produced by electricity.

elec'trochem'y [' + *chēmeia*, chemistry]. Therapy concerned with physical applications, such as electricity, which produce chemical effects in the tissues.

electrocis'ion [' + *L. cadere*, to cut]. Excision by electric current.

elec'trocoagula'tion [' + *L. coagulare*, to thicken]. Coagulation of tissue by means of a high frequency electric current. The heat producing the coagulation is generated within the tissue to be destroyed.

electrocontractility (e-lek'tro-kon-trak-til'i-ti) [' + *L. contrahere*, to contract]. Contraction of muscular tissue by electrical stimulation.

electrocryptectomy (e-lek'tro-krip-tek'to-mi) [' + *kryptos*, concealed, + *ektomē*, excision]. Destruction of tonsillar crypts by diathermy.

electrocution [G *elektron*, amber, + *L. secutus*, following]. The destruction of life by means of electric current.

electrocystoscopy (e-lek'tro-sis-tos'ko-pli) [' + *kystis*, bladder, + *skopein*, to examine]. The use of electric light to see the interior of the bladder.

elec'trode [' + *odos*, way]. A medium intervening bet. an electric conductor and the object to which the current is to be applied. In electrotherapy an electrode is an instrument with a point or

a surface from which to discharge current to the body of a patient.

e., active. See *therapeutic e.*

e., brush. A wire brush used to apply electricity to a part of the body.

e., cataphoric. E. devised so that the current passes from the positive pole to the body through a medicated solution.

e., Cherry's. Vaginal electrodes for medical diathermy treatments of pelvic infections.

e., depolarizing. E. with greater resistance than the part of the body in the circuit.

e., diffusion. See *cataphoric e.*

e., dispersive. When electrodes may be applied in pairs dissimilar in size and shape, then the smaller electrode is called the active, and the larger, the dispersive, indifferent, or inactive electrode.

e., exciting. See *therapeutic e.*

e., franklinic. Form used for the application of static discharge.

e., Guttman. Electrode for intramural electrocoagulation of the inferior turbinate.

e., Hyam's. Special cutting current instrument for "ionization" by high frequency current in treatment of chronic endocervicitis.

e., hydrogen. Form absorbing hydrogen gas.

e., impregnated. See *therapeutic e.*

e., indifferent. See *e., dispersive.*

e., multiple point. Several sets of terminals providing for the use of several electrodes. See *multiterminal.*

e., negative. Cathode.

e., non-polarizable. E. constructed to prevent polarization.

e., normal. E. with constant cross section of 10 square centimeters.

e., point. An electrode with an insulating handle at one end and a metallic point at the other for use in applying static sparks.

e., positive. Anode.

e., prescription. Therapeutic e. made according to a physician's prescription.

e., Roblee. Pelvic diathermy electrode introduced by Roblee, consisting of hard rubber vaginal speculum.

e., roller. Form of e. made like a roller.

e., silent. See *dispersive e.*

e., spark ball or point. An insulating handle having on one end a metallic ball or point. Used in giving static sparks.

e., therapeutic. E. devised so the carbon is impregnated with medicinal preparations.

e., vacuum. Hollow glass tubes or bulbs from which the air has been exhausted to varying degrees and to which the current is conveyed by a wire passing through one end or by a metal collar surrounding the stem without any internal connection. Used for high frequency and static currents.

e., vaginal. See *Cherry's electrode.*

e., Ze'ner's. Cervicovaginal diathermy electrode with 4 blades closing about cervix concentrating heat in cervical canal and immediate parametrium.

e., zinc. Used connected to positive pole of galvanic machine for ionic medication.

elec'trodesicca'tion [' + *L. desiccāre*, to dry up]. The destructive drying of cells and tissue by means of short high frequency electric sparks, in contradistinction to fulguration, which is the destruc-

tion of tissue by means of long high frequency electric sparks

elec'trodiagno'sis [*" + dia*, through, + *gnosis*, knowledge] The determination of the functional states of various organs and tissues according to their response to electrical stimulation.

electro'dial'ysis. A method of separating electrolytes from colloids by passing a current through a solution containing both

electrodynamometer (e-lek-tro-di-nam-om'et-er) [*" + dynamis*, power, + *metron*, measure] An instrument to measure the strength of an electric current either alternating or direct, as by means of the interaction of 2 wire coils carrying the current.

electroencephalogram (ē-lēk-trō-ēn-sēf'ā-lō-grām) [G *ēlektron*, amber, + *egkephalos*, brain, + *gramma*, a writing]. A tracing on an electroencephalograph

electroencephalograph (e-lēk-trō-ēn-sēf'ā-lō-grāf) [G *ēlektron*, amber, + *egkephalos*, brain, + *graphein*, to write] An instrument for recording electrical fluctuations of the brain after amplification of more than a billion times

Experiments show a direct connection between the brain records and intelligence of the subjects tested Brain waves are designated as Alpha rhythm with a frequency of about 10 waves a second, the Beta rhythm 25 per second, and the Delta waves 1/6 second and more.

electrography [G *ēlektron*, amber, + *graphein*, to write] Making of an x-ray picture *SYN skiagraphy*

electro'hemos'asis. The arrest of blood by means of a high-frequency current.

electrothi'otri'c (ē-lēk-trō-lī-thō'tri-tī). The destruction of a calculus by means of an electric current

electro'ogy [*" + logos*, science] The branch of science that deals with the phenomena and properties of electricity.

electrolysis (e-lek-trol'i-sis) [*" + lysis*, a dissolution]

Ex The passage of an electric current through hydrochloric acid (HCl) results in its decomposition, hydrogen gas being produced at the cathode and chlorine gas at the anode

electrolyte (e-lek-tro-lī't) [*" + lytos*, solution] 1 A solution which is a conductor of electricity 2 A substance which, in solution, conducts an electric current and is decomposed by the passage of an electric current

Ex. Acids, bases, and salts are common electrolytes.

e., amphoteric. One which produces both hydrogen (H) and hydroxyl (OH-) ions

electrolytic (e-lek-tro-lī'tik) [*" + lytos*, solution] Caused by or rel to electrolysis.

e. conduction. In metals the electrical charges are carried by the electrons of inappreciable mass.

In solutions the electrical charges are carried by electrolytic ions, each one of a mass several thousand times as great as the electron When a direct current passes through an electrolytic solution bet metallic electrodes immersed in it, the positive ions move to the cathode, the negative ions to the anode

electrolyzer [*" + lysis*, solution]. Instrument for reducing stricture with electricity.

electromag'net [*" + magnes*, magnet]. A magnet consisting of a length of insulated wire wound around soft iron core.

electromagnet'ic [*" + magnes*, magnet]. Pert to an electromagnet

e. induction. Generation of an electromotive force in an insulated conductor moving in an electromagnetic field, or in a fixed conductor in a moving magnetic field

electromag'netism [*" + " + ismos*, state of] Science of mutual relations of electricity and magnetism.

electromassage [*" + massein*, to knead] Massage combined with application of electrization

electrom'eter [*" + meltron*, measure]. An instrument for measuring pressure quantity and intensity of electricity, i.e. differences in electric potential

electromotive [*" + L motor*, motion] Pert to passage of electricity in a current, or motion produced by it

e. force (abbreviation, E M F)

That effect of difference of potential which, on the closing of a circuit, causes a flow of electricity from one place to another, giving rise to an electric current The strength of an electric current is directly proportional to the impressed electromotive force, and inversely proportional to the resistance in the case of direct current and to the impedance in the case of alternating current Electromotive force is measured in volts or in some convenient multiple or fraction of a volt Microvolt, millivolt and kilovolt are, respectively, one-millionth volt, one-thousandth volt and 1000 volts

electro'my'ogram. A graphic record of the contraction of a muscle as a result of electrical stimulation

electro'myog'raphy. The preparation, study of, and interpretation of electromyograms

electron [G *ēlektron*, amber] An extremely minute corpuscle or charge of negative electricity which revolves about the central core or nucleus of an atom They are the smallest known particles that exist, their mass being 1/1845 that of a hydrogen atom When emitted from radioactive substances known as *beta particles* or rays

electro'narco'sis. The induction of narcosis by the application of electricity to the body Used in the treatment of schizophrenia

electro'neg'ative [*" + L negāre*, to deny] Condition of being charged with negative electricity which results in the attraction of bodies positively charged and the repulsion of bodies negatively charged

electron'ic [G *ēlektron*, amber] Pert to electrons

electrization [G. *ēlektron*, amber] The use of radiation to restore electrical equilibrium

elect'ropath [*" + pathos*, disease] One skilled in practice of electrotherapy

electro'patho'ogy [*" + " + logos*, study of] Determining electrical reaction of muscles and nerves as means of diagnosis

electro'phore'sis (e-lek-tro-for-e'sis) [*" + phorein*, to bear] Diathermy or iontophoresis *SEE phoresis* The movement of charged colloidal particles through the medium in which they are dispersed as a result of changes in electrical potential Electrophoretic methods are useful in the analysis of protein mixtures as protein particles move with different velocities dependent principally on the number of charges carried by the particle

electrophorus (e-lek-trōf'ōr-ūs) [*" + phorein*, to bear]. An instrument for

- obtaining static electricity by means of induction
- electrophother'apy** [' + *phōs*, light, + *therapeia*, treatment]. Treatment by means of electric light.
- electro'phre'nic**. Pertaining to stimulation of the phrenic nerve by electricity.
- electropos'itive** [' + *L positivus*, emphatic]. The condition of being subject to repulsion by bodies positively electrified, and to attraction by bodies negatively electrified.
- electro'physiol'ogy** [' + *physis*, nature, + *logos*, study of]. A branch of physiology which deals with the relations of body functions to electrical phenomena such as the effects of electrical stimulation upon the tissues, the production of electrical currents by organs and tissues, the therapeutic use of electric currents, etc.
- electropneumatotherapy** (e-lek'tro-nu'-mā-to-ther'ā-pi) [' + *pneuma*, air, + *therapeia*, treatment]. Treatment of voice by faradic current into the larynx.
- electroprogn'osis** [' + *prognōsis*, foreknowledge]. Prognosis by means of electrical reactions
- elec'tropuncture** [' + *L punctura*, a piercing]. Piercing tissues with an electric needle.
- electroprexia** (e-lek'tro-pi-reks'i-ā) [' + *pyressein*, to be feverish]. Elevation of temperature by electricity
- electroradiometer** (e-lek'tro-rā-di-om'e-ter) [' + *L radius*, ray, + *G. metron*, measure]. An electroscope for differentiation of radiant energy
- electro'retin'ogram**. A record of the action currents of the retina made by placing one electrode upon the cornea and the other on the optic nerve or the posterior pole of the darkened eyeball.
- electroscission** (e-lek'tro-si'shūn) [G *ēlektron*, amber, + *L scindere*, to cut]. Division of tissues by electrocautery
- electroscope** (e-lek'tro-skōp) [' + *skopein*, to see]. An instrument which detects positive or negative static electricity.
- electro'shock**. Shock produced by an electric current
- e. therapy**. The induction of convulsive seizures by the passing of an electric current through the brain. Used in the treatment of certain types of psychoses
- electrostatic** [' + *statikos*, causing to stand]. Pert to static electricity
- e. generator**. A device that generates static electricity. SEE. *influence machine*.
- e. unit**. Any unit of electrical measurement based on the attraction or repulsion of a static charge, as distinguished from an electromagnet unit, which is defined in terms of the attraction or repulsion of magnetic poles
- electrosur'gery** [' + *cheir*, hand, + *ergon*, work]. Surgery accomplished by electricity.
- electro'tax'is** [' + *taxis*, arrangement]. The movement of a cell or an organism toward or away from an electrical stimulus
- electro'thana'sia**. Death resulting from electric shock, electrocution
- electrotherapeutics** (e-lek'tro-ther'ā-pu'tiks) [' + *therapeutikē*, treatment]. The use of electricity in the treatment of disease
- electrotherapist** (e-lek'tro-ther'ā-pist) [' + *therapeia*, treatment]. A medical graduate who has had special training and has acquired skill in the therapeutic use of electricity. The term is some-

times used incorrectly to designate any one who administers electrical treatments

- elec'trother'apy** [' + *therapeia*, treatment]. Use of electricity in treating disease. SYN. *electrotherapeutics*.
- elec'trotherm**. An electrical apparatus for the therapeutic application of heat to the surface of the body. Used for relief of pain
- electrothermotherapy** (e-lek'tro-ther'mo-ther'a-pi) [' + *thermē*, heat, + *therapeia*, treatment]. The production of heat within the living tissues for therapeutic purposes by means of bodily resistance to the passing of an electric current
- elec'trotome**. An electrocautery device used for surgical procedures
- electroton'ic** [' + *tonos*, tone]. Of or pert to electrotonus
- electrotonus** [' + *tonos*, tone]. The change in the irritability of a nerve or muscle during the passage of an electric current.
- electrotropism** (e-lek-tro'tro-pizm) [' + *tropē*, a turning, + *ismos*, condition of]. Reaction of cells to an electrical current.
- electuary** (e-lek'tu-a-ri) [G *ekleichen*, to lick up]. Medicinal substance mixed with saccharine matter to form pasty mass
- eleidin** (ē-lē'id-in) [G *elaion*, oil]. An acidophil substance present in the stratum lucidum of the epidermis
- el'ement** [L. *elementum*, a rudiment]. In modern chemistry, a substance which cannot be separated into substances different from itself by ordinary chemical processes. They exist in a free and in a combined state. Over 90 have been identified. SEE *Appendix for table of Chemical Elements*
- element, words pert.** to: atom, body, chemical e, mineral e, monad, name of each element, oxidation, oxide, radicle
- eleoma** (el-e-o'mā) [G. *elaion*, oil, + *ōma*, tumor]. A neoplasm sometimes following injection of oil into the tissues.
- eleometer** (el-e-om'e't-er) [' + *metron*, measure]. Instrument for determining quality and spec. gravity of oils.
- eleomyen'chysis** (el'e-o-mi-en'kis-is) [' + *mys*, muscle, + *egchysis*, infusion]. 1. The intramuscular injection of oils for chronic local spasms. 2. Prosthesis by paraffin injection.
- eleop'athy** [' + *pathos*, disease]. Swelling of joints due to fatty deposits. SYN. *elaiopathy*.
- eleoptene** (el-e-op'tēn) [' + *ptēnos*, fleet-ing]. The fluid part of a volatile oil.
- eleosaccharum** (el'e-o-sak'a-um) [' + *sakcharon*, sugar]. A mixture of powdered sugar with a volatile oil.
- eleotherapy** (el-e-o-ther'ā-pi) [' + *therapeia*, treatment]. The use of oil for therapeutic purposes.
- eleotho'rax** [' + *thōrax*, chest]. The injection of oil into the pleural cavity to compress a tuberculous lung.
- elephantiasis** (el-ē-fan'ti-as-is) [G. *elephas*, elephant]. SYN. *lymphedema, filariasis*. A chronic condition characterized by pronounced hypertrophy of the skin and subcutaneous tissues resulting from obstruction of the lymphatic vessels. The lower extremities and the scrotum are parts most frequently involved
- Error. E may be congenital (Milroy's disease), or the result of metastatic invasion of the lymph nodes by tumor cells, inflammatory. E results from filariasis or local infection of the lymph nodes. Elephantiasis is most common

Elements Having Medicinal Uses		
Element	Compound Form	Some Medicinal Uses
Aluminum (Al)	Alum Aluminum acetate	Astringent to contract mucous membranes, as a gargle and a douche. Astringent and antiseptic in surgical dressings.
Arsenic (As)	Arsenic trioxide Potassium arsenite	Hematinic, i.e., in minute doses, it increases the amount of red corpuscles in the blood, thereby acting as a tonic to improve the appetite and digestion.
Barium (Ba)	Barium sulfate	Coats the stomach and intestines for taking x-ray pictures.
Bismuth (Bi)	Bismuth subnitrate Bismuth subcarbonate	Insoluble compounds used as dusting powders on the skin, astringents, and antiseptics for ulcerations of the stomach.
Boron (B)	Boric acid (boracic acid)	Mild antiseptic, nonirritating, particularly used for an eyewash
Bromine (Br)	Sodium and Potassium Bromide	Nerve sedatives
Calcium (Ca)	Calcium chloride Calcium lactate	Assists in clotting of the blood. Calcium compounds are used for the treatment of tetany in children. Calcium salts are necessary for the growth of bones and teeth, for regulating muscular, nervous, and glandular activity
Chlorine (Cl)	Sodium chloride Chlorinated lime	Disinfectant for urinals and excreta. A deodorant
Copper (Cu)	Copper sulfate (blue vitriol)	Removes granulations on the eyelids in trachoma Produces vomiting Used as an astringent
Hydrogen (H)	All acids, e. g., hydrochloric Hydrogen peroxide	Dilute solutions extract water from the tissues, and in the stomach aid digestion. Antiseptic.
Iodine (I)	Iodine tincture Potassium iodide	Antiseptic Treatment of syphilis, to increase secretions, and as treatment in hyperthyroidism
Iron (Fe)	Iron chloride	Hematinic as in cases of anemia. Astringent
Lead (Pb)	Lead acetate	Astringent. Contracts tissues in ulcers and wounds
Magnesium (Mg)	Magnesium citrate "Milk of Magnesia" Magnesium sulfate (Epsom salt)	Purgative. Cathartic, neutralizes acidity of the stomach. Purgative Allays inflammations
Mercury (Hg)	Mercuric chloride (bichloride of mercury) Mercurous chloride (calomel)	Local antiseptic. Cathartic.
Mercuric salicylate		Intramuscular injection in syphilis.
Nitrogen (N)	Nitrous oxide (laughing gas) Ammonia water	Anesthetic. Cleanser, heart stimulant.
Oxygen (O)		Used in resuscitation in anoxemia, and in basal metabolism.
Phosphorus (P)	Sodium phosphate	Saline purgative Reduces accumulation of fluid in the tissues, as in edema.
Potassium (K)	Potassium acetate Potassium permanganate Potassium sodium tartrate	Diuretic. Antiseptic for wounds. Saline purgative.
Radium (Ra)	Radium bromide	Treatment for cancer
Silver (Ag)	Silver nitrate	Antiseptic to contract mucous membranes of eye, to cauterize, and for nose and throat inflammations.
Sodium (Na)	Sodium bicarbonate (baking soda)	Acidosis treatment
Sulfur (S)		Used in ointments for skin diseases. May be used as a laxative
Zinc (Zn)	Zinc oxide Zinc stearate Zinc sulfate	Astringent Dusting powder (irritating if inhaled). Dusting powder

in tropical countries and is caused by infestation by *Wuchereria bancrofti*, a filarial worm.

e. arabum. SYN: *elephantiasis*.

e. graecorum. Leprosy

e. telangiectodes. E. with blood vessel enlargement

elevator [L. *elevare*, to lift]. 1. Curved retractor for holding lid away from the globe of the eye. 2. One for raising depressed bones by levers or screws

eleventh cranial nerve. Accessorius nerve, *XI*.

eliminant (ē-lim'i-nant) [L. *ē*, out, + *limen*, threshold]. 1. Effecting evacuation. 2. Agent aiding in elimination

eliminate (ē-lim'i-nāte) [+ *limen*, threshold]. To expel; to rid the body of waste material.

elimination [+ *limen*, threshold]. Excretion of waste body products by the skin, kidneys, and intestines

e. diet. Based on patient's history of food sensitiveness and results of skin tests. The "elimination diet" found to relieve the patient's symptoms is increased by gradual addition of foods to which patient has been found to be non-sensitive, until in so far as possible all the essentials of an adequate diet are included

elimination, words pert. to: constipation, costive, defecation, dejecta, egesta, ejecta, evacuate, feces, names of excretions, *nisus*

linguination (ē-lin-gwā'shun) [L. *ē*, out, + *lingua*, tongue]. The operation of removing the tongue from the oral cavity.

elixir [Arabic *al-izir*, philosopher's stone]. A sweetened, aromatic, hydro-alcoholic liquid used in the compounding of medicines. Elixirs constitute one of the most commonly used classes of preparations, and contribute largely toward the possibility of pleasant medication. The National Formulary contains many of the more popular formulae, but only 2 elixirs are official.

Ellett treatment. Treatment given by means of rubber bag that distends vagina when attached to machine delivering water at temperature of 115° to 128° F maintained for 45 to 60 minutes; used in pelvic inflammatory disease

elutriation (ē-lū-tri-a'shun) [L. *elutriare*, to cleanse]. The separation of insoluble particles from finer ones by decanting the fluid.

elytritis (el-i-tri'tis) [G. *elytron*, vagina, + *itis*, inflammation]. Inflammation of the vagina.

elythrocele (el'i-tro-sēl) [+ *kēlē*, hernia].

Hernia into the vagina. SYN *colpocele*.

elythroclasia (el'i-tro-kla'si-a) [+ *klasis*, rupture]. Rupture of the vagina.

elythrocleisis (el'i-tro-klī'sis) [+ *kleisis*, closure]. Closure of the vagina

elytronitis (el-i-tro-ni'tis) [+ *itis*, inflammation]. Inflammation of the vagina.

elytropolasty (el'i-to-ro-plas'ti) [+ *plastēn*, to form]. Plastic operation upon the vagina.

elytropsis (ēl'i-trōp-tō'sis) [+ *ptōsis*, a drooping]. Prolapse of the vagina.

elytrotorrhaphy (el-i-tro-rā'ff) [+ *raphē*, suture]. Suture of vaginal wall.

elytrotostenosis (el'i-tro-sten-o'sis) [+ *stenōsis*, narrowing]. Narrowing of the vagina

elytrotomy (el-i-tro'to-mi) [+ *tomē*, incision]. Incision of vaginal wall

emaciate (ē-mā-si-āt) [L. *ēmaciāre*, to grow thin]. To cause to become excessively lean.

emaciated. Excessively lean.

emaciation [L. *ēmaciāre*, to grow thin]. Wasting of the flesh; state of being extremely lean

ETIOI. Malnutrition, diseases of gastrointestinal canal. If rapid Marasmus, Addison's d., tuberculosis, cancer, diabetes, suppuration, hyperthyroidism, chronic diarrhea, stricture of esophagus, pyloric obstruction; parasites, loss of sleep, exophthalmic goiter, starvation. See *lean*, *tabes*, *wasting*.

emaculation (em-ak-u-lā'shun) [L. *ēmaculāre*, to remove spots]. Removal of spots from the skin

emailloid (em-a'lōid) [Fr. *émail*, enamel, + G. *eidos*, form]. Tumor having its origin in tooth enamel.

emana'tion [L. *ē*, out, + *manāre*, to flow]. 1. Something given off, radiation; emission. 2. A disintegration product

e., actinium. One given off by actinium. SYN *actinon*.

e., radium. A radioactive gas given off by radium. SYN *aton*.

e., thorium. One given off by thorium. SYN *thoron*.

emansio mensium (em-an'si-o men'si-um) [L.] Amenorrhea in which menstruation has never occurred

emasculation (ē-mas-ku-lā'shun) [L. *ēmasculāre*, to castrate]. Castration,* excision of the testicles. RS *spay*.

emballometer (ē-māi-ōm-ēt-ēr) [G. *emballein*, to throw, + *metron*, a measure]. Device employed in connection with a stethoscope

embalming (em-bahm'ing) [L. *in*, in, + *balsamum*, balsam]. Preservation of a dead body against putrefaction

embed'ding [+ AS *bedd*, to bed]. In histology, the process by which a piece of tissue is placed in a firm medium such as paraffin or celloidin in order to support it and keep it intact during the subsequent cutting into thin sections for microscopic examination

embolia [G. *embolos*, thrown in, + *lalia*, babble]. Meaningless language of the insane. SYN *embolophrasia*

embole (em'bo-lē) [G. *a throwing in*]. 1. Reduction of a dislocation. 2. Formation of the gastrula by invagination. 3. Enarthrosis. SYN *emboly*

embol'ic. Pert. to or caused by embolism.

embol'iform [G. *embolos*, thrown in, + L. *forma*, form]. 1. Resembling a nucleus. 2. Wedge-shaped, as the *nucleus emboliformis*.

embolism (em'bo-lizm) [G. *embolē*, a throwing in, + *ismos*, condition]. Obstruction of a blood vessel by foreign substance or a blood clot. RS *embolus*, *thrombosis*, *thrombus*

Diagnosis depends upon the factors predisposing. Arteriosclerosis favors a diagnosis of thrombosis, while auricular fibrillation, bacterial endocarditis, or thrombophlebitis points to embolism. Nearly always embolism is due to bacterial endocarditis.

e., air. One caused by air bubble. SEE *air embolism*.

e., fat. Globules of fat obstructing blood vessels

e., pyemic. E. caused by purulent matter

embolophrasia (em'bol-o-fra'zi-ā) [+ *phrasis*, utterance]. Meaningless speech. SYN *embolia*

emb'olus (pl. *emboli*) [G. *embolos*, plug]. A mass of undissolved matter present in a blood or lymphatic vessel brought there by the blood or lymph current. Emboli may be solid, liquid, or gaseous.

Other emboli may consist of bits of tissue, tumor cells, globules of fat, air bubbles, clumps of bacteria, and foreign bodies such as bullets. Emboli may arise within the body or they may gain entrance from without. Occlusion of vessels from emboli usually results in the development of infarcts, *q.v.* See: *thrombus, thrombosis*

NP: Postoperative cases must be handled with great care. Sudden sitting up or turning over, esp from 5th to 8th day, may displace an embolus into the circulation and cause sudden death. Fat embolism is not uncommon in bone injuries and fractures, and bacterial emboli may be present in blood "poisoning." See *embolism*.

e., *air*. An air bubble in the veins, the right atrium, or ventricle, or in the capillaries. See: *air embolism*.

e., *coronary*. May be complication of arteriosclerosis and cause angina pectoris. Sym: Similar to pulmonary e.

e., *pulmonary*. The commonest embolus met with. Sym: Face gray, eyes staring and wild, look of distress, gasping for breath, sudden death.

emb'oly [G. *embolē*, a throwing in] Formation of the gastrula from invagination. SYN *embolē*.

embrace reflex (em-brās' [L. *brachium*, arm]) A variety of defensive reflex. The throwing out of the arms in an attitude of embrace, in fearful response.

embrasure (em-brā'shūr) [Fr. *embrasér*, to widen an opening] An opening widening outwardly or inwardly.

e., *buccal*. Opening spreading toward the buccal aspect.

e., *labial*. Embrasure opening toward the labial aspect.

e., *lingual*. One spreading to the lingual aspect.

e., *occlusal*. Space mesially and distally bet marginal ridges of approximating teeth.

embroc'a'tion [G. *embrochē*, fomentation]. 1. Fomentation, such as the application of heat and moisture, a stupe. 2. A drug rubbed into the skin.

embryectomy (em-bri-ek'to-mī) [G. *embryon*, embryo, + *ektomē*, excision] Removal of an extrauterine embryo.

embryo (em'bri-o) (G. *embryon*) 1. The young of any organism in an early stage of development. 2. Stage in prenatal development of a mammal between the ovum and the fetus. In humans, stage of development between the second and eight weeks, inclusive.

STAGES OF DEVELOPMENT Following fertilization, cells multiply (cleavage) resulting in formation of a *morula* which develops into a *blastocyst*, consisting of a trophoblast and inner cell mass. Two cavities (amniotic cavity and yolk sac) arise within the *inner cell mass*. These are separated by the *embryonic disc* which gives rise to the three germ layers (*ectoderm*, *mesoderm*, and *endoderm*) which develop into the *embryo proper*; the blastocyst wall or *trophoblast* gives rise to auxiliary structures.

During the period of the embryo (3rd to 8th weeks) the germ layers of the embryonic disc give rise to the principal organ systems and the body acquires a somewhat human form. After the second month, the developing young is called a *fetus*.

e., *development of*. 1. *Period of the ovum*, (first two weeks) Blastocyst forms. embryo enters uterus and implantation occurs. 2. *Period of the embryo* (3rd to 8th weeks). Embryo increases

in length from about 1.5 mm. to 23 mm. Organ systems arise and embryo acquires human form. 3. *Period of the fetus* (3rd to 9th month). (a) 3rd month, 4 in long.

The alimentary canal, liver, pancreas, and lungs develop from *endoderm*, muscle, all connective tissues, blood, lymphatic tissue and the epithelium of blood vessels, body cavities, kidney, gonads, and suprarenal cortex develop from *mesoderm*, the epidermis, nervous tissue, hypophysis, and the epithelium of the organs, nasal cavity, mouth, salivary glands, bladder, and urethra develop from *ectoderm*.

embryocardia (em-bri-o-kar'dī-ā) [G. *embryon*, embryo, + *kardia*, heart]. Heart action in which first and second pause are equal, and resembling the fetal heart sounds. Another variety is an undue lengthening of the first sound followed by a long pause.

Error. Overworked heart; digitalis poisoning.

embryoctony (em-bri-ok'to-nī) [' + *kteinein*, to kill]. Destroying the fetus in utero, as in cases where delivery is impossible, or for abortion. See *craniotomy*.

embryogenetic, embryogen'ic [' + *gennan*, to originate]. Pert to or giving rise to an embryo.

embryog'eny [' + *gennan*, to develop]. The growth and development of an embryo.

embryog'raphy [' + *graphein*, to write] A treatise on the embryo.

embryol'ogy [' + *logos*, study]. The science which deals with the origin and development of an individual organism.

embryo'ma (em-bri-o'mā) [' + *ōma*, tumor] A tumor consisting of derivatives of the embryonic germ layers but lacking in organization; a dermold cyst.

embry'onal [G. *embryon*, embryo] Pert. to or resembling an embryo.

embryonic (em-bri-on'ik) [G. *embryon*, embryo]. Pert to or in condition of an embryo.

embryoniza'tion [G. *embryon*, embryo] Reversion of a cell or tissue to an embryonic structure.

embryonoid (em'bri-on-oyd) [' + *eidōs*, form]. Having the appearance of an embryo.

embryoplas'tic [' + *plassein*, to form] Having a part in the formation of an embryo; said of cells.

embryot'ocia (em'bri-o-to'sī-ā) [' + *tokos*, birth]. An abortion; delivery of an embryo.

embryotome (em'bri-o-tōm) [' + *tomē*, incision] Instrument used in dismemberment of fetus in utero.

embryotomy (em-bri-ot'o-mī) [' + *tomē*, incision]. The dissection of a fetus to aid its delivery.

embryotoxon (em-bri-o-tox'on) [' + *toxōn*, bow]. Congenital marginal opacity of the cornea.

embryotroph (em'bri-o-trof) [' + *trophē*, nourishment]. A fluid resulting from the enzyme action of the trophoblasts upon the neighboring maternal tissue and which nourishes the embryo from the time of implantation into the uterus.

embryotrophy (em-bri-ot'ro-fi) [' + *trophē*, nourishment]. Nutrition of the fetus.

embryul'cia (em-bri-ul'sī-ā) [' + *elkein*, to draw] Forcible removal of the fetus as by embryotomy or taking a dead fetus with instruments.

embryulcus (em-bri-ul'kus) [G. *embryoulkos*]. Instrument for extracting a fetus.

emedullate (e-med'ul-ät) [L. *ē*, out, + *medulla*, marrow]. To remove the marrow from a bone.

emergency [L. *emergere*, to raise up]. An unexpected serious happening, demanding immediate action

e. light reflex. Marked pupillary contraction, frowning, and closure of eyelids, resulting from sudden powerful light stimulus of retina.

e. theory. Formulated by Cannon. Adrenal secretion is stimulated by sympathetic nervous system activity to meet bodily emergencies, as emotional excitement, pain, etc

emergency, words pert. to: asphyxia, asphyxiation, bites, choking, convulsion, dislocation, drowning, fainting, fire emergencies, foreign bodies, fumes, gases, poisoning, shock, stings, unconsciousness

emergent [L. *emergere*, to raise up]. 1. Growing from a cavity or other part. 2. Sudden, unforeseen

emesis (em'es-is) [G. *emein*, to vomit]. Vomiting

May be gastric, systemic, nervous, reflex, or irritation of vomiting center.

NP. The relation of vomiting to eating is important, and the nurse should determine how it is affected by pain, by soft or solid foods, by liquids, by odors before or after eating or drinking. Note the type, character, and color of vomitus. *See anacathartic, antemetic, emetic, vomit, vomitus*

e., gastric. In gastric ulcer, gastric carcinoma, acute gastritis, chronic gastritis, gastroenteritis, gastric hyperesthesia, hyperacidity and hypersecretion, Asiatic cholera, pressure upon stomach

e., irritation. Drugs, uremia, nephritis, some brain tumors, chloroform, ether

TREATMENT. Depends upon the cause. After vomiting, patient may be given a small dose of baking soda in warm water, and then nothing by mouth for some time. Hot applications to the abdomen are helpful

e., nervous. Tumor or abscess of brain, sea sickness, acute myelitis, meningitis, anemia and hyperemia of brain, concussion and contusion of brain, fracture of skull, Ménière's disease, migraine, paresis, sclerosis.

e., reflex. Irritation of fauces and pharynx, coughing, removal of viscous secretion from nasopharynx, eyestrain, unpleasant odors and sights, shock, nervousness, anticipation, anxiety, hysteria, morning sickness, gastric crisis of tabes, various heart troubles, hiccough.

e., systemic. Pulmonary tuberculosis, whooping cough, peritonitis, irritations of bowels, acute obstruction of bowels, renal or biliary colic, Addison's disease.

emetic (e-met'ik) [G. *emein*, to vomit]. Medicine that produces vomiting. *Ex:* apomorphine, *at.* hydrochloride, ipecac, mustard, sodium chloride.

e., direct. Those acting directly on gastric nerves, *c. g.*, mustard.

e., indirect. Those acting on vomiting center of brain, as apomorphine.

e., local. Those which act through nerve irritation, such as salt.

e., systemic. Those acting through the circulation, irritating vomiting centers by stimulation, such as mustard, soapy water, syrup of ipecac.

One tablespoonful of mustard in ½

pint of water, or 2 of common salt with sufficient water to be swallowed.

PROCEDURE TO INDUCE VOMITING. Dilute contents of stomach before giving any emetic. Emetics may be dangerous because of their own toxic effect, as in severe heart or blood vessel diseases, tuberculosis, advanced pregnancy, rupture, ulcers of the stomach, or corrosive poisoning. For these reasons chemical emetics are omitted from the nurse's treatment of poisoning.

Vomiting may be induced by generous amounts of warm water, preferably warm soapy water and by irritating the uvula or posterior pharynx. Gastric lavage is preferable to emetics in poisoning. Emetics may induce vomiting by their local effect, as copper sulfate or zinc sulfate, mustard, ipecac, etc., in small doses diluted in water, or by their effect on the central nervous system, such as apomorphine hydrochloride which works by hypodermic injection. Emesis is much more likely to take place when the stomach is distended.

emetine [G. *emein*, to vomit] Powdered, white alkaloid obtained from ipecac, *q. v.*
emetine bismuth iodide (em'e-tin biz'muth i'o-did) A combination of emetine and bismuth containing about 25% emetine and 20% bismuth

ACTION AND USES. Same as emetine.

e. hydrochloride. USP. The hydrochloride of an alkaloid obtained from ipecac [dysentery].

ACTION AND USES. Chiefly in amebic **emetism** [G. *emein*, to vomit, + *ismos*, condition of] Poisoning from overdose of ipecac

SYM. Acute inflammation of pylorus, hyperemesis, diarrhea, and perhaps coughing and suffocation

emetocathartic [' + *katharsis*, a purging]. Producing both emesis and catharsis

emetology [' + *logos*, understanding]. Study of emetics and their action.

E. M. F. Abbr. for *electromotive force*.

emiction (e-mik'shun) [L. *ē* + *ungere*, to urinate]. The act of urination.

emigration [' + *migrare*, to move] Passage of white blood corpuscles through the walls of capillaries and veins during inflammation

em'lnence [' + *minere*, to hang on] A prominence or projection, esp. of a bone.

e., arcuate. A rounded eminence on upper surface of petrous portion of temporal bone. *SYN.* *jugum petrosum*.

e., articular, of the temporal bone. A rounded *e.* forming ant. boundary of the glenoid fossa.

e., auditory. A collection of gray matter on floor of 4th ventricle of brain at its lower part, forming the deep origin of the auditory nerve.

e., bicipital. A tuberosity for insertion of biceps muscle on radius

e., blastodermic. An elevated mass of cells of a developing ovum forming the blastoderm.

e., canine. A vertical ridge on the external surface of the superior maxilla

e., collateral. One bet middle and post horns in lat ventricle of brain.

e. of Doyère. Slight elevation of muscular fiber corresponding to entrance of a nerve fiber.

e. of the aquaeductus Fallopii. A ridge which traverses the inner wall of the tympanum above the fenestra ovalis.

e., frontal. A rounded prominence on either side of median line, a little below center of frontal bone (B. N. A., *tuber frontale*).

e., germinal. The *discus protigerus*.

e., hypothernar. One on ulnar side of palm, formed by muscles of little finger

e., iliopectineal, e., ilioptic. E. on upper aspect of pubic bone above the acetabulum, marking the junction of bone with the ilium (B. N. A., *eminentia iliopectinea*)

e., intercondyloid. A process on the head of the tibia lying between the two condyles

e., mamillary. Projection of inner pillars of foramen

e., median. Ant. bodies of medulla oblongata separated by ant. median fissure

e., nasal. A prominence on vertical portion of frontal bone above the nasal notch and bet. the 2 superciliary ridges.

e., occipital. Protuberance on occipital bone.

e., olivary. Oval projection at upper part of medulla o., above extremity of lateral column.

e., parietal. The marked convexity on outer surface of parietal bone (B. N. A., *tuber parietale*).

e.'s, portal. The small median lobes on lower surface of liver

e., pyramidal. An elevation on the mastoid wall of the tympanic cavity. It contains a cavity in which lies the stapedius muscle

e., thenar. The ball of the thumb.

eminencia (em-in-en'shi-ä) [L]. An eminence

e., alveolaris. Bony prominence on mandible 1 1/2 in ant. and sup. to the tonsil, corresponds to the location of the last molar tooth

e., articularis. Prominence on temporal bone

e., collateralis. Prominence on inferior horn of the lateral ventricle

em'issary [L ē, out, + *mittere*, to send] 1 Providing an outlet 2 An outlet

e., veins. Small veins piercing the skull, carrying blood from the sinuses within to the veins without the skull

emissio (e-mis'si-o) [L]. A discharge, emission *

e., seminis. Discharge of semen

emission (e-mish'un) [L ē, out, + *mittere*, to send]. The discharge, esp. involuntary, of semen by the male, particularly during sleep SYN *pollution*. SEE *ejaculation*.

emmenagogue (em-en'ä-gog) [G. *emmēna*, menses + *agēn*, to lead] An agent that stimulates the menstrual function Ex *ergot. preparations of iron, manganese dioxide, viburnum*.

e., direct. E. directly affecting the organs involved.

e., indirect. E. effective in alleviating the causative disorder, such as anemia.

emmenia (em-me-ni-ä) [G. *emmēna*]. The menstrual flow

emmen'ic. Pert. to the menses.

em'menin [G. *emmēna*, menses]. A placental hormone causing precocious maturity.

emmenio'pathy (em-me-ni-o'path-i) [" + *pathos* disease]. Any disorder of the menstruation.

emmenol'ogy [" + *logos*, science]. Science of menstruation.

emmetrope (em'met-rōp) [G. *emmetros*, in due measure, + *opsis*, sight]. One endowed with normal vision.

emmetropia (em-me-tro'pi-ä) [" + *opsis*, sight]. Normal condition of eye in refraction, with eye at rest parallel rays are focused on retina, ability to focus on the retina a luminous point from 3.9 to 4.7 in. from the eye

emmetrop'ic. Normal in vision. SEE: *hypermetropic*, *myopic*.

EMMETROPIC EYE

Parallel light rays brought to a focus upon retina, with lens at rest SEE *hyperopia*, *myopia*.

Em'met's operation. 1 Uterine trachelorrhaphy 2 Suturing of a lacerated perineum 3 Converting a sessile submucous tumor of the uterus into a pedunculated one 4 Operation for procidentia uteri

emol'lient [L ē, out, + *mollire*, to soften] An agent that will soften and soothe the part when applied locally The term is usually confined to agents affecting the surface of the body Ex *ointment of rose water, olive oil, petrolatum*. SEE *demulcent*.

e., enema. One for the purpose of coating membranes and allaying local pain and irritation, in order to soften and protect tissues

emotion (e-mo'shun) | *ēmo'pēre*, to disturb] 1 A mental state or strong feeling affect usually accompanied by physical changes in the body such as alteration in heart rate and respiratory activity, vasomotor reactions, and changes in muscle tone 2 A mental state or feeling such as fear, hate, love, anger, grief, joy. These constitute the "drive" which brings about the motor adjustment necessary to satisfy instinctive needs

Frustration is normally associated with displeasure and the intensifying of need, the process of gratification is accompanied by pleasurable feeling tone which persists for a variable period in less intense form Somatic (e. g., postural) changes precede and immediately follow the emotion, at least the two are inseparable and the recognition of "affect" (apart from one's subjection sense) is dependent upon the presence of its appropriate physical correlates.

Anxiety, or fear, arises when one doubts his ability adequately to meet a situation, neutralization consists of "flight" from the danger, and a struggle (fight) to remove the threat. The physical changes are those favorable to success and phylogenetically may well have antedated the psychic phase of the fear Often a partial syndrome of fear may exist with this latter phase apparently absent (and denied), and then the condition may be considered heart disease, stomach trouble, toxic goiter, etc. Other physical affect reactions may

be similarly confusing. Civilized man may find an instinctive goal unattainable because his conditioned (moral) reactions regard the goal as socially objectionable (or even deny the goal entirely). Here arise the conflict and the starting point of psychogenic disease.

emotion, disorders of. An emotion is not felt in the same way by healthy persons as by one suffering from schizophrenia. In the latter, there is a decrease of pleasure, hate, love, and other emotions. There is a loss of affection for relatives and a lack of interest in things. The emotions he does show are not in harmony with his ideas, for example, he may smile while describing tortures and terrors.

Unhappiness is marked in manic depressive psychosis. It varies in degree and may lead to suicide. In the excited stage undue happiness is marked. Depressions and elations have no apparent cause.

Emotions are easily aroused in aged persons and in alcoholics.

Depressed patients are so wrapped up in their own misery they take no notice of anything else. Excited patients cannot concentrate their attention. Confused ones may not realize they are not in the proper place for their actions. Hallucinated patients are influenced by imaginary voices. Deluded ones have unreasonable fears.

emotion, words pert. to: affective, agonia, alula, amor, amor sui, althymia, cathexis, manias, noci association, parathia, psychiatri, sex.

emotional [L *emovere*, to disturb] Relating to any of the emotions.

e. attitudes. Those which express any of the emotions, such as joy, sorrow, etc. Seen in hysteroleptics.

e. instability. Psy Pert to a psychopathic personality given to easy rage, brooding, and vastly fluctuating moods.

emotivity (e-mo-tiv'i-ti) [L *ē*, out, + *motus*, moving]. One's capability for emotional response.

em'pasm. A powder, usually perfumed, for external application to the body.

empathema (em-path-e'ma) (pl *empathemata*) [G *en*, in, + *pathos*, suffering] Ungovernable or dominant passion.

e. atonicum. Hypochondriasis.

e. entonicum. An active mania.

e., l'ane. Passion and excitement without cause or purpose.

empath'ic. Pert to, or characterized by, emotions.

empathy (em'pa-thi) [G *en*, in, + *pathos*, feeling] 1 Sympathetically trying to identify one's feelings with those of another. 2 Consciousness of cold identification in a social group of two or more members.

emphysis (em'fis-is) (pl *emphyses*) [" + *physis*, an eruption]. Any vesicular or exanthematous eruption.

emphractic (em-frak'tik) [G. *emphrazis*, an obstruction] 1. Obstructive, as clogging of pores of skin. 2. Anything that obstructs a function.

emphraxis (em-frāk'is) A stoppage, or obstruction, an infarction.

emphysatherapy (em-fiz-ā-ther-ā-pl) [G. *emphysan*, to inflate, + *therapeia*, treatment]. Injection of gas into a cavity for therapeutic purposes.

empyema (em-fi-se'mā) [G. *emphysan*, to inflate] 1 Distention of tissues by gas or air in the interstices. 2. A condition in which the alveoli of the lungs become distended or ruptured. Usually

the result of an interference with expiration, or loss of elasticity of the lung.

e., atrophic. SYN *senile e.*
e., chronic hypertrophic. E accompanied by bony changes resulting in the so-called "barrel chest."

e., compensatory. E which results from overstretching of a functional part of the lung when another portion fails to function. A secondary condition seen in tuberculosis, or pneumonia. Also called *complemental e.*

e., cutaneous. Subcutaneous e
e., gangrenous. Malignant variety of edema caused by a microbe

e., interstitial. Rupture of air cells from overdistention, and escape of air into interlobular tissue

e., pulmonary. E. *vesicular*

e., subcutaneous. Presence of air or gas in subcutaneous tissues, with consequent distention. Often caused by infection by gas-producing organisms, esp *Bacillus aerogenes*

e., surgical. Cutaneous emphysema due to operation, esp after wounds of respiratory tract

e., vesicular. Overdistention of alveoli and smaller bronchial tubes with air. SYN *Dyspnea* upon exertion, accelerated pulse, cough, and expectoration of whitish mucus. Short inspiration, prolonged expiration. **TREATMENT** Tonics, stimulants, rest.

empyematous (em-fi-sem'at-us) [G *emphysan*, to inflate] Affected with or pert to emphysema.

empir'ic [G *emperikos*, experimental]. One who relies solely upon experience.

empirical (em-pir'ik-al) [G *emperikos*, skilled] 1 Pert to or based on experience. 2 Pert to an empiric

empiricism (em-pir'is-izm) [" + *ismos*, condition of] 1 Experience, not theory, as basis of medical science. 2 Quackery.

emphastic (em-plas'tik) [G. *emphastikos*, clogging] 1. A constipating medicine. 2. Fit to be used as a plaster or in one

emphas'trum (pl *emplastra*) [G *emphastron*, a plaster] Preparation for external application, and of such consistency that it requires heat to spread it, and adheres to the skin when applied. Not often prescribed. Four are official. SYN *plaster*.

emprosthotonos (em-pros-thot'o-nos) [G. *emprosthen*, forward, + *tonos*, tension]. Lying with body incurved and resting upon forehead and feet with face downward. SEE: *Illustration*, p. E-20

Sometimes seen in tetanus and strychnine poisoning. The reverse of *opisthotonos*. SEE *posture*.

emphy'sis (em'p'i-tis) [G a spitting]. Expectoration of blood or blood-stained mucus, hemoptysis.

empyema (em-pl-e'ma) [G *en*, within, + *pyon*, pus]. Pus in a body cavity, esp. in the pleural cavity.

SYN Chills, fever, and sweating. Skin is gray, malar flush, appetite poor, marked malaise, pain in side, cough, emaciation. Dyspnea may ensue.

TREATMENT Aspiration, open operation. Constant irrigation of pleural cavity by regular suction is an effective treatment.

NP: *Postoperative* Patient should sit up inclined to affected side to facilitate drainage, then to opp. side to aid expansion of lung. SEE *resection*.

e., encapsulated. Collection of pus walled off by adhesions.

e., interlobular. Form with pus bet. lobes of lung.

EMPROSTHOTONOS.

e. necessitatis. Form in which pus can escape spontaneously

e., pulsating. Form with cardiac beats causing pulsation of chest wall

empyesis (em-pi-é'sis) [G *empein*, to suppurate] A pustular eruption on the skin.

empyocele (ém-pi-ô-sél) ["" + *kêlê*, tumor] A collection of pus in a sacculated cavity, especially in the scrotum; a suppurating hydrocele

emul'gent [L. *émulgere*, to drain out] Extracting or draining

e. vessel. Blood vessel of the kidney.

emulsifica'tion [L *emulsio*, emulsion, + *facere*, to make] 1 Process of making an emulsion 2 The breaking down of large fat globules in the intestine to smaller, uniformly distributed particles, accomplished largely through the action of bile acids which lower surface tension

emul'sifier ["" + *facere*, to make]. Anything used to make an emulsion.

emulsify (e-mul'si-fi) ["" + *facere*, to make] To form into an emulsion

emul'sion [L *emulsio*]. A mixture of 2 liquids not mutually soluble

If they are thoroughly shaken, one will divide into globules and is called the *discontinuous* or *dispersed* phase, the other is then the *continuous* phase. Milk is an emulsion in which butter fat is the discontinuous and water the continuous phase

emul'soid (ê-mul'soyd) ["" + G *eidōs* form] A colloid in an aqueous solution in which the colloid has a marked attraction for water to the extent that the dispersoid contains large quantities of water Also called hydrophilic or lyophilic colloids Protoplasm, starch, soap, gelatin, and egg white are common examples

emulsion (e-mul'sum) [L] A fluid in which oil or resin is suspended by means of a mucilaginous substance

emunc'tory (e-munk'to-ri) [L. *émungere*, to cleanse]. 1. Pert. to organ or duct having an excretory function 2. An excretory duct, i. e., pores of skin.

enamel (en-am'el) [A.S. *en*, on, + *amaile*, ivory]. SYN *substantia adamantina* It is the hardest substance in the body The hard, white, dense substance forming a covering for the crown of the teeth.

e., mottled. Condition in which the enamel acquires a mottled appearance as a result of the ingestion of excessive amounts of fluorides in water or foods.

e. organ. A cup-shaped structure which forms on the dental lamina of an embryo. It produces the enamel and serves as a mold for the remainder of the tooth.

enanthem, enanthema (en-an'them, -the-mā) [G *en*, in, + *anthēma*, blossoming] Eruption of mucous membrane Ex Koplik's spots SEE *rash*. OPP. *exanthem*.

enanthematous (en-an-them'at-us) [G *en* + *anthēma*, a blossoming] Of the nature of an enanthema

enanthesis (en-an-the'sis) ["" + *anthen*, to bloom] A skin eruption due to internal disease

enanthrope (en-an-thrōp) ["" + *anthrōpos*, man]. The source of a disease originating internally

enantiobiosis (ên-ân-ti-ô-bi-ô'sis) [G. *en-antios*, opposite, + *bios*, life] The condition in which associated organisms are antagonistic to each other. SEE. *symbiosis*

enantiopathy (en-an-ti-op'ath-i) ["" + *pathos*, disease] Treatment of one disease by another disease antagonistic to it, as malaria in general paresis

enarkyochrome (en-ar'ki-o-kiôm) [G *en*, in, + *arkus*, network, + *chroma*, color]. A nerve cell arranged like a network, taking a stain best in the cell body

enarthri'tis ["" + *arthron*, joint, + *itis*, inflammation] Inflammation of a ball-and-socket joint

enarthrosis (en-ar-thro'sis) (Pl *enarthroses*) ["" + *arthrōsis*, joint]. A ball-and-socket joint, a form of diarthrosis

RS *amphiarthrosis*, *condylarthrosis*, *diarthrosis*, *synarthrosis*, *synchondros-sis*.

encan'this [G *en*, in + *kanthos*, angle of the eye] An excrescence or new growth at the inner angle of the eye

encapsula'tion [L *en*, in, + *capsula*, a little box] 1 Inclosure in a sheath not normal to the part 2 The process of the formation of a capsule or a sheath about a structure

encatarrhaphy (en-kat-ar'raf-i) [G. *egkatarraptein*, to sew in] Insertion of an organ or tissue into a part where it is not normally found

enceinte (on-sant') [Fr.]. Pregnant.

encelial'gia [G. *en*, in, + *kolia*, belly, + *algos*, pain]. Abdominal pain.

encephalalgia (en-sef-al-al'i-ā) [G. *egkephalos*, brain, + *algos*, pain]. Deep-seated head pain. SYN *cephalalgia*.

encephalasthenia (en-sef'al-as-the'n-i-ā) ["" + *asthenia*, weakness]. Deficiency in brain power

encephalatrophy (en-sef-al-at'rof-i) ["" + *a-*, priv. + *trophê*, nourishment]. Cerebral atrophy

encephalic (en-sef-al'ik) [G *egkephalos*, brain]. Pert. to the brain or its cavity.

encephalin (en-sef'al-in) [G. *egkephalos*, brain]. A nitrogenous glucoside obtained from brain tissue by boiling.

encephalitis (en-sef-â-lî'tis) [" + *itis*, inflammation]. Inflammation of the brain.

Error. It may be a specific disease entity due to a virus, or it may occur as a sequela of influenza, measles, German measles, chicken pox, smallpox, vaccinia, or several other diseases.

e., cortical. E of brain cortex only.

e., epidemic. SEE: *e. lethargica*.

e., hemorrhagic. Hemorrhage in brain inflammation.

e. hyperplastica. Acute encephalitis without suppuration.

e., infantile. Brain inflammation in the young causing cerebral palsy.

e., influenzal. SEE: *e. lethargica*.

e. lethargica (leth-ar'jî-ka). Epidemic neurotoxic, epidemic stupor, Type A encephalitis (Japan), Economo's disease. An infective disease of virus origin which first appeared pandemically in 1916-1917. It appeared epidemically in various regions of the world up to 1925 usually following epidemics of influenza. Occurs usually in winter months. Since that time, it has occurred sporadically.

Sym. Stupor, ocular paralyses, tremor, nocturnal wakefulness. The face becomes expressionless and grave. Moral changes may result. The symptoms vary in different individuals. The disease is notifiable. **Sym.** *sleeping sickness*.

e., meningo. E. combined with meningitis.

e. neonato'rum. A form occurring in the newly born. **ETIOL.** Fatty cells in the brain.

e. periaxialis. Inflammation of the white matter of the cerebrum, occurring mainly in the young.

e., purulent. E characterized by abscesses in the brain.

e., pyemic, e., pyogenic. SEE: *purulent e.*

e., St. Louis type. A virus disease which first occurred epidemically in the summer of 1933 in and around St. Louis. Now endemic in America. Occurs most frequently during summer months.

encephalocele (en-sef'al-o-sêl) [L. *en*, in + *kêlê*, hernia]. Protrusion of the brain through a cranial fissure.

encephalocystocele (en-sef'al-o-sis'to-sêl) [" + *kystis*, a bladder, + *kêlê*, hernia]. Protrusion of brain distended by hernial sac containing fluid.

encephalodialysis (en-sef'al-o-di-al'is-is) [" + *dialysis*, loosening]. Softening of the brain.

encephalogram (en-sef'al-o-gram) [" + *gramma*, a writing]. A roentgen ray picture of the brain.

encephalography (en-sef'al-o-gra-fi) [" + *graphem*, to write]. 1 Examination of head following the introduction of air into the subarachnoid space as a means of diagnosis. 2. Roentgenography.

encephaloid (en-sef'â-loid) [" + *eidōs*, form]. 1 Resembling the cerebral substance. 2 A malignant neoplasm of brainlike texture.

e. cancer. Malignant brainlike tumor. **Syn.** *encephaloma*.

encephalolith (en-sef'al-o-lith) [L. *en*, in, + G. *egkephalos*, brain, + *lithos*, stone]. A calculus of the brain.

encephalology (ên-sêf-â-lôl'ê-jî). [L. *en*, in + " + *logos*, study of]. That divi-

sion of medical science which deals with the structure, function, and pathology of the brain.

encephalo'ma [" + *ōma*, tumor]. 1. Tumor of the brain. 2 Brain cancer.

encephalomalacia (en-sef'al-o-mal-â'si-â) [" + *malakia*, softening]. Brain softening.

encephalomeningi'tis [" + *mênigz*, membrane, + *itis*, inflammation] Inflammation of the brain and its membranes.

encephalomeningocele (en-sef'al-o-men-in'go-sêl) [" + " + *kêlê*, hernia]. Protrusion through the cranium of membranes and brain substance.

encephalomere (en-sef'al-o-mêr) [L. *en*, in + *meros*, part] A primitive segment of the embryonic brain, a neuro-mere.

encephalometer (en-sef'al-om'ê-ter) [" + *metron*, measure] An instrument for measuring the cranium and locating brain regions.

encephalomyelitis (en-sef'al-o'mî-el-i'tis) [" + *myelos*, marrow, + *itis*, inflammation] Encephalitis with myelitis.

encephalomyelopathy (en-sef'al-o-mî-el-op'a-thî) [" + " + *pathos*, disease]. Any disease of brain and spinal cord.

encephalon (en-sef'â-lon) [G. *egkephalos*, brain]. The brain, including the cerebrum, cerebellum, medulla oblongata and pons, diencephalon and mid-brain.

encephalop'athy [" + *pathos*, disease]. Any dysfunction of the brain.

enceph'alopuncture [" + L. *punctura*, a piercing] Puncture into the brain substance.

encephalopyosis (en-sef'al-o-pi-o'sis) [" + *pyôsis*, suppuration] Abscess of the brain.

encephalorrhagia (en-sef'al-or-â'jî-a) [" + *rêgnunai*, to burst forth] Hemorrhage of the brain.

encephaloscclerosis (en-sef'al-o-skle-ro'sis) [" + *sklerôsis*, hardening]. Brain hardening.

encephalo'sis [" + *osis*]. A degenerative process of the brain.

encephalosp'inal [" + L. *spina*, thorn]. Pert. to brain and spinal cord.

e. axis. Cerebrospinal axis.

encephalothlipsis (ên-sêf'â-lô-thlîp'sis). Compression of the brain.

encephalotome (en-sef'al-o-tôm) [" + *tomê*, incision]. Instrument for incising brain tissue.

encephalotomy (ên-sêf'â-lôt'ô-mî) [" + *tomê*, a cutting] 1 Brain dissection. 2 Surgical destruction of the brain of a fetus to facilitate delivery.

enchondroma (en-kon-dro'mâ) [G. *en*, in, + *chondros*, cartilage, + *ōma*, tumor]. A cartilaginous tumor occurring generally where cartilage is absent or within a bone where it expands the diaphysis.

enchondrosarcoma (en-kon'dro-sar-ko'mâ) [" + " + *sarz*, flesh, + *ōma*, tumor]. Sarcoma made up of cartilaginous tissue.

enchondrosis (ên-kôn-drô'sis). A cartilaginous outgrowth from bone or cartilaginous tissue; an enchondroma.

enchylema (en-ki-l'e'mâ) [" + *chylōs*, juice]. Fluid granular matter in interstices of cell body and nucleus. **Syn:** *cytochylema*.

enchyma (en'ki-mă) [" + *chymos*, juice].

A fluid formed from chyme which elaborates and repairs tissues and cells

enclave (en-klāv') [Fr *enclaver*, to surround] A mass of tissue which becomes enclosed by a tissue of another kind

enclavement (en-klāv'ment) [Fr] GYN: An impaction of the fetus in the pelvic strait.

enclitic (en-klit'ik) [G *egklinein*, to incline]. Having the planes of the fetal head inclined to those of the maternal pelvis

encolpism (en-kol'pizm) [G *en*, in, + *kolpos*, vagina, + *ismos*, condition] Medication by vaginal suppositories and injections

encolpitis (en-kol-pl'tis) [" + *kolpos*, vagina, + *itis*, inflammation] SYN *endocolpitis* Inflamed condition of the vaginal mucosa

encopresis (en-kop-re'sis) Fecal incontinence not due to illness or organic defect

encranial [" + *kraion* cranium] Intracranial or within the cranium

encyesis (en-si-e'sis) [" + *kyesis*, pregnancy] Normal uterine pregnancy.

encyopyelitis (en-si-o-pi-e-lit'is) [" + " + *pyelos*, pelvis, + *itis*, inflammation]. Inflammation of the renal pelvis occurring in normal pregnancy

encysted (en-sist'ed) [" + *kystis*, cyst]. Surrounded by membrane, encapsulated

end [AS *ende*]. A termination, extremity.

e. artery. An artery which does not anastomose directly or indirectly with other arteries, e.g., in kidney and spleen, etc.

e. body. Substance that kills bacteria in immunity to typhoid SYN: complement

e. brain. The telencephalon

e. bud, e. bulb, e. capsule. The terminal of a sensory nerve

e. bulb of Krause. An encapsulated nerve-ending found in the skin and conjunctiva, mediates sense of cold

e. organ. An encapsulated sensory nerve-ending

e. organ, neuromuscular. Spindle-shaped bundle of specialized muscle fibers in which sensory nerve fibers terminate in muscles, muscle spindle

e. organ, neurofendineous. Specialized tendon fasciculi in which sensory nerve fibers terminate in tendons, a tendon spindle

e. result. The ultimate or final result.

Entamoeba (en'dam-ē'bā) Entamoeba

endangitis, endangitis (end-an-jr-'itis, -it'is) [G *endon*, within, + *aggeion*, vessel, + *itis*, inflammation] Inflammation of the endangium

endangium (en-dan'ji-um) [" + *aggeion*, vessel] Innermost coat or intima of blood vessels

endaortitis (end'a-or-tit'is) [" + *aortē*, aorta, + *itis*, inflammation]. Inflammation of inner coat of the aorta

endarterial (end-ar-ter-i'al) [" + *arteria*, artery] 1. Pert. to the inner portion of an artery 2. Within an artery

endarteritis (end-ar-ter-i'tis) [" + " + *itis*, inflammation]. Inflammation of innermost coat or intima of an artery resulting from syphilis, trauma, pyogenic bacteria, or infective thrombi.

e., acute. Of large arteries. Rare.

e., chronic. Degeneration of arterial coats in the aged SYN *atheroma*.

e. deformans. Thickening of intima or replacement with atheromatous or calcareous deposits

e. obliterans. Chronic progressive thickening of intima leading to stenosis or obstruction of lumen

endeictic (en-dik'tik) Symptomatic

endem'ic [G *en*, in, + *demos*, people]

e. disease. A disease which is present more or less continuously in a community Used in contrast to sporadic or epidemic

e. neuritis. A form of polyneuritis SYN *beriberi*.

ende'moeptidem'ic [" + " + *epi*, on, + *dēmos*, people] Endemic, but becoming epidemic periodically

endermatic, enderm'ic [" + *derma*, skin] Administering medicine through the skin

endermo'sis [" + " + *ōsis*] 1. Administration of medicines through the skin. 2. Herpetic affection of any mucous membrane

en'deron [" + *deros*, skin] The dermis or corium, the portion of a mucous membrane underlying the epithelial layer

en'dive. ASH CONST Ca 0.104, Mg 0.013, K 0.380, Na 0.109, P 0.038, Cl 0.167, S 0.035, Fe 0.00123, Av SKWING 15 gr. Pro 0.2, Fat trace, Carbo 0.6 Vit. A+, C + to +

endoaneurysmorrhaphy (en'do-an-ū-ris-mor'af-i) [G *endon*, within, + *aneurysma*, aneurysm, + *raphē*, suture]. Opening an aneurysmal sac and suturing its orifice

endoangitis (en'do-an-jī-t'is) [" + *aggeion*, vessel, + *itis*, inflammation] Inflammation of the coat of blood vessels, SYN *endoarteritis*, *endophlebitis*.

en'doantitox'in | + *anti*, against, + *toxikon*, poison] An antitoxin within a cell

en'doappendic'itis [" + *L appendere*, to hang, + *G itis*, inflammation] Inflammation of mucosa of the vermiform appendix

endoarteritis (en'dō-ār-tēr-i'tis) [G *endon*, with, + *arteria*, artery, + *itis*, inflammation] Endarteritis, *qv*

en'doauscultat'ion [" + *L auscultāre*, to listen to] Auscultation by esophageal tube passed into the stomach

endoblast (en'do-blast) [" + *blastos*, germ] 1. The nucleus cell 2. Inner layer of the blastoderm. SYN *endoderm*, *hypoblast*

endobronchi'tis [" + *brogchos*, windpipe, + *itis*, inflammation] Inflammation of bronchial mucosa

endocar'diac, endocar'dial [" + *kardia*, heart] Within the heart or arising from the endocardium

endocarditis (en-do-kar-dit'is) [" + " + *itis*, inflammation] Inflammation of the lining membrane of the heart or *endocardium*.

It is usually confined to the external lining of the valve, sometimes to the lining membrane of its chambers. Generally of bacterial origin

NP Practically the same as that for pericarditis and other heart conditions. Rest in bed essential, but during symptoms of dyspnea patient should be propped up in bed and supported by pillows with arms resting on pillows. All bodily activities should be kept at a minimum. Patient should not reach for

anything. Pulse should be taken before and after any exertion and if it does not return to original pulse within 2 minutes after the effort it indicates strain as a result. Normal bowel action essential, no stimulating drinks, esp. in the evening.

TREATMENT: Antibiotic therapy for at least one month Procaine penicillin in large doses is usually employed, although streptomycin, aureomycin, terramycin, and chloramphenicol are sometimes effective

e., chronic. SEE: *ulcerative endocarditis*.

e., exudative. Begins as an acute affection. Rheumatism chief cause **SYM:** Auscultation may give only indication—a prolongation of heart sound **PROG:** Guarded. **TREATMENT:** Absolute rest.

e., malignant. Usually secondary to suppurative inflammation elsewhere. SEE *ulcerative endocarditis*.

e., subacute bacterial. A condition caused by lodgment of the *Streptococcus viridans* in an abnormal heart or in valves damaged by rheumatic fever

e., ulcerative. A rapidly destructive form, characterized by necrosis or ulceration of the valves and the deposition of colonies of micrococci

SYM: High fever, chills; profuse sweats, great prostration, often delirium and stupor, hurried breathing, rapid, irregular pulse, brown, fissured tongue; jaundice and diarrhea frequently present

PROG: Almost invariably fatal Duration few days to several weeks

TREATMENT: Ice bags to heart. Light, nutritious diet Stimulants.

e., vegetative. Fibrinous clots on ulcerated valvular surfaces. SEE *exudative endocarditis*.

endocardium [' + *kardia*, heart]. Lining (serous) membrane of inner surface and cavities of the heart

It is continuous with the intima or int coat of arteries

endocervical (en-dō-sēr-vī-kal) [' + *L. cervix*, neck] Pert to the endocervix.

endocervicitis (en-dō-sēr-vī-sī'tis) [' + *G. itis*, inflammation]. Inflammation of mucous lining of the cervix uteri.

Usually chronic and due to infection, and accompanied by erosion

SYM: Opaque, whitish-yellow, often thick and lumpy vaginal discharge, esp. preceding menstruation

TREATMENT: General Patient should be kept as quiet as possible, food generous, and bowels active. Local Hot vaginal douches 3 times a day, first of Lugol's solution, later as acute stage subsides, an astringent douche

Another method is the Cherry treatment which employs bipolar electrode to coagulate membrane and glands, via the vaginal orifice

endocervix (en-dō-sēr-vīks) [*G. endon*, within, + *L. cervix*, neck] The lining of the canal of the cervix uteri.

endochondral (en-dō-kon'dral) [' + *chondros*, cartilage] Within a cartilage.

endochorion (en-dō-ko'ri-on) [' + *chorion*, chorion] The inner chorion; vascular layer of allantois

endochrome (en'dō-krōm) [' + *chrōma*, color]. The coloring matter (not green) of a cell's endoplasm.

endocolitis [' + *kōlon*, colon, + *itis*, inflammation]. Inflammation of the mucosa of colon. SEE *colitis*.

endocolpitis (en-dō-kol-pl'tis) [' + *colpos*, vagina, + *itis*, inflammation]. Inflammation of the vaginal mucosa. **SYM:** *encolpitis*.

endocomplement [' + *L. complère*, to fill]. An intracellular complement or one contained within the erythrocyte.

endocorpuscular [' + *L. corpusculum*, corpuscle] Within a corpuscle.

endocranial [' + *kranion*, cranium]. 1. Intracranial or within the cranium. 2. Pert to the endocranium

endocranitis [' + *itis*, inflammation]. Inflammation of endocranium **SYM:** *pachymeningitis*, *external*.

endocranium [' + *kranion*, cranium]. The dura mater of the brain which forms the lining membrane of the cranium

endocrinasthenia (en'dō-krin-as-the'nī-ā) [' + *krinein*, to secrete, + *asthenia*, weakness]. Neurasthenia due to dysfunction of the endocrines

endocrine (ën'dō-krin, -krin) [' + *krinein*, to secrete] 1. An internal secretion. 2. Endocrinous 3. Pertaining to a gland that produces an internal secretion.

e. gland. A ductless gland; a gland which produces an internal secretion discharged into the blood and lymph and circulated to all parts of the body. The active principles of the glands called *hormones* produce effects on tissues more or less remote from their place of origin. Some endocrine glands produce both an internal and external secretion (Ex: pancreas, testes).

The endocrine glands include *hypophysis cerebri* (pituitary gland), thyroid gland (the thymus and pineal body have not been shown to produce any hormones), parathyroid glands, adrenal (suprarenal) glands, islands of Langerhans of the pancreas, and the gonads (ovaries and testes). Other structures such as the gastrointestinal mucosa and the placenta have an endocrine function

The hormones secreted by the ductless glands may have a specific effect on an organ or tissue, or in some cases the effect is general affecting the entire body as in the case of the thyroid hormone which affects the rate of metabolism. Hormones may have an *excitatory* or stimulating effect, or a *retarding* or inhibiting effect. Hormones are effective in extremely minute amounts. They are not stored in the body but are destroyed or excreted. Among the physiological processes affected by hormones are rate of metabolism and the metabolism of specific substances such as carbohydrates and calcium, growth and developmental processes, the secretory activity of other endocrine glands, the development and functioning of the reproductive organs, psychic sexual characteristics and libido; the development of personality and higher nervous functions, the ability of the body to meet conditions of stress; resistance to disease.

Endocrine dysfunction may result from (a) *hyposecretion* in which an inadequate amount of the hormone(s) is secreted or (b) *hypersecretion* in which excessive amounts of hormones are produced. Secretion of endocrine glands may be under nervous control, or it may be controlled by chemical substances in the blood; in some cases, other hormones. Many pathological conditions are the result of, or associated with, the malfunctioning of the endocrine glands.

endoc'rinism [" + " + *ismos*, condition]. Disease due to malfunction of one or more of the endocrine glands. *SYN*: *endocrinopathy*.

endocrinology (en-do-krin-o'l'o-gi) [" + " + *logos*, science]. The science of the endocrines, or ductless glands, and their functions.

endocrinopath (en-do-krin-o-path) [" + " + *pathos*, disease]. One affected by a disorder of one or more glands of internal secretion.

endocrinopathic (en-do-krin-o-path'ik) [" + " + *pathos*, disease]. Of the nature of endocrinopathy.

endocrinopathy (en-do-krin-op'a-thi) [" + " + *pathos*, disease]. A disease due to disorder of an endocrine gland or glands.

endocrinosis (en-do-krin-o'sis) [" + " + *osis*]. Condition resulting from dysfunction of an endocrine gland.

endocrinotherapy (en-do-krin-o-ther'a-pl) [" + " + *therapeia*, treatment]. Treatment with endocrine preparations.

endocrinous (en-dok'rin-us) [" + *krinein*, to secrete]. Pert. to internal secretions or endocrine glands.

endocrit'ic [G. *endon*, within + *krinein*, to secrete]. Referring to internal secretions.

en'docyst [" + *kystis*, cyst]. The innermost layer of any hydatid cyst.

endocystitis (en-do-sis-ti'tis) [" + " + *itis*, inflammation]. Inflammation of membrane of bladder.

endoderm (en-do-derm) [" + *derma*, skin]. Inner layer of cells of an embryo. *SYN*: *hypoblast*. The endoderm, *q v*.

Endodermophyton (en-do-derm'o-fi'ton). Former name of a genus of parasitic fungi growing in the epidermis of the skin. *Now included in the genus Trichophyton, q v*.

The Principal Endocrine Glands:

Name	Position	Function	Diseases Connected With It
The Thyroid Gland	Two lobes in neck joined by a narrow band called the isthmus	Influences growth and nutrition through its hormone thyroxin	1 Goiter — an enlargement of the gland 2. Cretinism 3. Myxedema 4. Exophthalmic goiter
The Parathyroid Glands	Four tiny glands, 2 on each side, in the neighborhood of the thyroid	Influence nutrition of muscle tissue	Tetany. A disease in which painful spasms of the hands and feet occur. Chiefly seen muscles of the in children
The Suprarenal (or adrenal) Capsules	One lies above each kidney. Each has an outer layer, the cortex (bark), and an inner layer, the medulla (pith).	Hormone of cortex influences growth and sexual development. Hormone of medulla is called adrenaline, affects blood pressure, keeps up muscle tone, has some effect on the coloring matter in the skin	Addison's disease <i>SYN</i> Muscular weakness Low blood pressure A darkening of the skin Vomiting
The Pituitary Gland	About the size of a pea, lying in the floor of the skull. It is in 2 lobes, an anterior and posterior.	Anterior lobe influences growth, especially of bones Posterior. Has an action somewhat like that of adrenalin	Acromegaly. A disease in which there is enlargement of the bones of the hands, feet, and head
The Thymus Gland	Found just beneath the sternum. Weighs about half an ounce at birth, develops up to puberty, after which it atrophies	—	—
The Pineal Gland	About the size of a small cherrystone, connected with the upper surface of the zrain.	—	—
The Testicles and Ovaries	—	Cause the development of the secondary sexual characters such as the growth of hair and deepening of the voice in the male.	Dementia precox.

Note that of the 7, 2 are found in the brain, 2 small pairs and 1 large single one in the neck, 1 pair in the abdomen and 1 in the thorax.

Table Showing the Important Results of Disease of the Endocrine Glands¹

Gland	Name of Hormone	Hypersecretion		Hyposecretion	
		In Children	In Adults	In Children	In Adults
Thyroid	Thyroxin	Hyperthyroidism (exophthalmic goiter).		Cretinism	Myxedema.
Parathyroid	Parathormone	Generalized osteitis fibrosa, with high blood calcium		Tetany, with low blood calcium.	
Suprarenal (cortex)	Cortin or Eucortone	Sexual precocity.	Obesity, increased hairiness	Addison's disease.	
(mendulla)	Adrenalin	—	—	—	
Pituitary (anterior lobe)	—	Gigantism	Acromegaly	Infantillism	?
(posterior lobe)	Pituitrin	? Disorder of carbohydrate metabolism		Diabetes insipidus.	

¹ Sears, *Medicine for Nurses* (Modified)

endodiascopy (en-do-di-as'kō-pli) [" + *dia*, through, + *skopein*, to examine]. X-ray examination of a cavity.

endodontitis (en'do-don-ti'tis) [" + *odont*, tooth, + *itis*, inflammation]. Inflammation of the dental pulp.

endoenteritis [" + *enteron*, intestine, + *itis*, inflammation]. Inflammation of lining membrane of intestines.

endoenzyme [" + *en*, in, + *zymē*, leaven]. An intracellular enzyme.

endogastrectomy (en-do-gas-trek'to-mī) [" + *gaster*, belly, + *ektomē*, excision]. Excision of the gastric mucosa.

endogastric (en-do-gas'trik) [" + *gaster*, stomach]. Pert. to the stomach's interior.

endogastritis (en-do-gas-tri'tis) [" + " + *itis*, inflammation]. Inflammation of the lining membrane of the stomach.

endogenic [" + *gennan*, to produce]. Having origin within the organism. **Syn.** *endogenous*.

endogenous (en-doj'en-us) [" + *gennan*, to produce]. 1 Produced within a cell or organism. 2 Concerning spore formation within the bacterial cell. **Syn.** *endogenic*.

endoglobular [" + *L. globulus*, a globule]. Within the blood corpuscles, as malarial germs.

endointoxication [" + *L. in*, into, + *G. toxikon*, poison]. Poisoning due to an endogenous toxin.

endolabyrinthitis (en'do-lab-i-rin-thi'tis) [" + *labyrinthos*, labyrinth, + *itis*, inflammation]. Inflamed condition of the membranous labyrinth.

endolaryngeal [" + *larynx*, larynx]. Within the larynx.

Endolimax na-na (en-do-li'maks) [" + *limax*, meadow]. A minute species of ameba inhabiting the intestine of man, monkeys, and other mammals. It is a nonpathogenic organism living as commensally within its host.

endolumbar [" + *L. lumbus*, loin]. In the lumbar portion of the spinal cord.

endolymph (en'do-limf) [" + *L. lymphe*]. Pale, limpid fluid within the labyrinth of the ear.

endolymphatic [" + *L. lymphe*]. Rel. to the endolymph.

e. duct. A slender duct extending from post., surface of the sacculi of the inner ear. It ends blindly in the petrous portion of temporal bone as a dilated

pouch, the endolymphatic sac, endomastoiditis, mastoid antrum.

endolysin (en-dol'is-in) [" + *lysis*, a loosening]. Bacterial substance within a leukocyte which destroys bacteria.

endolysis [G *endon*, within, + *lysis*, a dissolution]. Disintegration of cell cytoplasm.

endomastoiditis (en'do-mas-toy-di'tis) [" + *mastos*, breast, + *oidos*, form, + *itis*, inflammation]. Inflammation of mucosa lining the mastoid cavity and cells.

endometrectomy (en'do-me-trek'to-mī) [" + *mētra*, uterus, + *ektomē*, excision]. Excision of uterine mucosa. **See:** *curetage*.

endometrial (en-do-me'tri-al) [" + *mētra*, uterus]. Pert. to the lining mucosa of the uterus.

e. cyst. An ovarian cyst or tumor that bleeds, which may develop dense and extensive adhesions.

endometrioma (en-do-me'tri-o'mā) [" + " + *ōma*, tumor]. A tumor containing shreds of ectopic endometrium, found most frequently in the ovary, *cul-de-sac*, rectovaginal septum, and the peritoneal surface of the post. portion of the uterus.

endometriosis (en-do-me'tri-o'sis) [" + " + *ōsis*]. Ectopic endometrium located in various sites throughout the pelvis or in the abdominal wall.

endometritis (en-do-me'tri'tis) [" + " + *itis*, inflammation]. Inflammation of the endometrium, the inner mucous lining of the uterus.

Etiol. Produced by bacterial invasion. May be acute, subacute, or chronic, the acute cases most commonly resulting from gonococcal infection or following abortion or full term pregnancy. The subacute type is the result of repeated acute attacks as is the chronic type. Occasionally the chronic type may be a tuberculous infection. There are many other conditions which are labeled as endometritis but which are of either vascular or endocrine origin. Some of these misnamed conditions are senile endometritis, hyperplastic endometritis, hypertrophic endometritis, etc.

Sym. There are no specific symptoms of this condition, in acute cases the symptoms resembling those of acute pelvic peritonitis. In the chronic cases, menorrhagia is common, but a positive

diagnosis cannot be made without a curettage and a histological study of the recovered material. See *cervix uteri*, *endometrium*, *uterus*.

e., cervical. Inflammation of the inner portion of the cervix uteri.

e. decidual. Inflammation of the mucous membrane of a gravid uterus.

e. dissecans. E accompanied by development of ulcers and shedding of the mucous membrane.

e., fungous. Endometrial enlargement with bleeding and granulations.

e., septic. Form caused by septic poisoning.

e., simple. Catarrhal inflammatory condition of the endometrium.

endometrium (en-do-me'trĭ-um) [+ *metra*, uterus] The mucous membrane lining the inner surface of the uterus. Histologically, it consists of a surface epithelium made up of a single layer of columnar cells, a few of which bear cilia. Invaginations of the epithelium form simple, branched tubular glands which extend to the myometrium. The glands are separated by connective tissue resembling mesenchyme which forms the *stroma*. There is no submucosa, the mucosa lying closely attached to the myometrium.

The endometrium is supplied by two types of arteries, *straight arteries* which supply the deeper third or basal layer of the endometrium and *spiral arteries* which supply the spongy and compact layers. They penetrate between the glands and form a sub-epithelial capillary plexus. These arteries show marked changes in response to hormonal stimulation during the menstrual cycle.

Between puberty and the menopause, the uterine endometrium passes through cyclic changes which constitute the menstrual cycle, *q v*. These changes are related to the development and maturation of the Graafian follicle, the discharge of the ovum, and the subsequent development of the corpus luteum in the ovary.

Following fertilization of the ovum, the endometrium serves as nesting place and implantation occurs. The endometrium fuses with the developing chorion of the embryo and at birth there is a splitting off and shedding of the uterine lining or *decidua*. During pregnancy, the *decidua basalis*, the endometrium lying between the chorionic vesicle and the myometrium, develops into the maternal portion of the placenta, *q v*.

endometry [+ *metron*, measure] Measurement of the interior of a cavity or organ.

endomix'is [G. *endon*, within + *mixis*, mixture] Mixture of the cell nuclear and cytoplasmic substance.

endomyocarditis (en'do-mĭ-o-kar-dĭ'tis) [+ *mys*, muscle, + *kardia*, heart, + *itis*, inflammation] Inflammation of the endocardium and myocardium.

endomysium (en-dō-mĭz'ĭ-um) A thin sheath of connective tissue consisting principally of reticular fibers which invests each striated muscle fiber and binds the fibers together within a fasciculus.

endoneur'itis [+ *neuron*, nerve, + *itis*, inflammation] Inflammation of the endoneurium.

endoneurium (en-dō-nū'rĭ-um) [+ *neuron*, nerve] Henle's sheath. A delicate connective tissue sheath which surrounds nerve fibers within a fasciculus.

endoparasite (en-do-par'as-ĭt) [+ *parasitos*, parasite] Any parasite living within its host.

endopathy (en-dop'ath-ĭ) [+ *pathos*, disease] Any endogenous disease.

endopelvic (en-do-pel'vic) [+ *L pelvis*, basin] Within the pelvis.

e. fasciae. The downward continuation of the parietal peritoneum of the abdomen to form the pelvic fasciae which have a very important part in the support of the pelvic viscera.

endopericarditis (en'do-per'ĭ-kar-dĭ'tis) [+ *pert*, around, + *kardia*, heart, + *itis*, inflammation] Endocarditis complicated by pericarditis.

endoperimyocarditis (en'do-per-ĭ-mĭ'o-kar-dĭ'tis) [+ " + *mys*, muscle, + *kardia*, heart, + *itis*, inflammation] Inflammation of the pericardium, myocardium, and endocardium.

endoperitonitis (en'do-per-ĭ-to-nĭ'tis) [+ *peritoneum*, peritoneum, + *itis*, inflammation] Superficial inflammation of the peritoneum.

endophlebitis (en'do-fle-bĭ'tis) [+ *phleps*, vein, + *itis*, inflammation] Inflammation of inner coat of a vein.

e. obliterans. E causing obliteration of a vein [tal vein].

e. portalis. Inflammation of the portaloplasm [+ *plasma*, matter formed]. The internal, more fluid protoplasm of a cell which lies within the ectoplasm which forms the peripheral layer.

endoplast (en'do-plast) [+ *plassem*, to form] A cellular nucleus.

end-organ. The expanded end of a nerve fiber in a peripheral structure.

e. sensory. An encapsulated termination of a nerve fiber which serves as a receptor.

endorrhachis (en-dō-rā'kis) [G. *endon*, within, + *rachis*, spine] Membrane lining, the spinal dura mater.

endorrhinitis (en-dō-rĭ-nĭ'tis) [+ *rhin*, nose, + *itis*, inflammation] Inflammation of the mucous membranes of the nose. *SYN* *coryza*.

endosalpingitis (en'do-sal-pin'ĭ'tis) [+ *salpĭx*, tube, + *itis*, inflammation] Inflammation of lining of fallopian tubes.

endoscope (en'do-skōp) [+ *skopein*, to examine] Metal, rubber, or glass tube for examining cavities through natural openings.

endoscopy (en-dos'ko-pĭ) [+ *skopein*, to examine] Inspection of cavities by use of the endoscope.

endosep'sis [+ *sepsis*, decay] Septicemia having its origin within the body.

endoskel'eton [+ *skeleton*, skeleton] Internal bony framework of the body. *SEE* *ezoskeleton*.

endosmometer (en-dos-mom'et-er) [+ *ōsmos*, a thrusting, + *metron*, measure] Device for estimating inward passage of liquid through a septum.

endosmose, endosmosis (en'dōs-mōs', -mō'sis) [+ *ōsmos*, a thrusting, + *ōsis*] Osmosis in which flow of water is from the outside liquid to the solution within a membranous cell.

endospore [+ *sporos*, a seed] Biol.: Thick walled spore within the bacterium.

endosteitis (en'dos-te-ĭ'tis) [+ *osteon*, bone, + *itis*, inflammation] Inflammation of the endosteum or of medullary cavity of a bone.

endosteoma [+ " + *ōma*, tumor] A tumor in the medullary cavity of a bone.

endosteum [+ *osteon*, bone] Membrane lining bone in the medullary cavity.

endostitis (en-'dos-tī'tis) [' + " + *itis*, inflammation]. Inflammation of the endosteum or the medullary cavity of a bone

endostoma (en-dos-to'mā) [' + " + *ōma*, tumor]. Osseous tumor within a bone

endostosis (en-dos-to'sis) [' + " + *ōsis*]. The development of an endostoma.

endothelial (en-do-the'll-ā) [' + *thēlē*, nipple] Pert. to or consisting of endothelium.

endotheliocyte (en-'do-the'll-ō-sit) [' + *kytos*, cell] Large, phagocytic, wandering cell found in circulating blood and in tissue.

endotheliocytosis (en-'do-the'll-ō-si-to'sis) [' + " + *kytos*, cell, + *ōsis*]. Abnormal increase in endothelial cells.

en'dothe'lio'ma [' + " + *is*, *m-*, fiber, + *ōma*, tumor] Tumorous growth arising from endothelium containing fibrous substance.

endotheliolysin (en-'do-the'll-ō-lis-in) [' + " + *lysis*, dissolution] An antibody found in snake venom which dissolves endothelial cells

endotheliolytic (en-'do-the'll-ō-lit'ik) [' + " + *lysis*, dissolution]. Capable of destroying endothelial tissue

endothelioma (en-'do-the'll-ō-mā) [' + " + *ōma*, tumor]. Malignant growth of lining cells of the blood vessels

endotheliomyoma (en-'do-the'll-ō-mi-o'ma) [' + " + *mys*, muscle, + *ōma*, tumor] Muscular tumor with elements of endothelium.

endotheliomyxoma (en-'do-the'll-ō-miks-o'mā) [' + " + *myxa*, mucus, + *ōma*, tumor] Myxoma with element from endothelium

endothelotoxin (en-'do-the'll-ō-toks'in) [' + " + *toxikon*, poison] A specific toxin which acts on endothelial capillary cells, causing hemorrhages

endothelium [' + *thēlē*, nipple] A form of squamous epithelium consisting of flat cells which line the blood and lymphatic vessels and the heart. It is derived from mesoderm

endotherm knife. A knife devised for using a high frequency current

endothermal [G *endon*, within, + *thermē*, heat] 1. Pert to production of heat within an organism 2. Pert to absorption of heat during formation of chemical compounds. SYN *endothemic*.

endothermic [' + *therme*, heat]. 1. Storing up potential energy or heat 2. Absorbing heat. 3. Accompanied by heat absorption

endothermy (en-'do-the'r-mi) [' + *thermē*, heat] Term used as a synonym for surgical diathermy.

endothrix [' + *thrix*, hair]. The parasite causing thea tonsurans

endothyropexy (en-do-thi're-o-peks'i) [' + *thyreos*, shield, + *pēxis*, fixation]. Displacing the thyroid gland and fixing it to the side of the neck

endothyroidopexy (en-'do-thi'royd-o-peks'i) [' + " + *eidōs*, form, + *pēxis*, fixation]. Operative displacement of the thyroid gland and fixing it to the side of the neck. SYN: *endothyropexy*.

endotoscope (end-o'to-skōp) [' + *ous*, of-, ear, + *skopein*, to examine] An ear speculum. SYN: *otoscope*.

en'dotexico'sis [' + *toxikon*, poison, + *ōsis*]. Poisoning due to an endotoxin.

en'dotoxin [' + *toxikon*, poison]. Bacterial toxin confined within the body of a bacterium, freed only when the bacterium is broken down

SEE *cytotoxin*, *erythrotoxin*, *exotoxin*, *leukotoxin*, *neurotoxin*.

endotracheitis (en-do-tra-ke-i'tis) [' + *trachea*, trachea, + *itis*, inflammation]. Inflammation of the tracheal mucosa.

endotracheitis (en-'do-tra-ke-l-i'tis) [' + *trachēlos*, neck, + *itis*, inflammation]. Inflammation of the endocervical tissues SYN *endocervicitis*.

en'dovasculi'tis [' + L. *vasculum*, vessel, + G. *itis*, inflammation] Inflammation of the endangium or inner coat of a blood vessel SYN *endangetis*.

endove'nous [' + L. *vēna*, vein]. Within a vein. SYN *intravenous*.

end plate. The terminal mass of a nerve fiber ending on a muscle cell

end-plate, motor. An ending in a striated muscle fiber, a myoneural junction

end product. The final waste or excretory product of digestion that passes from the system

endyma (en'dim-ā) Membranous lining of cerebral ventricles SYN *ependyma*.

en'ma (pl *enemas* or *enema'ta*) [G]. Injection of water, either plain or containing various drugs, etc., into the rectum and colon to empty the lower intestine, or to introduce food or medicine for therapeutic purposes

e., analleptic. One with ½ teaspoonful of salt to a pint of tepid water, a "thirst" enema

e., anthelmintic. One given to expel worms. Some thread worms will be carried away with a soapuds enema with turpentine. When given, the results should be scrutinized very closely to see if worms have been expelled. It may be necessary to send a specimen to the laboratory for microscopic or macroscopic examination. If so, the specimen must be sent immediately and while warm. Thermos bottles may be provided for such purposes. If so, the nurse should have the bottle warmed so that no time will be lost in getting the specimen to the laboratory.

USES. Quassia is used as an infusion for rectal injection in the treatment of pin or thread worms. To 1 diam of quassia chips add 8 ounces of cold water and let it stand for 2 or 3 hours. Strain and use for a single injection [rhea].

e., antidiarrheic. One given for diarrhea.

e., antiseptic. One for the destruction of microorganisms [spasms].

e., antispasmodic. One to counteract

e., astringent. One given to contract intestinal tissue and to provoke subsequent evacuation of worms. Those given for anthelmintic purposes are also useful when an astringent is needed. The following astringents are credited with inhibiting worms by dehydration, and with reducing the intestinal mucosa which harbors them

Alum in a 1 to a 250 parts solution, mixed with water

Calumba as ordered by the physician. *Limewater* in a saturated strength solution.

Phenol (carbolic acid) in a one-fourth of 1% solution, to a one-half of a 1% solution

Quinine bisulfate in a 1 to 2000 parts solution, or a 1 to 500 solution. Also used in amebic colitis for an irrigation.

Sodium chloride in a hypertonic solution. This in double strength or 1 tablespoonful to the quart

Tannic acid solution, 1 to 2500 parts of water.

e., blind. The insertion of a rubber tube to cause expulsion of gas or flatus.

SEE: *carminative enema*.

e., carminative. One given to relieve distention caused by flatus and to stimulate peristalsis.

It calls for an examination of the patient's abdomen both before and after administering the enema. Special attention must be paid to the exclusion of flatus and of fecal matter. Often there is a high degree of distention, and it is vastly important to know of the relief from flatulence and accumulated feces. A very detailed description must be given after a careful examination has been made of the returns.

The carminative enema should be sufficiently warm, as it is to reach more of the intestinal tissues than the general cleansing enema, and as it also causes a greater hyperemia. It should penetrate farther than most enemas.

The temperature may be 115° F. Hot normal saline solution, 110° F., to the amt of 500 cc, to which 1 dram, or 4 cc, of spirits of peppermint or tincture of asafetida has been added, may be used in relieving a patient of flatulence. The amt of the solution may be increased to 1000 cc, which will give good results.

e., cleansing. One to empty the lower intestine or the colon.

PROCEDURE: 1 Bring all equipment to bedside. 2 Screen bed. 3 Turn patient on left side, with right leg flexed, in as comfortable a position as possible. 4 Place small rubber sheet covered with large towel under buttocks. 5 Cover shoulders with 1 bath blanket folded crosswise. Cover legs with other bath blanket, fan-folding upper bedding to foot of bed, and having blankets lap a few inches over patient's buttocks. 6 Hang enema can on stand, having it about 2 feet above patient (not more), and see that stopcock is working properly. 7 See that solution is the proper temperature. 8 Lubricate rectal, or enema, tube for about 2 inches at end. 9 Run a little of the solution through tube into bedpan to warm tube. Close stopcock. 10 Insert tube into rectum. If you meet with resistance wait a few seconds, then proceed. 11 Open stopcock and let fluid run in. If it seems to be flowing too fast pinch the tube with your finger and thumb. 12 If patient complains of sharp pain, or is unable to retain fluid, stop flow for a minute. 13 When all fluid has been run in slowly remove tube and place bedpan. 14 Detach enema, or rectal, tube and lay in emesis basin. *Do not put it into the can.* 15 See that patient is comfortable on pan, covered with the bath blankets and the signal within reach. 16 Remove and care for enema tray. 17 When patient has finished expelling enema remove pan and do perineal toilet as usual. 18 Remove bath blankets and replace upper bedding. 19 If patient has used toilet paper himself provide soap and water for his hands. 20 Chart enema as directed.

e., demulcent. SEE *emollient enema*.

e., Dobell's. One for nutritive purposes.

e., egg and ether. Used as a last resort in the relief of distention.

It consists of magnesium sulfate, 1 ounce of ether, and the whites of 2 eggs. Water enough is added to make 1 pint of fluid. Mix the egg whites with the ether and beat until the mixture bubbles, then add the magnesium sulfate

which has been dissolved in hot water; lastly, add the remaining warm water. All should be ready before the final water is added.

CHARTING. The results of a carminative enema for flatulence should be noted and charted. The abdomen should be examined both before and afterward to be sure of the results obtained. If hard and distended before giving the enema, and soft and flat afterwards it is evident good results have been obtained. Do not rely entirely upon the patient's word. If there should be any amt of foam in the bedpan this indicates relief from the flatulence has been obtained.

e., emollient. One given to soften and protect tissues by making a coating over membranes, allaying local pain and irritation, and to act as a vehicle for the rectal administration of drugs.

It should be given at a temperature of about 105° F., or in a severe case at about 100° F. After giving the record must show if the patient felt relieved, and to what extent, also if the solution was retained in its entirety.

1 Mix *anilyum* 2 drams with 1 ounce of cold water, then add 5 ounces of boiling water. Boil mixture 1 or 2 minutes to the consistency of muciilage. Now cool to about 105° F., and give slowly with a large catheter. If too small a catheter is used the solution will not pass through, if of a pastilike constituency. A bulb or piston syringe attached to a rectal tube may be used. From 10 to 30 minims of laudanum are often used in this enema as prescribed by the attending physician. It is best given by means of a small hand syringe, the solution being injected rather than flowing by gravity. The results are also better given in this manner.

2 *Olive oil* or *cottonseed oil* will also act as an emollient when injected. The tissues in this way are prevented from coming in contact with irritating substances, thus relieving the pain of inflammations through protecting the delicate membrane.

3 *Mucilage of acacia* is used as an emollient, 1 ounce to 5 ounces of water, or a thin, strained tea from boiled flaxseed, 4 or 5 ounces, also acts as a good emollient. This, of course, is only used on a doctor's order.

4 *The bismuth enema* may be given for its emollient effect. This also must be prescribed by the physician. Four or 5 ounces of water are used in which to dissolve the bismuth. Too large an amt of enema may not be retained, in which case the effect desired is lost; the water will be absorbed and the bismuth will form a coating over the intestinal mucosa.

5 *Thin, strained gruel*, 4 ounces, may be given for emollient effect, and it may be absorbed as a nutrient.

e., evacuating. SEE *cleansing enema*.

e., Ewald's. A nutritive enema containing red wine, 20% grape sugar solution with wheat flour boiled in it, mixed with eggs.

e., flatus. One to relieve gas pressure. Contains 1 dram of glycerine and ½ ounce of magnesium sulfate in 4 ounces of water.

e., high. One to reach the colon. Insertion of rubber tube into rectum to carry water as far as possible. Too frequent irrigation, esp. with hot water, may cause diverticula.

e., lubricating. Administered after an operation for hemorrhoids, and in order to soften the feces and lubricate the passage or anal canal to the external orifice or anus. When there is an impaction of feces, a lubricating enema may be given, followed in 2 hours by a cleansing enema.

OLIVE OIL. 4 to 6 ounces, warmed, may be given, or cottonseed oil warmed in quantities of from 4 to 6 ounces in the evening. The patient should remain in a prone position with hips elevated for half an hour following the enema in order to help retain the oil and thus aiding it in passing higher in the colon.

WARM SWEET OIL. 4 ounces, injected into the rectum with a bulb or piston syringe, will serve the purpose better than the usual enema apparatus. The hips should be elevated, and a cotton pad held against the anal region for a few minutes in order to help retention.

e., m. and m. Eight ounces of milk, and 8 ounces of molasses. The mixture may also be in proportions of 6 to 6. This is esp. efficient, as the sugar of the molasses with the milk forms gases which distend the bowels, causing frequent copious bowel movements. Starch water may be added to a 6 to 6 mixture to the extent of 4 ounces.

e., Mayo. Granulated sugar, 2 ounces, 1 ounce of sodium bicarbonate, and 8 ounces of water.

The sodium bicarbonate is added to the sugar and water mixture at the bedside, just before the solution is ready to be given. The combination of the sugar with the acid content of the intestine coming in contact with the bicarbonate causes a fermentation and production of gases. The bowels thus become inflated, causing a hyperdistention which produces bowel action.

e., medicinal. An enema to which some drug or medication has been added on order of attending physician. It is necessary that this enema be retained and absorbed. It may be given to medicate diseased conditions of the rectum, sigmoid, or colon, or for absorption for its general effects. Although substances (other than fluids) are not absorbed in the large intestine as extensively as in the small intestine, the chemical changes that may occur must be very simple if any absorption may be expected. **See: preparations usually given by rectum.**

e., Noble's. One dram of turpentine mixed well with glycerine, 2 ounces, mix 3 ounces of magnesium sulfate with 4 ounces of water, and pour the 2 mixtures together.

e., nutrient or nutritive. One to give sustenance to a patient unable to be fed otherwise.

It may consist of peptonized milk, glucose, and other solutions. The temperature must be about body heat, and whatever food material is used should never be boiled.

The various prescriptions usually ordered are: (1) Foods most apt to be absorbed; (2) concentrated, easily digested and assimilable substances; (3) predigested foods; those that have been peptonized, such as milk, eggs, and meat broth.

Alcohol, brandy, and whisky produce energy but they do not feed the tissues. The energy produced reduces the tax upon the body's tissues for energy, and conserves the proteins as nourishing factors. Alcohol, however, should be re-

stricted as too much is destructive to the tissues. Dextrose is irritating although otherwise nutritive and absorbable.

TEMPERATURE OF SOLUTION. This should be 105° F. The attending physician prescribes the diet and the time of feeding. Much depends upon the condition of the patient and the diet prescribed.

GLUCOSE. If glucose is prescribed, 3 ounces of a 5-10% solution may be used. A very good nutritive enema is prepared by peptonized milk, 4 ounces, liquid beef preparation, ½ ounce, the white of 1 egg stirred into the mixture, and about 15 grains of salt. To this 15 cc of *spiritus frumenti* may be added. This serves a double purpose because it is both nutritive as well as stimulating. Another formula is malted milk, 15 grams, somatose, 4 grams, water, 4 ounces, sodium chloride, 15 grains, white of egg and peptonized milk, 1 ounce. Another is peptonized milk, 5 ounces, with white of 1 egg, alcohol, 1 dram, and 15 grains of salt. These solutions are best heated by setting in a pan of hot water.

PROCEDURE. An evacuating enema of normal saline solution is usually given every 24 hours as an aid to absorption and to remove any mucus. The feedings may be given at 4 A. M. and at 8 A. M., followed at 12 noon with the cleansing enema, and a feeding at 4 P. M. and 8 P. M. The feedings should not consist of more than 4 to 8 ounces. The cleansing enema, however, is preferably given in the morning at about 6 o'clock, then the feeding may be given at 7 o'clock. This interval gives time to recover from any peristaltic irritation.

Not too much should be given at one time, and not at too frequent intervals. Every 2 hours should be sufficient if only 2 or 3 ounces are given at a time. The nurse should endeavor to estimate the amt absorbed in a given time. Some feedings are ordered every 3 hours during the day, or every hour to 6 hours. If given every 4 hours during the day, the feeding at 4 or 6 o'clock in the morning may be omitted because the cleansing enema is usually given early in the morning to prepare the intestinal tract for the day's feedings.

The injections are given with a catheter which should be lubricated. Glycerine should not be used, as it activates peristalsis. At least 15 to 20 or 30 minutes should be taken for giving a nutritive enema, as the slower the feeding is given, the better are the chances of retention.

If patient cannot lie on left side for injection, hips should be elevated on a pillow (rubber covered). No air should be introduced through the rectal tube while giving the enema, as there may be a tendency to expel the solution.

PRECAUTION. Avoid anything that incites peristalsis. Be sure that the cleansing enema is administered before beginning a series of feedings as indicated. Every precaution should be taken to prevent the expulsion of the feeding, as the patient depends on this feeding for sustenance. Any expulsion of the feeding would defeat the purpose of the treatment.

e., olive oil. Mix 4 ounces of olive oil with 1 dram of turpentine, beating the mixture well so as to break the oil globules. This will cause sufficient peristalsis to move the bowels.

e., one-two-three. Magnesium sulfate, 1 ounce, glycerine, 2 ounces, and hot water, 3 ounces (115° F.).

This mixture must be given with a small tube because of the small quantity, and the action desired. The results following the injection are more satisfactory if given very carefully with assistance to help the patient retain it.

One or 2 drams of turpentine may be added to the one-two-three enema. In adding turpentine, the glycerine and turpentine must be beaten well together and added to the magnesium sulfate and water. The turpentine must be mixed well with the oil to prevent irritation of the mucous lining of the bowel, otherwise it may be absorbed and cause kidney irritation. All ingredients must be well mixed together before giving to the patient.

e., pancreatic. One containing pancreatin.

e., physiological salt solution. One teaspoonful of salt to a pint of water is a normal salt solution. It may be abbreviated as N S Sol. The distention made by this enema excites peristalsis and evacuation. There is no harm in retaining this enema. Often ordered when there is dehydration.

e., purgative. This produces action when other enemas fail, it should be a *high enema*. The rectal tube should be inserted at least 6 inches. The ingredients are 1 pint soapsuds, ½ ounce of magnesium sulfate crystals, 1 ounce glycerine, and ½ ounce oil of turpentine. Beat the glycerine and oil of turpentine into an emulsion and add the other ingredients.

Another purgative enema is ordinary soapsuds to which is added 15 grains of powdered ox-gall. This usually produces drastic results.

2 Ox-gall, 60 grains, with 4 ounces of castor oil may be used with the whites of 2 eggs stirred into the mixture. To this add 1 pint of very warm water at about 115° F.

3 One-half ounce of ox-gall may be added to 1 quart of plain water, or one-half of this mixture may be used with desired results.

e., quantity of. For retention, 3-8 ounces. Cleansing. For a child: ½-1½ pints, infants ½-2 ounces; adults 2-4 pints.

e., quassia. See *quassia*.

e., refecton. This is one to retain. It may be used to provide nourishment, to medicate a diseased mucous membrane, or for absorption purposes, or for general, local, or systemic action. This enema must be of constituents which will not stimulate the nerve endings and reflexly promote peristalsis. It necessarily must consist of a small amt. of solution. The rectum and lower bowel must first be well cleansed, and all irritation resulting from evacuation must subside before giving, or the purpose will be defeated. The patient should be placed on left side with knees flexed, and the rectal tube inserted high; 6 inches or more. Allow the fluid to flow through the tube before inserting to expel air. Pressure on tube should be made with fingers to prevent loss of liquid. Lubricate tube before inserting, and introduce with a twisting motion, slowly pushing it in so as not to bring discomfort to the patient. Unless absolutely necessary, the tube should not be slipped forward or backward to make

the solution flow. Pushing may stimulate peristalsis. If the fluid does not readily flow, grasp tube in one hand, squeezing, compressing, and relaxing, so that suction will cause solution to flow. Allow fluid to run very slowly, stopping occasionally to aid retention. If the least desire to expel is manifested fluid should be stopped until the desire to evacuate has passed. Upon withdrawal of tube, which should be done quickly, pressure with a pad of cotton should be made over anus for a minute or two to prevent evacuation. The patient should be informed of the purpose of this enema so that cooperation may be secured. Enemata classed in the retention group may include the following: *emollient, lubricating, medicinal, nutritive, sedative, stimulating, q.v.*

e., Rosenheim's. A nutrient one, containing cod liver oil, sugar, and pepsin in a 3% soda solution.

e., saline. One with solution of magnesium sulfate in warm water.

e., sedative. Retention enema given for its soothing action and to allay irritability. The temperature should be about 100°-105° F. Before and after it has been administered, the condition of the patient must be noted and recorded. Watch for untoward effects.

Paraldehyde may be ordered in delirium tremens, and this should be dissolved in thin, boiled starch solution. In water it dissolves in the proportion of 1 to 8. It must be injected with a small catheter. *Paraldehyde* is also sometimes ordered in epilepsy, manias, and various nervous irritations. The dosage varies in different institutions and among different physicians.

Chloral Hydrate. This may be administered as a sedative but only on a doctor's order. There are dangers attendant upon the administration of the drug in almost any form. The usual dosage for an enema is 20 grains dissolved in 3 ounces of olive oil or 3 ounces of hot milk, or boiled cornstarch. It should be given at a temperature of 105° F. and administered with a small catheter as a *high enema*. The higher, the better the absorption.

Luminal Sodium, Veronal, or Trional. These are hypnotics. Three to 6 ounces may be dissolved in 3 ounces of thin starch water. If the drug is dissolved in a small amt. of plain hot water, and the mixture stirred into the starch water it will be a better solution.

Sodium Bromide. Fifteen to 60 grains may be dissolved in 3 ounces of warm milk, as ordered by a physician.

Paregoric. The tincture may be given per rectum if added to at least 2 ounces of thin starch water. The mixture should contain at least 2 ounces but not more than 4 ounces. It is prescribed for some specific result desired and given only on a physician's order.

Laudanum. This is sometimes given, 10 to 30 grains to 3 ounces of starch water for absorption.

e., shock. One to ward off shock.

e., simple mixed. A soapsuds enema to which is added 1 dram of salt and ½ ounce of molasses.

e., soapsuds. The soapsuds are either ready prepared, or may be made by placing soap particles in a shaker and agitating the water until the right constituency is obtained. The foam is not removed. If liquid soap is used, 1 ounce to 1 quart of water is the right propor-

tion. A milky solution is of sufficient strength. Strong soapsuds should not be used, as there is danger of injuring the intestinal mucosa. The mild soaps, such as castile, are best for suds.

INCOMPATIBILITIES *Magnesium sulfate*.

e., s. s. & p. A mixture of 1 dram of peppermint added to a soapsuds solution. The peppermint may be added to a plain water solution, 1 dram to 16 ounces, a good enema to relieve flatulence.

e., s. s. & t. A mixture of thick liquid soap, green soap is best. Add $\frac{1}{4}$ ounce or 1 dram of turpentine and beat the 2 ingredients thoroughly together. The emulsion of this mixture is stirred into 1 quart of water at 115° F.

e., stimulating. This may be grouped with the medicated and the retention enemas. It is supposed to cause irritation. Should be given at 115° F. It is intended to excite activity and ordered when the patient is in shock, or in some unconscious state, as from narcotic poisoning. The patient's condition must be compared both before and after giving.

Ingredients used are the following: **Coarse.** Eight ounces black coffee with 1 of *spiritus frumenti* given in 4-ounce doses and repeated in 2 hours if absorption has taken place. Otherwise, 4 ounces every 4 to 6 hours. Black coffee and warm saline solution, the coffee being cooked in the solution. A cup of coffee made from 1 tablespoonful of ground coffee to 1 cup of water gives the equivalent of 0.1 to 0.2 gram or $1\frac{1}{2}$ to 3 grains of caffeine.

SALINE SOLUTION. Hot normal saline solution, 4 ounces, with $\frac{1}{2}$ to 1 ounce of *spiritus frumenti*.

DIGITALIS Tincture of digitalis or an infusion of digitalis mixed with black coffee and normal saline solution.

LUGOL'S SOLUTION. This solution with normal saline solution may be given per rectum as ordered.

e., temperature of. Carminative, stimulating, and for inflammations, 115° F. For hemorrhage, 120° F. For others, 105° F.

e., thirst. Analeptic enema, *q v*

e., yeast. One quart of warm water and $\frac{1}{2}$ cake of yeast, thoroughly mixed and given very warm.

enema, words pert. to: colocolyster, colonic irrigation, clyster, enteroclysis, medicine, rectal administration of.

enepidermic (en-ep-i-der'mik) [G. *en*, in, + *epi*, upon, + *derma*, skin] Pert. to drugs applied without friction. **See** *inunction*. Applied to or placed upon the surface of the skin. A term used in connection with application of medicinal agents to the skin without friction.

energometer (en-er-gom'e-ter) [“ + *ergon*, work, + *metron*, measure]. An instrument for measuring blood pressure. Especially one used in studying pulse pressure.

energy [“ + *ergon*, work] The capacity of a system for doing work or its equivalent in the strict physical sense.

Energy is manifested in various forms: Motion (kinetic *e.*), position (potential *e.*), light, heat, sound, and so on. These forms are mutually interchangeable according to certain laws. Thus, the chemical energy residing in 1 gram of glucose can be liberated in the form of heat, so that if complete oxidation (to carbon dioxide and water) is carried out at 20° C. and atmospheric pressure one obtains 3.74 calories of heat. This

fact is fundamental in the science of *dietetics*. **See** *calorie*.

e. changes. These may be physical or chemical, or both. Movement of a part of the body, as the arm, shortens and thickens the muscles involved and changes the position and size of cells, temporarily, but the intake of oxygen in the blood, combining with sugar and fat, creates a chemical change, producing heat and waste products within the cells, which in turn produce fatigue if not eliminated.

e., conservation of. The theory that no energy in the universe can be lost, but that it may be transformed into other forms.

e., latent. That which exists but which is not being used.

e., potential. **See** *latent e.*

e., radiant. That form of energy which is transmitted through space without the support of a sensible medium. Radio waves, infrared waves, visible rays, ultraviolet rays, x-rays, gamma rays and the recently discovered cosmic rays are energy in this form.

e., static. **See** *latent e.*

energy, words pert. to: chemism, chemokinesis, dietetics, kinetic, metabolism, physical agents, radiant, synergic, unit, *vital*.

enervation [L. *enervatio*, to weaken, + *nervus*, nerve] Weakness, failure of nerve energy.

engagemant. In obs. the entrance of the fetal head or the part being presented into the superior pelvic strait.

Engelmann's disk. A narrow zone of transparent material lying on each side of the intermediate disk in the isotropic or I disk of a striated muscle fiber.

englobe' [G. *en*, in, + L. *globus*, a ball]. To absorb within a spherical body, as the ingestion of bacteria by the phagocytes.

Engman's disease. Pustular eruption resembling eczema, which often occurs simultaneously with a pyogenic process. **SYN.** *dermatitis infectiosa eczematoides*.

engorged (en-gorj'd') [Fr. *engorger*, to obstruct, to devour]. Distended, as with blood.

engorge'ment [Fr. *engorger*, to obstruct, to devour] Vascular congestion, distention.

engram (en'gram) [G. *en*, in, + *gramma*, mark] 1. Suppositious traces on protoplasm made by irritants or stimuli which, when repeated, form a habit after the stimulus ceases, the mnemonic hypothesis. 2. The result of a psychic experience supposed to have established a pattern in memory. **See** *ekphorize*, *mnemic theory*.

engraphia (en-gra'fi-ä) [“ + *graphein*, to write] The process of making engrams, *q v*.

enhem'atospore [“ + *atma*, blood, + *sporos*, spore] A spore of the malarial parasite. **SYN.** *enhemospore*, *merozoite*.

enhemospore (en-hem'o-spör) [“ + *sporos*, spore]. A spore of the malarial parasite. **SYN.** *enhematospore*, *merozoite*.

enkatarrhaphy (en-kat-ar'af-i) [G. *enkatarrhaphen*, to sew in] Artificial implantation of a structure where it does not normally occur.

enolase (é-nô-läs). An enzyme present in muscle tissue which converts phosphoglyceric acid to phosphopyruvic acid.

enomania (en'-o-ma-ni-ä) [G. *oinos*, wine, + *mania*, madness]. Craving for alcohol. delirium tremens.

enophthalmus (en-of-thal'mus) [G. *en*, in, + *ophthalmos*, eye]. Recession of eyeball into orbit

enosomania (en-ö-si-mä-ni-ä) A mental state characterized by excessive and irrational terror

enoste'sis [' + *osteon*, bone, + *ösis*]. An osseous tumor within the cavity of a bone.

ensiform (en'si-form) [L. *ensis*, sword, + *forma*, form] Swordlike structure.

e. cartilage. Lower part of sternum, below the gladiolus. SYN *xiphoid cartilage* or *process*. SEE *chondroxiphoid*, *xiphodynia*.

ensisternum (en-si-ster'num) [' + G. *sternon*, sternum]. The tip of the sternum, ensiform or xiphoid appendix. SYN *metasternum*.

entrophe (en'stro-fe) [G. *en*, in, + *strephein*, to turn] Inversion, a turning inward, esp. of eyelids

en'tad [' + L. *ad*, toward]. Toward the inside, inwardly.

en'tal [G. *entos*, within]. Pert to the interior; inside, central

entamebiasis (ent-am-e-bi-as-is) [' + *amöbē*, change]. Infestation with *Entameba*

Entamoeba (ent-am-e'ba) [' + *amöbē*, change]. A genus of ameba several of which live in the intestine of man. Some are parasitic. Characterized by the presence of 4 or 8 nuclei in their cysts.

E. buccalis. **E. gingivalis**, *q v*

E. coli. Found normally in the upper intestinal tract. Nonparasitic

E. gingivalis. Non-pathogenic species which inhabits the mouth

E. histolytica. A parasitic form of ameba, the cause of amebic dysentery and tropical abscess

E. karful'isi. Found in the pus of necrotic bone abscesses.

E. tetragena. Now considered identical with *E. histolytica*

E. undulans. A species found in the intestine.

entasia (en-ta'si-ä) [G. *entasis*, a straining]. Spasmodic muscular contraction.

entelechy (en-tel'e-ki) [G. *entelecheia*, actuality]. 1. Complete development. 2. The activating cause of everything.

enteradeni'tis [G. *enteron*, intestine, + *adēn*, gland, + *-itis*, inflammation]. Inflammation of intestinal glands

en'teral [G. *enteron*, intestine]. Within the intestine as distinguished from *parenteral*.

enteralgia (en-ter-al'i-ä) [' + *algos*, pain]. Neuralgia or pain in the intestines. Intestinal cramps or colic.

enterectasia (en-ter-ek-tä'si-ä) [' + *ek-tasis*, dilatation]. Dilatation of the small intestines.

enterectomy (en-ter-ek'to-mi) [' + *ektomē*, excision]. Excision of a portion of the intestines.

enterocosis (en-ter-el-ko'sis) [' + *ek-tōsis*, ulceration]. Intestinal ulceration.

enteropilecele (en-ter-ep-i'pō-sēl) [' + *epiploon*, omentum, + *kēlē*, hernia]. Hernia involving the bowel and omentum.

enteric (en-ter'ik) [G. *enteron*, intestine]. Pert. to the intestinal tract.

e. fever. Typhoid fever.

e. pills. Those which will not dissolve until they reach the intestines.

enter'icoid [' + *eidos*, resemblance]. Resembling typhoid fever

enteritis (en-ter-i'tis) [' + *-itis*, inflammation] Inflammation of the intestines, more particularly of the mucous and submucous tissues, usually of the small intestines.

e., acute catarrhal. Acute inflammation of ileum and colon with diarrhea and intestinal catarrh. SYN *Frequent*, watery, light colored stools, abdominal colic, flatus. Attack short. TREATMENT: Liquid diet, laxatives, milk purgatives; complete rest.

e., chronic catarrhal. Chronic inflammation of intestines and colon with chronic diarrhea. SYN *Less severe than acute catarrhal enteritis*. TREATMENT: Diet restricted to milk, soups, cooked fruits, and vegetables. Rest.

e., croupous. Diphtheritic. A sequel of typhoid fever and other diseases. Often characterized by formation of false membrane. TREATMENT: SEE *chronic c. e.*

e., mucous. A condition involving the intestinal mucosa characterized by excessive secretion of mucus and passage in the stools of shreds of pseudomembranous material. Usually accompanied by constipation or diarrhea or both alternating, intestinal myxoneurosis.

entero- [G. *enteron*, intestine] Prefix. Noting some relation to the intestines.

enteroanastomosis (en'ter-o-an-as'to-mo'sis) [' + *ana*, up, + *stomōsis*, a mouth]. Intestinal anastomosis

enteroan'tigen [' + *anti*, against, + *genan*, to form]. An antigen derived from the feces

enteroapokleisis (en'ter-o-ap-o-kl'i'sis) [' + *apokleisis* a shutting out] Operation for exclusion of a part of the intestine.

enterobacteriotherapy (en'tēr-ō-bāk-tē-ri-o-ther-ä-pl) [' + *bakterion*, little rod, + *therapēia*, treatment] Use of vaccines containing intestinal bacteria.

enterob'lasis [' + *bios*, life] Infestation with pin worms (*Enterobius vermicularis*)

enterobil'iary [' + L. *bilis*, bile] Pert to the intestines and the bile passages

Enterobius (ēn-tēr-ō'bi-ūs). A genus of parasitic nematode worms, formerly *Oxyuris*

E. vermicularis. A species or nematode worms which inhabits the cecum, appendix, and neighboring regions of the intestine. In females, the genital organs and bladder may become infected. Female worms average 8 to 13 mm in length, males, 2 to 5 mm. Distribution is world wide. Infestations characterized by irritation of the anal region and allergic reaction of the neighboring skin, accompanied by intense itching which may result in loss of sleep, excessive irritability, and sometimes sexual disorders.

enterobro'sia [' + *brōsis*, an eating]. Perforation of the intestine.

enterocèle (en'ter-o-sēl) [' + *kēlē*, hernia]. 1. A hernia of the intestine. 2. Post vaginal hernia.

enterocentesis (en'ter-o-sen-te'sis) [' + *kentēsis*, puncture]. Puncture of intestine to withdraw gas or fluids.

enterochirurgia (en'ter-ō-ki-rur'i-ä) [' + *cheir*, hand, + *ergon*, work]. Intestinal surgery

enterocholecystostomy (en'ter-o-ko'le-sis-to-mi) [' + *cholē*, bile, + *kystis*, a bladder, + *stōma*, opening]. Making an opening bet the gallbladder and small intestine. SYN: *cholecystenterostomy*.

enterocholecystotomy (en'ter-o-ko'le-sis-to'to-mī) [" + " + *tomē*, incision] Incision of both gallbladder and intestine

enterocinesia (en'ter-o-sin-e'si-ā) [" + *kinēsis*, movement] Intestinal movement *SYN* peristalsis.

enterocinet (en'ter-o-sin-et'ik) [" + *kinēsis*, movement]. Pert. to or promoting peristalsis

enteroclysis (en-ter-ok'li-sis) [" + *klysis*, injection] 1 Injection of a nutrient or medicinal liquid into bowel 2 Irrigation of colon with large amt of fluid intended to fill the colon completely and flush it *SEE* proctoclysis.

PREPARATIONS USED 1 Bicarbonate of soda, 1 teaspoonful of soda to a pint or quart of normal saline solution 2 Boiled water with boric acid, ½ to 1 dram to a quart 3 Powdered alum, 1 teaspoonful to a quart of water, may be used 4 Flaxseed-tea, made very thin 5 Normal salt solution, 1 teaspoonful of salt to 1 pint of water This need not be sterile, unless indicated by rectal operation or condition 6 Oil of peppermint or cinnamon, 5 to 15 drops to a pint of saline solution or plain water 7 Potassium permanganate, 3 to 10 grains to 2 quarts of water 8 Silver nitrate, 10 to 20 grains to a quart of water Normal saline solution should be used after the silver nitrate treatment. 9 Solution of tannic acid, 1 to 2% 10. Witch hazel solution

CHARACTER Note all symptoms of the patient, the amount of the solution given, its nature, time of administering, length of treatment, results obtained and the reaction of the patient as to relief, discomfort, or untoward symptoms

enteroclysm [G *enteron*, intestine, + *klysmos*, an injection] A high enema *SYN* enteroclysis

enterococcus. Any species of streptococcus inhabiting the intestine

enterocolle (en'ter-o-se'le) [" + *kolla*, hollow] The abdominal cavity.

enterocolitis (en'ter-o-ko-li'tis) [" + *kolon*, colon, + *itis*, inflammation] Inflammation of intestines and colon, a disease of teething, principally during summer, bet 6 and 18 months and often later

SYM Abdomen swollen, diarrhea, pain, rising temperature Stools frequent, often 1 an hour Contain mucus or blood Urine scanty. Convulsions The more common types are the catarrhal, tuberculous, and ulcerative

TREATMENT Dietetic, anodynes, cold water. **DRT** Stop all food, give plenty of water by mouth or rectum After 24 or 48 hours begin with lemon water, white of egg, whey or buttermilk In a few days add cream to buttermilk or whey Institute correct diet for infant feeding

enterocrinin (en-tēr-ok'tin-in) [G *enteron*, intestine, + *kriuein*, to separate] Hormone from animal intestines which aids digestion by stimulating the secretion of intestinal juice by the intestinal glands

enterocyst (en'ter-o-sist) [" + *kystis*, cyst]. A cyst of the intestinal wall.

enterocystocele (en'ter-o-sis'to-sēl) [" + *kēlē*, hernia] Hernia of the bladder wall and intestine

enterocystoma [" + " + *ōma*, tumor]. Cystic tumor of the intestinal wall. *SYN* enterocyst.

enterodyn'ia [" + *odynē*, pain]. Pain in the intestine. *SYN*. *enteralgia*.

enteroenteros'tomy [" + *enteron* + *stōma*, opening]. Formation of a communication bet 2 segments (not continuous) of the intestine

enteroepiplocele (en'ter-o-e-pip'lo-sēl) [" + *epiploon* omentum, + *kēlē*, hernia]. Hernia of small intestine and omentum.

enterogastritis [" + *gastēr*, belly, + *itis*, inflammation] Inflammation of stomach (*gastritis*) and of the intestines (*enteritis*)

enterogastrone (en'tēr-ō-gas'trōn) [" + *gastēr*, belly] A hormone secreted by the intestinal mucosa which depresses gastric motility and secretion

enterogenous (en-ter-oj'en-us) [" + *genēan*, to produce] Originating in the intestines

enterogram [" + *gramma*, mark] Tracing or graph of intestinal movements

enterography [" + *graphein*, to write] 1 A description of the intestines 2 Making of an enterogram

enterohepatic [" + *ēpat-*, liver]. Pert. to intestines and the liver

enterohepatitis [" + " + *itis*, inflammation] Inflamed condition of both intestine and liver

enterohydrocele (en'ter-o-hi'dro-sēl) [" + *ydōr*, water, + *kēlē*, hernia] Hydrocele with loop of intestine in the sac

enteroidea (en-ter-oyd'e-a) [" + *eidos*, form] The intestinal fevers, those caused by intestinal bacilli including *enteric* and *parenteric* fevers

enterokinase (en-ter-o-kin'āz) [" + *kinēsis*, movement] A substance or hormone occurring in the mucosa of the duodenum necessary for the activation of the trypsinogen of the pancreatic juice which is converted into trypsin. One of the enzymes of the *succus entericus*. It has no fat-splitting properties. *RS* enzyme, prosecretin, *trypsin*, *trypsinogen*.

enterolite [" + *lithos*, stone] Intestinal calculus

enterolith (en'ter-o-lith) [" + *lithos*, stone] An intestinal concretion

enterolithiasis (en'ter-o-li-thi'ā-sis) [" + *lithos*, stone] The formation or existence of enterolites

enterology [" + *logos*, study]. The study of the intestinal tract

enteromegalia, **enteromegaly** [" + *megas*, large] Abnormal enlargement of the intestines. *SYN* *megacolon*, *megacenteron*.

Enteromonas hominis (en-tēr-ōm'ō-nās) A minute flagellated, protozoan parasite which lives in the intestine of man It is rare and considered nonpathogenic

enteromyiasis (en-tēr-ō-mi-ā'sis) Disease due to the presence of maggots (the larvae of flies), in the intestines

enteromycosis [" + *mykēs*, fungus, + *ōsis*]. Disease of intestine due to bacteria May include bacterial diseases

enteron (en'ter-on) [G] The intestine

enteroncuritis [G *enteron*, intestine, + *neurōn*, nerve, + *itis*, inflammation]. Neuritis of the intestine

enteronitis (en-ter-on-'tis) [" + *itis*, inflammation] Inflammation of the small intestine *SYN*: *enteritis*.

enteroparesis (en-ter-o-par'e-sis) [" + *paresis*, relaxation]. Flaccidity of the intestinal walls with diminished peristalsis

enteropathy (en-ter-op'ā-thī) [" + *patōs*, disease]. Any intestinal disease.

enteropexy (en'ter-o-peks-i) [" + *pēxis*, fixation]. Fixation of the intestine to the abdominal wall.

enteroplasty (en'ter-o-plas-tī) [+ *plastēin*, to form] Plastic operation on intestines NP Watch diet and fluid orders Care of mouth SEE *laparotomy*.

enteroplegia [+ *plēgē*, stroke] Paralysis of the bowels

enteroplex (en'ter-o-pleks) [+ *plexis*, a weaving] Instrument for joining out edges of intestines

enteroplexy [+ *plexis*, a weaving] Union of divided parts of the intestine

enteroptosis (en-tei-op-to'sis) [+ *ptōsis*, a dropping] Prolapse of the intestine or abdominal organs

enterorrhagia (en'ter-or-rā'ji-ā) [+ *rēgnunai*, to burst forth] Hemorrhage from the intestines

enterorrhaphy (en-ter-or-rā-flī) [+ *raphē*, suture] The stitching of the lips of an intestinal wound, or of the intestines to some other structure.

enterorrhexis (en-ter-or-reks'is) [+ *rēxis*, rupture] Rupture of the intestine

enteroscope (en'ter-o-skōp) [+ *skopein*, to examine] Device for examination of intestines

enterosepsis [+ *sepsis*, decay] Intestinal toxemia; sepsis developed from the intestinal contents

enterospasm (en'tei-o-spazm) [+ *spasmos*, spasm] Painful peristalsis

enterostasis [+ *stasis* a standing] Intestinal stasis Cessation of or delay in the passage of food through the intestine

enterostenosis [+ *stēnōsis*, a narrowing] Narrowing or stricture of the intestine

enterostomy (en-ter-os'to-mī) [+ *stoma*, opening] Surgical formation of a permanent opening into the intestine through the abdominal wall.

enterotome (en'ter-o-tōm) [+ *tomē*, incision] Instrument for incision of intestines

enterotomy (en-ter-ot'o-mī) [+ *tomē*, a cutting] Incision or dissection of the intestines

enterotoxin A toxin produced by certain species of bacteria which produces symptoms characteristic of food poisoning

enterotoxism [+ *toxikon*, poison, + *ismos*, condition] Absorption of intestinal toxins SYN *enterosepsis*.

enterotropie [+ *trōpē*, a turning] Affecting or attracted by the intestines

enterovaccine [+ *L vacca*, a cow] A vaccine composed of fecal bacteria

enterovirus A member of a group of human viruses including the three polioviruses, the Coxsackie viruses, and the ECHO viruses

enterozoic [+ *zōon*, animal] Pert. to parasites inhabiting the intestines

enterozoön [+ *zōon*, animal] Any intestinal animal parasite

entheomania (en-the-o-mā'nī-ā) [G *entheos*, inspired, + *mania*, madness] Religious insanity

enthermic [G *en*, in, + *thermē*, heat] Promoting or pert to warmth

entheses (ēn'thē-sis) [G *a* putting in] The use of metallic or other inorganic substances to substitute for or replace lost tissue

enthetic (en-thet'ik) [+ *tithenai*, to place] Introduced from outside SYN *exogenous*.

ento- [G] Prefix, *entos*, within, inside.

entoblast [G. *entos*, within, + *blastos*, germ] The endoderm or hypoblast.

entocoele (en-to-sel) [+ *kelē*, hernia] 1. Internal hernia. 2. Displacement of

a part, inward.

entochondrosis (en'to-kon-dro-sto'sis) [+ *chondros*, cartilage, + *osis*] The development of bone within cartilage.

entochoroida (en'to-ko-roy-de-ā) [+ *chorioeidēs*, choroid] The inner layer of the choroid, coat of the eye

entocineria (en-to-sin-er'i-ā) [+ *L cinereus*, ash] The internal gray matter of nerve centers, esp of the brain

entocone (en'to-kōn) [+ *kōnos*, cone] The inner post. cusp of an upper molar tooth

entocornea [+ *L corneus*, horny] Post or inner lining membrane of cornea SYN *Descemet's membrane*.

entocyte (en'to-sit) [+ *kytos*, cell]. Int part of a cell within the ectoplasm SYN *endoplasm*.

entoderm (en'to-derm) [+ *derma*, skin] SYN *endoderm hypoblast* Inner layer of cells in the blastoderm * Innermost of the three primary germ layers of a developing embryo It gives rise to the epithelium of the digestive tract and its associated glands, the respiratory organs, bladder, vagina and urethra

entoeckad (en-to-ek'tad) [+ *ektos*, without, + *L ad*, toward] From within outward

entome (en'tōm) [G *en*, in, + *tomē*, a cut] Knife for division of urethral stricture

entomion (en-to'mī-on) [G *entomē*, notch]. The tip of mastoid angle of the parietal bone

entomology [G *entomon*, insect, + *logos*, science] The study of insects e., *medical*. That branch of entomology which deals with insects and their relationship to disease

entophyte (en'to-fīt) [G *entos*, within, + *phylon*, plant] Any vegetable parasite within the body

entophyton (en-to'fīt-on) [+ *phylon*, plant] Vegetable parasite in the body. SYN *entophyte* *

entopic (en-top'ik) [G *en*, in, + *topos*, place]. Normally situated, in a normal place

entoptic (en-top'tik) [G *entos*, within, + *optikos*, seeing] Situated in the eyeball

entoptoscopy (en'top-tos'ko-pī) [+ *ōps*, eye, + *skopein*, to examine] Inspection of intraocular shadows

entoral (en-to'rāl) [+ *L os*, or-, mouth]. An oral respiratory vaccine. Uses For immunization against colds.

entoretina [+ *L rete*, a net]. Internal layer of the retina

entorrhagia (en-tor-a'ji-ā) [+ *rēgnunai*, to burst forth] Internal hemorrhage. SEE *enterorrhagia*.

entostoblast [G *entosthe*, from within, + *blastos*, germ] Hypothetical nucleus of the nucleolus SYN *entoblast*.

entotic (en-to'tik) [G. *entos*, within, + *ous* of-, ear] Pert to int of ear or to perception of sound due to condition of the auditory apparatus.

entozoön (en-to-zo'on) [+ *zōon*, animal] Any animal parasite in any internal organ

entrophia (en-tro'fi-ā) [G. *en*, in, + *trophē*, nourishment]. Normal growth and nourishment

entrophy (ēn-trō'fi) That portion of energy within a system which cannot be utilized for mechanical work

entropion [+ *trepein*, to turn] Inward curling of eyelid, esp. lower lid, with lashes

Error: Spastic contraction of muscular fibers or of a cicatrix.

e. citatrical. A resulting from scar tissue on the inner surface of the lid
e. spastic. A resulting from a spasm of the orbicularis oculi muscles

entropionize [' + *trepein*, to turn]. To invert or correct by turning in

entropium [' + *trepein*, to turn]. Inward curling of eyelids. SYN *entropion*.

en'tryp. A turning inward.

enucleate (e-nu'kle-ät) [L. *enucleäre*, to remove the kernel of] 1 To remove a tumor or a structure from the body without rupturing, to remove a part entire 2 To destroy or take out the nucleus of a cell

enucleation (e-nu-kle-a'shun) [L. *enucleäre*, to remove the kernel of] 1. Removal of a tumor from its capsule 2 Act of unfolding

enucleator [L. *enucleäre*, to remove the kernel of] Instrument for separating a tumor mass, as a myoma

enuresis (en-u're'sis) [G. *enourein*, to void urine] Incontinence Involuntary discharge of urine, complete or partial, diurnal or nocturnal, dependent upon pathologic or functional causes, although it may be voluntary as representative of a behavior pattern

A child, for instance, may feel neglected, or feel a desire for attention, and attempt to center attention upon himself by deliberately wetting his bed. Urinary control, however, is generally established after the second year, although incontinence may be reestablished as a pathological manifestation after the fourth or not later than the eighth year.

Condition in adults abolished by administration of A. P. L., commercial gonadotropic preparation from placenta, in large doses of 4000 international units.

e., diurnal. Urinary incontinence during the day and its etiology is of a pathological nature. It may be caused by muscular contractions brought about by laughing, coughing, or crying, and it often persists for long periods of time, esp after protracted illness, but more frequently in the female.

ETIOI. Enuresis may result from urethral irritation, and fecal incontinence is sometimes associated with it. Excessive water drinking. There may be deficiency of the cord due to injury, cystitis may be present, and it may be associated with various diseases, such as diabetes insipidus and mellitus, epilepsy, or mental deficiency.

Children suffering from enuresis may be shy and sensitive, sometimes gloomy. These nervous manifestations may result from the reaction to the condition, or they may be a part of the behavior pattern of which the enuresis is a symptom. Parents should be taught to differentiate between physiological and mental causes of enuresis, as the child who is suffering from pathological symptoms should not be reproached or punished for that which is beyond his control.

TREATMENT. Examine the urine as soon as possible, esp. to ascertain the presence of white cells which are indicative of abnormality of the urinary tract. Great concern or censure should be avoided as it adds to apprehensiveness on part of child. If the result of a behavior pattern, the condition should be ignored as much as possible, but the cause of the behavior difficulty needs to be found and corrected.

Fluid should be restricted late in day,

and diurnal voidings should be spaced at more than ordinary intervals. The child may be awakened once or twice in the night and when fully awake, robed and walked to the bathroom. As improvement is noticed the number of awakenings may be lessened. The foot of the bed may also be elevated.

e., nocturnal. Urinary incontinence during the night. Wetting is irregular, and unaccompanied by urgency or frequency. Incontinence may cease for several weeks only to return. This type is more common in boys than in girls.

environment [L. *in*, in, + *verer*, to turn]. The surroundings, conditions, or influences which affect an organism, or the cells within an organism.

e. external. Those influences which are outside the body.

e. internal. Those influences within the body. Specifically, the tissue fluid constitutes the internal environment.

enzygotic (en-zi-got'ik) [G. *en*, in, + *zygon*, yoke] Developed from the same ovum.

e. twins. Identical twins, those developed from one ovum. SEE *dizygotic*.

enzyme (en'zim) [' + *zyme*, leaven] An organic catalyst produced by living cells but capable of acting independently of the cells producing them. They are complex colloidal substances which are capable of inducing chemical changes in other substances without themselves being changed in the process. Many enzymes have been isolated in pure crystalline form and all have proved to be protein in nature.

Enzymes are found particularly in digestive juices, acting upon food substances causing them to break down into simpler compounds. They are capable of accelerating greatly the speed of chemical reactions.

The reactions affected by the digestive enzymes are chiefly decompositions of a hydrolytic nature, but enzymes are equally important in the synthetic reactions of assimilation.

Each hydrolytic enzyme has been given a name which indicates the substance upon which it acts with the addition of the suffix *ase*. As an example, *lipases* indicate fat-splitting enzymes, *amylases*, starch-splitting ones, and *proteases*, protein-splitting enzymes. Some of them take a qualifying adjective, as salivary or pancreatic enzymes. Exceptions are the enzymes rennin, pepsin, and trypsin.

The substance acted upon by an enzyme is called the *substrate*. Zymogen is the name given to the inactive enzyme within a cell. The more common groups of enzymes are: (a) Hydrolytic e., fat, protein, starch, and sugar-splitting e's. (b) Coagulating e's or those which cause clotting. (c) Oxidases or oxidizing e's, deaminizing e's. Those destroying amines or amino groups during oxidation. (d) Reductases or reducing e's. (e) Those producing carbon dioxide without the use of free oxygen. (f) Those which produce the breakdown of a larger molecule into a smaller one without change of composition. (g) Mutases, those which bring about chemical rearrangement without change of the molecules in size.

Enzymes are specific in their action, i. e., they will act only upon a certain substance or a group of chemically closely related substances and no other; each enzyme has an optimum temperature at which it acts with greatest effi-

clency; each enzyme is influenced by the reaction of the medium in which it acts, there being an optimum degree of acidity or alkalinity.

Enzyme activity can be retarded or inhibited by (a) low temperatures, (b) high temperatures, (c) presence of salts of heavy metals (copper, mercury), (d) dehydration, (e) ultraviolet radiation.

Enzymes sometimes require the presence of additional substances in order to make them active. Nonspecific substances which activate enzymes are called *activators* (Ex. HCl for pepsin), specific substances which act selectively with certain enzymes only are called *coenzymes* (Ex. enterokinase for trypsinogen).

e., amylolytic. E. changing starch to sugar.

e., autolytic. E. producing autolysis, or cell digestion.

e., bacterial. E. developed by bacteria.

e., coagulating. E. converting soluble proteins into insoluble ones. Ex. *rennin*. A coagulase.

e., deamidizing. E. dividing amino acids into ammonia compounds.

e., decarboxylating. E. which separates CO₂ from organic acids. (Ex. *carboxylase*)

e., digestive. E. which is involved in digestive processes in the alimentary canal.

e., extracellular. E. which produces its effects outside the cell that produces it.

e., of fermentation. E. produced by bacteria or yeasts which bring about the fermentation of substances esp. carbohydrates.

e., glycolytic. E. oxidizing sugar

e., hydrolytic. E. which decomposes a substance by the addition of water

e., inorganic. A metallic colloidal solution, acting somewhat like an e.

e., intracellular. An enzyme that acts within the cell which produces it

Summary of the Main Enzymatic Processes in Digestion*

Site	Secretion	Enzyme	Substrate	Degree of Digestion	Products of Digestion
Mouth.	Saliva.	Ptyalin	Starch.	Slight.	Dextrins, maltose
		Maltase (?)	Maltose	Very slight	Glucose.
Stomach.	Gastric juice.	Pepsin.	Protein.	Incomplete.	Proteoses, peptones.
		Lipase.	Emulsified fats	Very slight.	Fatty acids, glycerol.
Intestine.	Pancreatic juice.	Trypsin.	Proteins.	Nearly complete.	Peptides, amino acids.
			Proteoses		
			Polypeptides		
		Steapsin.	Fats.	Nearly complete.	Fatty acids, glycerol
		Amylopsin.	Starch.	Nearly complete.	Dextrins, maltose.
		Maltase.	Maltose.	Fairly complete.	Glucose.
		Lactase.	Lactose.	Fairly complete.	Glucose, galactose
		Invertase (?)	Sucrose.	Fairly complete.	Glucose, fructose
		Rennin.	Casein.	Complete.	Paracasein.
		Erepsin.	Ordinary peptides.	Nearly complete.	Amino acids.
Intestine.	Intestinal juice and intestinal mucosa.	Erepsin.	Ordinary peptides.	Nearly complete.	Amino acids
		Amylase.	Starch.	Nearly complete.	Dextrins, maltose
		Rennin.	Casein.	Generally complete.	Paracasein.
		Enterokinase	Activates trypsin		
		Lipase.	Fat.	Nearly complete.	Fatty acids, glycerol.
		Maltase.	Maltose.	Complete.	Glucose.
		Lactase.	Lactose.	Complete.	Glucose, galactose
		Invertase.	Sucrose.	Usually complete.	Glucose, fructose.
		Nucleinases.	Nucleic acids.	Usually complete.	Mononucleotides.
		Nucleotidases.	Mononucleotides.	Usually complete.	Nucleosides phosphoric acid.
		Nucleosidases (in mucosa).	Nucleosides.	Usually complete.	Purine bases, carbohydrates.

* Harry M. Vars, Ph.D., *Cyclopedia of Medicine, Surgery and Specialties*.

e., inverting. E. that converts a double sugar (sucrose) into simple sugars

e., lipolytic. E. that acts on fats hydrolyzing them to glycerol and fatty acids, a lipase

e., oxidation. See: deamidizing e.

e., oxidizing. E. that catalyzes oxidative reactions; an oxidase or dehydrogenase

e., polypeptolytic. E. having a hydrolytic action on the polypeptides

e., proteolytic. E. changing proteins into peptones

e., reducing. Reductase One that withdraws oxygen

e., respiratory. E. that acts within tissue cells catalyzing oxidative reactions with the release of energy Ex: flavoproteins, cytochromes

e., steatolytic. See lipolytic e.

e., sucroclastic. E. dividing or decomposing sugar

e., uricolytic. E. converting uric acid into urea

e., Warburg's yellow. An oxidative enzyme isolated from yeast cells

e., yellow. A flavoprotein One of a group of enzymes involved in cellular oxidations

enzymolysis (en-zim-o-l'ī-sis) [G *en*, in, + *zyme*, leaven, + *lysis*, dissolution]. Chemical change caused by an enzyme SYN *enzymolysis*.

enzymo'sis [' + ' + *ōsis*]. Fermentation due to an enzyme. SYN *enzymolysis*.

enzymu'ria [' + ' + *ouron*, urine]. Enzymes in the urine

eonism (e'on-izm) Desire to dress in the clothing of the opposite sex, a sexual perversion SYN *transvestism* *

eosin (ē'o-sin, -sēn) [G *ēōs*, dawn (rose colored)], ($C_{20}H_{16}Br_2O_6$) 1. A dye derived from action of bromine on fluorescein An acid dye much used for diagnostic purposes

Brownish-red crystals used in microscopy as a stain. SYN: *tetrabromfluorescein*.

2. Any of several similar dyes.

3. Rosy-red, dawn colored.

eosin'oblast [G *ēōs*, dawn, + *blastos*, germ]. A bone marrow cell which develops into a myelocyte. SYN *myeloblast*.

eosinopenia (ē'o-sin-o-pe-nī-ā) [' + *penia*, poverty]. Abnormally small number of eosinophil cells in the peripheral blood

eosinophil (ē-o-sin-o-fīl, or -fīl) [' + *philein*, to love] A cell or cellular structure that stains readily with the acid stain, *eosin*, specifically an eosinophilic leucocyte.

Eosinophils are present in small numbers under normal conditions. Supposed to originate in bone marrow.

They are large, slightly irregular cells with very distinct, bright pink granules. These granules cover the protoplasm, often making it invisible. Occasionally there are vacuoles scattered about through the granules. The nucleus is of a polymorphonuclear type. They make up from 1/2 to 2% of the white cells of normal man. See *oxyphil*.

e. leucocytes. Spherical cells found in blood and sometimes in connective tissues having a diameter of 9 to 14 microns. The nucleus is polymorphous usually having two lobes connected by a thin strand. The cytoplasm contains numerous coarse, highly refractile granules which stain intensely with eosin or other acid stains. They constitute 2 to 4 per cent of the white cell count.

Eosinophil leucocytes originate in the red bone marrow. Their function is not well established. They are ameboid but do not exhibit phagocytic activity. They increase in number in certain diseases such as asthma and in certain infestations with animal parasites. They decrease in number in circulating blood following the administration of ACTH or cortisone

eosinophilia (ē'o-sin-o-fīl'ī-ā) [' + *philein*, to love] 1. Accumulation of unusual number of eosinophil cells in the blood. 2. Condition of being eosinophilic.

eosinophilic (ē'o-sin-o-fīl'ik) [' + *philein*, to love]. Readily stainable with eosin

eosinoph'ulous [' + *philein*, to love] 1. Easily stainable with eosin. 2. Having eosinophilia.

eosinotactic (ē-o-sin-o-tak'tik) [' + *taktikos*, arranged] Attraction or repulsion of eosinophil cells

epac'mastic (ep-ak-mas'tik) [G. *epi*, upon, + *akmē*, prime]. Denoting increase of symptoms RS *ac'mastic*, *parac'mastic*.

epac'tal [G. *epaktos*, added to]. Supernumerary.

e. bone. Wormian bone

eparsalgia (ep-ar-sal'ij-ā) [G. *epairein*, to lift, + *algos*, pain]. Any disorder due to overstrain of a part. SYN *eper-salgia*.

eparter'ial. Located over or above an artery

epaxial (ep-ak'sī-al) [G. *epi*, upon, + *L. axis*, axis]. Situated above or behind any axis

epencephalon (ep-en-sef'al-on) [' + *egkephalos*, brain] The metencephalon, the anterior portion of the embryonic hind brain (rhombencephalon) from which arise the pons and cerebellum

ependyma (ep-en-dīm-ā) [G. *ependyma*, wrap]. Membrane lining the cerebral ventricles and central canal of spinal cord.

e. medullae spinalis. The spinal portion of the *e. ventriculorum cerebri*. The ventricular portion of the *e.*

ependym'al. Pertaining to the ependyma

e. cells. Cells of the developing neural tube which give rise to the ependyma. They arise from spongioblasts derived from the neural epithelium

e. layer. The innermost of three layers which form the neural tube of an embryo

ependymitis (ep'en-dīm-'ītis) [' + *-itis*, inflammation]. Inflammation of the ependyma

ependymoblast (ep-en-dīm-mo-blast) [' + *blastos*, germ]. An embryonic ependymal cell or ependymocyte.

ependymocyte (ep-en-dīm-mo-sīt) [' + *kytos*, cell]. A cell of the ependymal region.

ependymo'ma [' + *ōma*, tumor]. A tumor arising from fetal inclusion of ependymal elements.

epersal'gia [G. *epairein*, to lift, + *algos*, pain]. Pain and soreness due to overuse or unaccustomed use of a part.

ephebic (ef-e'bik) [G. *ephēbikos*, pert. to puberty]. Pert. to adolescence.

ephebiology (e-fe-bol'o-jī) [G. *ephēbos*, puberty]. The study of puberty and its changes.

ephedrine (ef'ed-rin). An alkaloid obtained from *Ma huang*, a species of *Ephedra*; first isolated by Nagai in 1887. *Ma huang* had a reputation in ancient

Chinese medicine as a diaphoretic and antipyretic. It was not until recent times, however, that its action was studied and its valuable therapeutic properties made known.

Action Similar to that of adrenalin. Its effects, although less powerful, are more prolonged, and it exerts an action when given orally, whereas adrenalin is effective only by injection. Ephedrine orally (or by injection) dilates the bronchial muscles, contracts the nasal mucosa, and raises the blood pressure. Chiefly used for its bronchodilator effect in asthma, and for its constricting effects on the nasal mucosa in hay fever.

Dosage From 1/4-5/6 gr. (0.015-0.05 Gm.). Some patients need carefully regulated doses. The least dose which will give the specific desired effect is desirable.

INCOMPATIBILITIES *Calcium chloride, iodine, tannic acid.*

e. hydrochloride. USP. A more soluble salt of the alkaloid, containing about 80% ephedrine.

Dosage 3/4 gr. (0.025 Gm.), locally, in from 1/2 to 3%.

INCOMPATIBILITIES *Sodium bicarbonate.*

e. sulfate. This contains about 75% ephedrine, dosage and uses same as *e. hydrochloride*, but believed by some to be more irritant.

ephelis (ef-él'is) [G. *ephēlis*, freckle]. Freckle, lentigo.*

epihemeral (e-fem'er-al) [G. *epi*, upon, + *ēmera*, day]. Of brief duration.

epidrosis (ef-i-dro'sis) [G. *epidrosis*, a sweating]. Abnormal amt. of sweating.

e. cruenta. Sweat containing blood.

e. saccharata. Diabetic condition in which sugar is present in sweat.

e. tincta. Colored sweat. SYN *chromidrosis*.

epi-, ep- [G.]. Prefix meaning upon, at, in addition to.

epiallopregnanolone (ēp'i-al'o-prēg-nan'ō-lōn) Male sex hormone in urine of pregnant women, which helps to form male sex characteristics.

epiblast [G. *epi*, upon, + *blastos*, germ]. SYN: *Ectoderm, qv*. Outer layer of cells of the blastoderm. SEE *hypoblast*.

epiblastic (ep-i-blas'tik) [I' + *blastos*, germ]. Pert. to the epiblast.

epibole, epiboly (ē-pib'o-lī) [G. *epibolē*, cover]. Inclusion of the hypoblast within the epiblast, due to swifter growth of the latter. SEE *emboly*.

epibular (ēp-i-bū'lār) Lying upon the bulb of any structure, more specifically, located upon the eyeball.

epicanthus [G. *epi*, upon, + *kanthos*, canthus]. A fold of skin extending from the root of the nose to the median end of the eyebrow, covering the inner canthus and caruncle. It is a characteristic of the Mongolian race and may occur as a congenital anomaly in Caucasians.

epicardia (ēp-i-kard'i-ā). [I' + *kardia*, heart]. The abdominal portion of the esophagus extending from the diaphragm to the stomach, about 2 cm in length.

epicardium [I' + *kardia*, heart]. The inner or visceral layer of the pericardium.* which forms a serous membrane forming the outermost layer of the wall of the heart.

epicole, epicoelia (ep'is-ēl, -i-coy'li-a) [I' + *koilia*, hollow]. The fourth ventricle of the brain.

epichordal (ēp-i-kórd'āl). Located dorsal to the notochord.

epicomus (ēp-i-kóm'ūs). A monster with a parasitic twin, or head attached to the summit or vertex of the skull.

epicondylalgia (ēp-i-kond-i-lāl'i-ā) [I' + *kondylos*, condyle, + *algos*, pain]. Pain in the elbow joint in the region of the epicondyles.

epicondyle [I' + *kondylos*, condyle]. The eminence at the articular end of a bone above a condyle.

epicranium [I' + *kranion*, cranium]. Soft parts covering the cranium.

epicranial (ep-i-kra'nī-us) [I' + *kranion*, cranium]. Occipitofrontal muscle and scalp.

epicrisis [I' + *krisis*, crisis]. A supplementary or secondary crisis following a return of morbid symptoms.

epicritic (ep-i-krit'ik) [G. *epikritikos*, judging]. Pert. to extreme sensibility, such as that of the skin when it discriminates between degrees of sensation caused by touch or temperature.

epicystitis [G. *epi*, upon, + *kystis*, bladder, + *itis*, inflammation]. Inflammation of cellular tissue above the bladder.

epicystotomy [I' + I' + *tomē*, incision]. Opening above the symphysis pubis into the bladder.

epicyte (ep'i-sīt) [I' + *kytos*, cell]. 1. An epithelial cell. 2. A cell membrane.
